MODIFICATION OF AIRPORT DESIGN STANDARDS

ITEMS 1-17 ARE TO BE COMPLETED BY THE AIRPORT SPONSOR(ORIGINATOR). ALL OTHER ITEMS WILL BE COMPLETED BY THE FAA.

THE COMPLETED FORM WILL BE TRANSMITTED BY THE ORIGINATOR TO THE APPLICABLE ADO/AFO. THE ADO/AFO WILL TRANSMIT THE FINAL FAA DETERMINATION TO THE ORIGINATOR.

MODIFICATION TO AIRPORT DESIGN STANDARDS REQUESTS SHOULD INCLUDE SKETCHES OR DRAWINGS WHICH CLEARLY ILLUSTRATE THE NONSTANDARD CONDITION.

ITEMS

1. LEGAL NAME OF AIRPORT.

2. ASSOCIATED CITY.

3. AIRPORT LOCATION IDENTIFIER (SEE APPROACH PLATES/AIRPORT FACILITY DIRECTORY).

4. IDENTIFY THE RUNWAY(S), TAXIWAY(S) OR OTHER FACILITIES EFFECTED BY THE PROPOSED MODIFICATION TO STANDARDS REQUEST.

5. IDENTIFY THE MOST CRITICAL APPROACH FOR EACH RUNWAY IDENTIFIED IN #4.

6. AIRPORT REFERENCE CODE - SEE PARAGRAPH 2, PAGE 1 AC 150/5300-13(CHANGE 4) - I.E. C-II, B-II, A-I (SMALL).

7. NOTE THE DESIGN AIRCRAFT (ARC OR SPECIFIC AIRCRAFT) FOR EACH FACILITY IDENTIFIED IN #4. A DESIGN AIRCRAFT MUST MAKE REGULAR USE OF THE FACILITY. NORMALLY, FAA CONSIDERS REGULAR USE TO BE 500 OR MORE ANNUAL INTINERANT OPERATIONS.

IF THE AIRPORT SERVES A WHOLE FAMILY OF AIRCRAFT IN A PARTICULAR GROUP, THE ARC (I.E. B-II) SHOULD BE SPECIFIED. IF,HOWEVER, THE AIRPORT IS USED BY ONLY 1 OR 2 OF A FAMILY OF AIRCRAFT (IX- BEECH KING AIR C90), THE MOST DEMANDING (APPROACH SPEED, WINGSPAN) AIRCRAFT SHOULD BE SPECIFIED.

8. IDENTIFY THE SPECIFIC NAME OF THE STANDARD THAT IS PROPOSED TO BE MODIFIED FOR THE SUBJECT LOCAL CONDITION.
9. DESCRIBE (WORDS AND NUMBERS) THE DIMENSIONS AND REQUIREMENTS OF THE STANDARD AS PROVIDED IN AC 150/5300-13.

10. STATE THE PROPOSED MODIFICATION TO THE STANDARD.

11. DISCUSS THE LOCAL CONDITIONS THAT MAKE IT IMPRACTICAL OR IMPOSSIBLE TO MEET THE STANDARD.

12. IDENTIFY ALTERNATIVES TO THE SUBJECT PROPOSED MODIFICATION, AND SHOW WHY THESE ALTERNATIVES ARE NOT VIABLE.

13. DISCUSS HOW THE PROPOSED MODIFICATION WOULD IMPACT AIRPORT SAFETY AND EXPLAIN WHY AN ACCEPTABLE LEVEL OF SAFETY, ECONOMY, DURABILITY, AND WORKMANSHIP WOULD STILL EXIST.

14. TYPED NAME AND SIGINATURE OF AIRPORT AUTHORITY REPRESELNTATIVE.

15. SELF-EXPLANATORY.

16. SELF-EXPLANATORY.

17. SELF-EXPLANATORY.

18. TO BE COMPLETED BY FAA.

MODIFICATION OF AIRPORT DESIGN STANDARDS

BACKGROUND

1. AIRPORT: **Friedman Memorial Airport**	2. LOCATION(CITY,STATE): **Hailey, ID**	3. LOC ID: **SUN**
4. EFFECTED RUNWAY/TAXIWAY: **RUNWAY 13-31**	5. APPROACH (EACH RUNWAY): **RW 13 VISUAL** **RW 31 NPI**	6. AIRPORT REF. CODE (ARC): **C-III**

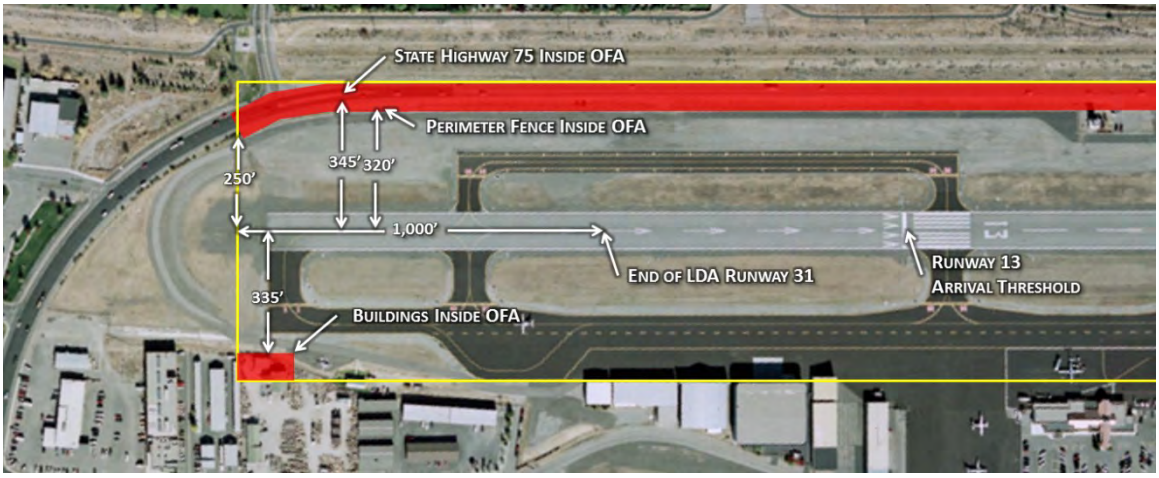
7. DESIGN AIRCRAFT (EACH RUNWAY/TAXIWAY): **Bombardier Q-400 and Gulfstream G-V**

MODIFICATION OF STANDARDS

8. TITLE OF STANDARD BEING MODIFIED (CITE REFERENCE DOCUMENT):

Runway Object Free Area (OFA), Advisory Circular 150/5300-13A, *Airport Design* (AC 150/5300-13A)

9. STANDARD/REQUIREMENT:



800 feet (400 foot either side of centerline) per Table 3-8 on page 94 of AC 150/5300-13A.

10. PROPOSED:

Varies see below.

11. EXPLAIN WHY STANDARD CANNOT BE MET (FAA ORDER 5300.1E):

State Highway 75 and the Perimeter Fence run parallel to Runway 13-31 from south to north until approximately 210' from the Runway 13 pavement end at which point they curve toward the runway until they are a minimum distance of 250' for the Perimeter Fence and 275' for State Highway 75 from the extended runway centerline. The following figure shows the deficiencies on the north end of the airfield in more detail:

As SUN is currently configured using declared distances, the OFA for arrivals and departures in each direction have different deficiencies. The OFA to the east of Runway 13-31 for both arrivals and departures is penetrated by both State Highway 75 and the Perimeter Fence at 345' and 320' respectively. The OFA for Runway 13 departures and Runway 31 arrivals are penetrated to a greater degree at the north end of the airfield by the Perimeter Fence and State Highway 75 along with two buildings located off airport property. The deficiencies are summarized in the following table:

Runway OFA	State Highway 75	Perimeter Fence	Off Airport Buildings
13 Arrivals	345'	320'	None
13 Departures	275' to 345'	250' to 320'	335'
31 Arrivals	275' to 345'	250' to 320'	335'
31 Departures	345'	320'	None

U.S. DEPARTMENT OF TRANSPORTATION
FEDERAL AVIATION ADMINISTRATION
NORTHWEST MOUNTAIN REGION
AIRPORT IMPROVEMENT PROGRAM

MODIFICATION OF AIRPORT DESIGN STANDARDS

In order to meet OFA requirements either the Runway and all airport facilities would have to be shifted to the West or State Highway 75 would have to be shifted to the East.

Neither of these options are seen as practicable and providing a less than standard OFA will provide an acceptable level of safety, based on the aircraft traffic at the airport.

12. DISCUSS VIABLE ALTERNATIVES (FAA ORDER 5300.1E):

The airport sponsor has considered three alternatives to provide a Runway OFA at the airport that complies with standards. The first two alternatives, though viable, are not practicable, due to cost and environmental impact.

1. Relocate Runway And All Airport Facilities To The West – Not Practicable
    - Essentially reconstructs the entire airport west of existing facilities, including the terminal, FBO facilities, all hangars and maintenance/ARFF facilities.
    - Total estimated cost exceeds $144 million.
2. Relocate Highway to the East – Not Practicable
    - Requires relocation of approximately 2 miles of State Highway 75 approximately 75 feet to the east.
    - A large neighborhood exists east of the airport in this location and relocating the highway will greatly increase the environmental impact of the highway on that neighborhood. Idaho Transportation Department has completed an Environmental Impact Statement study for a proposed project on this highway, which identifies the following environmental impacts of the highway in this location, all of which would be exacerbated significantly by relocating the highway as described. Note that an environmental analysis for the proposed action relative to the airport has not been completed – these impacts are identified based on previous studies and would require further evaluation.
        - Historical Resources: Relocation of the highway would require removal of a railroad berm that has been identified as a potential historic structure.
        - Noise: The noise levels of a relocated highway may exceed those permitted by Federal Highway Administration guidelines and require mitigation. Mitigation is difficult at this location, due to local ordinances prohibiting construction of noise walls.
        - Environmental Justice: The adjacent neighborhood is high density, with relatively low incomes and a high minority population. Based on these factors, relocating the highway could induce environmental justice impacts.
    - Costs for relocating the highway are estimated to exceed $17 million.
3. Allow Highway, Fence and Buildings To Remain
    - Do not relocate the highway.
    - Based on existing traffic at the airport, this will provide an acceptable level of safety. (See explanation below.)

U.S. DEPARTMENT OF TRANSPORTATION
FEDERAL AVIATION ADMINISTRATION
NORTHWEST MOUNTAIN REGION
AIRPORT IMPROVEMENT PROGRAM

MODIFICATION OF AIRPORT DESIGN STANDARDS

13. STATE WHY MODIFICATION WOULD PROVIDE ACCEPTABLE LEVEL OF SAFETY, ECONOMY, DURABILITY, AND WORKMANSHIP (FAA ORDER 5300.1E):

In 2011, the Transportation Research Board (TRB) published ACRP Report 51 – Risk Assessment Method to Support Modification of Airfield Separation Standards. This report provides a method for calculating the probability and associated risk for various runway to object separations, with the purpose of determining acceptability of modifications of standards. The method outlined in the report involves calculating the risk for three separate phases of aircraft operation: airborne phase, landing roll and takeoff roll. The highest risk value is then used to evaluate whether the separation is acceptable. The report provides figures for each of the phases of aircraft operations where the runway to object separation is used to determine the risk.

Current traffic at SUN includes less than 50,000 operations (25,000 takeoffs and 25,000 landings) per year. Using these operational numbers and the procedure outlined in ACRP Report 51, the estimated risk along with the return period for each phase of operation is summarized below for each of the objects located in the Runway Object Free Area. In each case, the controlling phase of flight was the Landing Roll. The table below summarizes the risk associated with each object.

Object (Separation)	Controlling Phase of Flight	Hazard Severity Classification	Rate of Occurrence	Acceptable Level?
Perimeter Fence (250')	Landing Roll	Major	Once every 250 years	Yes
Perimeter Fence (320')	Landing Roll	Major	Once every 440 years	Yes
State Highway 75 (275')	Landing Roll	Catastrophic	Once every 333 years	Yes
State Highway 75 (345')	Landing Roll	Catastrophic	Once every 571 years	Yes
Off Airport Buildings (335')	Landing Roll	Catastrophic	Once every 500 years	Yes

As shown in the table above, each of the various Runway to Object Separations provide an acceptable level of risk. In addition, the closest separations are all located on the north end of the airfield. Though each of these penetrates the departure OFA for Runway 13, the risk of an incident is actually much lower as an aircraft would be taking off in the opposite direction of the objects. For arrivals on Runway 31, due to the use of declared distances, the objects are located a minimum of 1,000' from the end of the runway declared suitable for landing operations. Their location is modeled as if the objects are located laterally to the runway and as such the actual risk of an incident is much lower.

AIRPORT IMPROVEMENT PROGRAM

MODIFICATION OF AIRPORT DESIGN STANDARDS

BACKGROUND

1. AIRPORT: **Friedman Memorial Airport**	2. LOCATION(CITY,STATE): **Hailey, ID**	3. LOC ID: **SUN**
4. EFFECTED RUNWAY/TAXIWAY: **RUNWAY 13-31**	5. APPROACH (EACH RUNWAY): **RW 13 VISUAL** **RW 31 NPI**	6. AIRPORT REF. CODE (ARC): **C-III**

7. DESIGN AIRCRAFT (EACH RUNWAY/TAXIWAY): **Bombardier Q-400 and Gulfstream G-V**

MODIFICATION OF STANDARDS

8. TITLE OF STANDARD BEING MODIFIED (CITE REFERENCE DOCUMENT):

Runway Safety Area (RSA) Grading, Advisory Circular 150/5300-13A, *Airport Design* (AC 150/5300-13A)

9. STANDARD/REQUIREMENT:

Per Figure 3-23 on page 82 of AC 5300-13, the RSA transverse grades vary from 1.5% to 3% from the edge of runway shoulder down to the edge of the runway safety area.

10. PROPOSED:

Existing transverse grades in the north half of the airport vary from 0% to 1% to remain.

11. EXPLAIN WHY STANDARD CANNOT BE MET (FAA ORDER 5300.1E):

In order to meet the RSA grading standards, approximately 250,000 cubic yards of excavation would be disposed of offsite in addition to approximately 50,000 yards of onsite embankment. The estimated cost of disposing of the material offsite alone is over $3.7 million dollars. In the mountain environment of Hailey, the project would need to occur in the summer during peak travel times and the airport's single runway would need to be shut down for approximately 90 days to complete the work. The closure of the airport for an extended period of time would have significant negative economic impacts on the community.

12. DISCUSS VIABLE ALTERNATIVES (FAA ORDER 5300.1E):

The airport sponsor has considered two alternatives to meet this standard. Though viable, the first alternative is not seen as practicable due to cost and operational impacts relative to the improvement in safety.

1. Grade the RSA so transverse grades are -1.5% to -3%.
    - Requires excavation of over 300,000 cubic yards of material, over 250,000 of which would need to be disposed of off site.
    - Additional cost of over $3.7 million to dispose of material off site.
    - Additional cost of $1.5 million to relocate storm drainage system.
    - Would require runway shut down of up to 90 days during summer months, with a huge negative impact to the airport and local economy.
2. Allow existing grades of 0% to +1% to remain.
    - Provides acceptable level of safety, as described below.
    - No operational or cost impacts.

U.S. DEPARTMENT OF TRANSPORTATION
FEDERAL AVIATION ADMINISTRATION
NORTHWEST MOUNTAIN REGION
AIRPORT IMPROVEMENT PROGRAM

MODIFICATION OF AIRPORT DESIGN STANDARDS

13. STATE WHY MODIFICATION WOULD PROVIDE ACCEPTABLE LEVEL OF SAFETY, ECONOMY, DURABILITY, AND WORKMANSHIP (FAA ORDER 5300.1E):

From AC 150/5300-13A, the purpose of the RSA is to *"enhance the safety of aircraft which undershoot, overrun or veer off the runway, and it provides greater accessibility for fire fighting and rescue equipment during such incidents."* The distance an aircraft departs from the runway is affected by three (3) major elements: weight of the aircraft, speed of the aircraft and RSA gradient. The third variable and the subject of this modification, the RSA gradient, affects the rate at which an aircraft slows after departing the runway. The steeper the gradient the longer it will take for an aircraft to stop. The existing transverse RSA gradients at SUN are flatter than standard; meaning an aircraft would actually come to a stop sooner if all other variables were equal. Paragraph 307 f in AC 5300-13 describes this condition: *"Keeping negative grades to the minimum practicable contributes to the effectiveness of the RSA."* Though flatter than standard, the RSA at SUN is graded smoothly and is capable of safely accommodating an aircraft without damage, in the case of a veer off.

The negative aspect of gradients flatter than standard are the inability to adequately drain the RSA during rainfall events. The existing RSA at SUN drains extremely well, with no accumulation of water. Existing soils drain very well and the local climate is dry, with an average annual rainfall of only 16 inches. In addition, the runway is equipped with a storm drainage system that collects and removes drainage efficiently.

The total estimated cost of meeting the minimum transverse grade of a 1.5% is $5 Million dollars and will require a full airport closure for 3 months. As the proposed RSA at SUN will meet the RSA requirements defined in AC 5300-13A, the grades flatter than standard will provide an acceptable level of safety.

RUNWAY CENTERLINE TO AIRCRAFT PARKING

U.S. DEPARTMENT OF TRANSPORTATION
FEDERAL AVIATION ADMINISTRATION
NORTHWEST MOUNTAIN REGION
AIRPORT IMPROVEMENT PROGRAM

MODIFICATION OF AIRPORT DESIGN STANDARDS

BACKGROUND

1. AIRPORT: **Friedman Memorial Airport**	2. LOCATION(CITY,STATE): **Hailey, ID**	3. LOC ID: **SUN**
4. EFFECTED RUNWAY/TAXIWAY: **RUNWAY 13-31**	5. APPROACH (EACH RUNWAY): **RW 13 VISUAL** **RW 31 NPI**	6. AIRPORT REF. CODE (ARC): **C-III**

7. DESIGN AIRCRAFT (EACH RUNWAY/TAXIWAY): **Bombardier Q-400 and Gulfstream G-V**

MODIFICATION OF STANDARDS

8. TITLE OF STANDARD BEING MODIFIED (CITE REFERENCE DOCUMENT):

Runway to Aircraft Parking Area, Advisory Circular 150/5300-13A, *Airport Design* (Advisory Circular 150/5300-13A)

9. STANDARD/REQUIREMENT:

500 feet per Table 3-8 on page 94 of AC 150/5300-13A.

10. PROPOSED:

400 feet

11. EXPLAIN WHY STANDARD CANNOT BE MET (FAA ORDER 5300.1E):

In the airport's current configuration, relocation of aircraft parking area to a separation of 500 feet would either require the reconfiguration of all airfield facilities on the west side of the airport or relocating the runway and Highway 75 to the east to provide the required separation. Neither of these options are seen as practicable and providing a separation of 400 feet between Runway 13-31 and Aircraft Parking will provide an acceptable level of safety, based on the aircraft traffic at the airport.

12. DISCUSS VIABLE ALTERNATIVES (FAA ORDER 5300.1E):

The airport sponsor has considered three alternatives to provide meet or improve compliance with standards at the airport, including Runway to Aircraft Parking Separation. The first two alternatives, though viable, are not practicable, due to cost and environmental impact.

1. Relocate Terminal and Aircraft Parking To The Southwest – Not Necessary
    - Acquire 30 Acres of land, relocate terminal building and access road, extend utilties and construct 50,000 SY of aircraft parking
    - Total estimated cost exceeds $30 million.
2. Relocate Runway and Highway to the East – Not Practicable
    - Requires relocation of approximately 2 miles of State Highway 75 approximately 75 feet to the east.
    - A large neighborhood exists east of the airport in this location and relocating the highway will greatly increase the environmental impact of the highway on that neighborhood. Idaho Transportation Department has completed an Environmental Impact Statement study for a proposed project on this highway, which identifies the following environmental impacts of the highway in this location, all of which would be exacerbated significantly by relocating the highway as described. Note that an environmental analysis for the proposed action relative to the airport has not been completed – these impacts are identified based on previous studies and would require further evaluation.
        - Historical Resources: Relocation of the highway would require removal of a railroad berm that has been identified as a potential historic structure.
        - Noise: The noise levels of a relocated highway may exceed those permitted by Federal Highway Administration guidelines and require mitigation. Mitigation is difficult at this location, due to local ordinances prohibiting construction of noise walls.
        - Environmental Justice: The adjacent neighborhood is high density, with relatively low incomes and a high minority population. Based on these factors, relocating the highway could induce environmental justice impacts.
    - Costs for relocating the Runway and Highway are estimated to exceed $119 million.
3. Reconfigure Aircraft Parking to Provide 400 Feet Separation
    - Can be accomplished along with other proposed standards improvements, without additional cost or environmental impact.
    - Provides acceptable level of safety.

U.S. DEPARTMENT OF TRANSPORTATION
FEDERAL AVIATION ADMINISTRATION
NORTHWEST MOUNTAIN REGION
AIRPORT IMPROVEMENT PROGRAM

MODIFICATION OF AIRPORT DESIGN STANDARDS

13. STATE WHY MODIFICATION WOULD PROVIDE ACCEPTABLE LEVEL OF SAFETY, ECONOMY, DURABILITY, AND WORKMANSHIP (FAA ORDER 5300.1E):

According to AC 150/5300-13A Paragraph 321 a (3), "Runway to aircraft parking area separation is determined by the landing and takeoff flight path profiles and physical characteristics of the aircraft. The runway to parking area separation standard precludes any part of a parked aircraft (tail, wingtip, nose, etc.) from being within the ROFA or penetrating the OFZ."

A runway to aircraft parking area separation of 400 feet would preclude any part of a parked aircraft from penetrating the Runway OFA or the Runway OFZ. In addition, a separation of 400 feet would also provide the following benefits:

1. Prevent parked aircraft from penetrating the Runway Primary Surface
2. Prevent parked aircraft from penetrating the Runway Transitional Surface
3. Prevent parked aircraft from penetrating the Taxiway OFA

As the proposed runway to aircraft parking area separation of 400 feet meets the purpose of this standard as stated in AC 150/5300-13A, this configuration will provide an acceptable level of safety.

TRANSPORTATION RESEARCH BOARD 2011 EXECUTIVE COMMITTEE*

OFFICERS

CHAIR: **Neil J. Pedersen,** *Administrator, Maryland State Highway Administration, Baltimore*
VICE CHAIR: **Sandra Rosenbloom,** *Professor of Planning, University of Arizona, Tucson*
EXECUTIVE DIRECTOR: **Robert E. Skinner, Jr.,** *Transportation Research Board*

MEMBERS

J. Barry Barker, *Executive Director, Transit Authority of River City, Louisville, KY*
Deborah H. Butler, *Executive Vice President, Planning, and CIO, Norfolk Southern Corporation, Norfolk, VA*
William A.V. Clark, *Professor, Department of Geography, University of California, Los Angeles*
Eugene A. Conti, Jr., *Secretary of Transportation, North Carolina DOT, Raleigh*
James M. Crites, *Executive Vice President of Operations, Dallas-Fort Worth International Airport, TX*
Paula J. Hammond, *Secretary, Washington State DOT, Olympia*
Michael W. Hancock, *Secretary, Kentucky Transportation Cabinet, Frankfort*
Adib K. Kanafani, *Cahill Professor of Civil Engineering, University of California, Berkeley*
Michael P. Lewis, *Director, Rhode Island DOT, Providence*
Susan Martinovich, *Director, Nevada DOT, Carson City*
Michael R. Morris, *Director of Transportation, North Central Texas Council of Governments, Arlington*
Tracy L. Rosser, *Vice President, Regional General Manager, Wal-Mart Stores, Inc., Mandeville, LA*
Steven T. Scalzo, *Chief Operating Officer, Marine Resources Group, Seattle, WA*
Henry G. (Gerry) Schwartz, Jr., *Chairman (retired), Jacobs/Sverdrup Civil, Inc., St. Louis, MO*
Beverly A. Scott, *General Manager and CEO, Metropolitan Atlanta Rapid Transit Authority, Atlanta, GA*
David Seltzer, *Principal, Mercator Advisors LLC, Philadelphia, PA*
Lawrence A. Selzer, *President and CEO, The Conservation Fund, Arlington, VA*
Kumares C. Sinha, *Olson Distinguished Professor of Civil Engineering, Purdue University, West Lafayette, IN*
Thomas K. Sorel, *Commissioner, Minnesota DOT, St. Paul*
Daniel Sperling, *Professor of Civil Engineering and Environmental Science and Policy; Director, Institute of Transportation Studies; and Interim Director, Energy Efficiency Center, University of California, Davis*
Kirk T. Steudle, *Director, Michigan DOT, Lansing*
Douglas W. Stotlar, *President and CEO, Con-Way, Inc., Ann Arbor, MI*
C. Michael Walton, *Ernest H. Cockrell Centennial Chair in Engineering, University of Texas, Austin*

EX OFFICIO MEMBERS

Peter H. Appel, *Administrator, Research and Innovative Technology Administration, U.S.DOT*
J. Randolph Babbitt, *Administrator, Federal Aviation Administration, U.S.DOT*
Rebecca M. Brewster, *President and COO, American Transportation Research Institute, Smyrna, GA*
Anne S. Ferro, *Administrator, Federal Motor Carrier Safety Administration, U.S.DOT*
LeRoy Gishi, *Chief, Division of Transportation, Bureau of Indian Affairs, U.S.DOT*
John T. Gray, *Senior Vice President, Policy and Economics, Association of American Railroads, Washington, DC*
John C. Horsley, *Executive Director, American Association of State Highway and Transportation Officials, Washington, DC*
David T. Matsuda, *Deputy Administrator, Maritime Administration, U.S.DOT*
Victor M. Mendez, *Administrator, Federal Highway Administration, U.S.DOT*
William W. Millar, *President, American Public Transportation Association, Washington, DC*
Tara O'Toole, *Under Secretary for Science and Technology, U.S. Department of Homeland Security, Washington, DC*
Robert J. Papp (Adm., U.S. Coast Guard), *Commandant, U.S. Coast Guard, U.S. Department of Homeland Security, Washington, DC*
Cynthia L. Quarterman, *Administrator, Pipeline and Hazardous Materials Safety Administration, U.S.DOT*
Peter M. Rogoff, *Administrator, Federal Transit Administration, U.S.DOT*
David L. Strickland, *Administrator, National Highway Traffic Safety Administration, U.S.DOT*
Joseph C. Szabo, *Administrator, Federal Railroad Administration, U.S.DOT*
Polly Trottenberg, *Assistant Secretary for Transportation Policy, U.S.DOT*
Robert L. Van Antwerp (Lt. Gen., U.S. Army), *Chief of Engineers and Commanding General, U.S. Army Corps of Engineers, Washington, DC*
Barry R. Wallerstein, *Executive Officer, South Coast Air Quality Management District, Diamond Bar, CA*

*Membership as of June 2011.

AIRPORT COOPERATIVE RESEARCH PROGRAM

Airports are vital national resources. They serve a key role in transportation of people and goods and in regional, national, and international commerce. They are where the nation's aviation system connects with other modes of transportation and where federal responsibility for managing and regulating air traffic operations intersects with the role of state and local governments that own and operate most airports. Research is necessary to solve common operating problems, to adapt appropriate new technologies from other industries, and to introduce innovations into the airport industry. The Airport Cooperative Research Program (ACRP) serves as one of the principal means by which the airport industry can develop innovative near-term solutions to meet demands placed on it.

The need for ACRP was identified in *TRB Special Report 272: Airport Research Needs: Cooperative Solutions* in 2003, based on a study sponsored by the Federal Aviation Administration (FAA). The ACRP carries out applied research on problems that are shared by airport operating agencies and are not being adequately addressed by existing federal research programs. It is modeled after the successful National Cooperative Highway Research Program and Transit Cooperative Research Program. The ACRP undertakes research and other technical activities in a variety of airport subject areas, including design, construction, maintenance, operations, safety, security, policy, planning, human resources, and administration. The ACRP provides a forum where airport operators can cooperatively address common operational problems.

The ACRP was authorized in December 2003 as part of the Vision 100-Century of Aviation Reauthorization Act. The primary participants in the ACRP are (1) an independent governing board, the ACRP Oversight Committee (AOC), appointed by the Secretary of the U.S. Department of Transportation with representation from airport operating agencies, other stakeholders, and relevant industry organizations such as the Airports Council International-North America (ACI-NA), the American Association of Airport Executives (AAAE), the National Association of State Aviation Officials (NASAO), and the Air Transport Association (ATA) as vital links to the airport community; (2) the TRB as program manager and secretariat for the governing board; and (3) the FAA as program sponsor. In October 2005, the FAA executed a contract with the National Academies formally initiating the program.

The ACRP benefits from the cooperation and participation of airport professionals, air carriers, shippers, state and local government officials, equipment and service suppliers, other airport users, and research organizations. Each of these participants has different interests and responsibilities, and each is an integral part of this cooperative research effort.

Research problem statements for the ACRP are solicited periodically but may be submitted to the TRB by anyone at any time. It is the responsibility of the AOC to formulate the research program by identifying the highest priority projects and defining funding levels and expected products.

Once selected, each ACRP project is assigned to an expert panel, appointed by the TRB. Panels include experienced practitioners and research specialists; heavy emphasis is placed on including airport professionals, the intended users of the research products. The panels prepare project statements (requests for proposals), select contractors, and provide technical guidance and counsel throughout the life of the project. The process for developing research problem statements and selecting research agencies has been used by TRB in managing cooperative research programs since 1962. As in other TRB activities, ACRP project panels serve voluntarily without compensation.

Primary emphasis is placed on disseminating ACRP results to the intended end-users of the research: airport operating agencies, service providers, and suppliers. The ACRP produces a series of research reports for use by airport operators, local agencies, the FAA, and other interested parties, and industry associations may arrange for workshops, training aids, field visits, and other activities to ensure that results are implemented by airport-industry practitioners.

THE NATIONAL ACADEMIES
Advisers to the Nation on Science, Engineering, and Medicine

The **National Academy of Sciences** is a private, nonprofit, self-perpetuating society of distinguished scholars engaged in scientific and engineering research, dedicated to the furtherance of science and technology and to their use for the general welfare. On the authority of the charter granted to it by the Congress in 1863, the Academy has a mandate that requires it to advise the federal government on scientific and technical matters. Dr. Ralph J. Cicerone is president of the National Academy of Sciences.

The **National Academy of Engineering** was established in 1964, under the charter of the National Academy of Sciences, as a parallel organization of outstanding engineers. It is autonomous in its administration and in the selection of its members, sharing with the National Academy of Sciences the responsibility for advising the federal government. The National Academy of Engineering also sponsors engineering programs aimed at meeting national needs, encourages education and research, and recognizes the superior achievements of engineers. Dr. Charles M. Vest is president of the National Academy of Engineering.

The **Institute of Medicine** was established in 1970 by the National Academy of Sciences to secure the services of eminent members of appropriate professions in the examination of policy matters pertaining to the health of the public. The Institute acts under the responsibility given to the National Academy of Sciences by its congressional charter to be an adviser to the federal government and, on its own initiative, to identify issues of medical care, research, and education. Dr. Harvey V. Fineberg is president of the Institute of Medicine.

The **National Research Council** was organized by the National Academy of Sciences in 1916 to associate the broad community of science and technology with the Academy's purposes of furthering knowledge and advising the federal government. Functioning in accordance with general policies determined by the Academy, the Council has become the principal operating agency of both the National Academy of Sciences and the National Academy of Engineering in providing services to the government, the public, and the scientific and engineering communities. The Council is administered jointly by both Academies and the Institute of Medicine. Dr. Ralph J. Cicerone and Dr. Charles M. Vest are chair and vice chair, respectively, of the National Research Council.

The **Transportation Research Board** is one of six major divisions of the National Research Council. The mission of the Transportation Research Board is to provide leadership in transportation innovation and progress through research and information exchange, conducted within a setting that is objective, interdisciplinary, and multimodal. The Board's varied activities annually engage about 7,000 engineers, scientists, and other transportation researchers and practitioners from the public and private sectors and academia, all of whom contribute their expertise in the public interest. The program is supported by state transportation departments, federal agencies including the component administrations of the U.S. Department of Transportation, and other organizations and individuals interested in the development of transportation. **www.TRB.org**

AUTHOR ACKNOWLEDGMENTS

The research reported herein was performed under ACRP Project 04-09 by Applied Research Associates, Inc. (ARA), Robert E. David & Associates, LCC (RED), Oklahoma University (OU), and Mr. Arun Rao. ARA was the contractor for this study, and RED, OU, and Mr. Rao served as subconsultants.

Dr. Jim Hall, P.E., Principal Engineer at ARA, was the Principal Investigator; Dr. Manuel Ayres, Principal Engineer at ARA, was the Project Manager; and Mr. Richard Speir, ARA Mid-Atlantic Division Manager served as Co-Principal Investigator. The other authors of this report are Mr. Hamid Shirazi (ARA), Mr. Robert David (RED), Dr. Yih-Ru Huang (OU), Mr. Regis Carvalho (ARA), Dr. Samuel Cardoso (ARA), and Ms. Edith Arambula (ARA). The work was done under the general supervision of Dr. Manuel Ayres.

FOREWORD

By Marci A. Greenberger
Staff Officer
Transportation Research Board

ACRP Report 51: Risk Assessment Method to Support Modification of Airfield Separation Standards provides a methodology that airports can use to support their request for modification of standards. It is intended to be used in those circumstances where the design criteria for separations between taxiways/taxilanes and (1) other taxiways/taxilanes and (2) fixed or movable objects as well as separations between taxiways and runways cannot be met. This risk-based methodology will be useful to airport staff and their consultants as they assess the risks associated with non-standard separations at existing constrained airports where the standards can't be practicably met.

To ensure safe operations, FAA-specified airfield design criteria include standards between runways and taxiways and other movement areas and fixed and moveable objects. As many airports were designed long before current design standards and as airplane design and operational realities have changed, so have the impacts that the separation standards can have on existing airfield operations. To account for these realities, the FAA does accept requests from airports for modification of standards.

As risk assessments become more and more a part of any decision-making criteria in many if not all aspects of airport operations and management, it is timely then that this risk-based methodology for assessing and justifying requests to modify separation standards has been developed. Applied Research Associates, Inc. (ARA) was retained under ACRP Project 04-09 to develop a method for assessing the risks associated with non-standard separations. The result of their efforts is *ACRP Report 51: Risk Assessment Method to Support Modification of Airfield Separation Standards*. The methodology was developed in part by analyzing data associated with aircraft veering from runway and taxiway centerlines and determining the probability of incidents occurring. ARA validated their methodology by examining actual modification of standards cases that were approved by the FAA.

Three of the report's appendices will be particularly helpful to the user in understanding the methodology. Appendix A: Risk Assessment Methodology presents a methodology for five different types of circumstances: taxiway/taxilane to taxiway, taxiway to object, taxilane to taxilane, taxilane to an object, and runway to taxiway/taxilane or object. Appendix F: Aircraft Database Summary presents a summary of aircraft characteristics by model, and Appendix H: Analysis of MOS Cases summarizes information collected in the modification of standards survey and presents results of application of the methodology described in Appendix A to each modification of standards case. Other report appendices provide detail and information on the development of the methodology and are provided on the TRB website at http://www.trb.org/Main/Blurbs/165180.aspx. Posted at the same URL on the TRB website is a PowerPoint presentation that may be useful for introducing and explaining the methodology to stakeholders.

SUMMARY

Risk Assessment Method to Support Modification of Airfield Separation Standards

The Federal Aviation Administration (FAA) sets standards for the planning and design of airports to provide safe aircraft operations. These design standards include separation distances between various airfield components such as runways and taxiways, taxiways and taxiways, and taxiways and objects.

Many U.S. airports were built according to older FAA design standards and were planned to accommodate smaller aircraft. With the rapid growth of aviation demand since World War II, many airports are facing the need to increase capacity and to accommodate larger and faster aircraft. However, some airports are finding it a challenge to modify existing airfield separations to meet current standards for larger aircraft because they are constrained by physical barriers, environmentally sensitive areas, and encroaching development.

When it is not feasible to meet existing separations, airports may submit to the FAA a request for modification of standards (MOS) to demonstrate that there are unique local conditions that restrict extending the airfield and to show that the modification will "provide an acceptable level of safety, economy, durability, and workmanship" (FAA, 1989). In requests for an MOS to a separation standard, the main concern is usually the safety of operations. As the FAA and the aviation industry transition to a safety management approach to improve safety, it is important that risks associated with changes be assessed.

Authorization for MOS may be granted if the MOS fulfills the criteria described in FAA's Advisory Circular (AC) 150/5300-13, Airport Design, which specifically addresses taxiway and taxilane separations (FAA, 1989). The criteria do not provide an assessment of risk that may be used for specific airfield scenarios, including the separation between runways and other airfield components (taxiways, taxilanes, and objects). Adherence to the FAA requirements can affect airport efficiency and capacity and, potentially, prevent certain aircraft from using an airfield.

The objective of this research effort was to develop a simple and practical methodology for assessing the risk of aircraft collisions associated with non-standard airfield separations. The tool developed is intended to support MOS requests for non-standard separations.

A practical, risk-based methodology to evaluate airfield separations was developed. The methodology is based on the probability of lateral and vertical deviations from the intended path during landing, takeoff, and taxiing operations. A series of risk plots based on centerline or wingtip separations is provided for each Aircraft Design Group (ADG), and step-by-step procedures are described for each type of separation involved in the analysis, such as runway and taxiway, and taxiway and taxiway.

The methodology was validated using actual MOS cases approved by the FAA that covered a spectrum of scenarios, airports, and FAA regions. Relevant information was gathered for each case to characterize the non-standard situation and was analyzed using the methodology developed in this study. Risk criteria were suggested based on the risk matrix used by the FAA in safety management systems, on the evidence of accident and incident rates, and the consequences gathered in this research effort.

CHAPTER 1

Background

Introduction

The modernization and complexity of the National Airspace System (NAS) have increased considerably in the last four decades, and its components require continuous improvements to increase capacity and safety. Airports are one of the main components of this complex and dynamic system.

To meet higher demands for flights, airlines are operating larger aircraft with greater seating capacity. However, the airfield configurations at many airports were established years ago, and many existing airports were designed and constructed in the 1960s and 1970s to accommodate the smaller aircraft in use at that time. As a consequence, some of these airports have airfield separations that are not compatible with current Federal Aviation Administration (FAA) design requirements and recommendations. Moreover, existing airports need to increase their capacity to meet demand. Many of these airports are constrained by urban development and physical and environmental restrictions, or they do not have the necessary real estate to accommodate the applicable separation standards.

With this potential traffic growth, many airports will need to bring larger aircraft and use instrumented runways to increase their capacity; however, existing separations may not be appropriate for larger aircraft or for upgraded approach categories.

When existing separations do not meet FAA standards, a request for modification of standards (MOS) may be required, and authorization for the operation may be granted if the MOS fulfills the criteria described in FAA's Advisory Circular (AC) 150/5300-13, Airport Design (FAA, 1989). In the context of this study, MOS means any change to FAA dimensional standards, other than those for runway safety areas (RSAs), applicable to an airport design or construction project (new, reconstruction, expansion, or upgrade).

So far, requests dealing with airfield separations have been analyzed according to non-risk-based methodologies, and the only available guidance is described in AC 150/5300-13 (FAA, 1989). This process can affect airport efficiency and capacity and, potentially, prevent certain aircraft from using an airfield. On the other hand, some of the factors that lead to aircraft accidents/incidents are considered under subjective criteria. This research addresses a more consistent risk-based decision-making process to analyze the separation standards at those constrained airports.

Project Goals

The main objective of this research was to develop a methodology for assessing the risk of aircraft collisions associated with non-standard airfield separations. The methodology is intended to provide a quantitative basis to support MOS requests by airport operators for airfield separations that do not meet FAA standards. This study is not aimed at modifying existing standards but rather at allowing an airport operator to assess the level of safety when those standards cannot be met. The methodology was developed to be simple and practical, allowing airport operators to estimate whether the level of risk is acceptable and to compare it to the level of risk achieved when the standard separations are met.

Major Challenges Associated with Airfield Separations

In the coming years, it is expected that air transportation will experience greater growth than has been observed during the 2008 to 2011 recession period. Anticipating the higher demand for flights, airlines are operating larger aircraft with greater seating capacity. However, it is sometimes impracticable to meet the separation standards for larger aircraft due to a number of physical, social, economical, and environmental limitations.

There is no acceptable method available to estimate the level of protection provided by existing airport layouts when evaluating the operation of large aircraft in terms of the probability of collision with another aircraft, vehicle, or object. Current separation standards have provided an excellent level of safety, as evidenced by the small number of accidents associated with

lateral deviations of aircraft. However, when standards cannot be met, there is no process by which to evaluate the level of risk of the smaller airfield separations.

Many aircraft collisions occur during taxiing operations. Over 20 percent of Part 121 accidents in 2005 were characterized as on-ground collisions with objects during taxi or standing (NTSB, 2009). These are collisions between two aircraft, between an aircraft and ground equipment, or between an aircraft and a stationary structure. Some of these accidents may be associated with airfield separations, and it is necessary to evaluate how these separations and lateral aircraft deviations interact to provide an assessment of the risk of collision.

Over 34 percent of fatal accidents with worldwide commercial jets occur on the ground (Boeing, 2009). Runway veer-offs and overruns represent 24 percent of all incidents and accidents in air transport operations (IFALPA, 2008). These types of events happen at an approximate rate of one per week, emphasizing the challenge that airport operators face, particularly when considering substandard airfield separation distances.

The Australian Transport Safety Bureau (ATSB) analyzed 141 accidents with 550 fatalities for commercial aircraft worldwide from 1998 to 2007. All fatal accidents were catastrophic runway excursions, and 120 of these occurred during landings (ATSB, 2009).

Airfield separations and runway and taxiway safety areas have been established and regulated to help reduce the risk of collisions and to mitigate the consequences of runway and taxiway excursions. Airfield separations are determined on the basis of the location, aircraft wingspan, random lateral and vertical deviations, and a separation margin of safety to account for extreme deviations. Over the years, aircraft wingspans have been increasing gradually, and the FAA has developed new separation standards to accommodate these larger aircraft.

The introduction of new large aircraft (NLA) is still in process and will continue bringing challenges to the aviation industry. NLA will have a significant impact predominantly on existing airports, particularly large hubs, due to the aircraft passenger capacity, weight, wingspan, length, tail height, and wheelbase. Some of the current airport separations between runways versus runways, taxiways, taxilanes, moveable and fixed objects, and taxiways versus taxiways, taxilanes, moveable and fixed objects, etc., may not be adequate to accommodate the introduction of NLA. Most airports with separations inadequate to accommodate NLA do not have enough space for construction of new facilities or for relocation of existing facilities to comply with current FAA standards.

It is important to emphasize that it is not only NLAs or existing aircraft like Lockheed C5 and Antonov AN124 that pose challenges to existing airports; recent and new aircraft, such as the Airbus A340-600 and B777-300 ER, require changes in some aspects of airport infrastructure due to their long fuselage length and associated long wheelbase.

FAA Modification of Standards

The FAA established the Airport Reference Code (ARC) system to aid in the geometric design of runways, taxiways, and other airport facilities. The system and the airfield separations associated with each code are described in AC 150/5300-13 (FAA, 1989). The ARC is based on aircraft dimensions and approach speeds to define several physical characteristics of airfields, including airfield separations. Standard distances were established for each aircraft category; although in certain cases it is possible to request a modification of standards.

According to AC 150/5300-13 (FAA, 1989):

> Modification to standards means any change to FAA design standards other than dimensional standards for runway safety areas. Unique local conditions may require modification to airport design standards for a specific airport. A modification to an airport design standard related to new construction, reconstruction, expansion, or upgrade on an airport which received Federal aid requires FAA approval. The request for modification should show that the modification will provide an acceptable level of safety, economy, durability, and workmanship. (CHG 10, Chapter 1, p. 5)

A survey conducted by the FAA in 2008 identified 142 airports that can accommodate Cat II and Cat III approaches. Of these 142 airports, 63 airports have less than a 500-ft separation between the runway and parallel taxiway, and three have less than a 400-ft separation, measured within the first 3,000 ft of the runway.

What is the risk if larger aircraft are allowed to operate at these airports with non-standard separations? Currently, there are no risk-based methodologies for assessing such risks, and each situation is treated as a unique case. The FAA may allow operation at airports that do not comply with minimum separation distances by evaluating an MOS submitted by the airport operator. The objective is to keep the airport/aircraft operations at a level of safety equivalent to that achieved by standard separations.

The FAA uses a computer program that considers the relationship between airplane physical characteristics and the design of airport elements to show that an MOS provides an acceptable level of safety for the specified conditions, including the type of aircraft (FAA, 1989).

AC 150/5300-13 also states that values obtained from the specific equations presented in the next chapter may be used to demonstrate that an MOS will provide an acceptable level of safety (FAA, 1989). The criteria are based on engineering judgment and can only be used to compare taxiway and taxilane separations. However, in the context of this study, it was necessary to address separations between runways and taxiways or taxilanes. There is no procedure in the FAA guidance material to evaluate runway separations for the risk of collision between an aircraft landing or taking off and a taxiing aircraft or an object.

CHAPTER 2

Airfield Separation Rationale

A preliminary task in the study was the identification of approaches that could be used as a framework for the risk-assessment methodology. The first step was the gathering of information on two basic rationales—that used by the FAA and that used by the International Civil Aviation Organization (ICAO)—to establish their airfield separation standards.[1] The bases for the development of both rationales were the random deviations of aircraft during operations. Such deviations are greater for runways and less for taxiways and taxilanes. In addition, some incidents may lead to very large deviations (e.g., runway excursions), and safety areas must be planned to mitigate the risk of these large deviations.

FAA Rationale

Most of the FAA documents reviewed for this study present the separation standards and sometimes identify design considerations, but they rarely provide detailed information on the design rationale. For this reason, two engineers were interviewed. They worked in the FAA airport organization that was responsible for developing design standards, including the separation standards. Also, an attempt was made to place several of the documents in the context of the historical time when they were issued.

In 1940, the Civil Aeronautics Authority issued a document entitled *Airport Design Information* (1940). The manual was "prepared for the instruction and guidance of Airport Section Engineers in their field consultation activities" (Hathi Trust Digital Library). It provided standards for four airport classes that were based on runway lengths required by aircraft expected to use the facility. The Civil Aeronautics Administration (CAA) published an updated version of this manual in 1941. In April 1944, the CAA published the first of four manuals titled *Airport Design.* This manual had standards for five classes of airports, with the classes based on runway lengths required by aircraft expected to use the facility.[2]

It is important to remember that these manuals were developed just prior to and during World War II. At that time, the United States had a massive war mobilization effort underway, and it is unknown if the manuals were the output of any intensive research and development effort. In all likelihood, the standards were based on the best engineering judgment of the era.

In January 1949, the CAA published the second manual titled *Airport Design,* and it provided for eight different airport classes. These classes were based on the type of service rather than the expected type of aircraft.

In relation to the historical context of this document, there are two points worthy of note:

- The standards contained in the document represent the knowledge gained from aircraft operations during World War II.
- In 1946, the Federal Aid Airport Program (FAAP) was enacted to provide federal funds to airport sponsors for capital development at their airports, and the program required that such development be done in accordance with standards issued by the CAA.

The importance of the FAAP cannot be overemphasized. This carrot and stick approach was successful in achieving uniformity of design within the various airport classes; however, there were so many classes that it was easy to incorrectly predict an airport's ultimate role in the national airport system.

[1] FAA and ICAO may use different terminology for their standards and recommended practices. Throughout the text, the original terms for each agency were kept. For example, the FAA "runway safety area" function is equivalent to that of ICAO's "graded area of the runway strip" plus its "runway end safety area."

[2] The information on these manuals is taken from a paper prepared by Robert David in 1973 (David, 1973). At that time, the documents were obtained from the FAA library, but they are no longer available.

Table 1. Minimum clearance standards of airports (ft) (FAA, 1959).

Type of Service	Runway Centerline to Taxiway Centerline	Centerline of Parallel Runways for Contact Operations	Centerline of Parallel Taxiways	Taxiway Centerline to Aircraft Parking Areas	Taxiway Centerline to Obstacle
Secondary	150	300	125	100	75
Local	250	500	200	175	100
Trunk	350	500	275	240	150
Continental	400	700	300	260	175
Intercontinental	450	700	325	280	200

In August 1959, the FAA issued Airport Engineering Data Sheet Item 24 as a revision to the table that appeared in the 1949 publication (see Table 1).

This data sheet reduced the number of airport classes from eight to five. The data sheet stated, "In order to assure maximum safety and the economical and efficient use of the airport site, careful consideration must be given to the clearance and separation between the various aircraft operating areas" (FAA, 1959, p. 1). It states that the distances established are recommendations and further states "increases to these distances may be desirable in some cases, necessary in others" (FAA, 1959, p. 1). It appears that although some classes were consolidated and renamed, only minor changes were made to the actual distances. No specific information is provided as to how these separation standards were defined.

This document was issued 2 months before the "jet" age in U.S. commercial aviation began. In October 1959, nonstop transatlantic flights with Boeing 707s were initiated between New York's Idlewild Airport (now known as John F. Kennedy International Airport) and Europe.

In 1961, the FAA published the third document titled *Airport Design* (Federal Aviation Agency, 1961). The revised standards (see Table 2) were no longer based upon the type of service, but rather on the runway length.

In the early 1960s, the FAA initiated the Advisory Circular publication series. Although the information in these publications was advisory, the airport standards contained in them became mandatory when federal aid was used for airport development. As documents were updated to conform to the new publication system, there was a tendency to develop Advisory Circulars containing design information for a specific type of airport. For example, AC 150/5300-1, VFR Airports, applied to airports that were intended to have operations by general aviation aircraft during visual meteorological conditions (FAA, 1963). AC 150/5300-4A, Utility Airports, was issued to provide guidance and standards for airports that intended to serve aircraft weighing 12,500 lb or less (FAA, 1968).

Table 2. Airport design and clearance recommendations (ft) (Federal Aviation Agency, 1961).

Runway Length	Runway Centerline to Taxiway Centerline	Centerline of Parallel Taxiways	Taxiway Centerline to Aircraft Parking Areas	Taxiway Centerline to Obstacle
1,600–3,200	150	100	100	75
3,201–4,200	250	200	175	100
4,201–6,000	400	300	250	200
6,001–7,500	400	300	250	200
7,501–10,500	400	300	250	200

During the late 1960s and through the 1970s, there were several Advisory Circulars published on specific aspects of airport design for airports intended to serve air carriers. Subjects of these Advisory Circulars included such things as runway geometry, taxiways, surface gradient and line-of-sight, and jet blast.

During this period, there were no funds allocated for the research and development of design standards. The runway/runway and runway/taxiway separation standards contained in these publications were based on the experience gained during the post-World War II period, including experience with the precision of navigational aids such as instrument landing systems (ILSs), the ability of pilots to stay on centerline, and air traffic control considerations. In the 1960s, the FAA's Flight Standards organization and the ICAO Obstacle Clearance Panel (OCP) developed the Collision Risk Model (CRM)[3] for ILS operations. The CRM was based on actual observation of 2,500 aircraft on an ILS precision approach to a runway. Four observations were made for each aircraft's approach. This model was used to define the area that needed to be protected on an airport when an aircraft was making an ILS approach. The runway/taxiway separation also took into account the possibility of an aircraft on landing rollout or takeoff roll veering off the runway. Additional information on the CRM is provided in Appendix B.

[3] FAA developed the CRM (ICAO, 1980) approach with the University of Oklahoma and input from other countries represented on ICAO's OCP.

The taxiway/taxiway separations were based on taking the most critical aircraft that would be using the taxiways (generally, the aircraft with the largest wingspan) and placing its main gear on the edge of the usable taxiway. The separation between the taxiway centerlines then could be calculated by adding half the width of each taxiway to twice the length of the wingspan that extended beyond the taxiway plus a safety factor. Likewise, the taxiway/object separations were based on taking the most critical aircraft that would be using the taxiways and placing its main gear on the edge of the usable taxiway. The separation between the taxiway centerline and the object could then be calculated by adding half the width of the taxiway to the length of the wingspan that extended beyond the taxiway plus a safety factor.

In the 1980s, in response to feedback from the aviation community, the FAA undertook an effort to consolidate the numerous design Advisory Circulars. In 1983, AC 150/5300-12, Airport Design Standards—Transport Airports, was published (FAA, 1983). This consolidated many of the design standards for transport aircraft into one document. In 1989, the FAA published AC 150/5300-13, Airport Design (the fourth document with this title), which consolidated the design standards for all airports except heliports and sea plane bases into one document (FAA, 1989). This publication grouped standards according to the ARC, consisting of a letter and a Roman numeral. The letter indicates the aircraft approach category and relates to the FAA Flight Standards approach speed group of the design aircraft (as used in terminal instrument procedures [TERP]). Generally, runway standards are related to the approach speed. The Roman numeral relates to the airport design group and the aircraft wingspan of the design aircraft. It is possible to have the approach category based on one design aircraft and the aircraft design group based on a different design aircraft.

Appendix 9 of AC 150/5300-13 provides the design rationale for separations associated with taxiways and taxilanes, except for those between a runway and its parallel taxiway (FAA, 1989). A number of parameters are contained in this appendix. To maintain airport operational capacity, the taxiway system should be designed so that aircraft can maintain an average speed of 20 mph. The parameters affecting taxiway separations for other than parallel taxiways are wingspan and wingtip clearance, with the need for wingtip clearance being driven by the fact that pilots of most modern jets cannot see their wingtips from the cockpit. Appendix 9 then provides the following information on separations:

- Taxiway to taxiway centerline (see Figure 1): Separation is calculated based on 1.2 times the wingspan of the most demanding aircraft plus 10 ft (wingtip clearance).

  $S_{TWY\text{-}TWY} = 1.2 * WS + 10$ ft

  where

  $S_{TWY\text{-}TWY}$ is taxiway to taxiway centerline separation and WS is wingspan of the most demanding aircraft.

- Taxiway centerline to object (see Figure 2): Separation is calculated based on 0.7 times the wingspan of the most demanding airplane plus 10 ft (wingtip clearance).

  $S_{TWY\text{-}OBJ} = 0.7 * WS + 10$ ft

  where

  $S_{TWY\text{-}OBJ}$ is taxiway centerline to object separation.

- Taxiway object free area (OFA): Width is equal to twice the taxiway centerline to object separation.

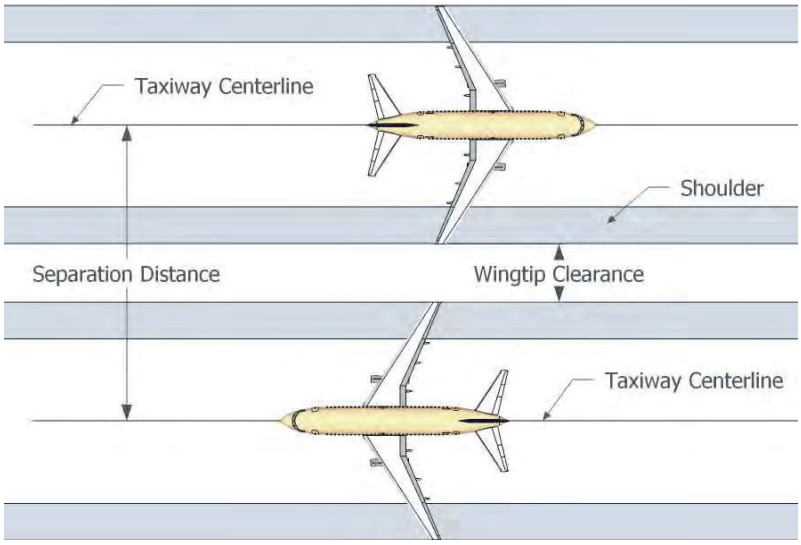

Figure 1. Wingtip clearance, parallel taxiways.

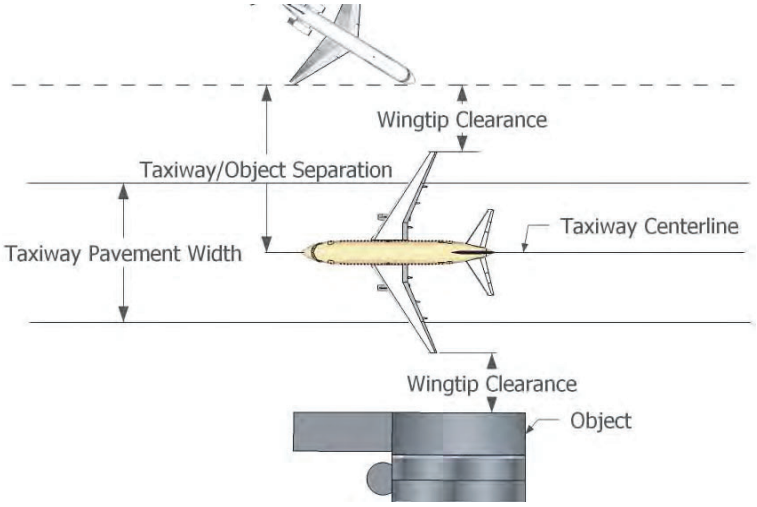

Figure 2. Wingtip clearance from taxiway.

$$\text{TWY-OFA} = 2 * S_{TO}$$

where

TWY-OFA is taxiway object free area width and S_{TO} is taxiway centerline to object separation.

- Taxilane centerline to object (see Figure 3): Separation is calculated based on 0.6 times the wingspan of the most demanding airplane plus 10 ft (wingtip clearance). Reduced clearances are acceptable because taxi speed is very slow outside the movement area, taxiing is precise, and special operator guidance techniques and devices normally are present.

$$S_{TXL\text{-}OBJ} = 0.6 * WS + 10$$

- Taxilane OFA (see Figure 4): Width is equal to twice the taxilane centerline to object separation for a single lane width and 2.3 times the wingspan of the most demanding airplane plus 30 ft for a dual lane.

$$\text{TXL-OFA} = 2 * S_{TXL\text{-}OBJ} \left(\text{single lane}\right)$$

$$\text{TXL-OFA} = 2.3 * WS + 30 \text{ ft } \left(\text{dual lane}\right)$$

Appendix 9 of AC 150/5300-13 does not indicate how the safety factors or the wingtip clearances were determined (FAA, 1989). Interviews indicated that these factors were based on engineering judgment.

As far back as the 1970s, and probably even before then, there were differences in airport design standards and the criteria used to establish instrument approaches. These differences primarily affected the standards associated with runway approaches and separations. Several attempts were made over the years to resolve these differences. This issue became critical in the early 2000s, when an analysis performed using the CRM indicated that aircraft located on a parallel taxiway 400 ft from the runway centerline posed a safety risk to aircraft on an instrument approach to that runway when those aircraft executed a missed approach.

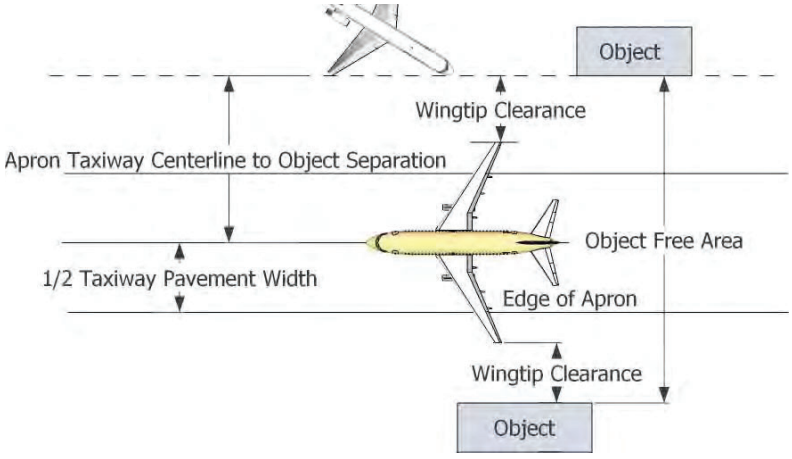

Figure 3. Wingtip clearance for taxilanes.

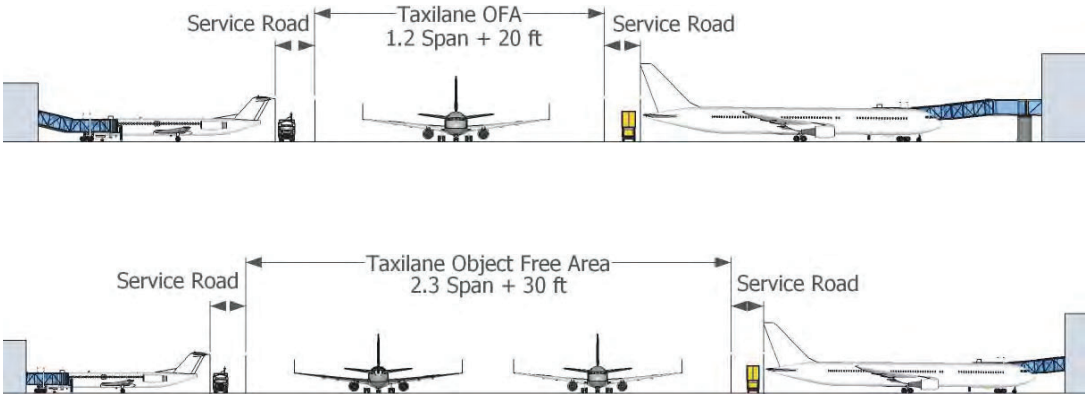

Figure 4. Wingtip clearance for taxilanes.

The issue was given to a multidisciplined group called the Airport Obstructions Standards Committee (AOSC) to resolve. After much deliberation, this group grandfathered runways and taxiways meeting existing separation standards into the airport design standards and determined further analysis was necessary. In the interim, separation standards for construction of new runways or taxiways were increased to 500 ft for Cat II/III operations involving Group V aircraft and for Cat I approaches involving Group VI aircraft. For Group VI aircraft making a Cat II/III approach, a separation of 550 ft would be required between new runways and taxiways. The AOSC work is documented in *AOSC Decision Document #04* (AOSC, 2005).

ICAO Rationale

To harmonize the development of aviation (including airports) globally, the ICAO was established toward the end of World War II with the signing of the Convention on International Civil Aviation (also known as the Chicago Convention) on December 7, 1944. Since then, ICAO has developed and updated international specifications on all aspects of aviation. In Annex 14 to the Chicago Convention, first published in 1949, the ICAO promulgated specifications on airport design and operations (ICAO, 1949).

ICAO has kept pace with technological developments in the aircraft industry and kept Annex 14 current to provide to its Contracting States (or Member Nations) the minimum safety specifications for designing new airports and upgrading existing ones to handle succeeding generations of newer, larger, and heavier aircraft.

Many of the current standards and recommended practices (SARPs) contained in Chapter 3 of Annex 14 were defined by the Aerodrome Reference Code Panel (ARCP) in 1981 (ICAO, 1981). As part of the process to define a new reference code for airports, ARCP also undertook a fundamental review of SARPs based on a more rational approach.

In 1990, Annex 14 was separated into two volumes (ICAO, 1990). Volume I now contains international specifications on aerodrome design and operations only, and Volume II deals with the design of heliports.

Statistics have shown that approach and landing is the most critical phase of a flight because the aircraft must follow a precise and stable approach path despite the challenging circumstances that characterize this flight phase—aircraft engine power is at its minimum, weather conditions on the ground may pose difficulties for landing, and habitation and land developments surrounding airports can be significantly impacted by deviations from the approach path.

Moreover, aircraft may sometimes touchdown before the runway arrival end or reject the takeoff and depart the runway if something goes wrong. These are the main reasons runways have a safety area. The FAA refers to this area as an RSA, whereas the ICAO defines an area with an equivalent function, consisting of the runway strip plus the runway end safety area (RESA). The objective of this area is to reduce the risk of damage to aircraft running off a runway and protect aircraft flying over a runway during takeoff or landing operations. The safety area applies not only to the airspace on or around an airport but also to the ground itself.

Runway Strip Width

ARCP's basis for the specifications of the graded portion of the strip is the acceptable risk of occurrence of aircraft veer-offs. From the information available, there seems to be no defined basis for the development of the specification of the full strip width for the protection of over-flying aircraft using the CRM. ARCP identified the following factors in the definition of the strip width:

- Aircraft approach speed
- Wingspan
- Aircraft mass
- Type of approach (visual or instrument)

Statistical data on aircraft veer-off events presented at the 8th Air Navigation Conference in 1974 were the basis for the

analysis. The frequency of veer-offs exceeding a given distance from the runway centerline were determined according to the type of operation and class of aircraft.

To maintain a safety area around the runway, a runway strip width of 984 ft (300 m) is specified for instrument runways, and a runway strip of 492 ft (150 m) is specified for smaller, non-instrument runways. The strip is symmetrically located on either side of the runway centerline. The central portion is required to be graded to certain specified slopes so that it is less likely that an aircraft will suffer substantial damage during runway veer-offs. These requirements are used to establish a safety area around the runway in which only those objects that must be located there are permitted, subject to the applicable frangibility criteria being met.

Airfield Separations

Every aircraft landing or taking off on a runway must proceed along a system of taxiways. During these movements, aircraft should be protected by wide, obstacle-free areas; thus, even the circulation areas (taxiways and aprons) must be located at suitable distances apart and at a specified distance from the runway.

The early specifications in ICAO Annex 14 were based on the layouts of airfields that existed at the time—mostly military airfields—that were deemed to be examples of best practice. It is not uncommon to see older airports with runways from 98 to 197 ft (30 to 60 m) wide. Similarly, the circulation taxiways were separated from the runways so that aircraft on the taxiway did not cause major risk to aircraft landing or taking off from the runway.

Since then, numerous ICAO studies, undertaken with assistance from ICAO technical panels and study groups, have fine-tuned the specifications as actual aircraft performance results and airport experience have become available. Improvements in aircraft manufacturing technology, better training, and the availability of modern visual aids have also contributed to this fine-tuning.

The broad principles governing airfield separations are explained in greater detail in the following sections.

Separation Distance between a Runway and a Taxiway

A parallel taxiway is located such that no part of the largest aircraft expected to operate on the parallel taxiway would penetrate into the adjacent runway strip. This is intended to accommodate any potential veer-off of a landing aircraft when the taxiway is being used and also to provide a sterile area, free of obstacles that may endanger an aircraft executing a missed approach or balked landing maneuver. The separation distance is expressed as follows:

$$S_{\text{RWY-TWY}} = \frac{SW}{2} + \frac{WS}{2}$$

where

$S_{\text{RWY-TWY}}$ is the distance between the centerlines of a runway and a parallel taxiway,
SW is the runway strip width, and
WS is the aircraft wingspan.

Figure 5 depicts the main factors in the ICAO rationale.

Although a link taxiway for entry into and exit from the runway is located within the runway strip, whenever the runway is in use, an aircraft on a link taxiway is required to stop and hold at a distance of 295 ft (90 m) from the runway centerline (ICAO Code E) (ICAO, 2004). For aircraft designated ICAO Code F, where the wingspan is greater than 213 ft (65 m) but not more than 262 ft (80 m), the holding position location is at a distance of 350 ft (107 m) from the runway centerline (ICAO, 2004). This distance may need to be increased for certain operational conditions, and this minimum holding distance should be reviewed if it interferes with radio navigational aids provided for the runway.

The separation distances between a runway and fixed objects other than visual aids required for air navigation purposes are the following (ICAO, 2006a):

- Within 254 ft (77.5 m) of the runway center line of a precision approach runway Cat I, II, or III where the code number is 3 or 4 and the code letter is F;

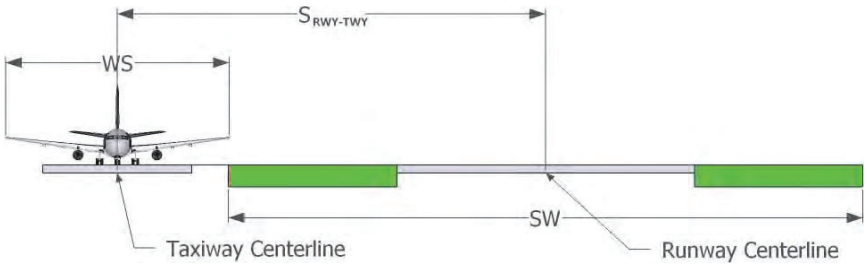

Figure 5. Runway/parallel taxiway separation distance.

- Within 197 ft (60 m) of the runway centerline of a precision approach runway Cat I, II, or III where the code number is 3 or 4; and
- Within 148 ft (45 m) of the runway centerline of a precision approach runway Cat I where the code number is 1 or 2.

In addition, no mobile object shall be permitted on this part of the runway strip during the use of the runway for landing or takeoff.

Separation Distance between a Taxiway and Another Taxiway

Taxiways are vital facilities of an airport on and around which certain safety areas must be provided at all times to ensure that a taxiing aircraft does not collide with another aircraft or an object. A primary assumption here is that an aircraft taxiing on a taxiway may deviate from its centerline; thus, using a "permissible" deviation, the taxiway strip width and taxiway width are determined. The taxiway strip, like the runway strip, should be clear of objects that may endanger taxiing aircraft. Furthermore, all other taxiways and objects that need to be on the operational areas of an airport are built to meet these criteria.

For two aircraft traveling in opposite directions on two parallel taxiways, it initially was deemed appropriate to provide for deviations of both aircraft from their respective centerlines toward each other. It was considered necessary to ensure that in such deviations there was still an adequate safety margin between the wingtips. While the permissible value of the deviation of an aircraft from the taxiway centerline is one factor, abnormal conditions like steering malfunctions, very slippery pavement conditions, low visibility, and poor markings could not be ruled out. Thus, the concept of a safety buffer was introduced to provide an additional safety margin to the separation distance.

The safety buffer, *Z,* is equal to the difference between the half width of the taxiway strip and the semi-wingspan of the largest aircraft in a given category (whose outer wheel is located at the edge of the paved taxiway, in other words, full deviation as permitted and added to the semi-wingspan). The safety buffer illustrated in Figure 6 is determined using the following equation:

$$Z = TCS - WS - C$$

where

Z is the safety buffer,
TCS is the taxiway centerline separation,
WS is the aircraft wingspan, and
C is the clearance between the outer main gear wheel and the taxiway edge (maximum allowable lateral deviation).

When deriving this specific dimension for Code F aircraft, it was considered that the steering mechanism of the Code F aircraft would not be worse than that of the Code E aircraft and, thus, the same deviation value of 15 ft (4.5 m) was retained. However, because it was felt that the wider, swept-back wings of modern aircraft might not permit a pilot in the cockpit to see where the wingtip would be, the safety buffer was increased in proportion to the wingspan increase vis-à-vis that for a Code E aircraft.

Separation Distance between Taxiway and Object

The separation distance between the taxiway and a stationary object is specified in order to ensure that a taxiing aircraft's wingtip does not collide with any stationary object. Because the object is not moving, only one deviation of the aircraft itself is taken into account along with the safety buffer, which includes all other factors that may cause further deviation of the taxiing aircraft. The relationship illustrated in Figure 7 is expressed as follows:

$$S_{\text{TWY-OBJ}} = \frac{WS}{2} + C + Z$$

where

$S_{\text{TWY-OBJ}}$ is the separation,
WS is the wingspan,

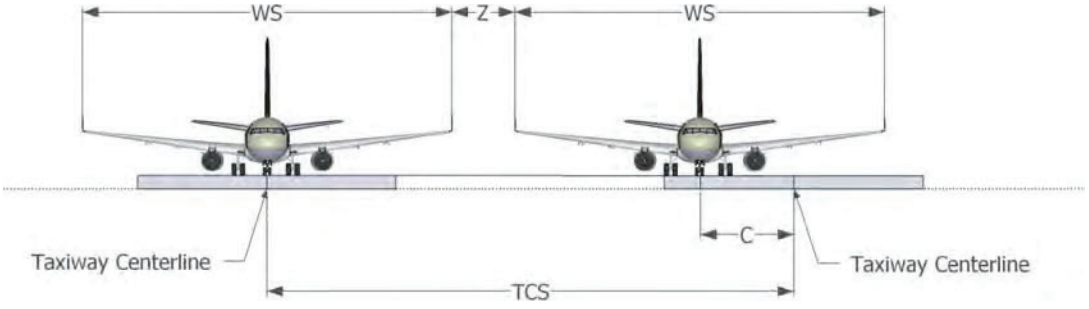

Figure 6. Parallel taxiway separation geometry.

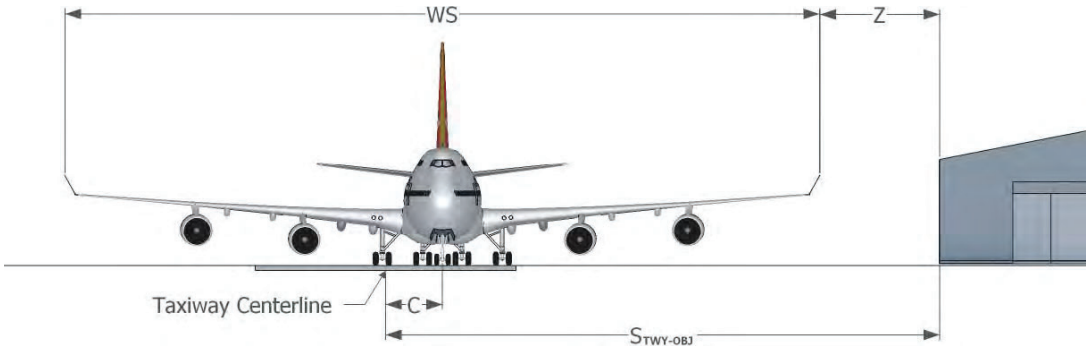

Figure 7. Taxiway/apron taxiway-to-object geometry.

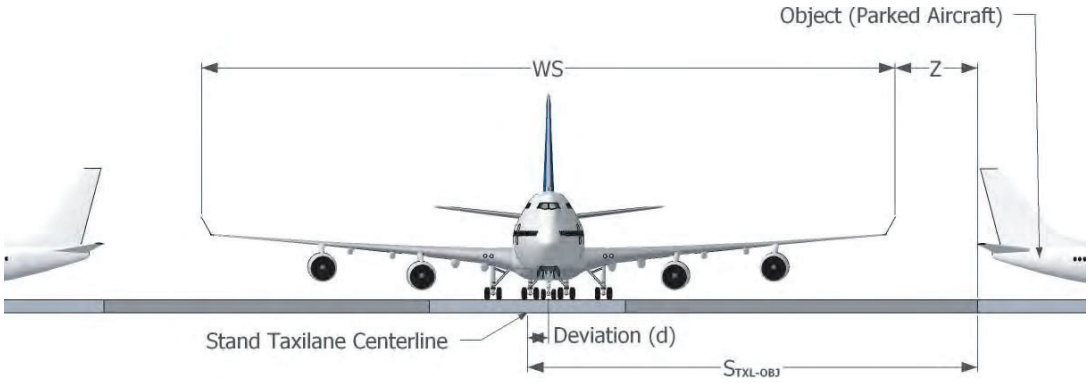

Figure 8. Aircraft stand taxilane-to-object geometry.

C is the clearance between the outer main gear wheel and the taxiway edge (maximum allowable lateral deviation), and

Z = safety margin distance (for example, 10.5 m and 13 m for aircraft Codes E and F, respectively).

Separation Distance between a Taxilane and an Object

For the clearance distance required on an aircraft taxilane, the safety margins are reduced due to the slow taxiing speed of aircraft and the availability of a visual docking guidance system or a marshaller to accurately guide the aircraft. The condition is illustrated in Figure 8. Therefore, for Code E aircraft operations, the *C* value was reduced to 8 ft (2.5 m) and the safety buffer (*Z*) was reduced to 25 ft (7.5 m). The formula is the same as the formula for the distance between a taxiway and an object.

$$S_{\text{TXL-OBJ}} = \frac{WS}{2} + C + Z$$

where

$S_{\text{TXL-OBJ}}$ is the separation distance between the taxilane centerline and an object.

In the case of Code F aircraft, again the 1.6-ft (0.5-m) increase in the *Z* value was engineering judgment to account for the larger wingspan aircraft.

For taxiways and taxilanes, the same document establishes that the minimum separation distance is equal to the wingspan plus max lateral deviation plus increment. ICAO Annex 14—Aerodromes (2006b) contains the standards and recommended practices on airport separations.

CHAPTER 3

Data for Modeling Aircraft Deviations

Airfield Lateral Deviation Studies

During the course of study, an attempt was made to obtain data on extreme lateral aircraft deviations for runways, taxiways, and taxilanes. Also, information was gathered from previous studies and lateral deviation data and models to determine the best alternatives to use in the approach and the methodology to evaluate airfield separations. Appendix C provides a summary of this literature review.

Ensuing sections of this report provide summaries of data collected in this research and describe previous studies evaluating the magnitude of lateral aircraft deviations during airfield operations as well as the attempts to model the probability distributions of these lateral deviations.

A major consideration is random lateral deviations of aircraft during runway, taxiway, and taxilane operations. The probability distribution of such deviations relative to the centerline/guideline of runways and taxiways is crucial to assessing the adequacy of existing separation/clearance distances for safe and regular operation of aircraft, both on straight portions and on taxiway curves. The following factors may impact those deviations (Eddowes, Hancox, and MacInnes, 2001):

- Quality of aircraft nose wheel guidelines (marking and lighting)
- Quality of signs
- Visibility conditions
- Level of light (day or night)
- Surface condition (dry, wet, contaminated by snow/ice, rubber, etc.)
- Approach speed and touchdown location
- Taxi speed
- Pilot's attention
- Pilot's technique during landing
- Stability of approach
- Pilot's technique on negotiation turns
- Wind effects (cross-wind)
- Aircraft handling characteristics
- Mechanical failures

In the 1970s, the FAA and the U.S. Army Corps of Engineers (USACE) carried out substantial studies on lateral distribution of aircraft traffic on runways and taxiways (Brown and Thompson, 1973; HoSang, 1975). More recently, Cohen-Nir and Marchi (2003), the FAA, and Boeing (Scholz, 2003a and 2003b) performed statistical analyses of taxiway deviations for large aircraft at John F. Kennedy International Airport (JFK) and Ted Stevens Anchorage International Airport (ANC).

Veer-Off Accidents and Incidents

Both the FAA and ICAO address the probability of aircraft veer-offs in their rationale for runway/taxiway separations. ICAO (2004) emphasizes that runway separation issues are supported by local airport experience in terms of identifying causes and accident factors specific to the local environment. No less important is the enormous variety and complexity of accident factors for collision risk.

One of the subtasks of this project was to carry out a functional hazard analysis (FHA) for aircraft veer-offs based on information gathered in the literature review. The objective of this subtask was to identify relevant factors associated with such events to support the data collection effort for accidents and incidents. The research team collected information that could be used in the modeling process, particularly data on causal factors and aircraft location. Identifying the most relevant factors causing or contributing to such events also was part of the modeling process.

An FHA is a formal and systematic process for the identification of hazards associated with an activity that is typically employed to support risk assessment and management. An FHA is often conducted in the form of a brainstorming workshop involving a multi-disciplinary team that could include pilots, air-traffic controllers, airside operations personnel, and

specialist risk assessors. The objective of the FHA is to explore relevant operational scenarios and identify hazards associated with them. The output of the FHA is typically a "hazard log," which includes all hazards identified and preliminary information about them that can be provided by the workshop team.

A recent study developed by the Flight Safety Foundation (2009) gathered information worldwide on runway excursion accidents occurring from January 1995 to March 2008. The study presents a matrix of contributing factors that identified common causes and followed trends. The study resulted in the following major conclusions.

The major contributing factors for takeoff excursions include the following:

- Rejecting takeoff after V1 was the most cited factor, which in turn was caused by
  - Pilot's perception of a catastrophic failure
  - Inability to rotate due to incorrect center of gravity (CG) location, mistake in performance calculation, or flight control anomalies
- Loss of directional control, which is generally associated with
  - Mechanical anomalies (30 percent of cases)
  - Contaminated runways
  - Crosswind

The major contributing factors for landing excursions include the following:

- Human errors and neglect of standard operating procedures such as
  - Landing long and/or fast during unstabilized approaches
  - Failing to go around despite unstabilized approach
  - Other pilot's errors, such as hard landing
- Mechanical problems leading to the following:
  - Spontaneous collapse of the landing gear
  - Asymmetric forces due to thrust reverse or braking problems
- Environmental factors such as the following:
  - Crosswind and tailwind conditions
  - Runway surface under wet or contaminated conditions

Information on runway, taxiway, and taxilane events was not readily available to use in this study. Relevant accident and incident reports were identified in worldwide databases. The basic idea was to collect information that could be used to develop risk models based on evidence from past accidents and incidents. Runway and taxiway veer-off accident and incident data were collected from the following sources:

- FAA Accident/Incident Data System (AIDS)
- FAA/National Aeronautics and Space Administration (NASA) Aviation Safety Reporting System (ASRS)
- National Transportation Safety Board (NTSB) Accident Database and Synopses
- Transportation Safety Board of Canada (TSB)
- Australian Transport Safety Bureau (ATSB)
- Bureau d'Enquêtes et d'Analyses pour la Sécurité de l'Aviation Civile (BEA)
- UK Air Accidents Investigation Branch (AAIB)
- New Zealand Transport Accident Investigation Commission (TAIC)
- Air Accident Investigation Bureau of Singapore
- Ireland Air Accident Investigation Unit (AAIU)
- Spain's Comisión de Investigación de Accidentes e Incidentes de Aviación Civil (CIAIAC)
- Indonesia's National Transportation Safety Committee (NTSC)
- Netherlands Aviation Safety Board (NASB)
- MITRE Corporation Accident and Incident Database

A list of accidents and incidents containing the cases used for model development is presented in Appendix D. In addition to the taxiway incidents identified, the list includes runway veer-off events that occurred within 1,000 ft of the runway centerline. Every identified event that has occurred since 1978 and for which reports were available was included in the database for this study.

Portions of the data are complemented with other sources of information, particularly information sources on aircraft, airport, and meteorological conditions. For example, in many cases information on the weather during the accident was missing, and the research team obtained the actual METAR for the airport to retrieve the data. In other situations, the runway used was missing, and the research team consulted the FAA Enhanced Traffic Management System Counts (ETMSC) and the Aviation System Performance Metrics (ASPM) to retrieve relevant information.

Additional filtering criteria were used so that the events were comparable. The first set of filtering criteria was applied so as to retrieve only information from regions of the world having accident rates that are comparable to the U.S. rate. In addition, the filtering criteria described in Table 3 were applied in this study. Filtering was necessary in order to make data collection a feasible task and to ensure that the data used in the modeling process were fairly homogeneous.

Aircraft Veer-Off Database Organization

The accident and incident database was developed in Microsoft Access. The system provides the software tools needed to utilize the data in a flexible manner and includes facilities to add, modify, or delete data from the database;

Table 3. Filtering criteria for accidents and incidents.

Filter #	Description	Justification
1	Remove non-fixed-wing aircraft entries.	Study is concerned with fixed-wing aircraft accidents and incidents only.
2	Remove entries for airplanes with certified max gross weight < 6,000 lb.	Cut-off criteria to maintain comparable level of pilot qualifications and aircraft performance to increase the validity of the modeling.
3	Remove entries with unwanted Federal Aviation Regulation (FAR) parts. Kept Part 121, 125, 129, 135, and selected Part 91 operations.	Some FAR parts have significantly different safety regulations (e.g., pilot qualifications). The following cases were removed: – Part 91F: Special Flt Ops – Part 103: Ultralight – Part 105: Parachute Jumping – Part 133: Rotorcraft Ext. Load – Part 137: Agricultural – Part 141: Pilot Schools – Armed Forces
4	Remove occurrences for unwanted phases of flight.	Study focus is the RSA. Situations when the RSA cannot help mitigating accident and incident consequences were discarded to increase model validity.
5	Remove all single-engine aircraft and all piston-engine aircraft entries.	Piston-engine aircraft are used infrequently in civil aviation and have been removed to increase the validity of the modeling. Moreover, single- and piston-engine aircraft behave differently in accidents due to the lower energy levels involved. Finally, the major focus of this study is air carrier aircraft.
6	Remove all accidents and incidents when the wreckage final location is beyond 1,000 ft from runway centerline.	It would be infeasible to have an RSA more than 1,000 ft from the runway centerline; the gain in safety is not significant.

make queries about the data stored in the database; and produce reports summarizing selected contents. Figure 9 illustrates the database organization.

The database includes for each individual event or operation the reporting agency, the characteristics of the aircraft involved, the runway and environmental conditions, event classification (accident or incident), and other relevant information such as consequences (fatalities, injuries, and damage) and causal or contributing factors. A unique identifier was assigned to each event.

Normal Operations Data (NOD)

Another key approach in this study was the use of normal operations (i.e., non-accident/incident flight) data for probability modeling of runway veer-offs. In the absence of information on risk exposure, even though the occurrence of a factor (e.g., contaminated runway) could be identified as a contributor to many accidents, it is impossible to know how critical the factor was since other flights may have experienced the factor without incidents. With NOD, the number of operations that experience the factor benignly, singly, and in combination can be calculated; risk ratios can be generated; and the importance of risk factors can be quantified. This assessment may allow the prioritization of resource allocation for safety improvement.

The NOD from the research reported in *ACRP Report 3: Analysis of Aircraft Overruns and Undershoots for Runway Safety Areas* was used in this study (Hall et al., 2008). The database was complemented with data for general aviation (GA) aircraft with a maximum takeoff weight (MTOW) of less than 12,500 lb and greater than 6,000 lb. These data are a large and representative sample of disaggregated U.S. NOD covering a range of risk factors associated with runway veer-offs, allowing their criticality to be quantified. The data on U.S. incidents and accidents were used as a sample to develop the frequency models for runway veer-offs only. A sample of the NOD data is available in Appendix E.

Incorporating this risk exposure information into the accident frequency model enhances its predictive power and provides the basis for formulating more risk-sensitive and responsive RSA assessments. Accident frequency models no

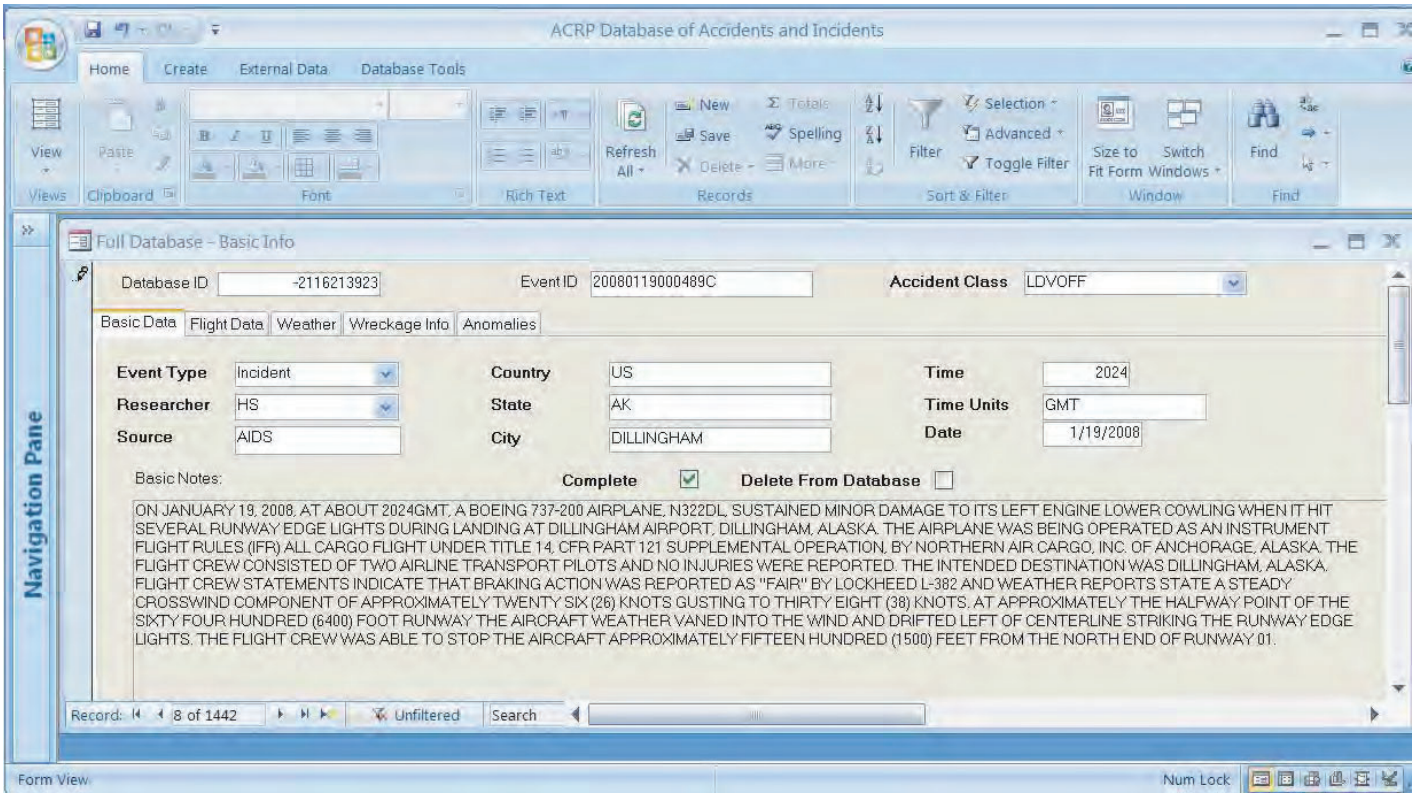

Figure 9. Accident and incident database for aircraft veer-offs.

longer need to rely on simple crash rates based on only aircraft, engine, or operation type.

Aircraft Data

The runway veer-off models incorporate an important factor to address the impact of aircraft performance and available runway length on the probability of veer-off incidents. For many of these events, particularly those taking place during the landing phase, if the runway length available is close to the runway length required by the aircraft for the operation, there may be a higher probability that a veer-off will take place because the safety margin is lower and more intense braking is required.

Two factors were included in the models that required additional data on aircraft performance: the runway distance available for the operation (takeoff or landing) and the aircraft runway distance required for the operation. The runway distance available was gathered for each accident, incident, and normal operation based on airport data.

Aircraft performance data were gathered from various sources, including aircraft manufacturers' websites and the following databases:

- FAA Aircraft Characteristics Database
- Eurocontrol Aircraft Performance Database V2.0
- FAA Aircraft Situation Display to Industry—Aircraft Types
- Boeing Airplane Characteristics for Airport Planning
- Airbus Airplane Characteristics for Airport Planning
- Embraer Aircraft Characteristics for Airport Planning

Aircraft performance data were used to develop the probability models. A summary of the aircraft database is presented in Appendix F.

CHAPTER 4

Methodology Approach

The basic goal of this study was to develop a methodology to evaluate airfield separations. There are a few different scenarios for the analysis of airfield separations, and each requires a different set of models and a specific procedure for the analysis. For example, the evaluation of a separation between a runway and a parallel taxiway requires a different set of models than a separation between a taxiway and an object.

The methodology presented in this report is applicable only to runways and straight parallel sections of taxiways and taxilanes and to straight sections of taxiways and taxilanes when the separation involves an object. The methodology also assumes that the pilot has full directional control of the aircraft, a good visual indication of the taxiway/taxilane centerline, and no assistance from a marshaller. The following are the types of separations that may be evaluated with the methodology:

- Taxiway to parallel taxiway
- Taxiway to parallel taxilane
- Taxiway to object
- Taxilane to parallel taxilane
- Taxilane to object
- Runway to parallel taxiway or taxilane
- Runway to object

The bases for the developed approach are the random lateral and vertical (airborne phase) deviations that may occur during normal operations and veer-off incidents. The risk of collision is related to the probability of large deviations from the nominal flight path and from the runway, taxiway, and taxilane centerlines when aircraft are moving on parallel routes.

Despite intensive efforts to identify taxiway and taxilane incidents, it was not possible to develop two-part models (frequency and location) for taxiway and taxilane veer-offs due to the difficulty in obtaining location data for close to 300 incidents occurring in straight segments of taxiways and very few relevant incidents occurring on taxilanes. However, it was noted that taxiway and taxilane incidents due to aircraft deviations do not lead to departures from the paved area of large distances. In the great majority of the cases, the pilots immediately stopped the aircraft when the aircraft departed the paved area. The following assumptions can be made regarding taxiway operations:

- Aircraft travel at slower speeds relative to runway operations;
- The end of the paved area is a discontinuity that signals to pilots that they are off the taxiway;
- Because the aircraft is traveling slower, the pilot usually has some control and can stop the aircraft almost immediately after departing the taxiway;
- These three factors combined lead to the assumption that the location probability distribution can be truncated for non-ramp taxiways.

Most taxiway and taxilane incidents and accidents occurred in curved segments or because another aircraft or ground equipment was located inside the taxiway or taxilane OFA. In most cases, events with large lateral deviations occurred during poor weather conditions and situations of low surface friction (low visibility, rain, and ice).

Modeling of aircraft lateral and vertical deviations on the runway involved different phases of flight, and for each phase a specific model was developed or used. For approach and landing, the airborne phase was modeled using the FAA/ICAO CRM, and for the rollout phase after aircraft touchdown, a two-part model (frequency and location) was developed and is described in ensuing sections. During takeoff, the factors and risk of veer-off are different from the models for landing, and another set of models (frequency and location) was required for this phase of flight.

Taxiway and Taxilane Deviation Modeling

Initially, the approach for modeling taxiway deviations was a two-part model composed of a frequency model and a location model. Taxiway veer-off incident data were collected to

obtain information on causal and contributing factors (visibility, taxiway surface conditions, etc.) to develop a frequency model to estimate the chance of taxiway veer-off incidents occurring under certain conditions. In addition, it was initially thought that lateral deviation information for those incidents should be collected to develop location models, particularly for aircraft that departed the paved taxiway area. With these two models, it would be possible to estimate the likelihood of an incident occurring with a lateral deviation greater than a certain distance from the taxiway edge. Although enough information was available from the data collection exercise to develop frequency models, information on incident location and deviations was not available.

A couple of observations led to the conclusion that a two-part frequency/location model was not the best approach for modeling taxiway veer-off incidents and the possibility of aircraft collisions with other aircraft and fixed or movable objects. The first observation was that historical taxiway collision events were not related to taxiway deviations; in almost every case, the collision occurred because another aircraft or movable object was inside the wing path of the taxiing aircraft. The second observation was that when a taxiway veer-off occurred, the aircraft stopped immediately after it departed the paved taxiway area.

Therefore, the combination of frequency and location models will only help to estimate the probability that the aircraft will stop off the taxiway paved area, and it will not be possible to quantify the risk of wingtip collisions associated with large deviations to evaluate the taxiway separation. In addition, very few incidents were found to occur when the pilot had control of the aircraft. For taxilanes, even the frequency model could not be developed due to the lack of cases with which to build a database.

The alternative selected was to use the taxiway deviation models developed by FAA/Boeing (Scholz, 2003a and 2003b). The approach and models proved to be in line with the goals for this project. Appendix G provides a summary of the methodology and results from the FAA/Boeing studies. The first report describes the study and deviation models for John F. Kennedy International Airport (JFK), the second describes the study for Ted Stevens International Airport (ANC), and the third combines the deviation models from both studies and describes the models for risk of wingtip collision between two aircraft and between an aircraft and an object. The collision risk between two taxiing aircraft can be estimated using the mean wingtip distance between the two aircraft, in other words, the wingtip clearance when both aircraft are located on the taxiway centerlines.

The deviations at each airport were extrapolated to more extreme deviations as they could happen for significantly higher numbers of event exposures, for example, $10^6 - 10^9$ taxiway operations. Based on the extreme value limiting assumption, absolute deviations were extrapolated using the 700 most extreme deviations at ANC and 200 most extreme deviations at JFK. The model resulting from the analysis was in the following general form:

$$p = 1 - \exp\left(-\frac{1}{n}\left[1 + c\left(\frac{y - \lambda}{\delta} \right) \right]^{-1/c} \right)$$

where

y is the specified threshold of exceedence,

p is the probability estimate of exceeding the threshold y distance from the centerline, and

λ, δ, n, and c are extrapolation parameters for the model.

Cohen-Nir and Marchi (2003) conducted another study using the data collected from JFK and ANC. In processing the JFK deviation data, they identified some problems with the data collected. Several large deviations that would have put the B-747 outside of the taxiway were recorded in a very short period of time. One of the lasers used in the FAA experiment had gone out of service, and all subsequent unusually large deviations occurred with only one laser in service and no ability to measure speed, wheelbase, or direction of travel. Because of the anomalies associated with the data collected from JFK, only the models developed for ANC were used in the airfield separation analysis methodology for this study.

To avoid collision between two taxiing aircrafts with WS_1 and WS_2 wingspans, the combined deviations need to satisfy the following equation:

$$T_{\text{TWY-TWY}} > \left(WS_1 + WS_2\right)/2 + d_1 + d_2$$

where

$T_{\text{TWY-TWY}}$ is the required separation between the taxiway centerlines and

d_1 and d_2 are the deviations of each aircraft, as shown in Figure 10.

A collision between an aircraft wingtip and a fixed or movable object can be avoided if:

$$T_{\text{TWY-OBJ}} > WS/2 + d$$

where

$T_{\text{TWY-OBJ}}$ is the separation between the object and the taxiway centerline,

WS is the wingspan, and

d is the aircraft deviation from the taxiway centerline.

This situation is presented in Figure 11.

One important observation when using the models developed with data gathered from ANC and JFK is that taxiway centerline lights were available in all taxiway sections that were monitored. Therefore, probability distributions characterizing those deviations rely on the conspicuity of taxiway centerlines. An important risk control recommendation when using

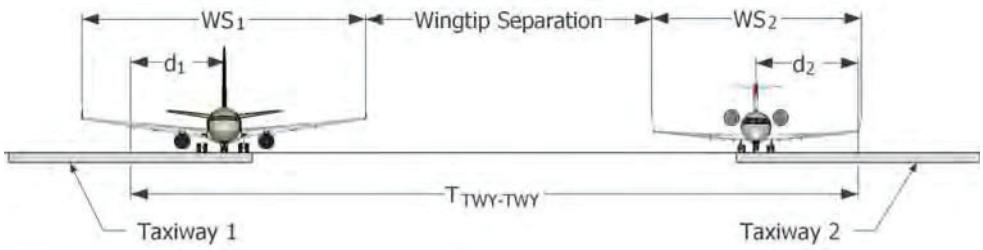

Figure 10. Taxiway/taxiway separation.

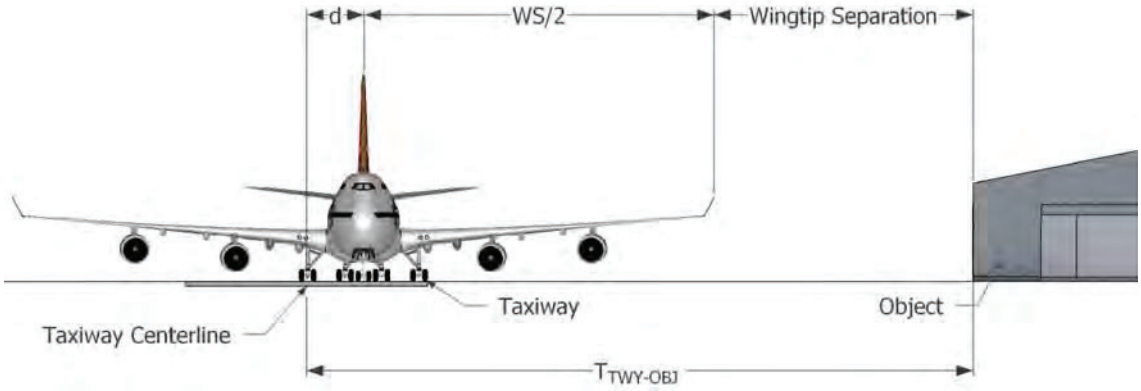

Figure 11. Taxiway/object separation.

this methodology is the assurance that taxiway centerlines will be evident under any conditions when using the taxiways.

Taxiway/Taxiway Separation

The analysis procedure for taxiway/taxiway separation is based on the models presented in the FAA/Boeing study to assess taxiway/taxiway collision probabilities, which are based on the wingtip separation of two aircraft located at the centerlines of two parallel taxiways (Scholz, 2005). In this approach, lateral deviations were split into two halves, and the deviations from the first half were randomly paired with deviations from the second half. In all, 6,157 pairs of $d_1 + d_2$ were obtained. For each set of such pairs, the extreme value extrapolation method was applied to the absolute value of $|d_1 + d_2|$ to obtain estimates of deviation probabilities. To correct for random splitting and pairing effects, the process was repeated 500 times, and a combined estimate with confidence bounds was obtained.

Table 4 presents the probability results, which were applied to the procedure to evaluate taxiway/taxiway separations described in this report. Table 4 presents the probability of wingtip collision based on the separation between taxiway centerlines and the wingspan distance. To facilitate the analysis, plots were developed for each Aircraft Design Group (ADG) based on the maximum wingspan for the specific ADG.

Although the data used to develop the lateral deviation models were collected for the B-747 only, the same models were used to develop risk plots for aircraft belonging to other ADGs. This is a conservative assumption because smaller deviations are expected for smaller aircraft.

The data presented in Table 4 were converted to a plot based on the wingtip separation, which is presented in Figure 12.

Table 4. Required separation between taxiway centerlines.

	Estimate $\leq T$ (ft)						
	collision risk p						
wingspan (ft)	10^{-3}	10^{-4}	10^{-5}	10^{-6}	10^{-7}	10^{-8}	10^{-9}

280	289.4	291.8	293.8	295.9	297.8	299.7	301.4

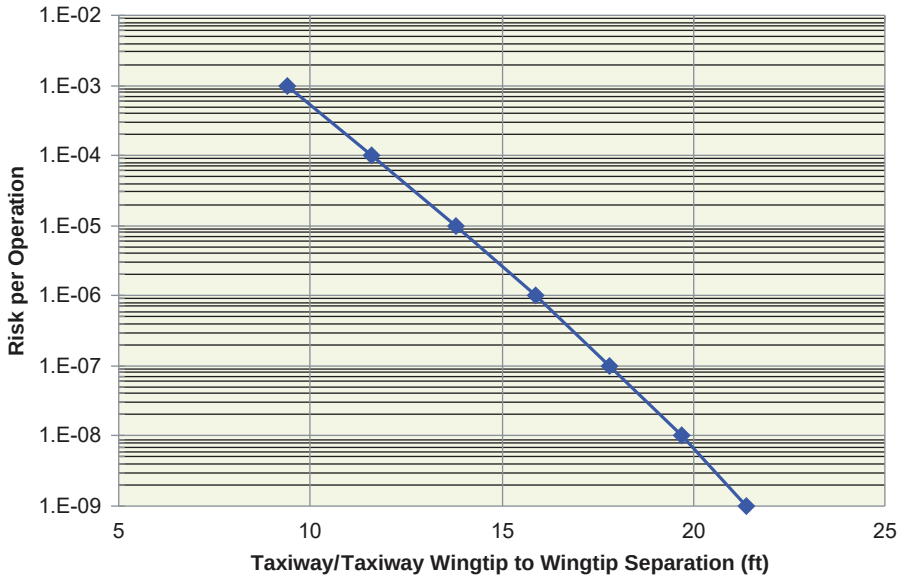

Figure 12. Taxiway/taxiway collision risk.

The same taxiway/taxiway separation models are used to evaluate taxiway/taxilane separations. The estimates of risk for this situation are considered conservative since the speed of aircraft is usually slower in taxilanes and deviations are expected to be smaller than they are for taxiways.

The extrapolation of risk for wingtip separations larger than 25 ft may lead to inaccurate results and very low risks. The standard separation for ADG V is 53 ft; based on the models, the risk for such a condition is lower than 1.0E-15, or one event in one quadrillion operations. This is no surprise, as there are no reports of wingtip collisions between two aircraft on parallel taxiways. In the accident and incident data collected, no record was found for wingtip collisions between two aircraft in parallel taxiways, and therefore the level of protection provided by the standards may be considered very high.

From the point of view of risk and based on the records of incidents and accidents, the worst credible consequence expected for wingtip collisions of two taxiing aircraft is aircraft damage. In this case, according to the risk matrix recommended by the FAA, the risk is acceptable if it is less than one in 10 million operations (1.0E-07), the same collision risk probability level used by ICAO in CRM analysis.

Taxiway/Object Separation

Using the models based on ANC data developed by FAA/Boeing (Scholz, 2003a), the wingtip collision risk can be derived based on the wingtip separation from an object when the aircraft is located at the taxiway centerline. Using this approach provides more flexibility to the analysis for specific aircraft wingspans, rather than considering the largest wingspan in the ADG. As shown in Figure 11, wingtip separation is the distance of the object from the centerline of the taxiway less half of the operating aircraft wingspan. Collision happens only if the deviation of the aircraft exceeds this distance to the side of the taxiway where the object is present. One simplifying assumption is necessary: the wingtip deviation distribution is the same as the aircraft lateral deviation distribution from the taxiway centerline.

Using data from the FAA study, it is possible to estimate the probability of taxiway-object collision based on the mean wingtip separation; in other words, the separation when both aircraft are located at the respective taxiway centerlines (Scholz, 2003a). The basic assumption in this case is that lateral deviations are similar, independent of the type of aircraft. Although this cannot be proved using existing data, the assumption is conservative because the data used to model risk were gathered for large aircraft.

The resulting model based on taxiway deviation data collected at ANC is presented in Figure 13.

Taxilane/Taxilane Separation

Aircraft deviation data or studies were not available to develop probability models for taxilane deviations. The data collection exercise carried out for this research identified a few taxilane veer-off incidents, and insufficient information was available to develop any lateral deviation models. Records of taxilane accidents demonstrate that, in most cases, another aircraft or movable object was parked or located inside the taxilane OFA. Therefore, the occurrence could not be considered a "taxilane deviation" case, and it could occur independently of the existing taxilane separation.

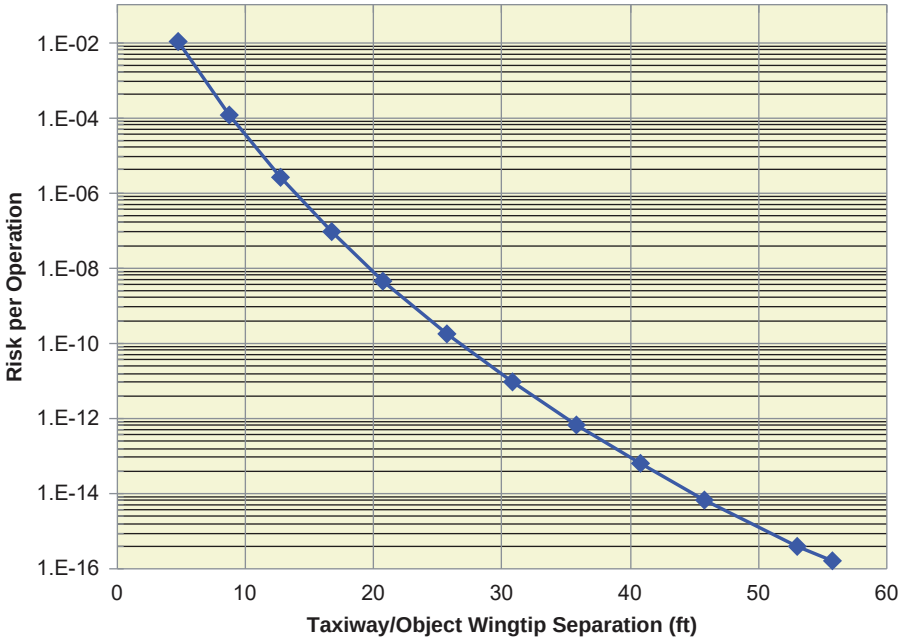

Figure 13. Taxiway/object collision probability based on wingtip separation.

FAA established separation criteria for taxilanes and taxiways and made changes in 1989 (FAA, 1989). These standards are based on aircraft design categories. There is no reference describing the quantitative basis for the criteria, and it is likely that engineering judgment was used to define those standards.

Both the FAA and ICAO recognize that aircraft deviations in taxilanes are usually smaller than those occurring in taxiways. Aircraft taxiing in taxilanes are moving at very low speeds, and pilots are usually very focused on parking operations in areas where movable objects are common.

For the approach presented in this report, the ratios of wingtip separations of taxiway/taxiway to taxilane/taxilane for each ADG were calculated. As shown in Table 5, the ratios varied from 0.75 for ADG I to 0.58 for ADG V and VI.

These ratios were used to adjust the models used for taxiway/taxiway separations developed by the FAA. The rationale is that the risk for veering off a taxilane OFA should be similar to or lower than the risk of veering off a taxiway. Therefore, the wingtip to wingtip separation distances associated with each level of risk for taxiways was adjusted using the ratio corresponding to the ADG. For example, a ratio of 0.58 was applied to the model for lateral deviations on taxiways for ADG V. The resulting model is illustrated in Figure 14.

The plot shows the risk trend for taxilane/taxilane separation of ADG V aircraft based on the mean wingtip separation (i.e., based on the wingtip distance when both aircraft are located on the centerlines of parallel taxilanes). The standards for taxilane separations are considered conservative, given the lack of recorded taxilane incidents associated with lateral deviations.

Figures similar to Figure 14, based on separation between taxilane centerlines, were developed for each ADG based on the ratios presented in Table 6 and the maximum wingspan for the ADG.

Table 5. Taxiway/object and taxilane/object mean wingtip separations for aircraft design groups.

Item	ADG Distances in ft					
	I	II	III	IV	V	VI
Taxiway/Object Wingtip Separation	20	26	34	44	53	62
Taxilane/Object Wingtip Separation	15	18	22	27	31	36
Ratio	0.75	0.69	0.65	0.61	0.58	0.58

Taxilane/Object Separation

Similar to the approach for taxilane/taxilane separations, adjustment factors were applied to the FAA/Boeing models for taxiway/object wingtip separations (Scholz, 2003a). The ratios are the same as those used for the taxilane/taxilane model because the standard wingtip separations between two aircraft and between an aircraft and an object are similar according to AC 150/5200-13 (FAA, 1989).

The standard minimum wingtip to object separation for ADG V in parallel taxilanes is 31 ft and, based on Figure 15, the risk of wingtip collision is lower than 1.0E-09.

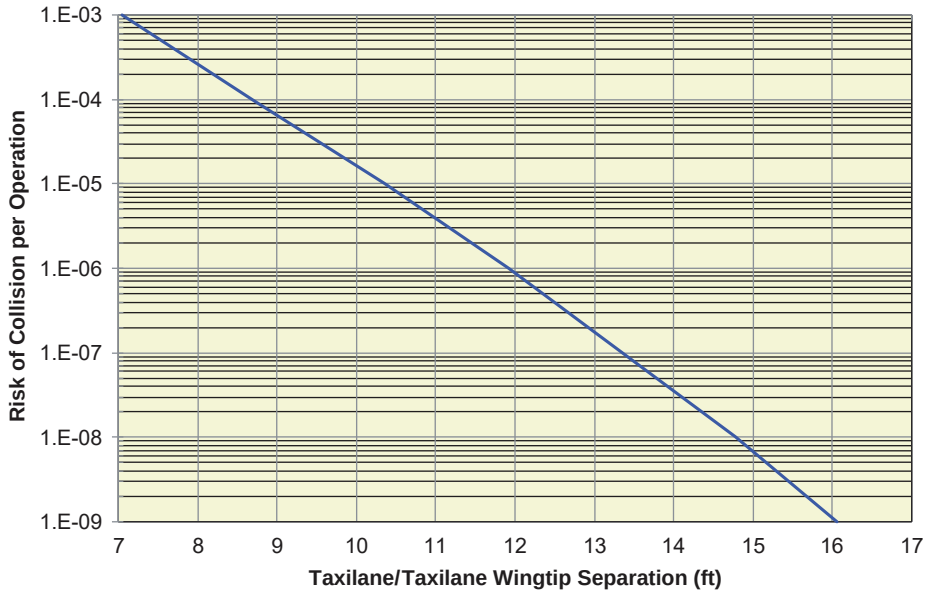

Figure 14. Taxilane/taxilane collision probability based on wingtip separation.

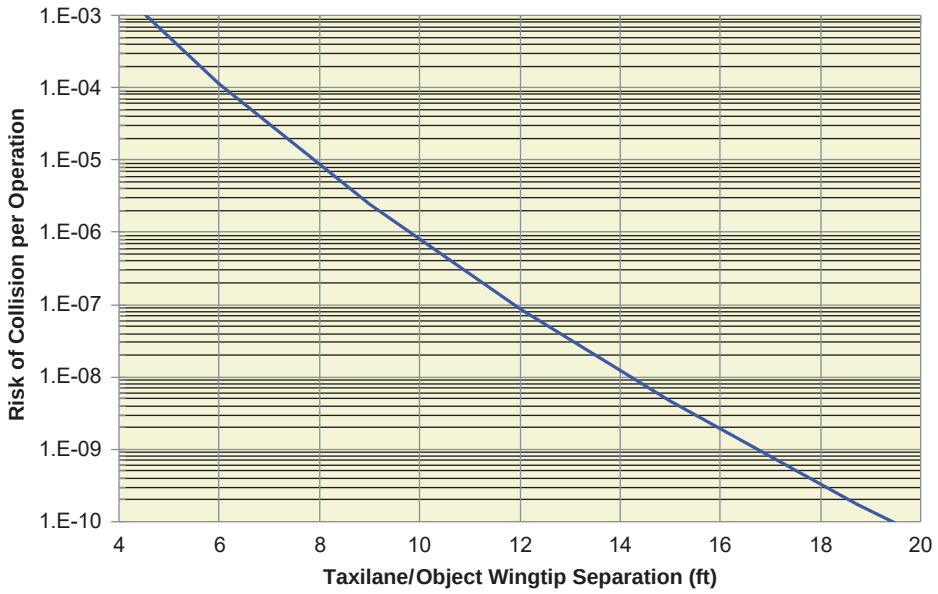

Figure 15. Taxilane/object collision risk based on wingtip separation.

Runway Deviation Modeling

The probability of aircraft collision associated with the separation between the runway and taxiway or objects depends on whether the movement is a landing or a takeoff operation.

For landing there are two types of risk that may be evaluated:

- Risk during the final approach phase when the aircraft is airborne and the combination of large lateral and vertical deviations from the nominal approach path may lead to collision with a fixed or movable object in the airfield area (e.g., an aircraft taxiing in a parallel taxiway).
- Risk if the aircraft loses directional control after touching down and veers off the runway, colliding with fixed or movable objects.

These two types of risk may be combined to provide the total risk for landing. The veer-off risk is estimated for every landing operation, whereas the airborne risk is computed only for missed approaches.

When taking off, the pilot may reject the procedure and intentionally or unintentionally veer-off the runway. If directional control is lost when in high speed, the aircraft may col-

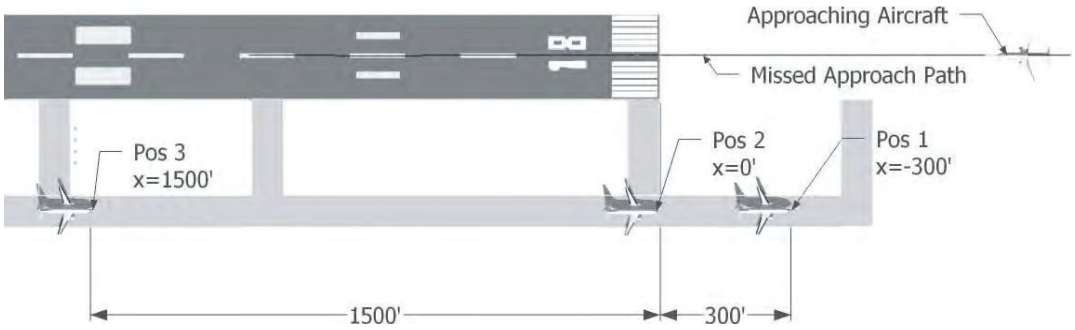

Figure 16. Plan view of CRM run experiment.

lide with fixed or movable objects after departing the runway edge and possibly the RSA.

The methodology used to assess risk during the airborne phase was the CRM. Although the CRM model was developed in the 1970s and the FAA has been improving these models since the 1990s, the original CRM can serve as a screening tool to evaluate the feasibility of submitting an MOS. The FAA has other tools to evaluate the need for further analysis if the risk estimated is within a feasible range. A summary of the CRM approach, variables, and models is provided in Appendix B.

Landing—Airborne Phase Model

It is recognized that running the CRM demands the availability of specific software and the expertise to use it. To facilitate the analysis and the application of the methodology, several CRM runs were made for common situations and different ADGs; however, when the analysis involves specific aircraft rather than an ADG, for the airport to obtain more accurate estimates of risk, the assessment should use direct results from the CRM analysis and specific conditions, if possible.

Several CRM runs were made with obstacles located at various separations from the runway centerline and along the runway length. For Cat I, an obstacle clearance height (OCH) of 200 ft was used, and for Cat II an OCH of 100 ft was used. The ranges used were –300, 0, 1,500, 3,000, and 4,500 ft. Figures 16 and 17 illustrate the experiment run for several runway/taxiway separations. In Figure 16, only ranges of –300, 0, and 1,500 ft are shown.

With the results from the CRM analysis, the maximum risk for each runway/taxiway separation was identified among the five locations along the parallel taxiway. The next step was to develop risk plots for wingtip separation versus risk in terms of accidents per number of operations. The process was repeated for each ADG, and risk plots were prepared for each group and instrument approach Cat 1 and 2.

The approach to estimating risk using the plots presented in Appendix A may be viewed as conservative for the following reasons:

- Only the highest risk along the runway length was used for the estimate of collision risk.

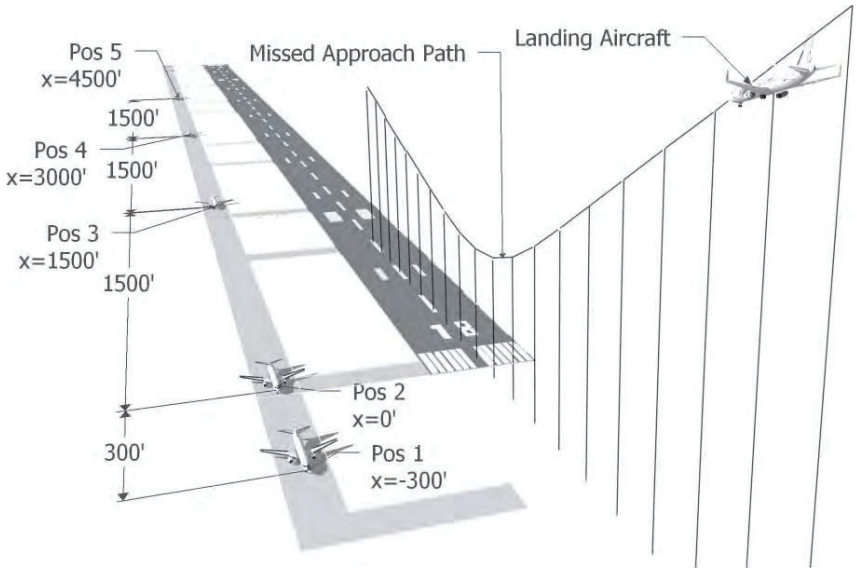

Figure 17. Perspective view of CRM run experiment (not to scale).

- The tallest tail height in the ADG was used to characterize the taxiing aircraft as an obstacle.
- The widest wingspan in the ADG was used to characterize the dimension of the approaching aircraft.
- The taxiing aircraft was assumed to be a fixed object; however, for many airports, a taxiing aircraft will not be present during most of the landings.
- A missed approach rate of 1 percent was kept for the calculations. Based on the latest FAA data, even a 0.2-percent rate is conservative (FAA, 2008).

Runway Veer-Off Models for Landing and Takeoff

During the landing, after touchdown, or during the takeoff roll, the pilot may lose directional control. Some common causes and contributing factors include low runway friction, mechanical failures, and adverse weather conditions.

The basis of the approach used in this study is the probability of aircraft runway excursions and the risk that an aircraft will stop outside the boundaries of the existing or planned RSA. The approach to model risk of collisions is accomplished by using a combination of frequency and location models. In a sense, the modeling considered the bounds of the RSAs rather than the presence of obstacles in the vicinity of the RSAs or the aircraft speed when striking obstacles. While the difference makes the new models simpler, the approach can be extended to consider risk if this type of analysis is required. The two-part model approach is represented in Figure 18.

Event Probability (Frequency Model)

The likelihood of an aircraft veer-off incident depends on operational conditions and human factors. It includes airport characteristics, weather conditions, and aircraft performance, as well as the relationship between the runway distance required by the aircraft for the given conditions and the runway distance available at the airport.

Similar to the approach presented in *ACRP Report 3* (Hall et al., 2008), backward stepwise logistic regression was used to calibrate the veer-off frequency models. Data were gathered from accidents and incidents and NOD. To avoid the negative effects of multicolinearity on the model, correlations between independent variables were tested to eliminate highly correlated variables, particularly if they did not contribute significantly to explaining the variation of the probability of an accident.

The selected approach can identify relationships missed by forward stepwise logistic regression (Hosmer and Lemeshow, 2000). The predictor variables were entered by blocks, each consisting of related factors, such that the change in the model's substantive significance could be observed as the variables were included.

The basic model structure used is logistic, as follows:

$$P\{Accident_Occurrence\} = \frac{1}{1+e^{b_0+b_1X_1+b_2X_2+b_3X_3+\ldots}}$$

where

$P\{Accident_Occurrence\}$ is the probability (0–100%) of an accident type occurring given certain operational conditions,

X_i are independent variables (e.g., ceiling, visibility, crosswind, precipitation, and aircraft type), and

b_i are regression coefficients.

Several parameters were considered for inclusion in the models. The backward stepwise procedure helps identify the most relevant variables for each type of event. One major improvement relative to models presented in previous studies was the use of tailwind and headwind. These variables were not present in the overrun and undershoot models presented in *ACRP Report 3* (Hall et al., 2008) because the actual runway had not been identified in the NOD. The research team gathered information on the runways used, and the process allowed the calculation of the head/tailwind components of the model.

Another major accomplishment that has increased model accuracy was the inclusion of a runway criticality factor. The new parameter represents the interaction between the runway distance required by the aircraft and the runway distance available at the airport. The logarithm of the ratio between the distance required and the distance available was used to

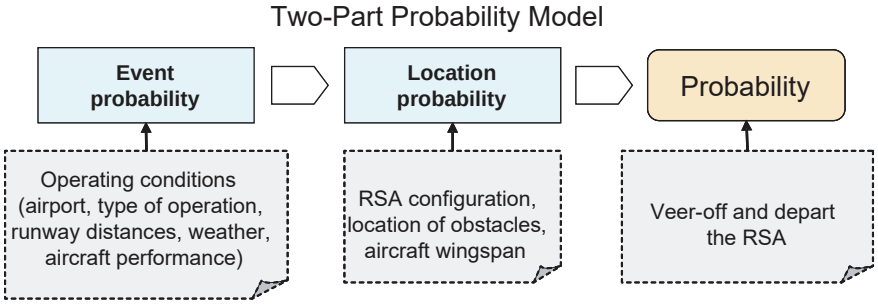

Figure 18. Modeling approach.

represent the criticality factor. The greater the value, the more critical the operation because the safety margin decreases, and in many cases strong braking or the possibility of overruns may lead to veer-off events.

The distance required is a function of the aircraft performance under specific conditions. Therefore, every distance required under International Organization for Standardization (ISO) conditions (sea level, 15 deg centigrade) was converted to actual conditions for operations. Moreover, the distances were adjusted for the runway surface condition (wet, snow, slush, or ice) and for the level of head/tailwind. The adjustment factors for runway surface conditions are those recommended by the Flight Safety Foundation (2009).

To summarize, the runway distance required was adjusted for temperature, elevation, runway surface conditions, and wind. Table 6 presents the factors applied to the distance required by the aircraft. A correction for slope was not applied, as this factor had little effect on the total distance required.

The use of NOD in the accident frequency model was a major improvement introduced in *ACRP Report 3* (Hall et al., 2008), and it was maintained for this study. The analysis with NOD also adds to the understanding of cause and effect relationships for veer-off incidents. Table 7 summarizes the model coefficients obtained for each veer-off frequency model.

Table 8 summarizes the parameters representing the accuracy of each model obtained presenting the R^2 and C-values

Table 6. Correction factors applied to required runway distance.

Local Factor	Unit	Reference	Adjustment	Factor Definitions
Elevation (E) [(i)]	1000 ft	E = 0 ft (sea level)	$F_e = 0.07 \times E + 1$	F_e is runway distance adjustment factor for elevation
Temperature (T) [(i)]	deg C	T = 15 deg C	$F_t = 0.01 \times (T - (15 - 1.981 E) + 1$	F_t is runway distance adjustment factor for temperature
Tailwind (TWLDJ) for Jets [(iii)]	knot	TWLDJ = 0 knot	$F_{TWJ} = (RD + 22 \times TWLDJ)/RD$ [(ii)]	F_{TWJ} is runway distance adjustment factor for tailwind (jets)

TOVO	0.14	0.82

for each model. Relatively low R^2 values are the norm in logistic regression (Ash and Schwartz, 1999), and they should not be compared with the R^2 of linear regressions (Hosmer and Lemeshow, 2000). A better parameter to assess the predictive capability of a logistic model is the *C*-value. This parameter represents the area under the sensitivity/specificity curve for

the model, which is known as the receiver operating characteristic (ROC) curve.

Sensitivity and specificity are statistical measures of the performance of a binary classification test. Sensitivity measures the proportion of true positives that are correctly identified as such (the percentage of accidents and incidents that are identified when using the model). Specificity measures the proportion of true negatives that are correctly identified (the percentage of normal operations that the model can identify as non-incident). These two measures are closely related to the concepts of Type I and Type II errors. A theoretical, optimal prediction can achieve 100-percent sensitivity (i.e., predict all incidents) and 100-percent specificity (i.e., not predict a normal operation as an incident).

To assess how successful the models are in classifying flights correctly as "incident" or "normal," and to find the appropriate cut-off points for the logistic regression model, the ROC curves were defined for each model to calculate the *C*-value as shown in Table 8. The values achieved for the veer-off model are considered very good, with the area under the curve representing a *C*-value higher than 80 percent.

The frequency models developed under this study will require the use of historical information on operations and weather for the specific airport. The necessary information on operations includes the time of the flight, runway used, type of aircraft, type of flight, and whether the operation was an arrival or departure. In addition, it is necessary to collect the weather information for the same period that operational data are available, usually for 1 year.

Weather information can be acquired directly from the National Oceanic and Atmospheric Administration (NOAA) database for the weather station located at the airport. However, the information on operations, particularly for non-towered airports, may be harder to obtain, particularly the identification of the runway used. For towered airports operational data can be requested from the FAA. Another challenge is running the analysis because computations can be made only with the help of a computer and specific software that incorporates these models.

To facilitate the analysis, a series of plots were developed based on average veer-off incident rates for the United States. The rates are presented in Table 9 and were combined with the location models to build the risk plots presented in Appendix A. The average incident rates are based on the number of accidents and incidents, and the total traffic of relevant operations from 1982 to 2009.

From Table 9, one can see that landing veer-offs are approximately four times more likely to occur than takeoff veer-offs.

Event Location

The farthest location of the veer-off path from the runway edge was used to develop the location models. The probability of this distance during an incident is not equal for all locations measured from the runway centerline or runway edge. The probability of veer-off with lateral deviation in the proximity of the runway edge is higher than at larger distances from that boundary. This dependence is represented by the accident location model, which is the second main element of the risk assessment approach. The accident location models are based on historical accident and incident data for aircraft veer-offs.

Worldwide data on accidents and incidents were used to develop the location models. The model structure is an exponential decay function similar to that used in the research reported in *ACRP Report 3* (Hall et al., 2008). Based on the accident/incident location data, two cumulative probability distribution models were developed. With the functions obtained, the fraction of accidents involving locations exceeding a given distance from the runway edge can be estimated. When the probability estimated with the location model is multiplied by the frequency of accident occurrence, it is possible to quantify the overall frequency of incidents involving locations exceeding a given distance from the runway edge.

Figure 19 shows the runway edge origin location used to represent veer-off incidents. The reference location of the aircraft is its nose wheel. The y-axis origin is the edge of the runway, not necessarily the edge of the paved area when the runway has shoulders.

The model structure for the location models is the following:

$$P\{Location > y\} = e^{-by^m}$$

where

$P\{Location > y\}$ is the probability that the veer-off distance from the runway edge is greater than y,

Table 9. Average veer-off incident rates (1982–2009).

Type of Incident	Number of Incidents	Incident Rate per Operation	Incident Rate in Operations per Incident
LDVO	512	1.195E-06	837,000
TOVO	111	2.590E-07	3,861,000

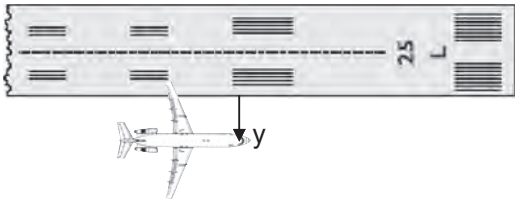

Figure 19. Y origin for aircraft veer-offs.

y is a given location or distance from the runway edge, and *b* and *m* are regression coefficients.

A typical transverse location distribution is presented in Figure 20.

The actual model parameters are presented in Table 10 and illustrated in Figures 21 and 22.

CHAPTER 5

Validating the Methodology

MOS Case Studies

One of the goals of this study was to evaluate the types of justification used by airports when submitting MOS requests to the FAA, specifically when the non-compliance issue was related to airfield separation. A second objective was to test and validate the methodology applied to those cases to evaluate how the new methodology might help support such requests. To achieve these objectives, a survey was conducted of airports with MOS for airfield separations that have been approved by the FAA.

MOS Survey

The Airports Division of the FAA regional offices were contacted to obtain a list of airports that have received MOS approvals related to airfield separations. Fifty-nine cases were identified for which some information was available. Out of those cases approved by the FAA, 20 were selected to cover various regions and the spectrum of National Plan of Integrated Airport Systems (NPIAS) categories. The airports were characterized according to geographic region, aircraft operations, fleet mix, airport reference code, and NPIAS classification. The list of MOS cases selected for this study is shown in Table 11. More details about each case are presented in Appendix H.

Methodology Applied to MOS Cases

To validate the methodology and the models developed in this study, the analysis procedures presented in Appendix A were applied to each of the 20 selected MOS cases. A summary of results is presented in Table 12. For each case, the following information is provided:

- The non-standard situation and the compliance standards;
- The analysis of the separation using the risk analysis methodology;
- Comparison of estimated and historical incident/accident rates, when available; and
- Major conclusions on risk level and acceptance.

Additional details for each analysis are presented in Appendix H. The following describes the information contained in each column of Table 12:

- **Airp.**—FAA code of the airport.
- **ADG**—Aircraft Design Group that defines the separation.
- **Type of MOS**—Type of procedure used in the analysis.
- **Risk Level**—Probability for risk severity considered. Catastrophic consequences were considered for every analysis involving runway separation, and major consequences were considered for the remaining cases. The definitions for severity and likelihood classifications are based on the FAA risk matrix (FAA, 2010)
- **Expected # Yrs**—Number of years that an accident is expected to occur.
- **Risk < 1.0E-7**—Yes, if risk is lower than 1 in 10 million operations.
- **Risk < 1.0E-9**—Yes, if risk is lower than 1 in 1 billion operations.
- **Expected Severity**—Worst credible consequence expected for the accident, based on categories defined in the FAA risk matrix (FAA, 2010).
- **FAA Risk Classification**—Level of risk according to classification based on FAA risk matrix (FAA, 2010).
- **Acceptable**—Yes, if level of risk is medium or low; however, for medium risk, measures to mitigate and control may be necessary.

Figures 23 and 24 present a summary of the most frequent justifications and restrictions, respectively, when submitting MOS requests related to airfield separations.

As observed in Table 12, the methodology would help support the analysis of MOS. With the exception of one case,

the analysis results provided an insight into the quantitative risk associated with each case. Moreover, the results helped identify the level of risk and consequently the need to include additional measures to control risk.

The cases with low levels of risk are satisfactory without additional measures, except to keep the conspicuity of taxiway and taxilane centerlines under any weather conditions.

Based on these results, some important conclusions can be drawn:

- The suggested level of risk criterion for taxiway/taxilane/object separations is one accident in 10 million movements. This criterion was met for each of the case studies that does not involve runway separations. This is also the maximum risk for the range defined in the FAA risk matrix for accidents of major severity, the worst credible consequence for taxiway/taxilane collisions (FAA, 2010).
- The same criterion is suggested to evaluate runway separations because it was the basis for defining design standards using the FAA/ICAO CRM. It should be noted that the most credible consequence for aircraft veering off a runway is catastrophic. As such, the acceptable risk level is one accident in 1 billion operations, and according to the FAA, the risk is classified as medium.
- The FAA also added criteria specific for airports, and the maximum risk for accidents of major consequences is one in every 2.5 million departures or 4×10^{-7}; however, based on the results of the analysis using the risk methodology, a more conservative level may be used, and a level of one accident in 10 million operations for cases involving taxiway/taxilane/object is recommended.

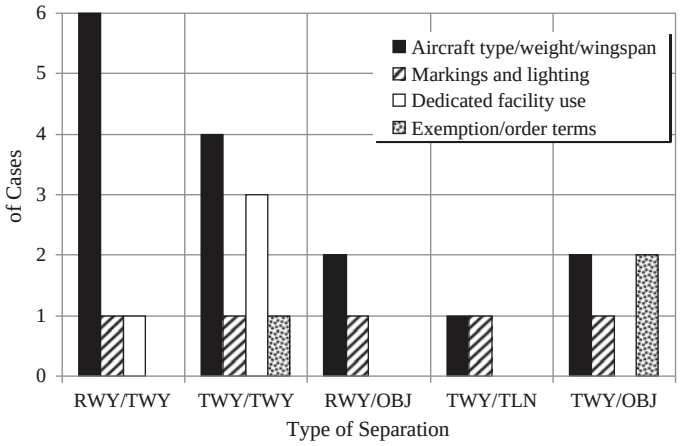

Figure 24. Most common restrictions for MOS of airfield separations.

CHAPTER 6

Conclusions and Recommendations

The aviation industry is relatively young compared to other industries. Over the past 100 years, rapid technological changes have had a substantial impact on airfield configuration and design standards. Airfield standards have been modified to improve safety and to accommodate new technology to improve airport capacity and maintain acceptable safety levels. When the standards are changed to require larger areas and dimensions, existing airports increasingly find themselves constrained by land development and other natural features.

Another common situation occurring with airports is the need to have larger aircraft operating at the airport to increase capacity. In this case, the new aircraft may belong to a higher ADG, and the corresponding standards may be different and require larger airfield separations.

The methodology developed in this study provides a practical and simple tool to help airports quantify and evaluate risk if they cannot comply with the standards and want to pursue an MOS to submit to the FAA. The methodology is based on lateral deviation studies and models developed in this research as well as in previous studies conducted by the FAA, Boeing, and ICAO. A comprehensive survey of accidents and incidents associated with lateral deviations during landing, takeoff, and taxiing operations was conducted to identify causal and contributing factors, as well as to characterize the lateral deviation during those events.

Major Achievements

Airfield Separation Rationale to Develop Standards

It is simple to understand the need for airfield separations to avoid aircraft collisions. However, the rationale used by the FAA and ICAO to establish existing standards is not readily available in the literature. This study gathered the information available from FAA and ICAO personnel who were involved in the development or in the management of those standards. The information presented in Chapter 2 herein can be very helpful to the industry and provides documentation that may be used for reference in future studies.

Development of Veer-off Accidents and Incidents Database

A comprehensive worldwide database of aircraft veer-off accidents and incidents was developed that contains information gathered from existing accident and incident databases and information obtained from other sources (e.g., weather data). The database was developed in Microsoft Access, which provides editing and querying capabilities. The database contains a synopsis of the event, date, location, runway characteristics, characteristics of the aircraft involved, causal factors, consequences, and wreckage location/path data.

Development of Risk Models for Runway Veer-Offs

Risk models for aircraft veer-off during takeoff and landing operations were developed using an approach similar to that presented in *ACRP Report 3* for overruns and undershoots (Hall et al., 2008). A two-part model based on the probability of an incident occurring and an estimate of the probability that the aircraft will travel beyond a given distance from the runway edge is used to assess the risk that an aircraft may depart the existing safety areas.

The frequency model is based on operational and weather factors, including a criticality factor that related aircraft performance under given conditions with the available distance for operation. The frequency model uses accident, incident, and normal operations data to quantify accident risk factors and provide an assessment of flight risk exposure.

Development of a Tool to Analyze Airfield Separations

An analysis process for each type of airfield separation is presented in Appendix A. The procedures are simple to use, and the instructions include practical examples to help the user.

The methodology serves as a screening tool to support MOS requests involving airfield separations when the standards cannot be met. The process helps to quantify the risk levels for non-standard conditions and, based on criteria recommended in this report, in agreement with the FAA risk matrix, it is possible to evaluate the feasibility of approval of an MOS request (FAA, 2010).

Different procedures are provided depending on the type of airfield separation. It is possible to analyze separations involving runways, taxiways, taxilanes, and objects. A specific approach was used for each type of separation. To facilitate the application of the methodology, risk plots are presented for each ADG, and when the analysis involves specific aircraft, risk plots based on wingtip clearance are provided.

Recommended Risk Criteria for Taxiway and Taxilane Separations

An extensive survey of historical taxiway and taxilane incidents helped assess the major factors involved in these events. Due to the slow speeds of aircraft on taxiways and taxilanes as compared to aircraft speeds on runway operations, even under adverse weather conditions or slippery pavements, the pilot was able to stop the aircraft as soon as it departed the paved surface of the taxiway. Further, historical taxiway collision events were not related to taxiway deviations. In almost every accident/incident, the collision occurred because there was another aircraft or movable object inside the OFA of the taxiing aircraft.

One major conclusion is that the existing standards provide an excellent level of safety and that the risk is lower than one accident in 1 billion operations. Even when another aircraft or object was in the path, resulting in a collision, there has never been a serious injury associated with the accidents, and the damages have been limited mostly to the wingtip of the aircraft.

Based on the available evidence, the worst credible consequence for a taxiway or taxilane according to the FAA risk matrix is major damage to aircraft and/or minor injury to passengers/workers, major unplanned disruption to airport operations, or serious incident (FAA, 2010). For major consequences, the maximum acceptable level of likelihood is "remote." In this case, a remote event is expected to occur once every year or 2.5 million departures, whichever occurs sooner.

Limitations

The methodology developed in this study has some limitations. Risk of collision between two aircraft, or an aircraft and an object, estimated with this methodology is applicable only to straight parallel segments of taxiways and taxilanes.

Although the lateral deviation data in taxiing operations used to develop the risk plots were measured only for the B-747 aircraft, it is assumed that smaller aircraft have lateral deviation distributions that have smaller ranges. Thus, the model can be considered conservative when applied to smaller aircraft. However, the taxiway deviation models used in this study were developed from lateral deviation data collected on taxiways with centerline lights. Therefore, the conspicuity of the taxiway/taxilane centerline is an added risk mitigation measure that should be used when justifying an MOS request.

The FAA/ICAO CRM during missed approach was developed based on data for two- and three-engine jet airplanes. The veer-off models developed under this study are based on data from veer-off accident/incident reports taken from several countries and for aircraft with MTOW larger than 5,600 lb.

The collision risk during the approach phase of landing is modeled for missed approach during instrument approaches under Cat I and II. This is assumed to be the highest risk condition, and the phase when the pilot is under visual conditions is not modeled in the risk curves presented.

CRM risk is estimated for an aircraft located on the centerline of a parallel taxiway. The taxiing aircraft is of the same ADG as the approaching aircraft, and the maximum tail height for the ADG is taken to characterize the obstacle located in the taxiway. The same plots may be used to assess risks associated with other types of obstacles at a certain distance from the runway centerline; however, such obstacles must be lower than the maximum tail height of the ADG used to develop the charts.

Recommendations for Future Work

Effort to Collect Taxiway/Taxilane Deviation Data

As described in previous sections of this report, many of the separation standards were developed during World War II and were based on engineering judgment. These standards have helped maintain very high levels of safety, as evidenced by the fact that there is no history of collisions between two aircraft taxiing in parallel routes.

With the increase in traffic volume and the need to increase airport capacity, many airports are restricted in their ability to increase existing airfield separations to introduce operation of larger aircraft. Although the FAA permits MOS based on formulas developed for this purpose, the formulas were developed based on engineering judgment, rather than using a probability approach.

Recent FAA studies on aircraft deviation for large aircraft have demonstrated the feasibility of collecting data to develop risk models. However, these studies have focused on large aircraft on taxiway segments with centerline lights. There is a need to collect additional data for various categories of aircraft, for both taxiway and taxilane segments, under various environmental conditions, with and without conspicuous centerline markings, and with and without centerline lights.

Such studies should not be undertaken to modify the current standards, but they can support MOS processes when the evaluation of shorter-than-standard distances is necessary.

Effort to Collect Aircraft Deviation Data during Landing and Takeoff Operations

The development of risk plots for the airborne phase of landing used the FAA/ICAO CRM for instrument approach Cat I and II. The CRM model was based on the limited data available at the time it was developed. Aircraft technology and navigational aids have improved significantly since then. As it is expected that airport capacity will need to increase two- or threefold in the near future, it is necessary to develop a more rational approach to more accurately assess the level of safety. Many airports still rely on visual and non-precision approaches, and for these categories, that analysis can be made only by using Part 77 imaginary surfaces obstruction evaluation to obtain a very basic assessment of risk.

A risk-based model for the assessment of visual segment or non-precision approaches would benefit many airports in the United States and abroad, particularly for the evaluation of airfield areas. Therefore, studies that address risk assessment for aircraft operations associated with movable or fixed objects within or in the vicinity of airports would greatly benefit the aviation industry.

Definitions

Acceptable Level of Risk. For regulations and special permits, the acceptable levels of risk are established by consideration of risk, cost/benefit, and public perception.

Accident. An unplanned event or series of events that results in death, injury, damage to, or loss of, equipment or property.

Consequence. The direct effect of an event, incident, or accident. In this study, it is expressed as a health effect (e.g., death, injury, exposure) or property loss.

Hazard. The inherent characteristic of a material, condition, or activity that has the potential to cause harm to people, property, or the environment.

Hazard Analysis. The identification of system elements, events, or material properties that lead to harm or loss. The term "hazard analysis" may also include evaluation of consequences from an event or incident.

Incident. A near-miss episode, malfunction, or failure without accident-level consequences that has a significant chance of resulting in accident-level consequences.

Likelihood. Expressed as either a frequency or a probability. Frequency is a measure of the rate at which events occur over time (e.g., events/year, incidents/year, deaths/year). Probability is a measure of the rate of a possible event expressed as a fraction of the total number of events (e.g., 1 in 10 million, 1/10,000,000, or $1 \times 10\text{-}7$).

METAR. Aviation routine weather report.

Nonconformity. Non-fulfillment of a requirement. This includes, but is not limited to, non-compliance with federal regulations. It also includes an organization's requirements, policies, and procedures, as well as requirements of safety risk controls developed by the organization.

Quantitative Risk Analysis. Incorporates numerical estimates of frequency or probability and consequence.

Risk. The combination of the likelihood and the consequence of a specified hazard being realized. It is a measure of harm or loss associated with an activity.

Risk Analysis. The study of risk in order to understand and quantify risk so it can be managed.

Risk Assessment. Determination of risk context and acceptability, often by comparison to similar risks.

Safety. Freedom from unacceptable risk. Often, safety is equated with meeting a measurable goal, such as an accident rate that is less than an acceptable target. However, the absence of accidents does not ensure a safe system. To remain vigilant regarding safety, it is necessary to recognize that just because an accident has not happened does not mean that it cannot or will not happen.

Safety Risk Management. The systematic application of policies, practices, and resources to the assessment and control of risk affecting human health and safety and the environment. Hazard, risk, and cost/benefit analysis are used to support the development of risk reduction options, program objectives, and prioritization of issues and resources. A critical role of the safety regulator is to identify activities involving significant risk and to establish an acceptable level of risk.

Veer-Off. An aircraft running off the side of the runway during takeoff or landing roll.

Worst Credible Condition. The most unfavorable condition or combination of conditions that it is reasonable to expect will occur.

How to Use This Methodology

This methodology is intended to serve as a screening tool for analysis associated with requests for modification of standards (MOS) related to airfield separations. In no case should this methodology be used to justify changes to current FAA design standards for airfields. Conclusions drawn based on this methodology shall be subject to further analysis and approval by the FAA before the non-standard separation is adopted. Additional mitigating procedures and risk control measures may be required to achieve an acceptable level of safety for operations in the airfield.

This appendix provides a step-by-step methodology to evaluate the risk of aircraft collision associated with airfield separations in parallel segments. The methodology uses information on existing or planned conditions and provides estimates of risk. The level of risk should be compared to acceptable levels of risk recommended by the FAA.

Different procedures are used depending on the type of analysis desired, as explained in ensuing sections. The methodology is divided into five basic sections, and each section presents the procedure to assess the risk for a specific scenario.

The outcome of the analysis is the risk of collision between two aircraft or between an aircraft and an object, depending on the type of analysis required. To determine the appropriate section containing the methodology and step-by-step procedure for the desired type of analysis, the two types of structures must be selected from Table A-1. For example, to analyze the separation between a taxiway and an object, the user should use the procedure described in Section 2 and the risk plots presented in Figures AA-8 to AA-14 presented in the attachment to Appendix A.

When describing the procedure, some acronyms are used to characterize specific parameters. Definitions of these acronyms can be found within the section in which they appear. When an equation is included in the procedure, a number located in parenthesis to the right of it is used to reference the equation in the text.

Many of the risk plots presented in this methodology should be used for specific Aircraft Design Groups (ADGs) as defined in FAA Advisory Circular (AC) 150/5300-13 (FAA, 1989).

Table A-2. Airplane Design Groups (FAA, 1989).

Group #	Tail ei t ft	in span ft
I	20	49
II	20 to 30	49 to 79
III	30 to 45	79 to 118
IV	45 to 60	118 to 171
V	60 to 66	171 to 214
VI	66 to 80	214 to 262

Table A-2 presents a summary of tail height and wingspan ranges for each ADG.

As mentioned earlier, the outcome of the analysis is the risk of collision. Both the FAA and the International Civil Aviation Organization (ICAO) have been using a collision risk value of one in 10 million operations (1×10^{-7}) as the acceptable level during the approach phase under instrument conditions. This is also the level criterion suggested when applying this methodology.

Limitations

This methodology should be used carefully, and the user must be aware of its limitations. This methodology can be applied to estimate the risk of collision between two aircraft or an aircraft and an object only on straight parallel segments of taxiways and taxilanes. Also, because the taxiway deviation models used in this study were developed from lateral deviation data collected on taxiways with centerline lights, the conspicuity of the taxiway/taxilane centerline is an added risk mitigation measure that should be used when justifying an MOS request for separations that do not include runways.

Although lateral deviation data in taxiing operations used to develop the risk plots were measured only for the B-747 aircraft, it is assumed that smaller aircraft have lateral deviation distributions that have smaller ranges. Thus, the model applied can be considered conservative when applied to smaller aircraft.

The FAA/ICAO Collision Risk Model (CRM) during missed approach was developed based on data for two- and three-engine jet airplanes. The veer-off models developed under this

Table A-1. Procedure selection.

	Ta i ay	Ta ilane	Run ay

Ta ilane	Section 1 (Figures AA-1 to AA-7)	Section 3 (Figures AA-15 to AA-21)	Section 5 (Figures AA-29 to AA-54)
Object	Section 2 (Figures AA-8 to AA-14)	Section 4 (Figures AA-22 to AA-28)	Section 5 (Figures AA-29 to AA-54)

ACRP study are based on data from veer-off accident/incident reports taken from several countries and for aircraft with maximum takeoff weight (MTOW) larger than 5,600 lb.

The collision risk during the approach phase of landing is modeled for missed approach during instrument approaches under Cat I and II. This is assumed to be the highest risk condition, and the phase when the pilot is under visual conditions is not modeled in the risk curves presented.

CRM risk is estimated for an aircraft located on the centerline of a parallel taxiway. The taxiing aircraft is of the same ADG as the approaching aircraft, and the maximum tail height for the ADG is taken to characterize the obstacle located in the taxiway. The same plots may be used to assess risks associated with other types of obstacles at a certain distance from the runway centerline; however, such obstacles must be lower than the maximum tail height of the ADG used to develop the charts.

Risk Criteria

The suggested risk criteria to use with this methodology are those used by the FAA and represented by the risk matrix shown in Figure A-1 (FAA, 2010). A risk classification (high, medium, or low) is provided based on the combination of severity and likelihood.

Severity is the measure of how bad the results of an event are predicted to be and is defined as the worst credible consequence that may take place for risk associated with a given hazard. Likelihood should be considered only after determining severity, and at the same time, likelihood should not be considered when determining severity.

Definitions for each level of severity and consequence are presented in Tables A-3 and A-4.

Two cases can serve as examples: (1) risk of collision between an aircraft landing and an aircraft located in a parallel taxiway and (2) risk of wingtip collision between aircraft taxiing in parallel taxiways. The first step is to determine the worst credible consequence for each of these events. The worst credible consequence for runway veer-offs in most cases is hull loss and multiple fatalities, which is classified as catastrophic. According to the FAA risk matrix, such a condition is acceptable only if it occurs less than once every 100 years or less than once in 25,000,000 departures.

For the second case, based on historical data of accidents and incidents, the worst credible consequence may be classified as major. In this case, the risk is acceptable if it is expected to occur about once every year or every 2.5 million departures (4×10^{-7}), whichever occurs sooner.

The ICAO Obstacle Clearance Panel (OCP) has set the acceptable risk of collision during the approach phase at a value of one in 10 million operations (1×10^{-7}). Since this is the risk level used to establish most of the airfield design standards defined by the FAA, and this methodology will serve as a screening tool, this criterion is used in this screening methodology. However, the risk classification based on the risk matrix defined by the FAA must be highlighted when submitting MOS for FAA approval (FAA, 2010).

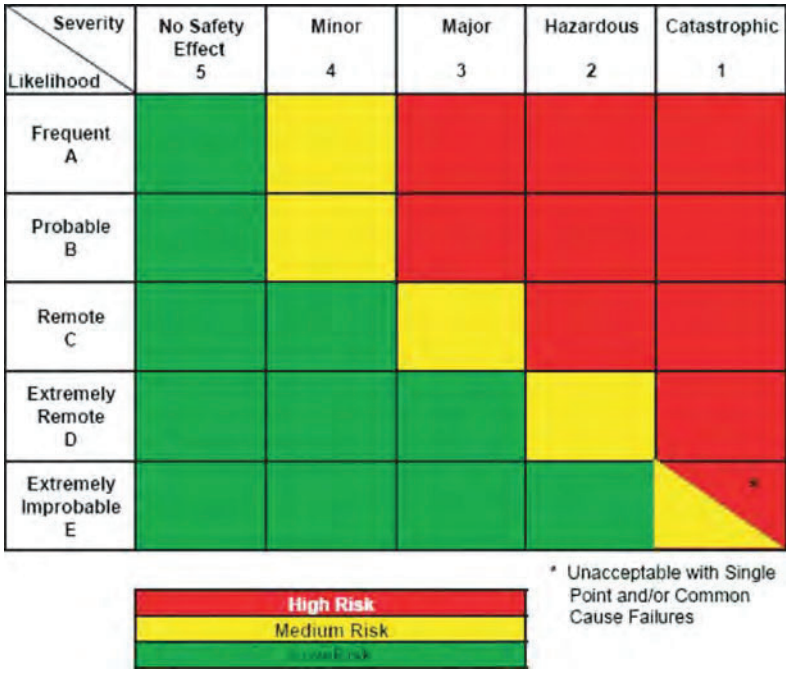

Figure A-1. FAA risk matrix (FAA, 2010).

Table A-3. FAA likelihood levels (FAA, 2010).

	General	Airport pecific	AT Operational	
			Per Facility	NA ide
Fre uent A	Probability of occurrence per operation is equal to or greater than 1 10^{-3}	Expected to occur more than once per week or every 2,500 departures (4 10^{-4}), whichever occurs sooner	Expected to occur more than once per week	Expected to occur every 1–2 days
Probable	Probability of occurrence per operation is less than 1 10^{-3}, but equal to or greater than 1 10^{-5}	Expected to occur about once every month or 250,000 departures (4 10^{-6}), whichever occurs sooner	Expected to occur about once every month	Expected to occur several times per month
Remote	Probability of occurrence per operation is less than 1 10^{-5} but equal to or greater than 1 10^{-7}	Expected to occur about once every year or 2.5 million departures (4 10^{-7}), whichever occurs sooner	Expected to occur about once every 1–10 years	Expected to occur about once every few months
tremely Remote D	Probability of occurrence per operation is less than 1 10^{-7} but equal to or greater than 1 10^{-9}	Expected to occur once every 10–100 years or 25 million departures (4 10^{-8}), whichever occurs sooner	Expected to occur about once every 10–100 years	Expected to occur about once every 3 years
tremely Improbable	Probability of occurrence per operation is less than 1 10^{-9}	Expected to occur less than once every 100 years	Expected to occur less than once every 100 years	Expected to occur less than once every 30 years

Note: Occurrence is defined per movement.

Table A-4. FAA severity definitions (FAA, 2010).

Figure A-2. Example of taxiway/taxiway separation analysis for specific aircraft.

Section 1—Taxiway to Taxiway or Taxiway to Taxilane

Procedure to Estimate Risk of Collision

1. Identify the taxiways and the centerline separation to be evaluated.
2. Identify the ADG for analysis or the aircraft with the largest wingspan that will be using each taxiway. It is possible that each taxiway is assigned to a different ADG or specific aircraft.
3. If the assessment is for a specific ADG, the simplified collision risk plots can be used based only on the taxiway centerline separation (Figures AA-1 to AA-6 in the attachment to this appendix).
4. If the risk assessment involves specific aircraft or two different types of aircraft, the wingtip separation chart in Figure AA-7 should be used, and in this case, the following steps will be required:
   a. Place both aircraft at the centerlines of the parallel taxiways (see Figure A-2).
   b. Calculate the wingtip clearance for this situation using Equation 1:

$$WD = CS - (WS1 + WS2)/2 \quad (1)$$

where

WD is the distance between wingtips of the two aircraft when both are positioned at the centerline of the taxiways,

CS is the centerline separation between the parallel taxiways,

*WS*1 is the wingspan for the first aircraft, and
*WS*2 is the wingspan for the second aircraft.

   c. Using Figure AA-7, enter the wingtip separation and estimate the risk.
5. Using the risk level estimated, compare to 1×10^{-7}, the upper probability for risk of major consequences according to the risk matrix recommended by the FAA.

Example 1—Taxiway/Taxiway Separation

An airport is planning to build a new taxiway to accommodate larger capacity. The airport handles aircraft up to ADG V; however, the space available is enough for a taxiway/taxiway centerline separation of only 233 ft, as shown in Figure A-3. The standard separation for ADG V is 267 ft, and an MOS was deemed necessary to demonstrate that the available separation is safe.

For taxiway/taxiway separation involving ADG V, Figure AA-5 is used. Entering the separation of 233 ft, the risk of collision when two ADG V aircraft are taxiing is approximately 2.3 E-08 (see Figure A-4), or one collision in 43,500,000 movements. The risk is lower than 1.0E-07 and therefore it is acceptable.

Section 2—Taxiway to Object

Procedure to Estimate Risk of Collision

1. Identify the taxiway and the object separation to be evaluated.

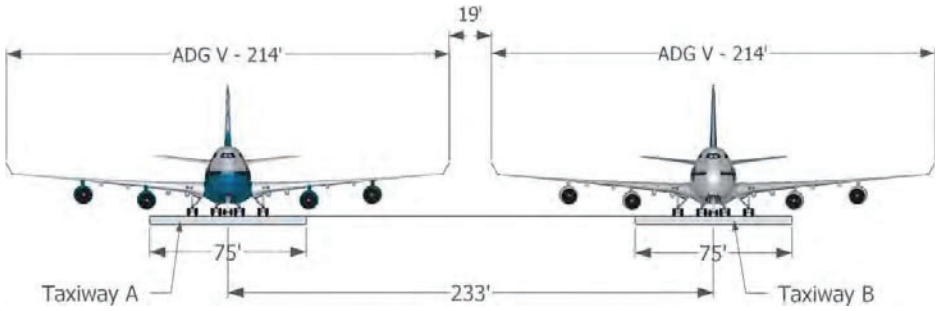

Figure A-3. Example of analysis for taxiway/taxiway separation.

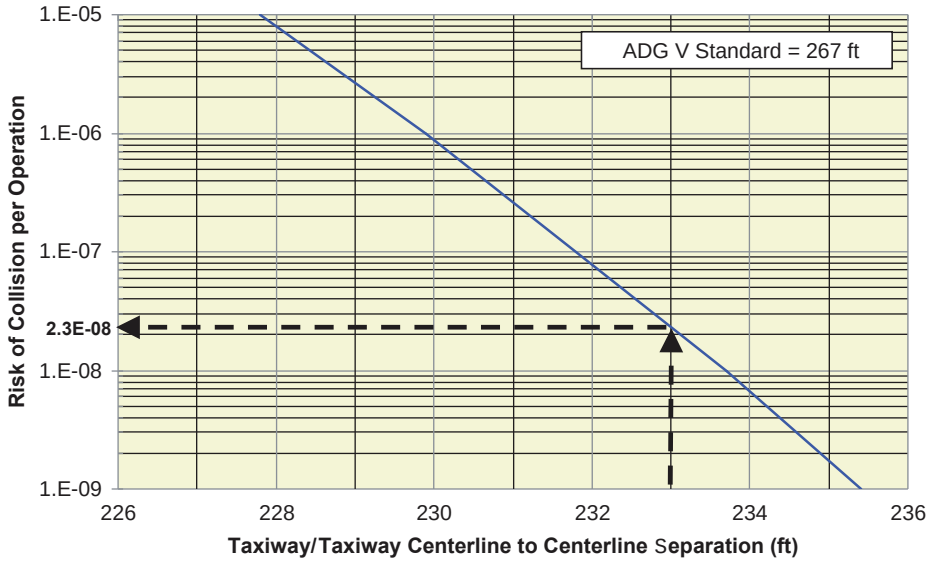

Figure A-4. Example of analysis of taxiway/taxiway separation (ADG V).

2. Identify the ADG for analysis or the aircraft with the largest wingspan that will be using the taxiway.
3. If the assessment is for a specific ADG, the simplified collision risk plots can be used based only on the centerline to object separation (Figures AA-8 to AA-13).
4. If the risk assessment involves a specific aircraft, the wingtip separation plot in Figure AA-14 should be used, and, in this case, the following steps will be required:
   a. Place the aircraft at the taxiway centerline (see Figure A-5).
   b. Calculate the wingtip clearance for this situation:

$$WD = CS - WS/2 \quad (2)$$

where

WD is the distance between the wingtip and the object when the aircraft is positioned at the centerline of the taxiway,

CS is the separation between the taxiway centerline and the object, and

WS is the aircraft wingspan.

   c. Using Figure AA-14, enter the wingtip separation and calculate the collision risk.
5. Compare the risk level estimated to 1×10^{-7}, the highest acceptable probability for risk of major consequences according to the risk matrix recommended by the FAA.

Example 2—Taxiway/Object Separation

An airport is planning to use an existing taxiway for ADG III aircraft; however, it currently is used by ADG II aircraft, and the separation between the taxiway and an existing service road is only 72 ft. The scenario is presented in Figure A-6. The airport does not have space to move the service road because it is limited by the airport perimeter fence. The standard separation for ADG III is 81 ft, and an MOS is necessary to evaluate whether the separation is safe.

For taxiway/object separation involving ADG III, Figure AA-10 is used. Entering the separation of 72 ft, the risk of collision when an ADG III aircraft is taxiing is approximately 1.0E-06 (see Figure A-7), or one collision in 1,000,000 movements. The risk is not acceptable based on the criterion of 1.0E-07; however, it may be possible to evaluate mitigation

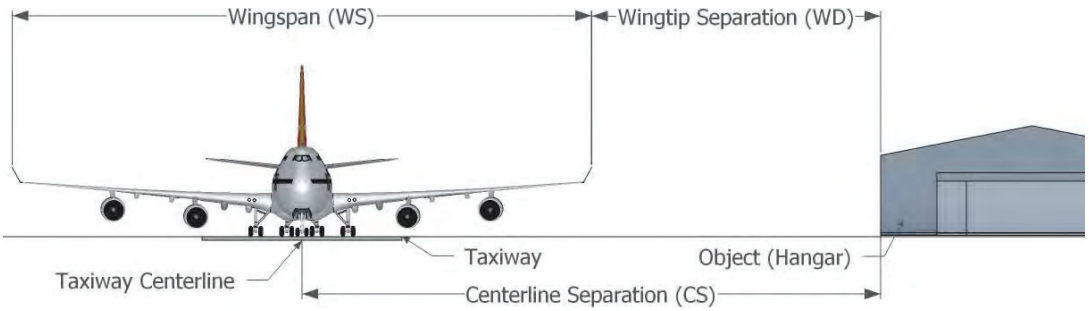

Figure A-5. Example of taxiway/object separation analysis for specific aircraft.

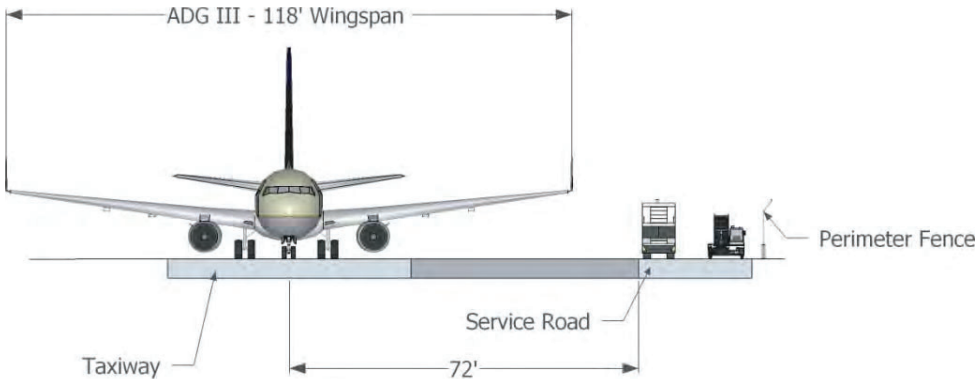

Figure A-6. Example of analysis for taxiway/object separation.

measures (e.g., restricting the wingspan of taxiing aircraft, using centerline lights) or to evaluate the expected number of years for one collision event based on the volume of operations in the taxiway.

For smaller airports with lower volumes of traffic, an accident may be expected to occur less than once every 100 years, and this condition is classified as extremely improbable. In this case, the risk may be considered acceptable according to the criteria suggested by the FAA.

Section 3—Taxilane to Taxilane

Procedure to Estimate Risk of Collision

1. Identify the taxilanes and the centerline separation to be evaluated.
2. Identify the ADG for analysis or the types of aircraft that will be using each taxilane. It is possible that each taxilane is assigned to a different ADG or specific aircraft.
3. If the assessment is for a specific ADG, the simplified collision risk plots can be used based only on the taxilane centerline separations (Figures AA-15 to AA-20).
4. If the risk assessment involves specific aircraft or two different types of aircraft, the wingtip separation plot in Figure AA-21 should be used, and, in this case, the following steps will be required:
   a. Place both aircraft at the centerlines of the parallel taxilanes (see Figure A-8).
   b. Calculate the wingtip clearance for this situation:

$$WD = CS - (WS1 + WS2)/2 \quad (3)$$

where

WD is the distance between wingtips of the two aircraft when both are positioned at the centerline of the taxilanes,
CS is the centerline separation between the parallel taxilanes,
*WS*1 is the wingspan for the first aircraft, and
*WS*2 is the wingspan for the second aircraft.

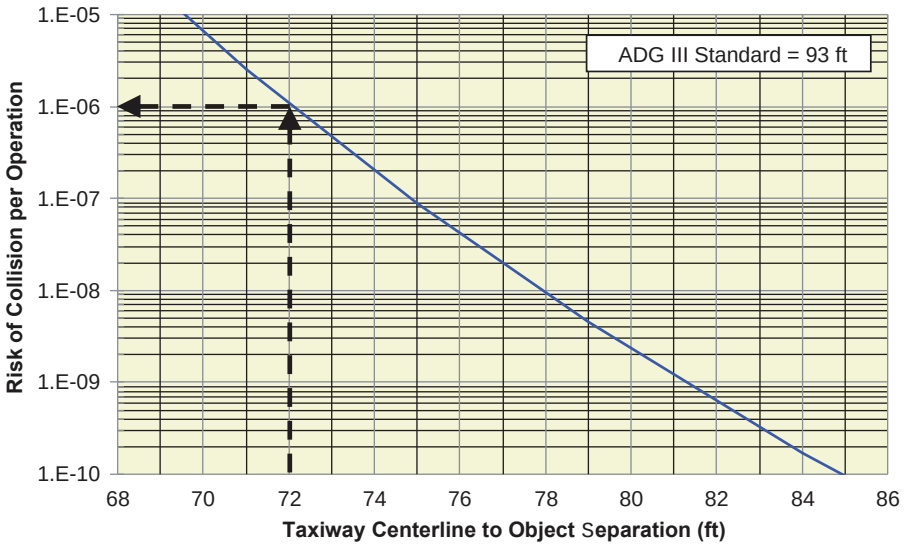

Figure A-7. Example of analysis for taxiway/object separation (ADG III).

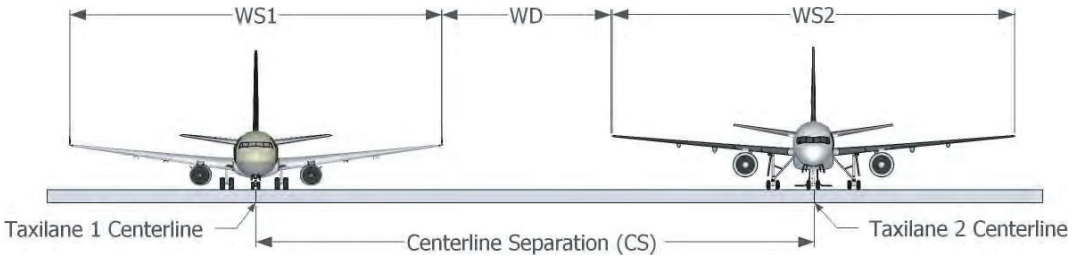

Figure A-8. Example of taxilane/taxilane separation analysis for specific aircraft.

c. Using Figure AA-21, enter the wingtip separation and calculate the risk.

5. Using the risk level estimated, compare to 1×10^{-7}, the upper probability for risk of major consequences according to the risk matrix used by the FAA.

Section 4—Taxilane to Object

Procedure to Estimate Risk of Collision

1. Identify the taxilane and the object separation to be evaluated.
2. Identify the ADG for analysis or the aircraft with the largest wingspan that will be using the taxilane.
3. If the assessment is for a specific ADG, the simplified collision risk plots can be used based only on the taxilane centerline to object separation (Figures AA-22 to AA-27).
4. If the risk assessment involves a specific aircraft, the wingtip separation plot in Figure AA-28 should be used, and, in this case, the following steps will be required:
   a. Place the aircraft at the taxiway centerline (see Figure A-9).
   b. Calculate the wingtip clearance for this situation:

$$WD = CS - WS/2 \quad (4)$$

where:

WD is the distance between the wingtip and the object when the aircraft is positioned at the centerline of the taxilane,

CS is the separation between the taxilane centerline and the object,

WS is the aircraft wingspan.

c. Using Figure AA-28, enter the wingtip separation and calculate the collision risk.

5. Using the risk level estimated, compare to 1×10^{-7}, the upper probability for risk of major consequences according to the risk matrix used by the FAA.

Section 5—Runway to Taxiway, Taxilane, or Object

The runway/taxiway, runway/taxilane, or runway/object separation has two scenarios: takeoff and landing. For landing operations, the analysis is divided into two parts: airborne (approach) phase and ground (landing rollout) phase. For takeoff operations, the analysis considers only the ground (takeoff roll) phase. In most cases, the runways are used for both landing and takeoff operations, and the analysis for takeoff operations will not be necessary because the risk of major lateral deviations during takeoff is lower than the risk during landing.

The airborne collision risk during the approach for landing is characterized using the FAA/ICAO CRM. A series of plots, one for each ADG, was developed to facilitate the use of this methodology.

For the landing ground roll phase, risk plots were derived based on a two-part model: frequency and location. Each plot integrates historical runway veer-off accident/incident rates with veer-off location models to simplify the use of this methodology. Given that the aircraft veered off the runway, the chance that the aircraft deviates more than a certain distance from the runway edge is given by the location model.

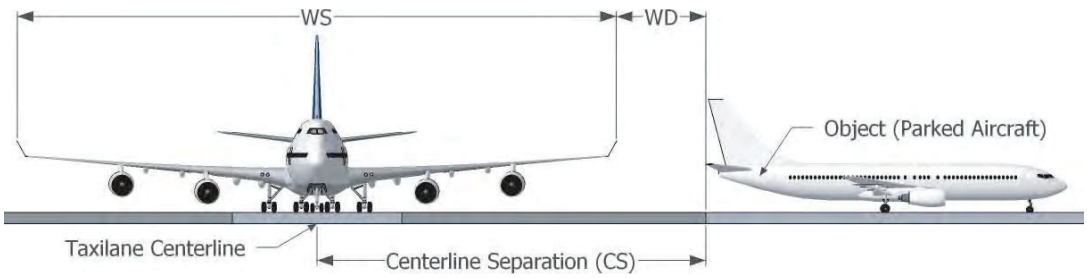

Figure A-9. Example of taxiway/object separation analysis for specific aircraft.

Table A-5. Average probability of occurrence by type of incident (U.S. data—1982 to 2009).

Type of Incident	Probability
Landing veer-off (LDVO)	1 per 837,002 landings
Takeoff veer-off (TOVO)	1 per 3,860,665 takeoffs

The combination of the frequency and location models will provide the probability that an aircraft will veer off the runway *and* deviate more than a given distance from the runway edge.

Table A-5 provides the average incident rates for landing and takeoff veer-offs.

It is also possible to use an alternative approach that may be more accurate but will require intensive calculations and the need to use an electronic spreadsheet or computer software. Details of the second approach can be found in the attachment to this appendix.

Subsection 5.1—Landing

For landing, it is necessary to estimate two types of risk: the risk of collision during the approach phase before the touchdown and the risk of collision during the ground phase in case the aircraft veers off the runway during the landing rollout. These two risks may be combined to provide the total risk. The veer-off risk is estimated for every landing operation, whereas the airborne risk is computed only for missed approaches under instrument conditions, which are assumed to be the worst scenario.

For the airborne phase, because this analysis is intended to evaluate the risk of collision between the approaching aircraft and an aircraft located in a parallel taxiway or an object, the analysis will focus only on the area within the immediate vicinity of the runway threshold and touchdown zone.

The basis for the analysis is the FAA/ICAO CRM and ranges of –300, 0, 750, 1,500, 3,000, and 4,500 ft along the runway, which were evaluated to develop the curves presented in Figures AA-29 to AA-34. The range corresponding to the negative number represents a distance before the runway end for an approaching aircraft, and positive values are for distances after the runway arrival end.

The plots provide the highest probability of collision during missed approaches under instrument (Cat I or Cat II) conditions. Although the CRM was developed in the 1970s and the FAA has made modifications to improve these models, the original CRM will serve as a screening tool to lead to further analysis by the FAA if the risk estimated is within a feasible range for additional analysis. The runs were made with obstacles located at various distances from the runway centerline and along the runway length.

The following steps apply to the estimation of risk during landings:

1. Calculate the risk during the airborne phase.
2. Calculate the risk during the landing rollout phase.
3. Calculate the total risk during landing.

Each of these steps is explained below.

5.1.1—Risk in Airborne Phase (Landing)

For this phase, the obstacle to the approaching aircraft is assumed to be another aircraft located in any segment of the parallel taxiway. This is a conservative assumption because, in most cases, the obstacle will be an aircraft moving on a parallel taxiway and the obstacle will have a small length compared to the total runway length.

Figure A-10 presents a typical scenario for this type of analysis. The plots are based only on the horizontal separation between the runway and taxiway centerlines, and the vertical separation is already considered in the plots presented in this section.

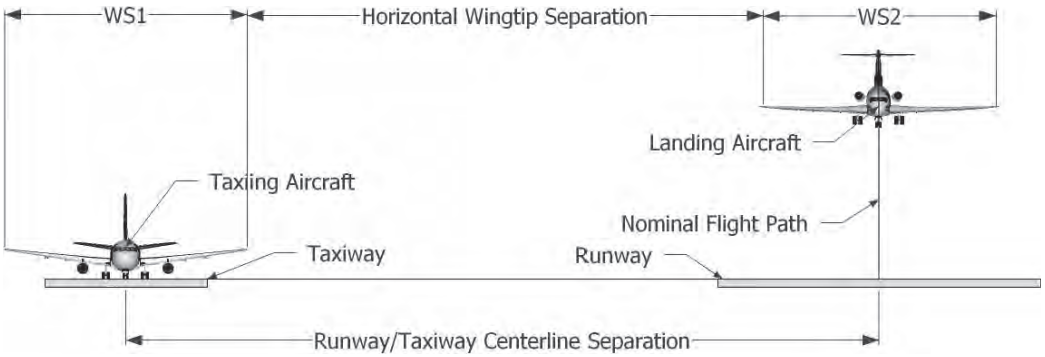

Figure A-10. Example of runway/taxiway separation analysis.

Procedure to Estimate Risk of Collision. The following presents the procedure to estimate risk of collision:

1. Identify the runway and the taxiway (or taxilane or object) centerline separation to be evaluated.
2. Identify the ADG for analysis based on the aircraft with the largest wingspan that will be using both the runway and the taxiway or taxilane.
3. Select the plot for the specific ADG involved and estimate the risk based only on the runway centerline to taxiway centerline separation (see Figures AA-29 to AA-40).
4. Using the risk level estimated, compare to 1×10^{-7}, the lowest probability for risk of severe consequences according to the risk matrix used by the FAA.

5.1.2—Risk in Ground Phase (Landing)

There are two alternatives that may be used to estimate the risk for the ground phase of landing, i.e., during the landing rollout. Alternative 1 is the default analysis and provides a simpler and direct estimate based upon generalized inputs. Alternative 2 provides a more accurate estimate for specific cases but also requires a significant amount of data and computation.

Procedure to Estimate Risk of Collision. The following are the steps to estimate risk for the landing rollout phase. For Alternative 1 (Default):

1. Figures AA-41 to AA-47 represent the risk curves that integrate both the frequency and location models for the specific case.
2. Characterize the separation between the runway centerline and the parallel taxiway, parallel taxilane, or object.
3. Characterize the ADG involved in the analysis.
4. Select the correct plot for the ADG involved in the analysis.
5. Enter the centerline separation to obtain the risk of collision in the plot selected.

For Alternative 2:

1. Obtain 1 year of historical landing operational data and information on weather conditions for the runway.
2. Calculate the frequency of landing veer-offs for the runway by applying the frequency model (see "Event Probability" and Table 7 in Chapter 4).
3. Calculate the probability that the aircraft veers off beyond a given distance:
   a. Obtain the wingtip clearance *WD* between the aircraft landing and the nearest obstacle, as shown in Figures A-11 and A-12, by placing the center of the aircraft landing at the edge of the runway.
   b. Use *WD* and apply the location model (see Table 10) to calculate the probability of a lateral deviation beyond *WD*.
4. Multiply the frequency probability by the location probability and repeat Steps 2 and 3 for each historical landing operation on the runway.
5. Calculate the average value for the probabilities estimated with historical landing data for the runway.

$$WD = CS - RW/2 - (WS1 + WS2)/2 \quad (5)$$

where

WD is the wingtip distance,
CS is the separation between the runway and the taxiway,
RW is the runway width,
*WS*1 is the wingspan for the aircraft taking off, and
*WS*2 is the wingspan for the aircraft in the parallel taxiway.

If the analysis is for a specific ADG, *WD* can be picked up from Table A-6.

Another possibility is the evaluation of separation between the runway and an object. Figure A-12 shows an example using a runway and a service road. In this case, the wingtip separation is calculated using Equation 6:

$$WD = CS - RW/2 - SW/2 - WS/2 \quad (6)$$

where

WD is the wingtip separation,
CS is the separation between the runway and the service road,
RW is the runway width,
SW is the width of the service road, and
WS is the wingspan of the aircraft.

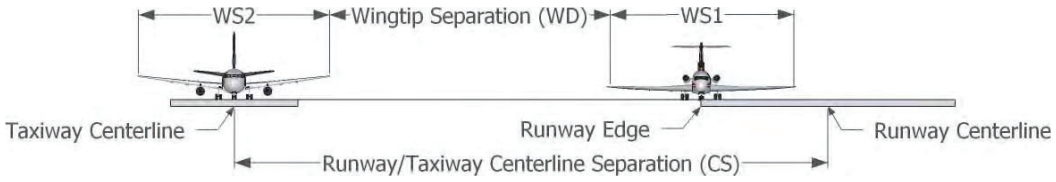

Figure A-11. Typical runway/taxiway scenario for runway veer-off incidents.

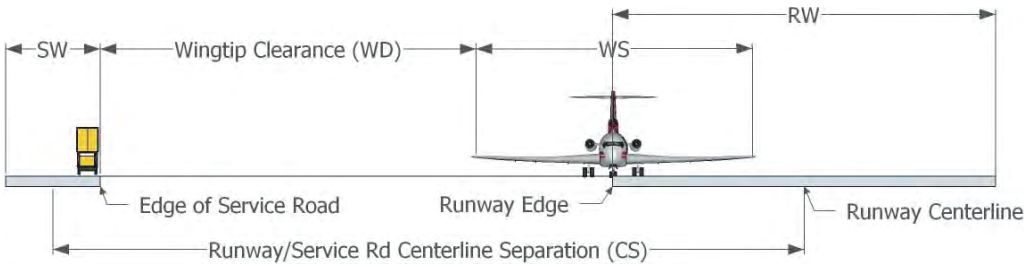

Figure A-12. Typical runway/object scenario for runway veer-off incidents.

The frequency and location models for veer-off are presented in Tables 7 and 10.

Subsection 5.2—Takeoff

For takeoff, the risk is that an aircraft will veer off the runway and strike an obstacle in the vicinity of the runway obstacle free zone (OFZ). In this case, the obstacle is assumed to be an aircraft or another object (fixed or movable) that is closest to the runway centerline. This is a conservative assumption because an aircraft may not be present in the parallel taxiway, and the obstacle has a small length compared to the total runway length.

Analysis for takeoff is only applicable to runways with departure operations only. This is because when the runway is used for both landing and takeoff, the highest risk condition is for landing.

Similar to the case for landings, there are two alternatives for estimating the risk of collision. Alternative 1 is the default analysis and is simple and direct, based upon generalized inputs. Alternative 2 provides a more accurate estimate that takes into account specific operation conditions for the airport; however, it requires a significant amount of data and computation.

Procedure to Estimate Risk of Collision. The following are the steps to estimate risk for the takeoff roll phase for Alternative 1 (Default):

Table A-6. Wingtip separation based on largest wingspan in ADG.

ADG	***RW*** ft	***WD*** ft
I	100	CS-99
II	100	CS-129
III	100	CS-168
IV	150	CS-246
V	150	CS-289
VI	200	CS-362

1. Figures AA-48 to AA-54 represent the risk curves that integrate both the frequency and location models for the specific case.
2. Characterize the separation between the runway centerline and the parallel taxiway, parallel taxilane, or object.
3. Characterize the ADG involved in the analysis.
4. Select the correct plot for the ADG involved in the analysis.
5. Enter the centerline separation to obtain the risk of collision in the plot selected.

For Alternative 2:

1. Obtain 1 year of historical takeoff operational data and information on weather conditions for the runway.
2. Calculate the frequency of takeoff veer-off for the runway by applying the frequency model (see "Event Probability" and Table 7 in Chapter 4).
3. Calculate the probability that the aircraft veers off beyond a given distance:
   a. Obtain the wingtip clearance *WD* between the aircraft taking off and the nearest obstacle, as shown in Figures A-11 and A-12, by placing the center of the aircraft landing at the edge of the runway.
   b. Use *WD* and apply the location model (see Table 10) to calculate the probability of a lateral deviation beyond *WD*.
4. Multiply the frequency probability by the location probability and repeat Steps 2 and 3 for each historical takeoff operation on the runway.
5. Calculate the average value for the probabilities estimated with historical takeoff data for the runway.

Example 3—Runway/Taxiway Separation

In this example, an ADG II airport wants to bring regular flights of ERJ-170 aircraft. The runway is 150 ft wide and has a Cat I instrument landing system (ILS). The wingspan of an ERJ-170 is 85.3 ft, and it is classified in ADG III. The existing separation between the runway and the parallel taxiway centerlines is 320 ft; however, the standard for

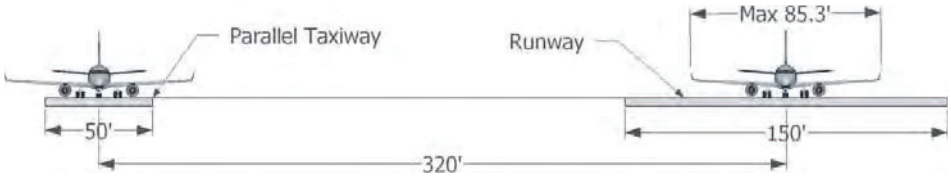

Figure A-13. Example of Runway/Taxiway Separation.

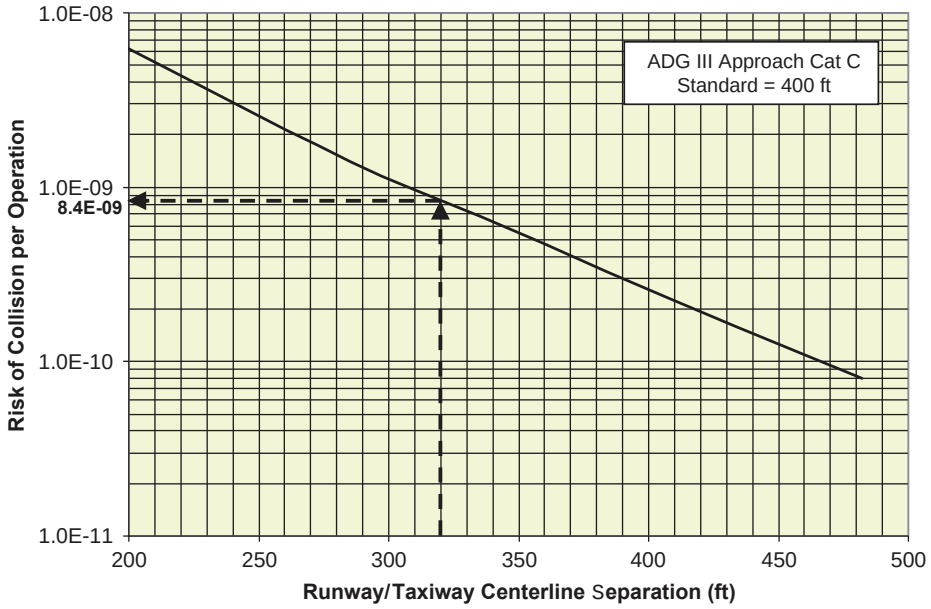

Figure A-14. Estimating airborne risk of runway/taxiway separation (ADG III–CAT I).

ADG III aircraft is 400 ft. The scenario is illustrated in Figure A-13.

The analysis involves a two-step process. In the first step, it is necessary to evaluate the risk during the airborne phase, and, in the second step, it is necessary to estimate the risk for aircraft veer-off during the landing roll.

The risk of collision for ADG III Cat I during the airborne phase of landing is estimated using Figure AA-33. The runway/taxiway centerline separation for the case is 320 ft, and the risk of collision is 8.4E-9 (see Figure A-14), or one chance in 119 million landings. This level is considered acceptable according to the FAA risk matrix.

The final step is to estimate risk of collision in case the aircraft veers off the runway. Figure AA-43 is used for ADG III aircraft, and the separation of 320 ft is entered to estimate the risk of collision of 9.0E-08 (or one chance in 11.1 million landings). As this risk is lower than 1.E-07, it may be acceptable to the FAA.

ATTACHMENT—RISK PLOTS

This attachment contains several plots that should be used with the methodology described in Appendix A.

The input parameter is always the centerline separation or the wingtip clearance in feet. The output of these plots is the risk of collision. The scale for the risk values is logarithmic. When the analysis involves one specific ADG, the centerline separation should be entered. In an example plot (see Exhibit AA-1), a text box contains the current FAA standard separation for the specific scenario.

Exhibit AA-1 also illustrates the use of these plots. To estimate the risk of collision when the centerline separation of two parallel taxiways used by aircraft in ADG I is 65 ft, use the plot shown in Figure AA-1 to enter the centerline separation and move vertically until crossing the curve. Then move horizontally to read the risk of collision—in this example, it is approximately 9.0E-07, or 9 events in 10,000,000 operations. The procedure is illustrated in Exhibit AA-1.

APPENDIX G

Summary of FAA/Boeing Taxiway Deviation Studies

Appendix G of the contractor's final report is not published herein, but is available on the TRB website at http://www.trb.org/Main/Blurbs/165180.aspx.

APPENDIX H

Analysis of MOS Cases

This section summarizes the information collected in the MOS survey and presents results for application of the methodology described in Appendix A to each MOS case. Table H-1 shows the airports included in the MOS survey.

Table 1 Airports included in MO sur ey

ase #	Airport	ID	NPIA	MO Type	FAA Re ion
1	Philadelphia, PA	PHL	LH	TWY/TWY	AEA
2	Anchorage, A	ANC	MH	TWY /OBJ	AAL
3	Addison, TX	ADS	RL	RWY/TWY	ASW
4	Bridgeport, CT	BDR	GA	RWY/TWY	ANE
5	Accomack, VA	MFV	GA	RWY/OBJ	AEA
6	Lincoln Park, NJ	N07	RL	TLN /OBJ	AEA
7	New York JF , NY	JF	LH	TWY/TWY	AEA
8	Newark, NJ	EWR	LH	TWY/TWY*	AEA

19	Leesburg, VA	JYO	RL	RWY/OBJ	AEA
20	Taunton, MA	TAN	GA	RWY/TWY	ANE

Table H-2 summarizes the cases by type of MOS; the majority of the cases were MOS for runway/taxiway separation and taxiway/taxiway separation.

Table 2 Number of cases for eac MO type

MO Type	Airport	Number of ases
Runway/Taxiway	ADS, ASE, BDR, HYA, LCI, SEA, TAN	7
Taxiway/Taxiway	AC , EWR, JF , MSP, ORD, PHL	6
Runway/Object	JYO, MFV	2
Taxiway/Taxilane	SEA	1
Taxiway/Object	ANC, ILG, N07, ORD	4
	Total	20

Table H-3 summarizes the cases by type of justification used to approve the MOS by the FAA, and Table H-4 presents a summary of the restrictions imposed due to the MOS.

Table ustifications used to obtain MO appro al

MO ustification	Run ay Ta i ay	Ta i ay Ta i ay	Run ay Object	Ta i ay Ta ilane	Ta i ay Object	Total
Advisory Circular acceptable level of safety	2	3	1	1	2	9
Airport facilities capacity	2	2	1	1	2	8
Communications					1	1
Delays/Congestion		2				2
Economic constraints	2		1	1	1	5
Environmental constraints	2		1		1	4
Operations capacity		3	1	1		5
Prior ADG standards compliance	2				1	3
Physical constraints	5	4	1	1	2	13
Runway/Taxiway separation		1				1
Security					1	1

Each MOS may have more than one justification

Table Number of cases for eac MO restriction by MO type

MO Restriction	Run ay Ta i ay	Ta i ay Ta i ay	Run ay Object	Ta i ay Ta ilane	Ta i ay Object	Total
Aircraft exit angle			1			1
Aircraft speed				1		1

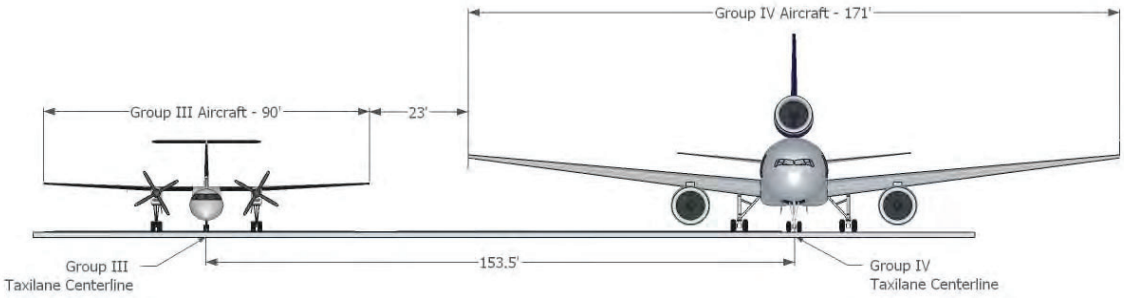
Construction requirements	1					1
Dedicated facility use	1	3				4
Exemption/order terms		1			2	3
Markings and lighting	1	1	1	1	1	5
Operations time of day		1				1
Simultaneous facility operations		1				1
Vehicle type/ dimensions					1	1

Each MOS may have more than one restriction



The methodology was applied to each of the 20 MOS cases, and the following sections provide a summary of the issues involved, as well as characterization of the airfield separations. For each case, the methodology developed in this study was applied, and a summary of results is presented.

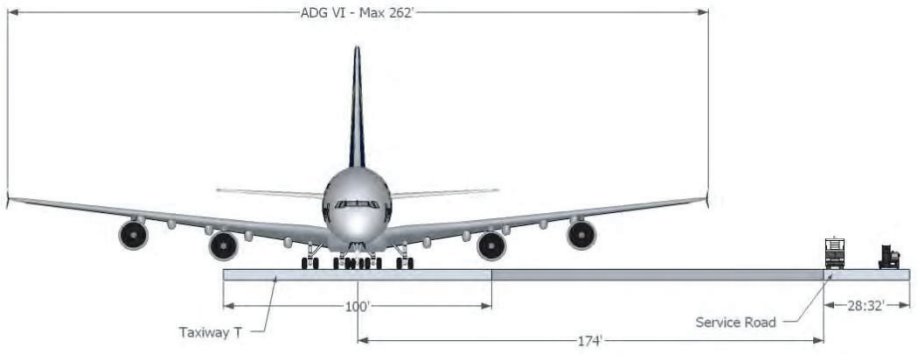
Case Study #1 - Philadelphia International Airport (PHL)

MO Issue	Taxilane/Taxilane	Appro al Date	6/7/1999
eparations	OFA	Centerline	Wingtip
Standard	423 ft	198 ft	27
Existing	330 ft	153.5 ft	23

Airport Ref ode	C-III and C-IV	
ritical Aircraft	Aircraft 1	Aircraft 2
Model	Dash 8-300	Boeing 767
ADG	III	IV
Wingspan	90	171

ynopsis	One of the parallel taxilanes would be designed to serve only Terminal F (Group III aircraft) while the other taxilane would be designed to serve both Terminals E and F (Group III and IV aircraft). Proposed OFA separation distance is 330 ft.
Restrictions	Use of southernmost taxilane is permitted to Group IV (Boeing B-767) or Group III (Dash 8-300) aircraft. Use of northernmost taxilane is limited to Group III aircraft (Dash 8-300).
ustification	Handle the high traffic volume, minimize delays. Adequate clearance when the northernmost taxilane is limited to commuter aircraft no larger than 90 ft wingspan. Restrict the use of the taxilane to aircraft with wingspans up to 90 ft.
Accidents Incidents	13 accidents and incidents were identified between 1982 and 2009.

Application of Met odolo y



Risk Plot	Figure AA-21	Wingtip Sep	23
Severity	Major	Risk Level	1.0E-09
Conclusion	Low Risk	Acceptable	

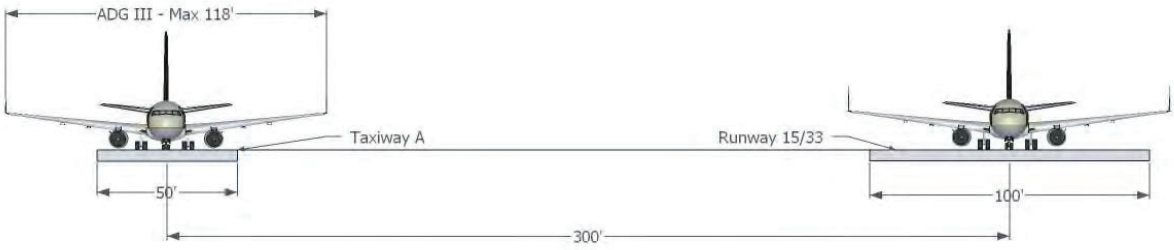
Case Study # 2 - Ted Stevens Anchorage International Airport (ANC)

MO Issue	Taxiway/Object	Appro al Date	6/14/2004
eparations	OFA	Centerline	Wingtip
Standard	193 ft	193 ft	62 ft
Existing	174 ft	174 ft	43 ft

Airport Ref ode	D-VI	
ritical Aircraft	Aircraft 1	Aircraft 2
Model	A-380-800	N/A
ADG	VI	
Wingspan	262	

ynopsis	With the introduction of ADG VI (i.e., Airbus 380-800) to the airport operations, ANC proposed to reconstruct Taxiway R and widen it to 100 ft to meet the new ADG requirements. The projected taxiway width left an available taxiway OFA of 174 ft between the centerline of Taxiway R and the tug road vs. the required 193 ft OFA centerline separation based on AC 150/5300-13, Chapter 4, Table 4-1.
Restrictions	Maintain Airbus A388 characteristics as most demanding aircraft. Handle the tug road as an operational item with Antonov 124 aircraft operations.
ustification	Limited space availability; Cost efficiency; Security of airport operations area; Limited communication ability with tug operators; Maintain current level of cargo aircraft parking capacity. Airport already accommodates ADG VI on the existing runways and taxiways.
onditions for Appro al	Tugs and vehicles operating on tug road between Taxiways and T are limited to maximum height of 14 ft. Commuter simulation indicates jet blast from A388 on tug road should not be a problem. If drivers report jet blast related problems, airport authority must submit a proposed mitigation plan.
Accidents Incidents	Nine accidents and incidents were identified between 1982 and 2009.

Application of Met odolo y



Risk Plot	AA-13	Centerline Sep	174 ft
Severity	Major	Risk Level	1.0E-09
Conclusion	Low Risk	Acceptable	

Case Study # 3 - Addison Airport (ADS)

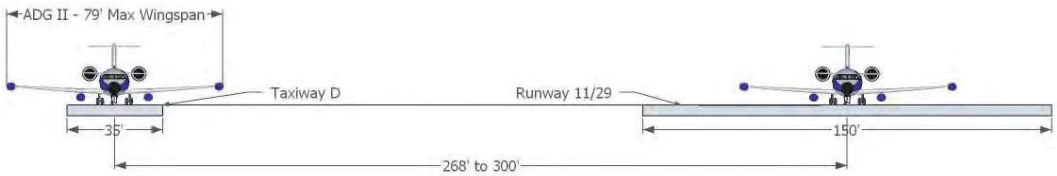
MO Issue	Runway/Taxiway	Appro al Date	11/18/2008
eparations	OFA	Centerline	Wingtip
Standard		400 ft	282 ft
Existing		300 ft	182 ft

Airport Ref ode	C-III	
ritical Aircraft	Aircraft 1	Aircraft 2
Model	B-737	B-737
ADG	III	III
Wingspan	118	118

ynopsis	The existing separation between Runway 15/33 and parallel Taxiway A is 300 ft, less than the required 400 ft as established in AC 150/5300-13, Chapter 2, Table 2-2 for the airport s ADG III using approach categories C and D. Relocating the parallel taxiway or the runway were not feasible options due to the limited area available to the airport for further development.
Restrictions	Maintain B-737 characteristics as most demanding aircraft.
ustification	Limited area available for relocating either Runway 15/33 or the parallel taxiway due to existing road and industrial developments. Airport safety will not be impeded by the proposed modification to the runway/taxiway separation.
onditions for Appro al	None specified
Accidents Incidents	Two accidents and incidents were identified between 1982 and 2009.

D

Application of Met odolo y



Risk Plot	AA-33 and AA-43	Centerline Sep	300 ft
Severity	Catastrophic	Risk Level Airborne	1.1E-9
		Risk Level Ground	1.0E-7
Annual Vol. Operations	133,600	Expected Years	> 140 years
Conclusion	Medium Risk	Mitigation Recommended	

Case Study # 4 - Igor I. Sikorsky Memorial Airport (BDR)

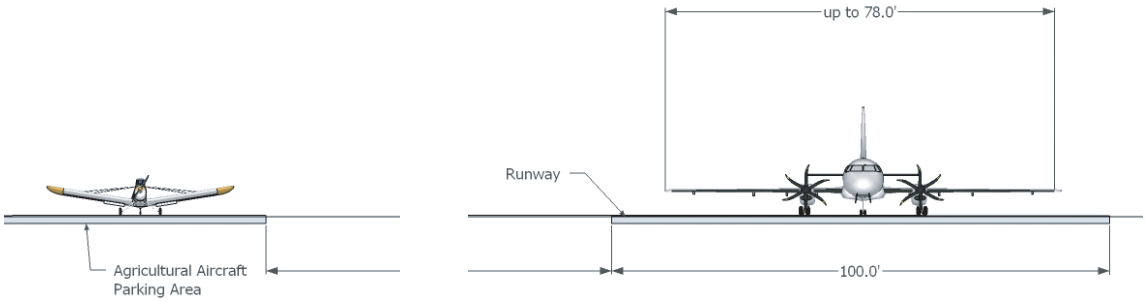
MO Issue	Runway/Taxiway	Appro al Date	8/04/2003
eparations	OFA	Centerline	Wingtip
Standard		300 ft	221
Existing		268–300 ft (variable)	189–221 ft

Airport Ref ode	C-II	
ritical Aircraft	Aircraft 1	Aircraft 2
Model		
ADG	II	II
Wingspan	Max 79 ft	Max 79 ft

ynopsis	The required separation between runway and taxiway at BDR is specified as 300 ft based on AC 150/5300-13, Chapter 2, Table 2-2. Locating the centerline of 35-ft-wide Taxiway D at the required distance through its length would position the end of the taxiway (i.e., toward the approach end of Runway 11) in a tidal ditch. To avoid the ditch incursion, the taxiway centerline needed to gradually decrease from the required 300 ft to 268 ft. Based on the wingspan dimension of the critical aircraft, it was determined that adequate clearance would remain between the end of Taxiway D and the runway Obstacle Free one (OF). In addition, no part of the critical aircraft would go beyond the 200 ft half-width OF limit for Runway 11/29, which is a modified width permitted for ADG II within category C per AC 150/5300-13, Chapter 3, Table 3-3 notes.
Restrictions	Runway Safety Area for aircraft Approach Category C reduced to 200 ft half-width due to ADG II as per Table 3-3 in AC 150/5300-13.
ustification	Space limitation imposed by a deep tidal ditch. Satisfactory clearance of Runway Safety Area by ADG aircraft.
onditions for Appro al	Location of taxiway holding position at 250 ft from runway centerline.
Accidents Incidents	Two accidents and incidents were identified between 1982 and 2009.

DR

Application of Met odolo y



Risk Plot	Plots AA-31 and AA-42	Centerline Sep	268 ft
Severity	Catastrophic	Risk Level Airborne	1.1E-10
		Risk Level Ground	1.1E-7
Annual Vol. Operations	64,000	Expected Years	> 100 years
Conclusion	Medium Risk	Mitigation Recommended	

Case Study # 5 - Accomack County Airport (MFV)

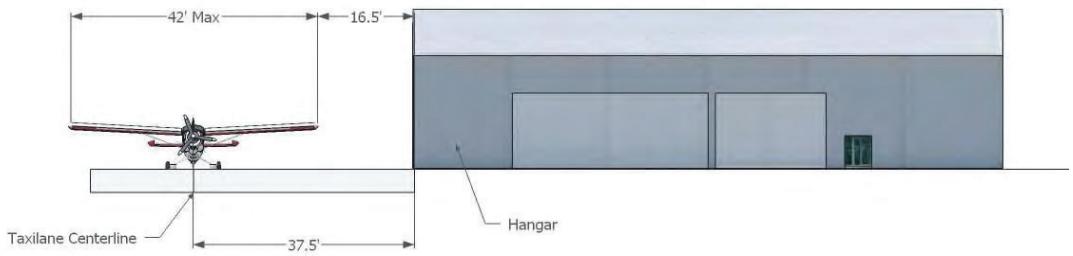
MO Issue	Runway/Object	Appro al Date	12/15/1992
eparations	OFA	Centerline	Wingtip
Standard	400 ft		
Existing	360 ft		

Airport Ref ode	C-II	
ritical Aircraft	Aircraft 1	Aircraft 2
Model		
ADG	II	Parked aircraft
Wingspan	Max 79 ft	Max 79 ft

ynopsis	The aircraft parking area and agricultural storage shed located near the existing terminal building had a separation distance to the runway of 360 and 400 ft, respectively. Based on AC 150/5300-13, Chapter 2, Table 2-2, the standard required runway OFA for a C-II design aircraft is 400 ft, larger than the existing separation of 360 ft between the runway and the parking area.
Restrictions	Maintain type C-II as most demanding aircraft.
ustification	Maintaining aircraft parking and keeping agricultural storage shed facilities operational. Adequate clearance when compared to the available distance between the runway and the terminal building of 360 ft.
onditions for Appro al	None specified
Accidents Incidents	No accidents and incidents were identified between 1982 and 2009.

Application of Met odolo y

Risk Plot	Plots AA-31 and AA-42	Centerline Sep	360 ft
Severity	Catastrophic	Risk Level Airborne	1.0E-09
		Risk Level Ground	5.9E-08
Annual Vol. Operations	13,870	Expected Years	> 100 years
Conclusion	Medium Risk	Mitigation Recommended	



Case Study # 6 - Lincoln Park Airport (N07)

MO Issue	Taxilane/Object	Appro al Date	4/26/2007
eparations	OFA	Centerline	Wingtip
Standard	79 ft		
Existing	75 ft		

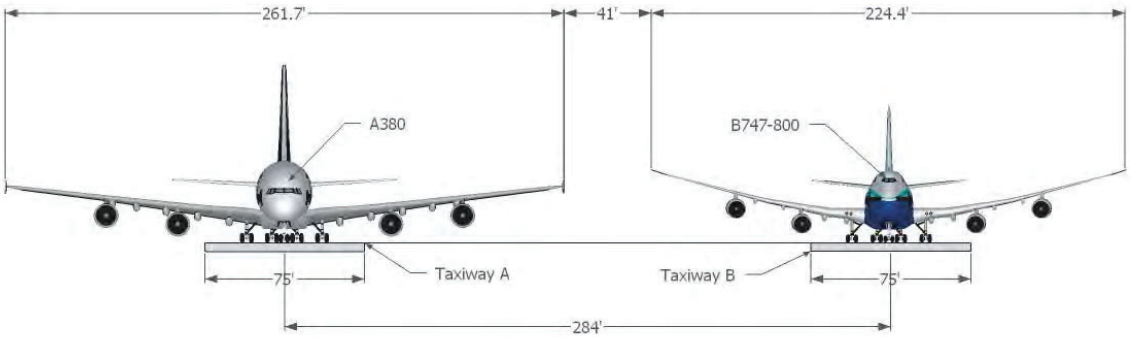
Airport Ref ode	D-VI	
ritical Aircraft	Aircraft 1	Aircraft 2
Model	Cessna 414 Chancellor	N/A
ADG	B-I	
Wingspan	41 ft	

ynopsis	The construction of four T-hangar units near the approach end of Runway 19 reduced the taxilane OFA to 75 ft versus the required distance of 79 ft. The location of the T-hangars was constrained by the Riparian Corridor of Middle Ditch, wetlands, and Part 77 surfaces. The proposed location of the hangars was the only place that met those constraints.
Restrictions	Taxiway and hangars should only be used by aircraft with a maximum wingspan of 42 ft.
ustification	Hangars location within the Passaic River Basin and constrained by the Riparian Corridor of Middle Ditch, wetlands, and Part 77 surfaces. Satisfactory OFA clearance when aircraft with wingspan up to 42 ft long travels on the taxilane based on the modified equation found in AC 150/5300-13, Chapter 4, at the bottom of Table 4-1 (1.2 wingspan + 20 ft).

onditions for	Restrict use of taxiway to aircraft with wingspan no greater than 42 ft.
Appro al	
Accidents Incidents	No accidents and incidents were identified between 1982 and 2009.

Application of Met odolo y

Risk Plot	Figure AA-28	Wingtip Sep	16.5 ft
Severity	Major	Risk Level	1.2E-09
Conclusion	Low Risk	Acceptable	



Case Study # 7 - John F. Kennedy International Airport (JFK)

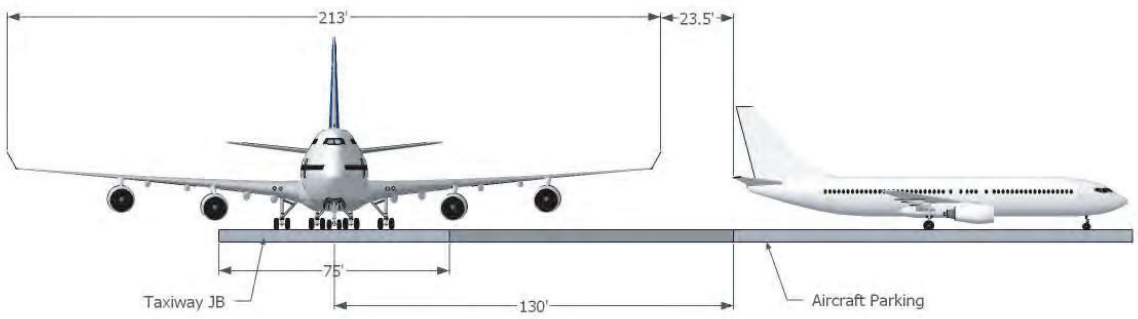
MO Issue	Taxiway/ Taxiway	Appro al Date	3/18/2008 (submitted)
eparations	OFA	Centerline	Wingtip
Standard		324 ft	
Existing		284–300 ft	

Airport Ref ode	D-VI	
ritical Aircraft	Aircraft 1	Aircraft 2
Model	B747-800	B747-800
ADG	VI	VI
Wingspan	224	224

ynopsis	Based on AC 150/5300-13, Chapter 2, Table 2-3, the required taxiway to taxiway centerline separation to accommodate a Boeing B747-8 (i.e., ADG VI) at JF is 324 ft. However, the separations between some taxiways at JF do not comply with the standards. The separation between Taxiways A and B is 284 ft, with the exception of a bridge section in which the separation is 250 ft. The separation between Taxiways P and , R and S, and CE and W is 300 ft. Physical space limitations at JF make it impossible to move the existing runways and/or taxiways to obtain the standard clearances. The option of relocating runways/taxiways would have reduced the runway to taxiway separation or reduced available ramp space, which in turn would have increased ramp congestion and ultimately affected the number of available gate positions.

Restrictions	Restrict simultaneous aircraft operation involving B747-800 aircraft on the bridge section of Taxiways A and B (i.e., bridge crossing the Van Wyck Expressway). Aircraft traveling north should hold on the intersection NA and aircraft traveling south will hold on the intersection with Taxiway NB. Restrict simultaneous aircraft operation involving B747-800 aircraft on Taxiways CA and CB, which separation is also 250 ft.
ustification	Limited space availability. Maintain current level of service without increasing ramp congestion or reducing the available ramp space. Based on the analysis titled *Statistical Extreme Value Analysis Concerning Risk of Wingtip of Fixed Object Collision for Taxiing Large Aircraft*, the 95% confidence interval risk of wingtip collision at JF between an Airbus A-380 and a Boeing B-747-800 on adjacent taxiways with a separation of 267 ft is as low as one in 1 billion. The existing separation between taxiways exceeds 267 ft, with the exception of a bridge section on Taxiways A and B, which separation is 250 ft. The calculated wingtip separation between an Airbus A-380 and a Boeing B747-800 traveling simultaneously on Taxiways A and B was 40 ft, which is greater than the standard taxilane wingtip requirement of 34 ft. Considering the case when the aircraft did not track the taxiway centerlines while taxiing, the wingtip separation was still greater than 10 ft.
Accidents Incidents	15 accidents and incidents were identified between 1982 and 2009.

Application of Met odolo y



Risk Plot	AA-7	Wingtip Sep	41 ft
Severity	Major	Risk Level	1.0E-09
Conclusion	Low Risk	Acceptable	

Case Study # 8 - Newark Liberty International Airport (EWR)

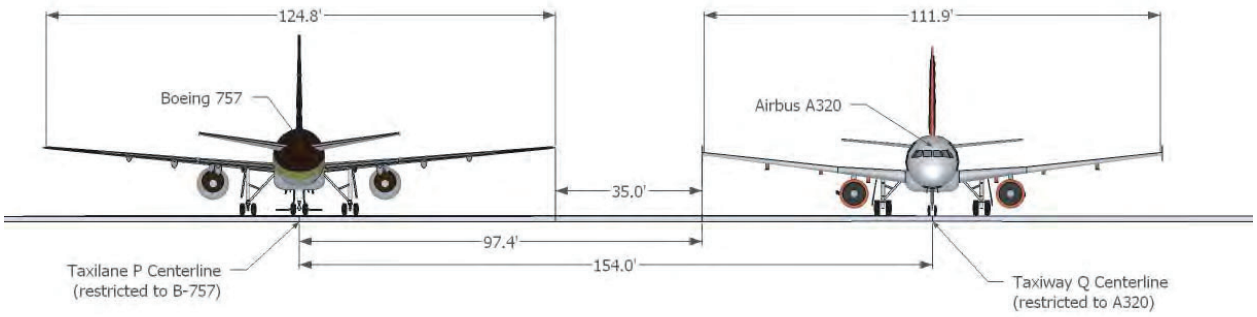
MO Issue	Taxiway/ Taxiway	Appro al Date	7/28/1995
eparations	OFA	Taxiway/Taxiway	Taxiway/Object
Standard	276 ft	267 ft	138 ft
Existing	260 ft	220 ft	130 ft

Airport Ref ode	D-V	
ritical Aircraft	Aircraft 1	Aircraft 2
Model	B747-400ER	Any
ADG	V	Parked aircraft
Wingspan	213	Any

ynopsis	The FAA standard taxilane OFA width for ADG V is 276 ft. Chapter 2, Table 2-3, of AC 150/5300-13 allows for a modified taxilane centerline to fixed or movable object of 0.6 wingspan + 10 ft which equals 138 ft while the existing separation is as shown in Figure H-8.
Restrictions	Taxiway S use is restricted to B-727 aircraft. This will increase the existing separation of 220 ft to 273 ft (220 + 214/2 −108/2). 273 ft of taxiway separation exceeds the standard requirements. Restrict operations on Taxiway S to B-727 Group III aircraft.
ustification	Based on the modified equation found in AC 150/5300-13, Chapter 2, at the bottom of Table 2-3 (0.6 wingspan + 10 ft), taxiway OFA of 130 ft provided clearance of more than 10 ft from the airplane wingtip to the parked aircraft. Taxiway S restriction allowed for enough clearance between the two taxiways when the largest aircraft expected to travel on Taxiway JB and the largest aircraft allowed in Taxiway S traveled side-to-side.

WR

Application of Met odolo y



Risk Plot	AA-26 (TLN/OBJ) AA-7 (TWY/TWY)	Wingtip Sep	130 ft (TLN/OBJ) 23.5 ft (TWY/TWY)
Severity	Major	Risk Level	1.0E-09 1.0E-09
Conclusion	Low Risk	Acceptable	

Case Study # 9 - Minneapolis- St. Paul International Airport (MSP)

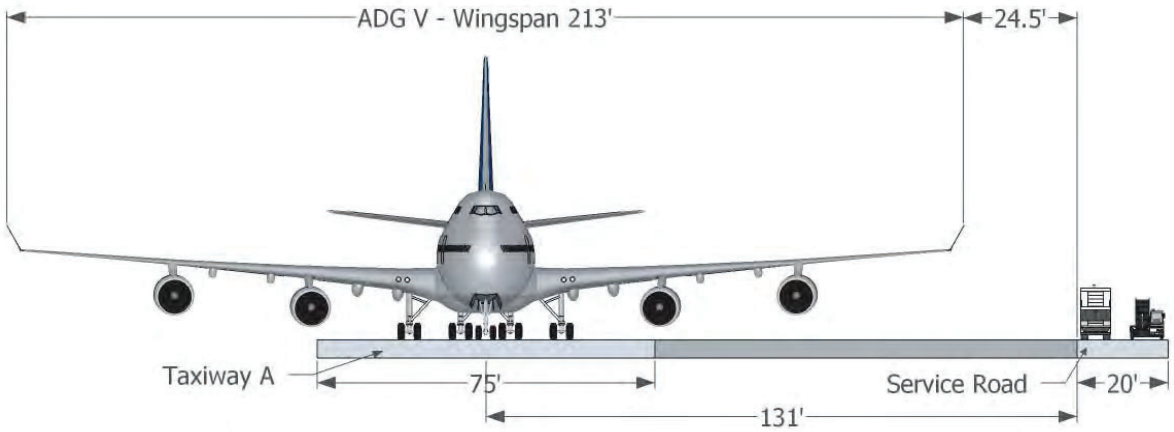
MO Issue	Taxiway/ Taxiway	Appro al Date	3/6/2006
eparations	OFA	Centerline	Wingtip
Standard		215 ft	
Existing		154 ft	35 ft

Airport Ref ode	C-IV	
ritical Aircraft	Aircraft 1	Aircraft 2
Model	B757-300	B757-300
ADG	IV	IV
Wingspan	125 ft	125 ft

ynopsis	In order to accommodate push-backs from Concourse B and for the aircraft to remain in the non-movement area without blocking Taxiway , a relocation/realignment of Taxiway was required. The proposed MOS was to relocate a portion of Taxiway between P2 and P3, moving it closer to Taxiway P. In order to maintain an acceptable level of safety on the parallel taxiways, the use of the reduced separation segment of Taxiway P was restricted to aircraft with wingspan no larger than 124.8 ft (B-757 size aircraft), and the use of the reduced separation segment of Taxiway was limited to aircraft with wingspans no larger than 111.9 ft (A-320 size aircraft).
Restrictions	Use of Taxiway P between P2 and P3 limited to aircraft with maximum wingspan of 124.8 ft. Use of Taxiway between P2 and P3 limited to aircraft with maximum wingspan of 111.9 ft. Operational restrictions on Taxiways P and to aircraft with wingspan no larger than 124.8 ft and 111.9 ft, respectively. Pavement marking changes to the 30R deicing pad renumbering circle 99 to circle 95. Adjustment to the deicing pad route to allow for a Mesaba staging area and facilitate the regional aircraft operations Concourses A and B. Reduce the painted Taxiway width from 75 ft to 50 ft on the affected segment of the taxiway to ensure object clearance. Change in the current Airport Layout Plan to reflect the changes to the taxiways and operational restrictions. Make regional airlines aware of jet blast issues posed by the proposed Mesaba staging area near the deicing pad. During special circumstances, when aircraft larger than 124.8 ft need to use Runway 12L/30R, parking on the east end of Taxiway P should only be granted if Taxiway is not in use.
ustification	Limited space availability to relocate Taxiway P. The taxiway OFA provides an acceptable level of safety based on the modified equations provided in AC 150/5300-13 below Table 2-3 and Table 4-1. Wingtip clearance of aircraft on both taxiways is acceptable when the aircraft main gear wheels remain entirely within the boundaries of the taxiway.

Application of Met odolo y

Risk Plot	AA-7	Wingtip Sep	35 ft
Severity	Major	Risk Level	1.0E-09
Conclusion	Low Risk	Acceptable	



Case Study # 10 - Chicago O'Hare International Airport (ORD)

MO Issue	Taxiway/Object	Appro al Date	9/30/2005
eparations	OFA	Centerline	Wingtip
Standard	160 ft		
Existing	131 ft		

Airport Ref ode	D-V	
ritical Aircraft	Aircraft 1	Aircraft 2
Model	B747-400	N/A
ADG	V	
Wingspan	213	

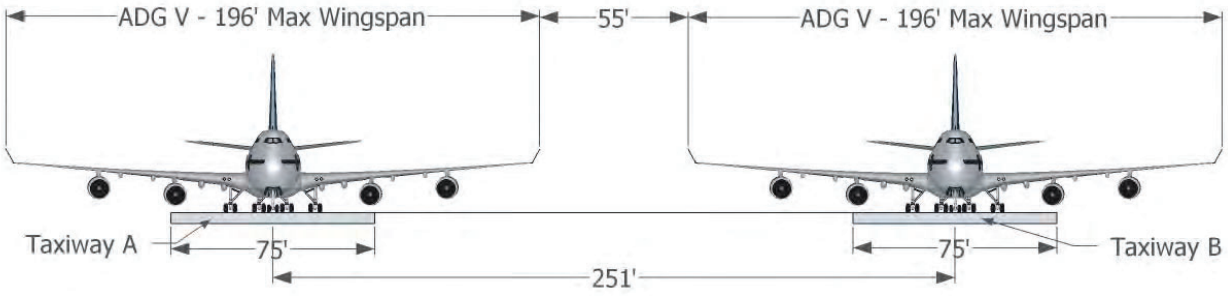
ynopsis	The existing separation between Taxiway A and the terminal core service road that is located next to Concourses C, E, F, G, and H is 131 ft, while the required taxiway object OFA is 160 ft. At the time the taxiway and terminal were built, the 131-ft OFA complied with ADG V standards. However, these standards have been revised, and AC 150/5300-13, Chapter 2, Table 2-3, now mandates a larger OFA of 160 ft. An MOS was requested to keep the existing taxiway/object separation while subjecting the ADG V operations. Safety was maintained by placing certain operational restrictions on the use of Taxiway A.
Restrictions	Use of Taxiwav A bv ADG V aircraft should be in accordance with the conditions for MOS approval.
ustification	Existing taxiway to object separation was based on ADG V standards at the time of the taxiway and terminal development.

onditions for Appro al	Taxiway A should contain green colored bi-directional centerline lights. Taxiway A centerline lights must be operational during A330, A340, B747-400, MD11, and B777 aircraft operations. Maintain, monitor, and enforce the aircraft parking limit line among all tenants and ground personnel.

RD

Application of Met odolo y

Risk Plot	AA-12	Centerline Sep	131 ft
Severity	Major	Risk Level	3.2E-10
Conclusion	Low Risk	Acceptable	



Case Study # 11 - Chicago O'Hare International Airport (ORD)

MO Issue	Taxiway/Taxiway	Appro al Date	9/30/2005
eparations	OFA	Centerline	Wingtip
Standard		267 ft	
Existing		251 ft	

Airport Ref ode	D-V	
ritical Aircraft	Aircraft 1	Aircraft 2
Model	B747-400	B747-400
ADG	V	V
Wingspan	196	196

ynopsis	The existing separation between Taxiways A and B is 251 ft, while the required separation is 267 ft. At the time the taxiways were built, 251 ft complied with the FAA design criteria. However, the standards have been revised and now AC 150/5300-13, Chapter 2, Table 2-3 mandates a larger separation of 267 ft. Operations on Taxiways A and B at ORD are managed by FAA Air Traffic Order ORD 7110.65C with an adequate level of safety. Therefore, after

	evaluating other alternative solutions to the separation between Taxiways A and B, an MOS was requested to keep the existing separation while following the mentioned Air Traffic Order operation restrictions.
Restrictions	In accordance with FAA Air Traffic Order ORD 7110.65C, no simultaneous taxi operations on Taxiways A and B are allowed for B747-400, B777-300, and A340-600 aircraft, and no aircraft is allowed to stop on the Taxiway A or Taxiway B bridges.
ustification	Existing parallel taxiway centerline separation was consistent with the FAA design standards at the time of the taxiways construction. A separation of 251 ft is acceptable subject to the operation restrictions contained in FAA Air Traffic Order ORD 7110.65C.
onditions for Appro al	Taxiway A should contain green colored bi-directional centerline lights. Taxiway A centerline lights must be operational during A330, A340, B747-400, MD11, and all series of B777 aircraft operations. Maintain and observe the aircraft parking limit line. No simultaneous taxi operations on Taxiways A and B are allowed for B747-400, B777-300, and A340-600 aircraft. No aircraft is allowed to stop on the Taxiway A or Taxiway B bridges.

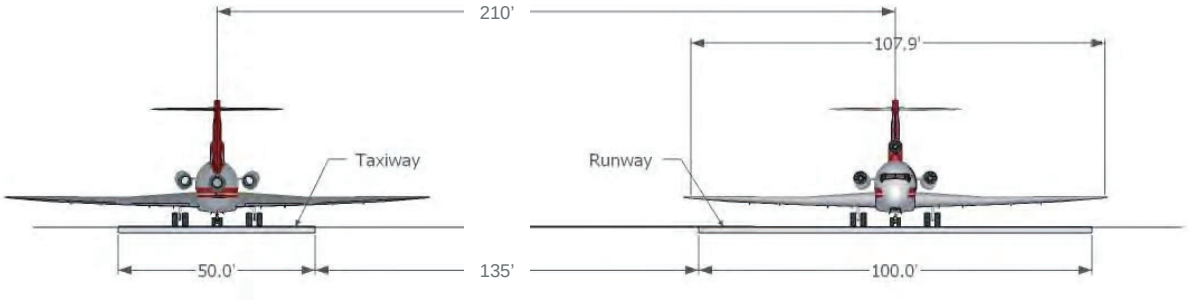
Case Study # 12 - Barnstable Municipal Airport (HYA)

MO Issue	Runway/Taxiway	Appro al Date	8/17/1998
eparations	OFA	Centerline	Wingtip
Standard		400 ft	282 ft
Existing		300 ft	219 ft
Airport Ref ode	B-III		

ritical Aircraft	Aircraft 1	Aircraft 2
Model	ATR-42	ATR-42
ADG	III	III
Wingspan	81	81

ynopsis	The northern section of Taxiway A, a 20-year old taxiway, was scheduled by HYA for rehabilitation. The existing separation between Taxiway A and Runway 15/33 is 300 ft rather than the required 400 ft by AC 150/5300-13, Chapter 2, Table 2-2. The northern section of Taxiway A is 50 ft in width while the southern section of the taxiway has a width of 60 ft. The width of the taxiway is not an issue since the entire taxiway meets or exceeds the minimum required width of 50 ft. Three options were considered and an MOS request was selected. It was determined that enough clearance space would exist between the existing runway safety area (RSA) and the runway Obstacle Free one, which is offset from the centerline of Runway 15/33 by 250 ft and 200 ft, respectively. The clearing between the RSA and the tip of the wing of the critical aircraft in a 50-ft-wide taxiway was calculated to be 9.7 ft.
Restrictions	Maintain ATR-42 characteristics as most demanding aircraft.
ustification	Cost feasibility. Negative impacts to the airport apron/terminal/parking capacity. Acquisition and cleaning of adjacent contaminated land needed for relocation. Airport design aircraft is less demanding than Group C representative aircraft. The RSA and runway OFA are satisfied utilizing the most demanding aircraft (ATR-42).
onditions for Appro al	Maintaining ATR-42 or less demanding design aircraft

Application of Met odolo y



Risk Plot	AA-33 and AA-43	Centerline Sep	
Severity	Catastrophic	Risk Level Airborne	1.1E-09

Annual Vol. Operations	118,000	Expected Years	> 100 years
Conclusion	Medium Risk	Mitigation Recommended	

Case Study # 13 - Laconia Municipal Airport (LCI)

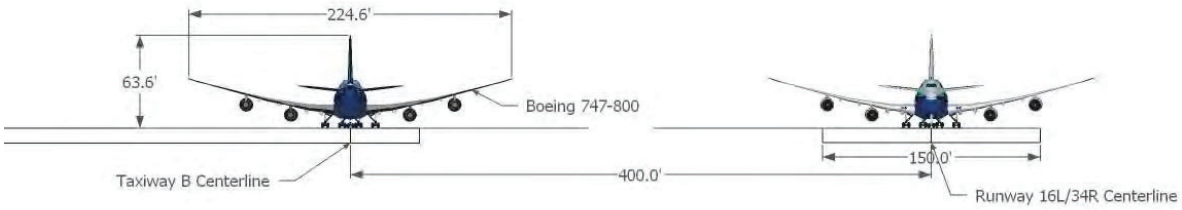
MO Issue	Runway/Taxiway	Appro al Date	4/24/1974
eparations	Runway OFA	Taxiway OFA	Centerline
Standard	500 ft	166 ft	400 ft
Existing	300 ft	110 ft	210 ft

Airport Ref ode	C-III	
ritical Aircraft	Aircraft 1	Aircraft 2
Model	B727-200	B727-200
ADG	III	III
Wingspan	108	108

ynopsis	A taxiway measuring 2,700 ft long and 50 ft wide ran parallel to Runway 7/25 (currently labeled as Runway 8/26). The separation between the runway and the existing taxiway was 210 ft, rather than the required 400 ft by AC 150/5300-13, Chapter 2, Table 2-2. Due to economic constraints, the feasible solution to the separation non-compliance was to request an MOS. After a detailed analysis of several representative aircraft, it was determined that the existing separation provided adequate clearance for two critical aircraft (B727-200) traveling side by side in the taxiway and runway, respectively. Maintaining the existing separation of 210 ft as shown in Figure H-13, the clearing between the wing tips of the two aircraft was calculated to be 123 ft. Although the B-727 was listed as the critical aircraft, that aircraft was not operating at the airport at that time. MOS is predicated upon commuter service type aircraft - Piper Apache or a De Havilland Twin Otter. In 2010, LCI does not have a Part 139 certificate, and it is doubtful that in the future it would have any operations by large aircraft such as B-727.
Restrictions	Airport is certified by the Civil Aeronautics Board (CAB) for seasonal service, which is provided by Delta using a Piper Apache as substitute commuter. Basic transportation criteria 150/5300-6 is considered in lieu of air carrier taxiway standards.
ustification	Cost feasibility - taxiway already existed at time the MOS was constructed. Clearance evaluation of two of the most demanding aircraft (B-727-200) passing side-by-side in the runway and taxiway proved satisfactory.
onditions for Appro al	Continued commuter substitute service. Construct taxiway safety area conforming to general aviation transport criteria.

Application of Met odolo y

Risk Plot	AA-33 and AA-43	Centerline Sep	210 ft
Severity	Catastrophic	Risk Level Airborne	5.0E-09
		Risk Level Ground	2.0E-07
Annual Vol. Operations	37,600	Expected Years	> 100 years
Conclusion	Medium Risk	Mitigation Recommended	



Case Study # 14 - Seattle-Tacoma International Airport (SEA)

MO Issue	Runway/Taxiway	Appro al Date	6/12/2009
eparations	OFA	Centerline	Wingtip
Standard		500 ft and 550 ft	
Existing		400 ft	

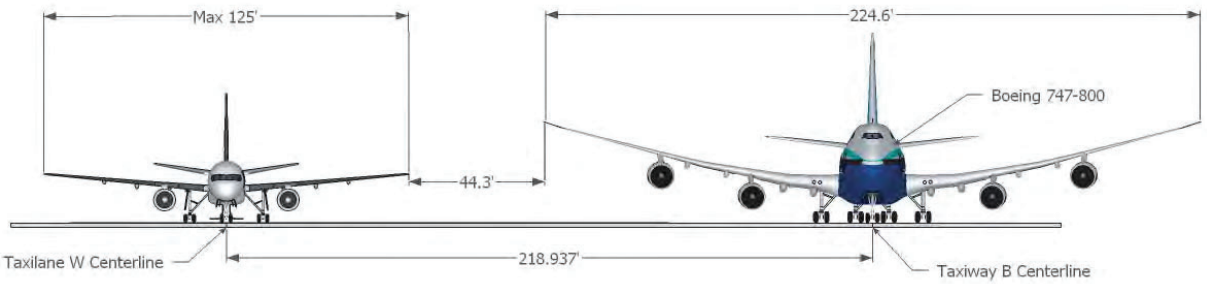
Airport Ref ode	D-VI	
ritical Aircraft	Aircraft 1	Aircraft 2
Model	B747-800	B747-800
ADG	VI	VI
Wingspan	224	224

ynopsis	Based on AC 150/5300-13, Chapter 2, Table 2-2, the required runway to taxiway separation at SEA is 400 ft for a CAT I approach, 500 ft for CAT II/III approach with a visibility no lower than statute mile, and 550 ft for CAT II/III approach with a visibility less than statute mile. The existing northernmost section of Taxiway B is located 400 ft east of the approach end of Runway 16L and thus complies with the requirement for CAT I approaches, but provides less than the required separation for CAT II/III approaches. With the introduction of Boeing aircraft model 747-800, the airport s ADG changed from D-V to D-VI, and the required runway to taxiway separation increased from 400 ft to 500 ft–550 ft depending on visibility conditions. The northern 3,000 ft of Taxiway B had an existing tail height restriction of 48 ft for aircraft taxiing on it during CAT II/III approaches. This restriction would also apply to the B747-800. An MOS was requested to allow the B-747-800 to operate on the northern 3,000 ft of Taxiways A and B as had previously been approved for the B-747-400.

Restrictions	Aircraft with a maximum tail height of 48 ft are allowed on the northern 3,000 ft portion of Taxiway B during CAT II and CAT III ILS operations on Runway 16L. Aircraft with tail heights exceeding 48 ft are restricted from operating on Taxiway A during CAT II and CAT III low visibility conditions.
ustification	Current runway to taxiway separation distance complies with prior airport ADG corresponding to D-V (Boeing B747-400). The southern portion of Taxiway B (south of Taxiway L) provides a 600-ft separation between the runway and taxiway centerlines, thus providing an adequate clearance for CAT II and CAT III operations under low visibilities.
onditions for Appro al	B-747-800 aircraft are not allowed to taxi on the northern-most 3,000 ft section of Taxiway B during CAT II/III approaches to Runway 16L since the aircraft s tail height exceeds the 48 ft maximum that had previously been established for operations on that taxiway under those visibility conditions. Taxiway A must be utilized for B-747-800 taxiing when restricted use of Taxiway B is in effect.

Application of Met odolo y

Risk Plot	AA-40 and AA-46	Centerline Sep	
Severity	Catastrophic	Risk Level Airborne	1.5E-06
		Risk Level Ground	1.2E-07
Annual Vol. Operations		Expected Years	> 100 years
Conclusion	High Risk		



Case Study # 15 - Seattle-Tacoma International Airport (SEA)

MO Issue	Taxiway/Taxilane	Appro al Date	6/2/2009
eparations	OFA	Centerline	Wingtip
Standard		324 ft	62 ft
Existing		219 ft	44.3 ft
Airport Ref ode	D-VI		

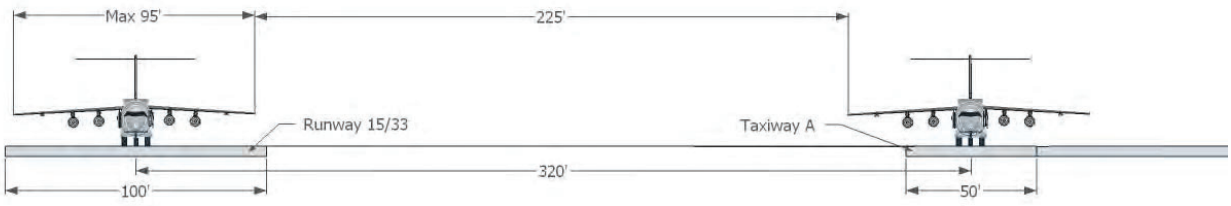
ritical Aircraft	Aircraft 1	Aircraft 2
Model	B747-800	B757-200
ADG	VI	IV
Wingspan	224	125

ynopsis	Taxiway B parallels Taxilane W in the passenger terminal area. Taxiway B was designed to comply with ADG V requirements and provide adequate separation for aircraft up to 125 ft wingspan (B757-200). The existing separation between Taxiway B and Taxilane W is 219 ft. Since year 2009, Boeing B747-800 aircraft started operating at SEA, increasing the Airport Reference Code to D-VI and requiring 62 ft wingtip clearance (AC 150/5300-13, Chapter 4, Table 4-3). The only feasible alternative was to limit operations on Taxilane W. An MOS was filed in order to keep the existing spacing configuration and to allow B747-800 aircraft to operate on Taxiway B and aircraft with wingspans up to 125 ft to operate on Taxilane W without restrictions.
Restrictions	Aircraft on Taxilane W should operate at 20 mph or less. Limit operations on Taxiway B to aircraft no larger than 224.4 ft wingspan (Boeing B747-800). Limit operations on Taxilane W to aircraft no larger than 125 ft wingspan (Boeing B757-200). Restrict the use of Taxiway B during pushback of aircraft types B757, ADG IV, and ADG V.
ustification	Cost limitations to relocate Taxiway B to the west of the airport. Limited space and negative impact on the aircraft terminal parking to relocate Taxilane W to the east of the airport. Negative impact on airfield efficiency by restricting the use of Taxilane W to aircraft with wingspans that would provide the required 62 ft wingtip clearance. Using the modified equation on AC 150/5300-13, Chapter 4, at the bottom of Table 4-3, (0.2 wingspan + 10 ft) the average wingtip clearance for an ADG IV taxilane and an ADG VI taxiway required a minimum wingtip separation of 42.3 ft. This distance is less than the available wingtip separation of 44.3 ft between the typical aircraft using Taxiway B (Boeing B747-800) and the typical aircraft using Taxilane W (Boeing B757-200). Statistical studies indicate that B747s are not likely to deviate from centerlines of straight taxiways such as Taxiway B. B747 operations represent less than 1% of the total operations at the airport and the number of operations for B747-800 is a very small portion of the total B747 operations. The probability of having a B747-800 on Taxiway B traveling side-to-side with a B-757 on Taxilane W is very small.

onditions for Appro al	Restrict operations on Taxilane W to aircraft with a maximum wingspan of 125 ft. Aircraft on Taxilane W should operate at 20 mph or less. Maintain the existing taxiway centerline lighting and taxilane centerline reflectors to provide guidance to the pilots during taxi.

Application of Met odolo y

Risk Plot	AA-7	Wingtip Sep	44 ft
Severity	Major	Risk Level	1.0E-09
Conclusion	Low Risk	Acceptable	



Case Study # 16 - Aspen-Pitkin County Airport (ASE)

MO Issue	Runway/Taxiway	Appro al Date	3/5/1999
eparations	Runway OFA	Taxiway OFA	Centerline
Standard		186 ft	400 ft
Existing		169 ft	320 ft

Airport Ref ode	D-III	
ritical Aircraft	Aircraft 1	Aircraft 2
Model	Grumman Gulfstream IV	Grumman Gulfstream IV
ADG	III	III
Wingspan	78	78

ynopsis	Based on AC 150/5300-13, Chapter 2, Table 2-2, the required runway to taxiway separation at ASE, classified as an ADG D-III airport, is 400 ft. A relocation of the existing taxiway was proposed to increase the runway/taxiway separation from 221.5 ft to 320 ft. Still, the new separation of 320 ft was less than the required 400 ft and thus an MOS was requested. Locating the taxiway at the required 400 ft was not feasible due to the space limitations that Highway 82, the airport frontage road, auto parking lots, and six other buildings posed on the area of interest. The alternative taxiway relocation only impacted the long-term and employee parking and the ARFF building.

	The proposed taxiway alignment was such that the western boundary of the taxiway OFA coincided with the eastern boundary of runway OFA. The width of the OFA on the runway side is 93 ft, which is half of the standard width of taxiway OFA s of 186 ft. However, the location of the relocated taxiway provides an OFA width of 76 ft (93 ft required by standard) between the taxiway and the apron. The apron cannot be relocated due to space constraints identified in preceding paragraph.
Restrictions	Location of airplanes on parking apron should be no closer than 493 ft from the runway centerline. Operations restricted to aircraft with wingspan no larger than 95 ft.
ustification	Lack of space to relocate the existing highway, roads, auto parking, and buildings. Full width taxiway OFA is provided on runway side of the taxiway. Limiting aircraft wing spans to 95 ft provides an adequate taxiway OFA on the apron side in accordance with AC 150/5300-13, Chapter 2, Table 2-3, using the modified formula at the bottom of the table for calculating OF widths for specific aircraft (0.7 wingspan + 10 ft).
onditions for Appro al	Use of the airport restricted to aircraft with wingspan no larger than 95 ft.

Application of Met odolo y

Risk Plot	AA-33, AA-34, and AA-43	Centerline Sep	320 ft
Severity	Catastrophic	Risk Level Airborne	Cat I – 8.5E-10 Cat II – 9.0E-09

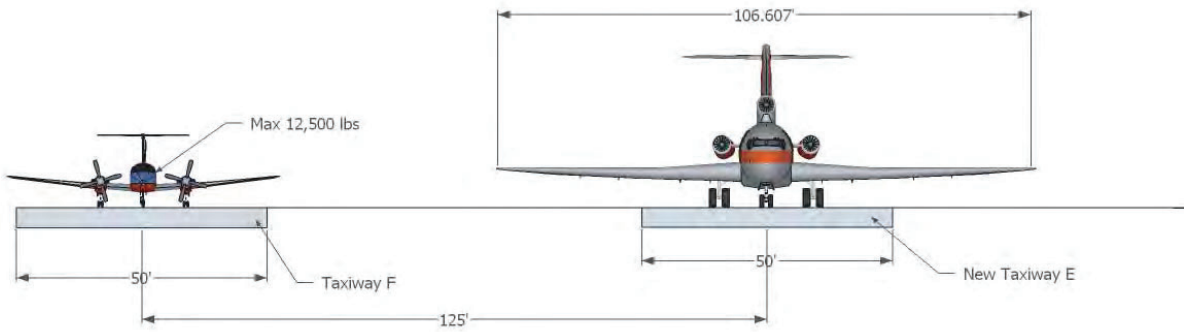
Annual Vol. Operations	45,000	Expected Years	> 100 years
Conclusion	Medium Risk	Mitigation Recommended	



Case Study # 17 - Nantucket Memorial Airport (ACK)

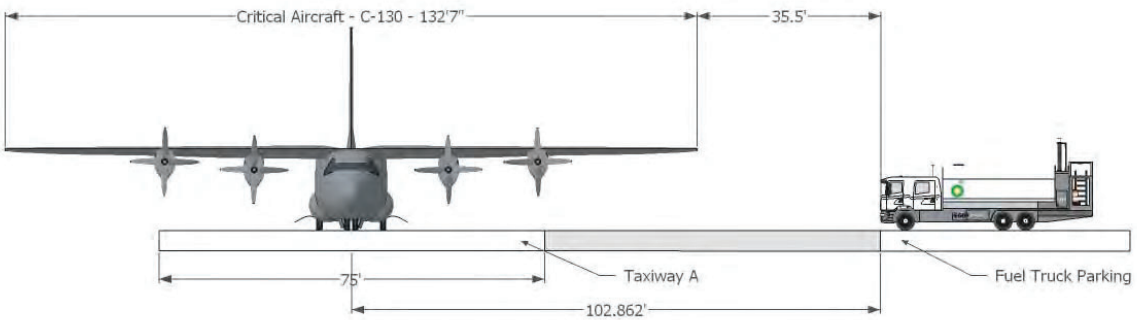
MO Issue	Taxiway/Taxiway	Appro al Date	5/6/1986
eparations	OFA	Centerline	Wingtip
Standard		152 ft	
Existing		125 ft	44 ft

Airport Ref ode	C-III	
ritical Aircraft	Aircraft 1	Aircraft 2
Model		
ADG	III	
Wingspan	107 ft	55 ft

ynopsis	An extension of Taxiway E from Taxiway C (now labeled D) to the approach end of Runway 24 would have caused the existing Taxiway F (extending from the terminal apron to the approach end of Runway 24) to be abandoned because the separation between the new Taxiway E and the existing Taxiway F did not meet standards. Abandoning Taxiway F would have caused a number of problems such as disconnection between the T-hangars and the run-up area; conflict among the north ramp, the main terminal ramp, and the southwest general aviation ramp traffic; and back taxi to achieve full length departure on Runway 15. The Taxiway E extension was located in accordance with standards so that the distance between Taxiway E s centerline and Runway 24 s centerline was 400 ft. This resulted in the separation distance between the parallel Taxiways (E and F) being 125 ft versus the required separation of 153 ft. To avoid abandoning Taxiway F, an MOS to the standard separation between Taxiway E and F was requested. The required parallel taxiway separation for the critical ADG III per AC 150/5300-13, Chapter 2, Table 2-3 was 152 ft. While airport use by these types of aircraft was infrequent at AC , simultaneous operation of aircraft on the parallel Taxiways E and F was still a possibility. Therefore, to maintain an acceptable level of safety, the approval of the MOS was conditioned upon several operational restrictions.
Restrictions	Use restricted by direction of air traffic control. Use restricted to daylight only. Use of Taxiway F restricted to small airplanes (max gross weight of 12,500 lb). Guidance signs unlighted. Existing lighting circuit discontinued. Taxiway safety area grading requirements as per AC 150/5300-12.

ustification	Comply with Runway 6/24 to Taxiway E standard separation. Maintain flexibility of operations and flow by air traffic control during peak traffic conditions. Satisfactory wingtip clearance when no simultaneous operation of ADG III aircraft occurs on the parallel taxiways.
onditions for Appro al	Restrict operations on this portion of the taxiway to daytime. Restrict use of this portion of the taxiway to aircraft of 12,500 lb or less. Maintain this portion of the taxiway unlighted.

Application of Met odolo y



Risk Plot	AA-7	Wingtip Sep	44 ft
Severity	Major	Risk Level	1.0E-09
Conclusion	Low Risk	Acceptable	

Case Study # 18 - New Castle Airport (ILG)

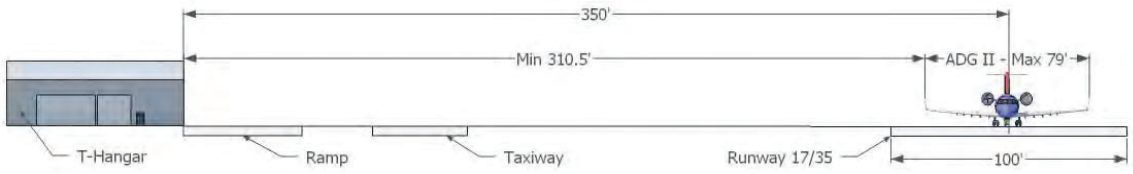
MO Issue	Taxiway/Object	Appro al Date	6/29/2000
eparations	OFA	Centerline	Wingtip
Standard	259 ft	129.5 ft	
Existing	206 ft	103 ft	

Airport Ref ode	D-V	
ritical Aircraft	Aircraft 1	Aircraft 2
Model	AC-130 Spectre	N/A
ADG	IV	
Wingspan	132.5	

ynopsis	The existing separation between Taxiway A and the movement/non-movement area near the aviation hangar located between Taxiways A3 and A4 is 103 ft. The required taxiway OFA width per AC 150/5300-13, Chapter 4, Table 4-1 is 259 ft or 129.5 ft separation between the taxiway centerline and the object. The location between Taxiway A3 and A4 on Taxiway A is designated as a fuel truck parking area. Complying with the required OFA standard would have displaced the parking space and placed the fuel truck too close to the aviation hangar, in violation of fire code. Since there were no other available parking areas for the fuel trucks, a MOS was requested to reduce the separation between the centerline of Taxiway A and the object (i.e., fuel trucks) and thus allow enough clearance between the fuel trucks and the hangar. Reduced separation is based on C-130, the largest aircraft using the airport.
Restrictions	Maintain Hercules C-130 characteristics as most demanding aircraft.
ustification	No other parking area available for aircraft fuel trucks. The required separation would have located the parked fuel trucks too close to the aviation hangar, in violation of fire code. Using the formula (1.4 wingspan + 20) found in AC 150/5300-13, Chapter 4, at the bottom of Table 4-1, the required separation between the taxiway centerline and the object resulted in 103 ft. Calculated clearance of 35.5 ft beyond the critical aircraft (i.e., C130) wingtip and 17.3 ft beyond the safety area edge.
onditions for Appro al	Movement/non-movement line painted at 103 ft from centerline of Taxiway A to delineate the parking limit for the fuel trucks.

Application of Met odolo y

Risk Plot	AA-11	Centerline Sep	103 ft
Severity	Major	Risk Level	2.8E-08
Conclusion	Low Risk	Acceptable	



Case Study # 19 - Leesburg Municipal Airport (JYO)

MO Issue	Runway/Object	Appro al Date	3/26/1997
eparations	OFA	Centerline	Wingtip
Standard	800 ft	300 ft	
Existing	750 ft	262.5 ft	

Airport Ref ode	C-II	
ritical Aircraft	Aircraft 1	Object
Model	Grumman Gulfstream III	
ADG	II	
Wingspan	79	

ynopsis	Based on AC 150/5300-13, Chapter 2, Table 2-2, the required runway to taxiway separation at JYO was 300 ft for a C-II aircraft. Locating the parallel taxiway at the required distance would have required one T-hangar unit and two hexagon hangar units to be relocated or reconstructed. In addition to the relocation/reconstruction of the hangars, other existing infrastructure elements such as the taxiway lighting system, the drainage system, a storm water detention facility, and 60,000 square ft of apron would have been impacted. Due to the economic and airport space limitations that redesigning, relocating, and/or reconstructing the existing infrastructure elements would entail, an MOS was requested. Based on AC 150/5300-13, paragraph 209 and Appendix 11, the minimum calculated runway to taxiway separation for ADG II was 239.5 ft and thus the proposed taxiway relocation at 262.5 ft exceeded the minimum requirement. With respect to the runway OFA, AC 150/5300-13, Chapter 3, Table 3-3 requires a width of 800 ft versus the 750 ft existing separation available. However, the hangar structures were outside of the taxiway OFA, the runway safety area (RSA), and the runway object free zone (OF). Besides, following the recommendations of a previous study, the hangar structures were marked with obstruction lights to prevent classifying them as hazards. JYO has only right angle taxiway exits from its runway, and there are not any plans to construct acute angle exits. The 400-ft half-width standard is based on a runway with acute angle exits.
Restrictions	Limit runway and taxiway use to Group II aircraft. Limit Group II aircraft to right-angled exits to assure required turning radii and fillets. Mark the T-hangar and hexagon hangar units with obstruction lights.
ustification	Relocation/reconstruction of one T-hangar unit, two hexagon hangars, the entire taxiway lighting system, and the existing drainage system. Loss of approximately 60,000 of usable apron. Redesign and reconstruction of a storm water detention facility.

	Economic feasibility. Capacity and space limitations. Adequate runway to taxiway clearance for Group II aircraft based on AC 150/5300-13 Appendix 11 calculations. Adequate turning radii and fillets for right-angled exits. Mitigation of penetration hazards by marking the hangars with obstruction lights.
onditions for Appro al	Unconditional approval granted with the specified operational restrictions.

Application of Met odolo y

Case Study # 20 - Taunton Municipal Airport (TAN)

MO Issue	Runway/Taxiway	Appro al Date	6/26/2002 (subm.)
eparations	Runway OFA	Taxiway OFA	Centerline
Standard			240 ft
Existing			197 ft

Airport Ref ode	B-II	
ritical Aircraft	Aircraft 1	Aircraft 2
Model	Beech ing Air C90	Beech ing Air C90
ADG	II	II
Wingspan	50	50

ynopsis	The parallel taxiway to Runway 12/30 was reconstructed in 1960 and its separation from the runway spans 197 ft. In order to comply with the 240 ft separation requirement per AC 150/5300-13, Chapter 2, Table 2-1, a relocation of the taxiway was considered as the primary option. This, however, was not feasible due to the existence of a stream parallel to a portion of the taxiway, and the negative impact on aircraft parking and existing wetlands that a relocation of the parallel taxiway would cause. Therefore, an MOS was requested to keep the existing separation given the fact that the RSA and OF distances provided enough clearance for the critical aircraft operating at the airport (i.e., Beach ing Air C90).
Restrictions	Maintain Beech ing Air C90 characteristics as most demanding aircraft.
ustification	The stream running parallel to a portion of the existing taxiway posed space constraints that made the relocation of the parallel taxiway unfeasible. Negative environmental impacts on the existing wetlands caused by relocating the stream running parallel to a portion of the existing taxiway. Negative impact on aircraft parking caused by relocating the parallel taxiway. The runway safety area and obstacle free zone are satisfied by the critical aircraft, namely a Beech ing Air C90.
onditions for Appro al	Restudy of the proposed MOS if a significant change in aircraft size or volume operations occur at TAN.

Report of Geotechnical Engineering Services
Aurora State Airport
Septic Drain Field Improvements for HDSE Sewer System
Aurora, Oregon
Project: AronFA-2-01

NV5 is pleased to present this report of geotechnical engineering services for subgrade improvements atop a proposed septic drain field for the HDSE sewer system in the runway safety area at the southern end of the Aurora State Airport located in Aurora, Oregon. Our services were conducted in accordance with our proposal dated August 26, 2021.

We appreciate the opportunity to be of continued service to you. Please call if you have questions regarding this report.

Sincerely,

NV5

Brett A. Shipton, P.E., G.E.
Principal Engineer

1.0 INTRODUCTION

NV5 is pleased to submit this report of geotechnical engineering services for improving the subgrade atop a future drain field located at the southern end of the runway at the Aurora State Airport located in Aurora, Oregon. The same solution could be used for the existing drain fields if needed. Figure 1 shows the site relative to existing physical features.

The proposed drain fields are located in the runway safety area (RSA). The FAA Advisory Circular AC No. 150/5300-13A states that RSA be should be capable, "under dry conditions, of supporting snow removal equipment, aircraft rescue and fire fighting . . . equipment, and the occasional passage of aircraft without causing damage to the aircraft." It also states, "Compaction of RSAs must comply with Specification P-152, Excavation, Subgrade and Embankment, found in AC 150/5370-10."

According to the FAA Airport Construction Standards (AC150/5370-10) Item P-152, the subgrade outside of paved areas must be compacted to at least 95 percent of the maximum dry density, as determined by ASTM D698. No compaction is required in the top 4 inches of the subgrade, and any soil that has become compacted from construction or other traffic in the upper 4 inches must be scarified to a loose state.

From Item P152-2.1:
Areas outside the limits of the pavement areas where the top layer of soil has become compacted by hauling or other Contractor activities shall be scarified and disked to a depth of 4 inches (100 mm), to loosen and pulverize the soil. Stones or rock fragments larger than 4 inches (100 mm) in their greatest dimension will not be permitted in the top 6 inches (150 mm) of the subgrade.

From Item P152-2.6:
"On all areas outside of the pavement areas, no compaction will be required on the top 4 inches (100 mm), which shall be prepared for a seedbed in accordance with Item T-901, T-906."

From Item P152-2.10:
The subgrade in areas outside the limits of the pavement areas shall be compacted to a depth of 12 inches (300 mm) and to a density of not less than 95 percent of the maximum density as determined by ASTM D698.

Such stringent compaction is not permitted in the soil cover of drain fields, and this study provides recommendations for preparing a subgrade in the RSA over the drain fields that is capable, under dry conditions, of supporting snow removal equipment, aircraft rescue and fire fighting equipment, and the occasional passage of aircraft without causing damage to the aircraft.

2.0 PURPOSE AND SCOPE

The purpose of our scope was to provide recommendations for improving the soil cover over the drain fields such that it is capable, under dry conditions and without rigorous compaction, of

supporting snow removal equipment, aircraft rescue and fire fighting equipment, and the occasional passage of aircraft without causing damage to the aircraft. Specifically, we have conducted the following tasks:

- Reviewed information provided to us by Aron Faegre and Associates and other available information in our files.
- Visited the site to observe the subgrade and conduct the following:
  - Collected bulk soil samples in order to establish moisture density relationships in accordance with ASTM D698
  - Measured the in situ density at the location of the proposed drain fields in general accordance with ASTM D6938, Procedure A, using a Troxler 3430 nuclear density gauge
  - Conducted DCP testing in general accordance with ASTM D6951 at the locations shown on Figure 2
- Conducted a laboratory testing program including proctor analyses in accordance with ASTM D698.
- Provided recommendations for subgrade stabilization that do not require significant compaction of the subgrade soil.
- Provided calculations showing that the subgrade atop the proposed drain fields can support emergency vehicles and occasional aircraft.
- Documented our findings, conclusions, and recommendations in this report.

3.0 SITE RECONNAISSANCE

Our site reconnaissance included collecting bulk samples to determine the moisture density relationship of the subgrade soil, conducting DCPs in order to estimate the resilient modulus of the subgrade, and measuring the in situ density of the subgrade soil. Figure 2 shows the locations of sampling and tests.

3.1 SOIL SAMPLING

Bulk soil samples were collected from the near-surface soil in the areas of the future drain fields. A moisture density relationship was determined on a combined bulk sample collected from the surface soil in the area of the proposed drain field. Groundcover at the sampling locations consisted of short grass. The vegetation was removed before sampling, and soil below a depth of 4 inches was placed in a sample bucket and transported to NV5's geotechnical laboratory in Wilsonville, Oregon, for testing. The soil was visually classified as silt in accordance with the soil classification system presented in Figure 3. A moisture density test was performed on the bulk sample in general accordance with ASTM D698. The test results are presented in Appendix A.

3.2 DCP TESTING

We performed DCP testing in general accordance with ASTM D6951 to estimate subgrade resilient modulus (M_r) at the locations shown on Figure 2. The DCP test results are presented on Appendix B. Since it is required that the upper 4 inches of the subgrade be loose, the upper 4 inches of soil was removed before testing was performed. We plotted the depth of penetration versus blow count and used the slope of the data to estimate the resilient modulus of the

subgrade. We correlated the DCP test results to resilient modulus using the methods presented in *The Structural Design of Bituminous Roads*. The computed resilient modulus was converted to CBR using the following relationship:

$CBR = M_r/1500$

Table 1 summarizes the estimated resilient moduli and corresponding CBR for the subgrade.

Table 1. DCP Test Results and Corresponding CBR

Location	Resilient Modulus (psi)	CBR (percent)
DCP-1	24,300	16.2
DCP-2	18,700	12.5
DCP-3	21,200	14.1
DCP-4	14,000	9.3
DCP-5	12,400	8.3
DCP-6	18,000	12.0
DCP-7	10,400	6.9
DCP-8	8,800	5.9

Some of the DCP tests were performed at a depth of 12 inches in order to avoid damaging the drain pipe in the existing drain field.

3.3 IN SITU DENSITY

The in situ density was measured at the locations shown on Figure 2. The density measurements were conducted in accordance with ASTM D6938, Procedure A. Since it is required that the upper 4 inches of the subgrade be loose, the tests were performed deeper than than 4 inches below ground surface. The tests were compared to the maximum dry density determined in the laboratory. Table 2 presents a summary of the in situ density measurements.

Table 2. Measured In Situ Density

Location	Measured Dry Density (pcf)	Measured Moisture Content (percent)	Relative Density ASTM D698 (percent)
D-1	97.0	8.0	92[1]
D-2	89.1	8.3	85[1]
D-3	80.0	6.9	80[2]
D-4	83.4	8.5	84[2]
D-5	109.4	19.7	103[1]
D-6	101.1	21.3	95[1]
D-7	91.1	19.5	92[2]
D-8	87.1	22.4	88[2]

1. Based on a maximum dry density of 105.4 pcf and an optimum moisture content of 18.4 percent
2. Based on maximum dry density of 99.5 pcf and an optimum moisture content of 20.5 percent

We tested the compaction at the existing drain field at locations D-4 and D-8. The other locations were taken randomly throughout the site. The varying degrees of compaction found to exist in the RSA are summarized in Table 1.

Because the FAA's intent is that fire trucks and other vehicles may operate in the RSA, it brings up the question of whether relative compaction definitively relates to the depth of a vehicle rut in the RSA. Although the compaction does not meet the FAA requirement at some locations, the estimated resilient modulus indicates that the subgrade in these areas is capable of supporting similar wheel loads as the areas in which the compaction requirement is met.

4.0 PROPOSED DRAIN FIELD

The proposed drain field consists of a series of subsurface drainage trenches that are approximately 24 inches wide and approximately 3.5 to 4 feet on center. The base of each trench is to have a minimum depth of 18 inches below the capping fill. Twelve inches of ¾- to 2½-inch washed gravel will be placed in the trench. A perforated pipe will be placed in the washed gravel through which the effluent will be drained. A maximum of 10 inches of capping fill will be placed over the trench.

5.0 SUBGRADE IMPROVEMENT

The drain fields are located in the RSA of Aurora State Airport. The FAA Advisory Circular AC No. 150/5300-13A states that the RSA should be capable, ". . . under dry conditions, of supporting snow removal equipment, aircraft rescue and fire fighting . . . equipment, and the occasional passage of aircraft without causing damage to the aircraft." It also states, "Compaction of RSAs must comply with Specification P-152, Excavation, Subgrade and Embankment, found in AC 150/5370-10, which requires that upper 4 inches of the subgrade be uncompacted and scarified to be in a loose state." The underlying 12 inches of subgrade soil should be compacted to at least 95 percent of the maximum dry density, as determined by

ASTM D698. Because a drain field will be beneath the subgrade in the RSA, it cannot be compacted to the standard required by AC 150/5370-10. It must also be capable of growing vegetation.

We have considered the following design vehicles to model emergency equipment and aircraft that may traffic the RSA:

- Emergency Vehicle: AASHTO H20 or a 16,000-pound wheel load
- Aircraft: GulfStream G550 with a gross weight of 91,000 pounds or a 30,300-pound ESWL

To accommodate design traffic, the subgrade located over the drainage trenches should be stabilized using a product such as the Presto GeoSystems Geoweb. We have determined that the GW30V Geocells will create a subgrade that can support both the AASHTO H20 and Gulfstream 550 ESWL with an adequate margin of safety. Our supporting calculations are presented in Appendix C. Table 3 summarizes the input parameters and results of our analysis.

Table 3. Subgrade Stabilization

Design Vehicle	ESWL (pounds)	Tire Pressure (psi)	CBR Beneath Geoweb (percent)	Product Specification	Bearing Capacity Safety Factor
AASHTO H20	16,000	110	5	GW30V 6-inch depth	1.5
Gulfstream 550	30,300	200	5	GW30V 8-inch depth	1.3

A 6-inch-deep cell may be sufficient if the RSA is only subject to ESWLs of 16,000 pounds, such as those of the AASHTO H20 axle load. The geoweb cells should be filled with a blend of two-thirds crushed aggregate and one-third topsoil mix. The crushed aggregate should be 3/8 to 1 inch in nominal diameter and have a D50 of 0.5 inch and a void space of 30 percent. The geoweb should extend beyond each drainage trench by a distance of at least 18 inches. The geoweb should be overfilled by at least 1 inch with the selected fill. In addition, the geoweb should be installed in accordance with the manufacturer's recommendations. A 4-inch layer of loose, uncompacted material can be placed on the improved subgrade to meet the requirement of Item P152-2.6

6.0 LIMITATIONS

We have prepared this report for use by Aron Faegre and Associates and members of the design team for the proposed project. The data and report can be used for bidding or estimating purposes, but our report, conclusions, and interpretations should not be construed as warranty of the subsurface conditions and are not applicable to other sites.

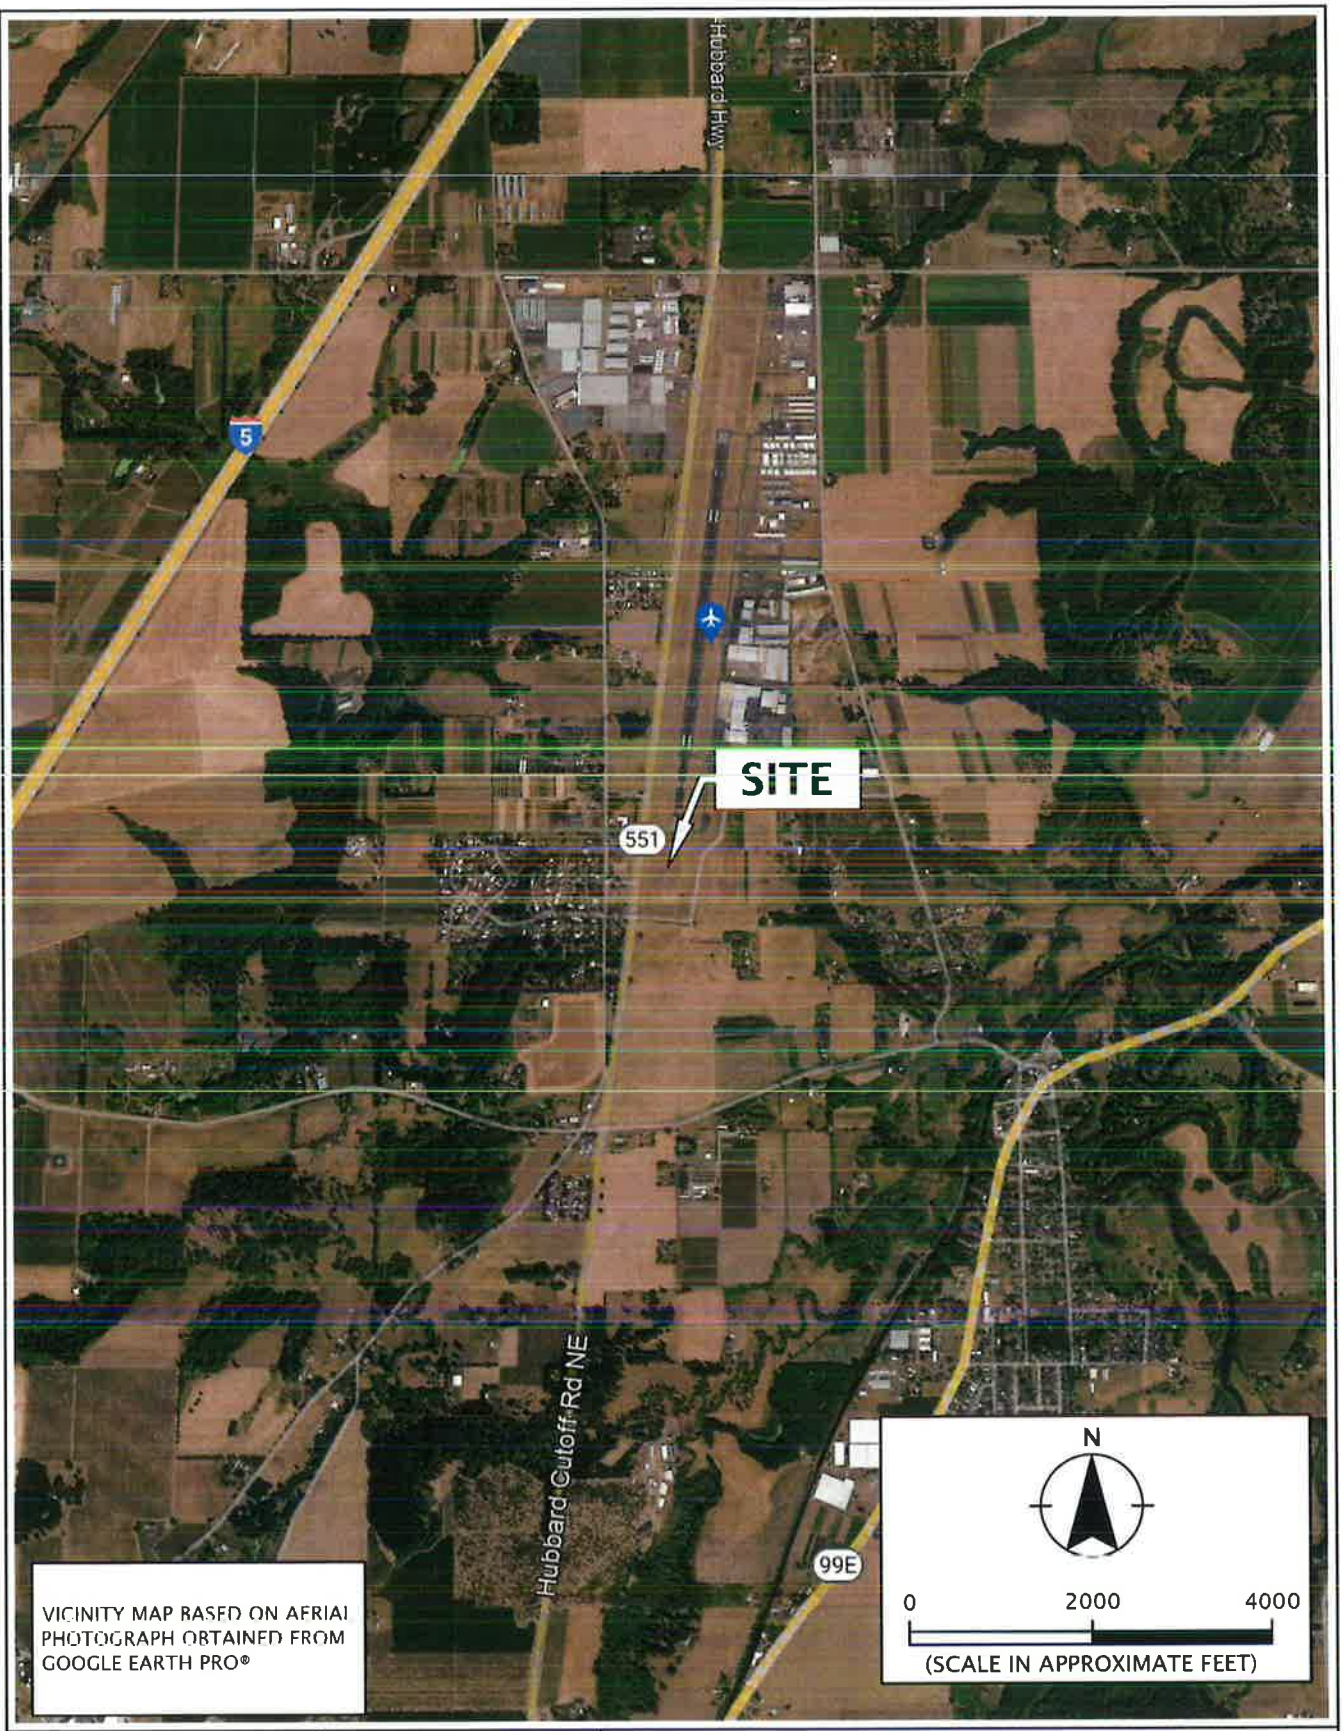
Exploration observations indicate soil conditions only at specific locations and only to the depths penetrated. They do not necessarily reflect soil strata or water level variations that may exist

between exploration locations. If subsurface conditions differing from those described are noted during the course of excavation and construction, re-evaluation will be necessary.

The scope of our services does not include services related to construction safety precautions, and our recommendations are not intended to direct the contractor's methods, techniques, sequences, or procedures, except as specifically described in our report for consideration in design.

Within the limitations of scope, schedule, and budget, our services have been executed in accordance with generally accepted practices in this area at the time our report was prepared. No warranty, express or implied, should be understood.

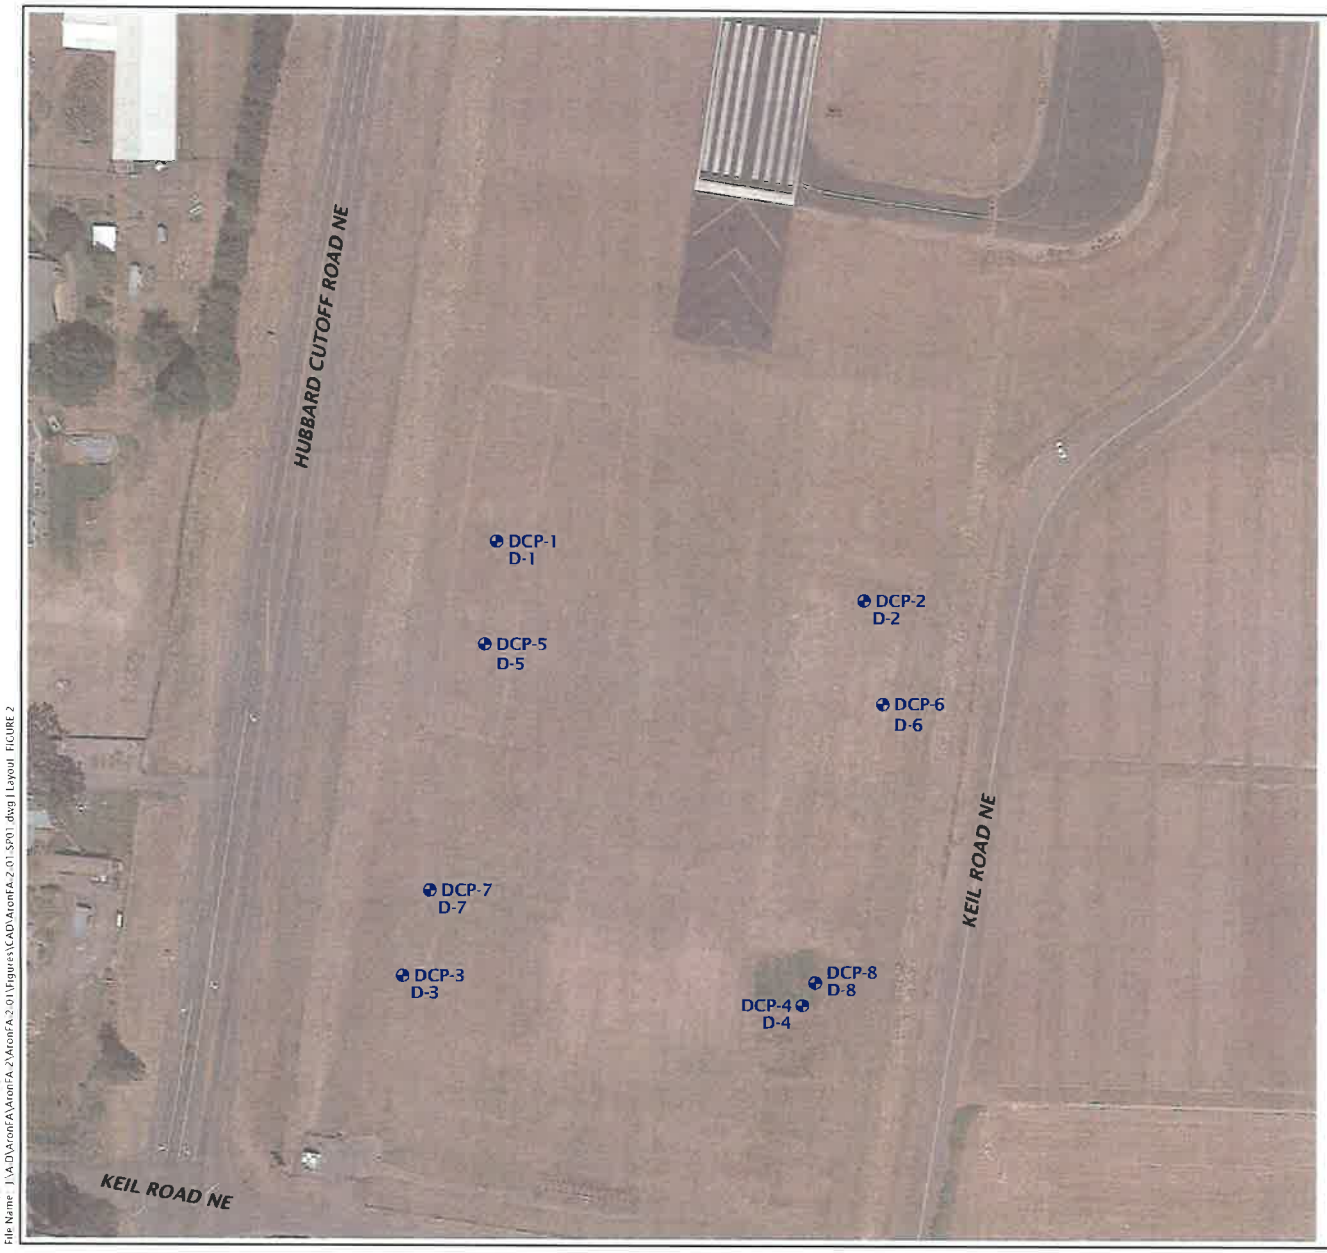
♠ ♠ ♠



We appreciate the opportunity to be of continued service to you. Please call if you have questions concerning this report or if we can provide additional services.

Sincerely,

NV5



Brett A. Shipton, P.E., G.E.
Principal Engineer

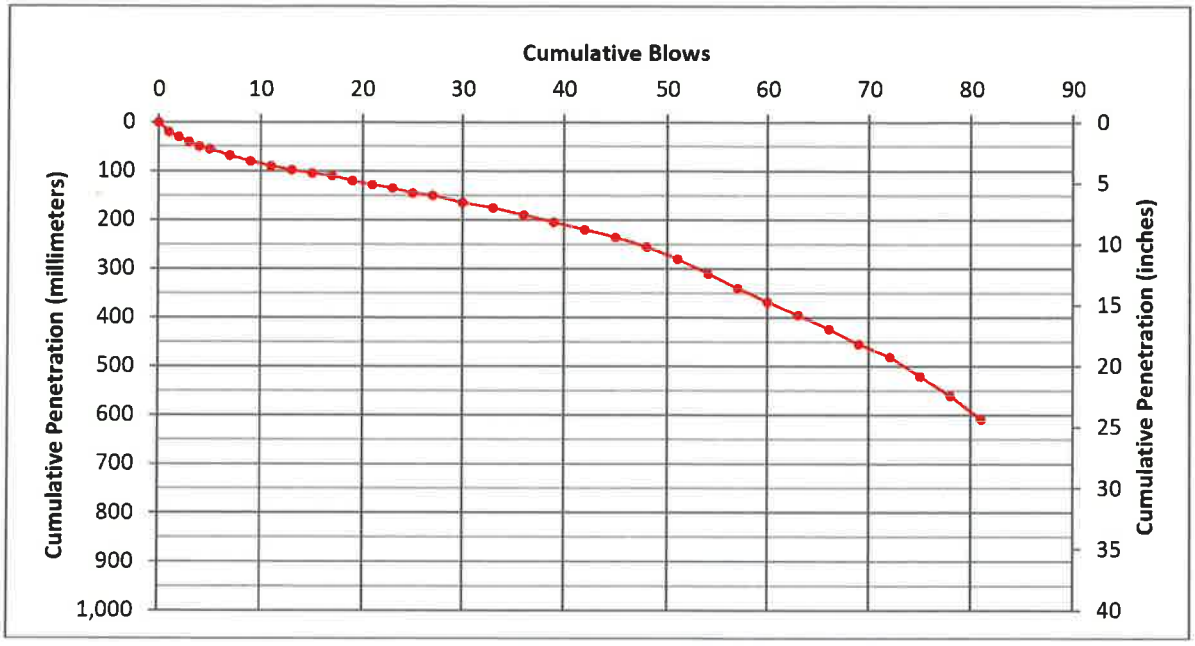
APPENDIX B



APPENDIX B

DCP TESTING

We performed DCP testing at the locations shown in Figure 2. The tests were performed in general accordance with ASTM D6951. We correlated the DCP test results to resilient modulus using the methods presented in *The Structural Design of Bituminous Roads*. The results of each test are presented in this appendix.

DYNAMIC CONE PENETROMETER RESULTS - DCP 1

Layer	Soil Type	Hammer weight =	17.6 pounds
		Slope (mm/blow)	M_R (psi)
1	Soil not CL, CBR < 10 or not CH	6.9	24,300
2	---	---	---
3	---	---	---

$M_R = 96658 \times S^{-0.7168}$; soil not CL, CBR < 10 or not CH

$M_R = 469673 \times S^{-1.28}$; CL soil, CBR < 10

$M_R = 108206 \times S^{-0.64}$; CH soil

M_R = resilient modulus (pounds per square inch)

S = slope (millimeters per blow); multiplied by two (2) if 10-pound hammer is used

Equivalent Single Wheel Loading (ESWL) GV-GER-1212

1. Introduction:

One consideration in operating Gulfstream aircraft is the strength of runway and taxiway pavements in relation to aircraft operating weight. This can limit operational weights in some airports. One common method of evaluating an aircraft for a given runway is the Equivalent Single Wheel Loading (ESWL). ESWL accounts for the extra tire flotation for multi-wheel landing gear struts such as the dual wheel struts used on the Gulfstream aircraft. This section provides information on how to compute ESWL for the G550 and G500 airplanes.

2. G550 and G500 Main Landing Gear Parameters:

Max Ramp Weight (pounds)	MLG Tire Size (inches)	Tire Spacing (inches)	Max Tire Pressure (psi)	Reduction Factor -	Maximum ESWL (pounds)
91,400	35 X 11.0	18.5	198	1.25	32,904

The reduction factor in the table above assumes a rigid pavement with a radius of equivalent stiffness of 40 inches, roughly equivalent to a 13.5 inch thick concrete slab. Thinner pavements would give higher reduction factors, so the factors presented are conservative.

3. ESWL Computation for Lower Operating Weights:

ESWL can be computed for lower operating weights as follows:
ESWL = (Gross Weight) x (0.9) x (0.5) / (Reduction Factor)

Aircraft	Gulfstream G550	
Gross Weight (lb)	91000	
Reduction Factor	1.35	assume 1.35, since rutting is allowed
ESWL (lb)	30333.33	
tire presure (psi)	200

Product Specification - GEOWEB® GW30V Geocells

GENERAL

GEOWEB® product is manufactured from textured, perforated strips of high density polyethylene that are bonded together to create a network of interconnected cells. The GEOWEB® cells can be filled with soil, aggregate, concrete, pulverized debris, recycled asphalt pavement, or other infill material for geotechnical applications such as: 1) load support for unpaved and paved roads, railways, ports, heavy-duty pavements, container yard, and basal embankments stabilization; 2) retaining structures, free-standing structures, and fascia walls; and, 3) slope, channel, and geomembrane protection.

DIMENSIONS

Parameter	Units	Value
Cell Depth (Available in 5 Depths)[1]	inches (mm)	3 (75), 4 (100), 6 (150), 8 (200), 12 (300)
Cell Size (Length x Width +/- 10%)	inches (mm)	11.3 x 12.6 (287 x 320)
Expanded Section Width	No. Cells	8
	Feet (m)	Varies: 7.7 to 9.2 (2.3 to 2.8)
Expanded Section Length	No. Cells	18, 21, 25, 29, or 34
	Feet (m)	Varies: 15.4 to 35.1 (4.7 to 10.7)

STRUCTURAL INTEGRITY AND SYSTEM PERFORMANCE

Parameter	Units	Value
Minimum Short Term Seam Peel Strength	lbf/in (N/cm)	≥80 (142)
Long-Term Seam Peel Strength (standard 4-inch sample width)[2]	lb (N)	160 (710)
Internal Junction Efficiency[3]	%	≥100
Mechanical Junction Efficiency (Connection Type: ATRA Key)[3]	%	≥100
Peak Friction Angle Ratio (δ/Φ)[4]	Unitless	0.95

MATERIAL PROPERTIES

Parameter	Test Method	Units	Value
Polymer Density	ASTM D1505 or D792	g/cm³	0.935 - 0.965
Carbon Black Content[5]	ASTM D1603	%	1.5 - 2.0
Sheet Thickness Prior to Texture	ASTM D5199	mm (mil)	1.27 (50), -5% +10%
Sheet Thickness After Texture	ASTM D5199	mm (mil)	1.52 (60), -5% +10%
Texture Type/Shape	—	—	Rhomboidal
Texture Density	—	indentations/cm²	22 - 31

DURABILITY

Parameter	Test Method	Units	Value
Environmental Stress Crack Resistance	ASTM D1693	hrs	>5,000
Resistance to Oxidation[6]	EN ISO 13438	yrs	≥50
Resistance to Weathering[7]	EN 12224	%	100

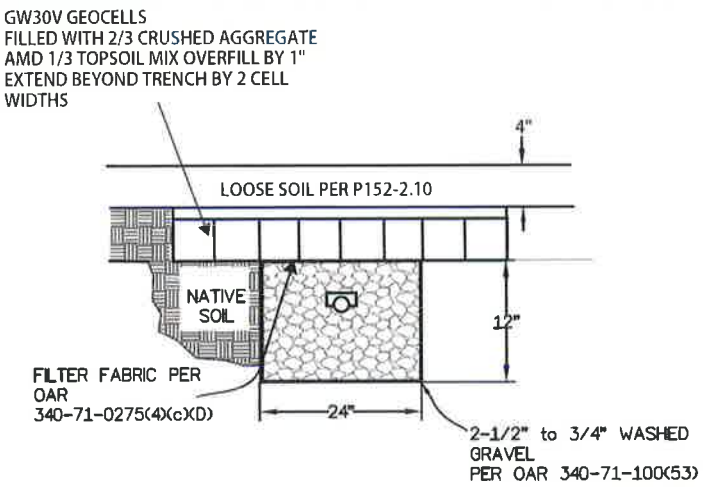
Notes:

1) 12-inch cell depth available in 21-cell panel length only.

2) A 100 mm (4.0 in.) wide seam sample shall support a 72.5 kg (160 lb) load for a period of 7 days minimum in a temperature-controlled environment undergoing a temperature change on a 10 hour cycle from ambient room to 54° C (130° F). Ambient room temperature is per ASTM E 41.

3) Junction efficiency determined as a percentage of junction performance (EN ISO 13426-1) to reinforced strip performance (EN ISO 10319).

4) Typical design value for clean granular infill material (i.e. - coarse sand or crushed aggregate). Consult with manufacturer to confirm value for other types of infill materials.



5) Standard black HDPE strips. For tan/green GEOWEB, hindered amine light stabilizer (HALS) content will be 2.0% by weight of carrier.

6) Predicted to be durable for a minimum of 50 years in natural soils with a pH between 4 and 9 and at a soil temperature ≤ 25°C.

7) 100% of original tensile strength retained following exposure to intense UV radiation and accelerated weathering in accordance with EN 12224.

ISO 9001:2015 Certified

AND JACK HOGAN	)	AN ADMINISTRATIVE ORDINANCE

ORDINANCE NO. 1205

THE MARION COUNTY BOARD OF COMMISSIONERS HEREBY ORDAINS AS FOLLOWS:

SECTION I. **Purpose**

This Ordinance is enacted pursuant to the authority granted to general law counties in the State of Oregon by ORS Chapters 197, 203, and 215 to implement the Marion County Comprehensive Land Use Plan. This ordinance amends the Marion County Comprehensive Plan by taking exceptions to Statewide Land Use Planning Goals 11—Public Facilities and Services and 14—Urbanization for certain properties to share a septic system at the Aurora State Airport. (T4S; R1W; Section 11A; Tax lots 200, 201, 203, and 400) and (T4S; R1W; Section 02D; Tax lots 1100 and 1600).

SECTION II. **Procedural History**

The Marion County Board of Commissioners held a public hearing on September 22, 2004, for which proper public notice and advertisement was given. The purpose of the hearing was to consider proposed amendments to the Marion County Comprehensive Plan to take exceptions to Statewide Land Use Planning Goals 11—Public Facilities and Services and 14—Urbanization for certain properties to share a septic system at the Aurora State Airport. All persons present during the public hearing were given the opportunity to speak or present written statements.

SECTION III. **Adoption of Findings and Conclusion**

The Board has reviewed the evidence and testimony in the record. The amendments to the Marion County Comprehensive Plan made hereunder are based on consideration and analysis of existing Marion County Comprehensive plan goals and policies and zoning regulations and the provision of ORS Chapters 197 and 215, Oregon Administrative Rules 660 Divisions 4, 11, 14, 8, and 33, and the State Land Use Planning Goals.

After careful consideration of all facts and evidence in the record, the Board adopts as its own the Facts and Findings contained in Exhibit A, attached hereto, and by this reference incorporated herein. The properties which are granted goal exceptions are shown on the map attached as Exhibit B, attached hereto, and by this reference incorporated herein.

SECTION IV. Action

The exceptions to Goals 11 and 14 to permit six parcels at the Aurora Airport to share an existing septic disposal system are **GRANTED**.

SECTION VI. Severability

Should any section, subsection, paragraph, sentence, clause, or phrase of this Ordinance or any policy, provision, findings, statement, conclusion, or designation to a particular land use or area of land, or any other portion, segment or element of this Ordinance or of any amendments thereto and adopted hereunder, be declared invalid for any reason, such declaration shall not affect the validity and continued application of any other portion or element of this Ordinance or amendments to the Comprehensive Plan; and if this Ordinance or any portion thereof should be held to be invalid on one ground, but valid on another, it shall be construed that the valid ground is the one upon which this Ordinance of any portion thereof was enacted.

SECTION VII. Effective Date

Pursuant to Ordinance 669, this is an administrative Ordinance and shall take effect 21 days after the adoption and signatures of the Marion County Board of Commissioners.

SIGNED and FINALIZED this 13 day of October, 2004 at Salem, Oregon.

MARION COUNTY BOARD OF COMMISSIONERS

Janet Carlson
Chair

Jan Eastwood
Recording Secretary

JUDICIAL NOTICE

Oregon Revised Statutes (ORS) Chapter 197.830 provides that land use decisions may be reviewed by the Land Use Board of Appeals (LUBA) by filing a notice of intent to appeal within 21 days from the date this ordinance becomes final.

Exhibit A

Facts and Findings:
Exceptions to Goals 11 and 14

BACKGROUND:

In 1999, the applicants received approval from the Oregon Department of Environmental Quality (DEQ) to construct a recirculating gravel filter septic disposal system which was intended to serve six parcels at the southern end of the Aurora. After constructing the system, the applicants were informed by DEQ that Goal 11 forbids the extension of septic lines across property lines and an exception to Goal 11 would have to be taken in order to connect and operate the system.

In June 2003, the applicants applied for a comprehensive plan change to take an exception to Goal 11 to permit shared septic facilities. Staff from the Department of Land Conservation and Development commented that the Goal 11 exception would have to be accompanied with either an exception to Goal 14, because the Public zone at that time did not comply with Goal 14 requirements, or amendments to the Public zone that would bring it into compliance with Goal 14 requirements for rural uses outside of rural communities.

The county was involved in a periodic review task to amend the rural zoning ordinance to comply with Goal 14 and the applicants agreed to place their application on hold until the Goal 14 issues were resolved regarding the Public zone. On July 28, 2004, the Marion County Board of Commissioners adopted amendments to the Marion County Rural Zoning Ordinance which brought the code into compliance with Goal 14 requirements. Subsequently, this application was taken off hold and the applicants requested that the Board call-up the request and hold the first evidentiary hearing. Notice of public hearing was mailed on September 1, 2004 to property owners within 500 feet of the subject parcels. Notice was also published in the Statesman-Journal.

On September 22, 2004, the Board held a public hearing to consider amendments to the Marion County Comprehensive Plan taking exceptions to Goals 11 and 14 for an existing shared septic system for six parcels at the southern end of the Aurora Airport. The Board closed the hearing and directed staff to prepare an ordinance taking those exceptions.

FACTS:

1. The subject properties are designated Public in the Marion County Comprehensive Plan and are correspondingly zoned P (PUBLIC) under the Marion County Rural Zoning Ordinance (MCRZO). The purpose of the Public designation and zone is to provide regulations governing the development of land appropriate for specific public and semi-public uses.

2. The properties are located on the north side of Keil Road NE, approximately 1,700 feet west of the intersection of Airport Road NE and Keil Road. The parcels contain aircraft related facilities and are proposed for additional development in the future.

3. Adjacent properties to the southwest, west, east, and north are zoned P and contain the Aurora Airport and airport related uses and businesses. Properties to the south are zoned EFU (EXCLUSIVE FARM USE) and are devoted to farm use.

4. The airport facility was constructed at this site in 1943 to provide an emergency alternate field for carrier aircraft. It has been in operation as an airport, and zoned public, since that time. Since before 1968, additional land east of the runway and north of Keil Road has also been zoned public and closely associated with the airport. Between 1968 and 1981, properties to the south of Arndt Road and east of the runway were rezoned to public and developed with airport uses. In 1981, the airport facility, and surrounding airport related uses in the public zone, were acknowledged as exceptions in the Marion County Comprehensive Plan.

5. The 1976 Airport Master Plan was adopted by Marion County as part of its comprehensive plan. The adoption included a committed exception area to Statewide Planning Goal 3 of approximately 250 acres at the Aurora State Airport. In 1994, an exception for an additional 1.86 acres was taken and acknowledged to add land to the southwest of the airport. The County's Airport Overlay Zone, Marion County Rural Zoning Ordinance (MCRZO) Chapter 177 has been applied to both the 1981 exception area and the area added in 1994.

6. In Legislative Amendment 03-3, which amended the Marion County Rural Zoning Ordinance to comply with Goal 14 requirements for rural exception areas, an exception to Goal 14 for size of use was approved for airport related uses at the Aurora State Airport due to its being developed with a use that is urban in nature and requiring urban styled development to support the existing uses.

COMMENTS:

7. Marion County Building Inspection commented that based on the information submitted in the attached site plan, Building Inspection cannot make a determination on the permit requirements.

8. The FAA commented, "on-airport development requires submittal to FAA of FAA Form 7460-1, off-airport development requires submittal of separate form 7860-1, concurrence of Oregon Dept. of Aviation required for on-airport development, recommended for off-airport development."

9. All other contacted agencies stated that they had no objections or had not commented at the time the staff report was prepared. All comprehensive plan changes are subject to review by the State Department of Land Conservation and Development (DLCD).

DLCD's comments are contained in the file and explained in the background section of this report.

ANALYSIS:

10. Goal 11—Public Facilities and Services states: "Local Governments shall not allow the establishment or extension of sewer systems outside urban growth boundaries or unincorporated community boundaries...." The Goal defines "extension of a sewer or water system" as "the extension of a pipe, conduit, pipeline, main, or other physical component from or to an existing sewer or water system in order to provide service to a use that was not served by the system on the applicable date of this rule...."

    Goal 14—Urbanization prohibits the establishment of urban services on rural lands and the shared septic facility constitutes a urban level of service as defined by Goal 11. Because of this, an exception to Goal 14 will have to be taken along with an exception to Goal 11.

11. The exception requirements for land physically developed to uses other than those allowed by the applicable goal is set forth in OAR 660-004-0025:

    (1) A local government may adopt an exception to a goal when the land subject to the exception is physically developed to the extent that it is no longer available for uses allowed by the applicable goal.

    (2) Whether land has been physically developed with uses not allowed by an applicable Goal will depend on the situation at the site of the exception. The exact nature and extent of the areas found to be physically developed shall be clearly set forth in the justification for the exception. The specific area(s) must be shown on a map or otherwise described and keyed to the appropriate findings of fact. The findings of fact shall identify the extent and location of the existing physical development on the land and can include information on structures, roads, sewer and water facilities, and utility facilities. Uses allowed by the applicable goal(s) to which an exception is being taken shall not be used to justify a physically developed exception.

12. It was determined previously in Legislative Amendment Case No. 03-3 that the existing airport-related development at the airport exceeds the size limitations for commercial and industrial uses allowed by Goal 14 and the Unincorporated Communities Rule and an exception was talen to permit continued development to occur at a level consistent with existing development at the airport. The Land Use Board of Appeals (LUBA) recognized that the level of development at the airport would likely require exceptions to Goals 11 and 14, referring to the Aurora State Airport as an "urban public facility" and commenting that the text of an exception "probably could be very similar to that required for the proposed exception to Goal 3," an exception which was subsequently acknowledged by LCDC. Murray et al. v. Marion County, 23 Or LUBA 268 (1992).

13. OAR 660-014-0040 sets forth the criteria for taking an exception to Goal 11—Public Facilities and Goal 14—Urbanization:

(1) As used in this rule, "undeveloped rural land" includes all land outside of acknowledged urban growth boundaries except for rural areas committed to urban development. This definition includes all resource and nonresource lands outside of urban growth boundaries. It also includes those lands subject to built and committed exceptions to Goals 3 or 4, but *not* developed at urban density or committed to urban level development.

(2) A county can justify an exception to Goal 14 to allow incorporation of a new city or establishment of new urban development on undeveloped rural land. Reasons which can justify why the policies in Goals 3, 4, 11, and 14 should not apply can include but are not limited to findings that an urban population and urban levels of facilities and services are necessary to support an economic activity which is dependent upon an adjacent or nearby natural resource.

(3) To approve an exception under this rule, a county must also show:

(a) That Goal 2, Part II(c)(1) and (c)(2) are met by showing the proposed urban development cannot be reasonably accommodated in or through expansion of existing urban growth boundaries or by intensification of development at existing rural centers;

(b) That Goal 2, Part II(c)(3) is met by showing the long-term environmental, economic, social and energy consequences resulting from urban development at the proposed site with measures designed to reduce adverse impacts are not significantly more adverse than would typically result from the same proposal being located on other undeveloped rural lands, considering:

(A) Whether the amount of land included within the boundaries of the proposed urban development is appropriate, and

(B) Whether urban development is limited by the air, water, energy and land resources at or available to the proposed site, and whether urban development at the proposed site will adversely affect the air, water, energy and land resources of the surrounding area.

(c) That Goal 2, Part II(c)(4) is met by showing the proposed urban uses are compatible with adjacent uses or will be so rendered through measures designed to reduce adverse impacts considering:

(A) Whether urban development at the proposed site detracts from the ability of existing cities and service districts to provide services; and

(B) Whether the potential for continued resource management of land at present levels surrounding and nearby the site proposed for urban development is assured.

(d) That an appropriate level of public facilities and services are likely to be provided in a timely and efficient manner;

(e) That incorporation of a new city or establishment or new urban development of undeveloped rural land is coordinated with comprehensive plans of affected jurisdictions and consistent with plans that control the area proposed for incorporation.

14. The Aurora Airport has been in place since 1943 and airport related uses have been associated with the airport since before 1968. The airport consists of properties in multiple ownerships providing a wide range of aviation-related and support services such as aircraft instruction, rental, maintenance, charter, sales, avionics sale and repair, aircraft construction, storage, fueling, helicopter maintenance and fueling, aerial photography, and others. This airport provides necessary air transportation services to businesses and individuals in Marion, Clackamas, Washington and Multnomah counties, enhancing the economy of the region and the state. The airport facility depends on its location, and the commercial, industrial and population centers and growth in the area, for its viability and necessity. This state airport facility is uniquely able to provide services to the surrounding rural area and nearby communities, as well as a connection to other urban airports because of it's proximity to the Interstate 5 corridor and Highway 99E, the county roadway system, Clackamas County and the south Metro area. In addition, the need for airport transportation facilities is recognized in the Marion County Comprehensive Plan (MCCP).

The Aurora State Airport is needed to serve the economic and air transportation needs of the surrounding community which is dependent upon the existing location of the airport. The criteria in 13(1) and 13(2) are met.

15. The nearest UGB is that of the City of Aurora, approximately 1500 feet to the southeast of the airport. The land between the existing UGB and the airport boundary is resource land. The City of Aurora originally proposed that the airport be included in the UGB when it was going through acknowledgement; however, this was not approved by LCDC and the UGB was reduced to the present area. It continues to be unreasonable to extend the UGB this distance due to the amount of intervening resource land at this time. There are also no rural centers which could encompass the proposed exception area. The closest rural center, Fargo Interchange, is over 9,000 feet west of the airport. The criterion in 13(3)(a) is met.

16. The criteria in 13(3)(b) require that the long-term environmental, economic, social and energy consequences resulting from urban development at the proposed site not be significantly more adverse than would result from the same proposal being located on

other undeveloped rural lands. Because the Aurora Airport is already developed with airport and airport-related uses, and because of its demonstrated need to be located where it currently is, as explained in #14, there are no alternative locations being considered requiring the use of undeveloped land.

Additionally, information provided by the applicant demonstrates that developing the properties with septic or holding tanks would be much more expensive than using a shared septic system.

Also there are environmental concerns developing with septic systems on the subject properties. The soils on the subject properties are not optimum soils for septic systems and can be difficult to locate a system on an individual property. A shared septic also provides the opportunity to process the effluent in a more complete manner that can be certified to meet Leadership in Energy and Environmental Design (LEED) standards.

Considering the lack of alternatives locations for the airport, as well as the benefits economically and environmentally and the potential for positive affects on the air, water, energy and land resources of properties and surrounding area, the criteria in 13(3)(a) and (b) are met.

17. Public facilities are not provided by any of the surrounding cities or service districts. The airport has existed surrounded by resource land and uses since 1943. During that time there has been no evidence that the airport has reduced the potential for continued resource management of land surrounding the airport. Aside from a runway extension, no expansion of airport facilities has occurred historically and no expansion of facilities is proposed in the airport master plan. There is no evidence that a shared septic system for the subject properties will adversely impact surrounding property uses. The criterion in 13(3)(c) is met.

18. The airport has established an Aurora Airport Water Control District to provide a fire suppression water system. Development on the subject properties would still be limited to the capacity of systems in place, including holding tanks, which would serve the uses. Although the City of Aurora sewer system became operational in 2001, there are no plans to extend the system to the airport, at this time, nor has any determination been made of the capacity of the city system to serve the airport. The criterion in 13(3)(d) is met.

19. No incorporation of a new city or establishment is proposed. Any new urban development of undeveloped rural land will be coordinated with the comprehensive plans of affected jurisdictions and applicable zoning. The criterion in 13(3)(e) is met.

20. OAR 660-004-0018 states that for "physically developed" and "irrevocably committed" exceptions to goals, plan, and zone designations shall authorize a single numeric minimum lot size and shall limit uses, density, and public facilities and services to those:

    (a) Which are the same as the existing land uses on the exception site; or

(b) Which meet the following requirements:

(A) The rural uses, density, and public facilities and services will maintain the land as "Rural Land" as defined by the goals and are consistent with all other applicable Goal requirements; and

(B) The rural uses, density, and public facilities and services will not commit adjacent or nearby resource land to nonresource use as defined in OAR 660-004-0028; and

(c) The rural uses, density, and public facilities and services are compatible with adjacent or nearby resource uses.

21. The proposal does not change the allowable commercial or industrial uses at the airport. The purpose of the exception is to allow a shared septic system to serve six parcels at the airport, consistent with the existing urban level of development already existing at the airport. There is no evidence that an exception to permit a shared septic will not commit adjacent or nearby resource land to nonresource use as defined in OAR 660-004-0028. The proposal satisfies the criterion in 20(a) and (b).

22. The airport has a history of being compatible with adjacent and nearby resources uses since its inception over sixty years ago. There is no evidence that allowing the subject properties to share a septic system will be incompatible with surrounding resource uses. The shared septic will be located on the properties where the septic is shared and will not commit surrounding land to nonresource uses. The surrounding resource uses have also been compatible with airport uses. The master planning process, which the Oregon Department of Aviation recently completed for the airport in 2000, requires consideration of National Environmental Protection Act (NEPA) requirements as well as compatibility with surrounding uses. The proposal satisfies the criterion in 20(c).

23. In addition to providing procedures, the MCCP provides guidelines and policies to ensure compatibility with the adopted comprehensive plan and consistency in the planning process. The first guideline is that the proposal should comply with the Statewide Planning Goals that apply in a particular situation. This proposal must be consistent with all applicable Statewide Planning Goals except Goals 3, 11 and 14 for which exceptions have been taken.

24. The proposal is consistent with Statewide Planning Goal 1—Citizen Involvement, which provides for citizen involvement in the planning process. Notice was sent of the request for goal exceptions. A public hearing will were be held before the Board of Commissioners where concerned citizens will have the opportunity to provide comment and make suggestions.

The application is consistent with Goal 2—Land Use Planning since the proposal is consistent with the County's acknowledged comprehensive plan. Moreover, appropriate analysis of the exception provisions have been provided with regard to Goals 11 and 14.

Goals 3—Agricultural Lands, 4—Forest Lands and 5—Open Spaces, Scenic and Historic Areas, and Natural Resources are not applicable to this proposal.

Because the airport and related uses already exist, and the proposal seeks to maintain development at the existing level of uses and sizes, there is no evidence that the proposal will impact air, water or land resource quality over any impacts of the existing airport. Development within the public zone is subject to standards that address and seek to minimize adverse impacts to surrounding uses and resources. The proposal is consistent with Goal 6—Air, Water and Land Resources Quality.

The airport is not in an area subject to natural disasters; the proposal is consistent with Goal 7—Areas Subject to Natural Disasters and Hazards.

Goal 8—Recreational Needs is not applicable to this proposal.

The proposal is consistent with Goal 9—Economic Development. The subject properties are needed to serve commercial, industrial, and public uses in the surrounding community. Allowing development to continue at sizes commensurate with existing development will sustain the economic viability of the airport. The airport and associated uses provide employment to the area and in the state. Employment at the airport should also increase as use of the airport continues to increase as described in the Aurora State Airport Master Plan.

Goal 10—Housing is not applicable to this proposal.

The proposal is consistent with Goal 12—Transportation because the airport is necessary to serve the aviation needs of users at the airport and the surrounding communities. The location of this airport has also been demonstrated to be necessary because neighboring cities and communities do not provide public airport facilities. In addition, the airport is either bordered by or in close proximity to major road facilities, the Interstate 5 corridor, Hubbard Cutoff Road, Highway 99E, Arndt Road, Keil Road, and Airport Road, which provide the traveling public access to and from the airport for both persons and freight.

Goals 13—Energy Conservation, 15—Willamette River Greenway, 16—Estuarine Resources, 17—Coastal Shorelands, 18—Beaches and Dunes and 19—Ocean Resources do not apply to this proposal.

Overall, the proposal is in compliance with the Statewide Planning Goals or an appropriate exception has been taken.

25. The proposal must also conform to the relevant policies in the comprehensive plan. In discussing this requirement, only relevant comprehensive plan policies will be mentioned.

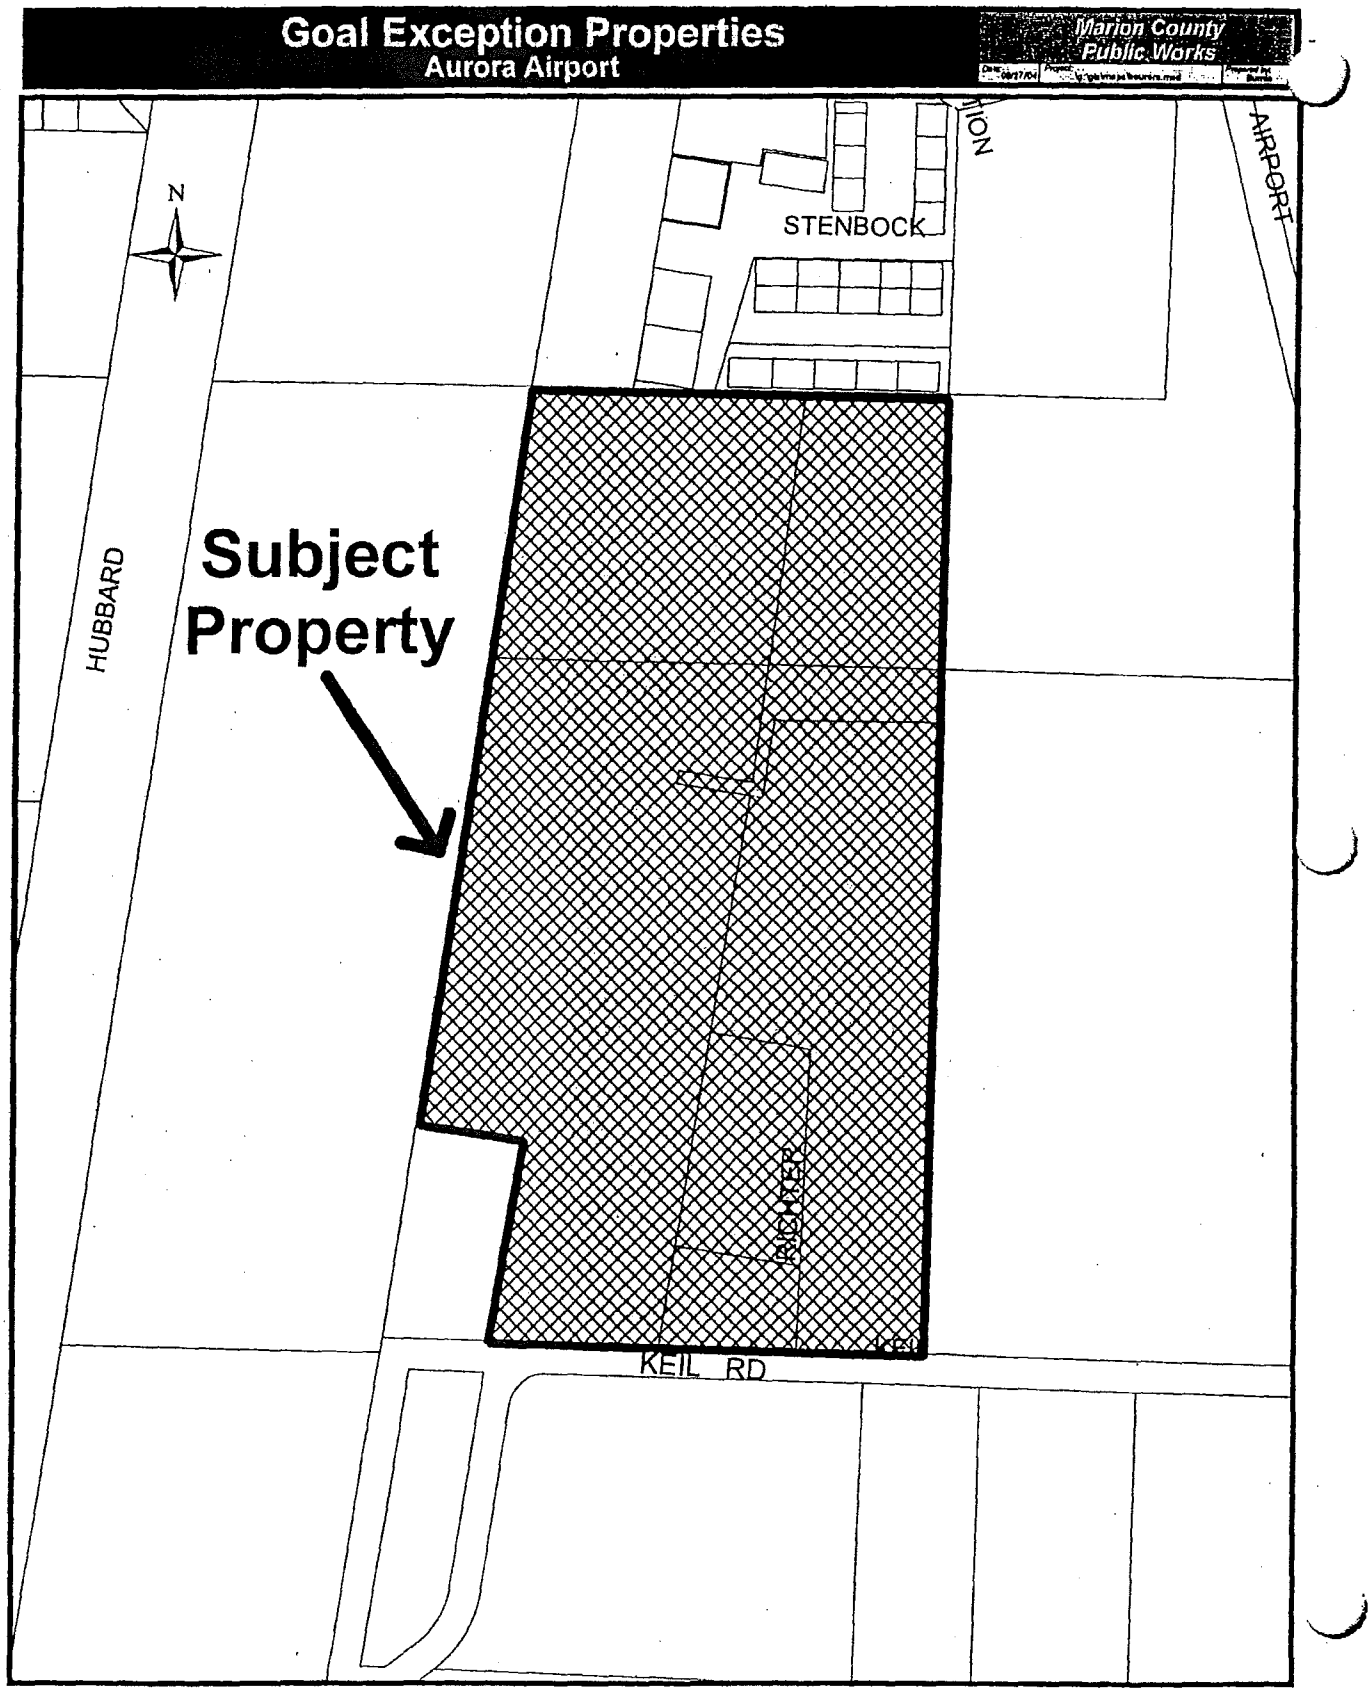
Rural Services Policy #1: The impact on existing services and the potential for additional facilities should be evaluated when rural development is proposed.

Rural Services Policy #2: It is the intent of Marion County to maintain the rural character of areas outside of urban growth boundaries by allowing those uses that do not increase the potential for urban services.

Rural Services Policy #3: Only facilities and services that are necessary to accommodate planned rural land uses should be provided unless it can be shown that the proposed service will not encourage development inconsistent with maintaining the rural density and character of the area.

Rural Services Policy #4: The sizing of public or private service facilities shall be based on maintaining the rural character of the area. Systems that cannot be cost effective without exceeding the rural densities specified in this Plan shall not be approved. The County shall coordinate with private utilities to ensure that rural development can be serviced efficiently.

Any new development on the subject properties will be airport-related and similar to, and no more intensive than, existing development. There is no evidence that the existence of the airport since 1943 has increased the need for urban services or that the development at the airport has impacted the density or character of the rural area. The shared septic facility reflects the urban nature of uses at the airport while not committing the parcels to a fully urban level of development. The parcels would still be able to be developed with urban facilities once those became available. The proposal complies with the rural development policies.



Transportation Policy #8: Airports and airstrips shall be located in areas that are safe for air operations and compatible with surrounding uses.

The existing location of the airport has demonstrated it is in a safe location for air operations. There have been concerns from neighboring residential areas regarding noise at the airport. Efforts have been made over the years to reduce the level of noise associated with airport operations. This proposal will not have an impact on airport operations and, so, will not affect the level of noise produced at the airport. The fact that many of the surrounding lands are in resource zones helps to mitigate the impact of noise from the airport on those lands and surrounding urbanized uses. The proposal complies with applicable transportation policies.

CONCLUSION:

The Board finds that the proposed exceptions meet the applicable criteria in the Oregon Administrative Rules, Oregon Revised Statutes, Statewide Planning Goals, and the Marion County Comprehensive Plan that physically developed and reasons exceptions to Goals 11 and 14 are justified for the subject properties to be able to share a septic system at the Aurora State Airport.

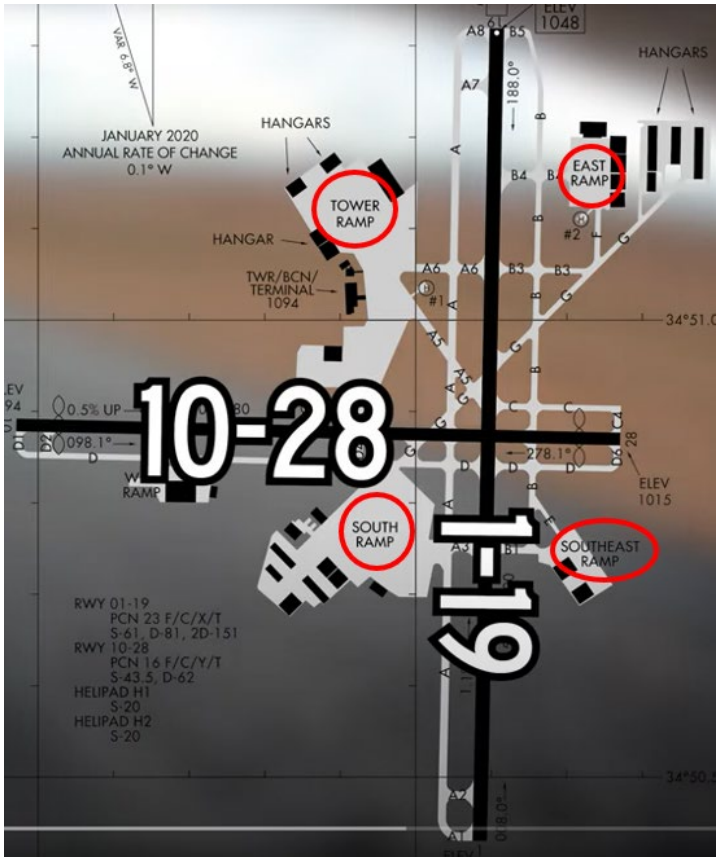
KNOW Before You Go

KNOW BEFORE YOU GO



This information is subject to change. Not for navigation or legal pre-flight action.

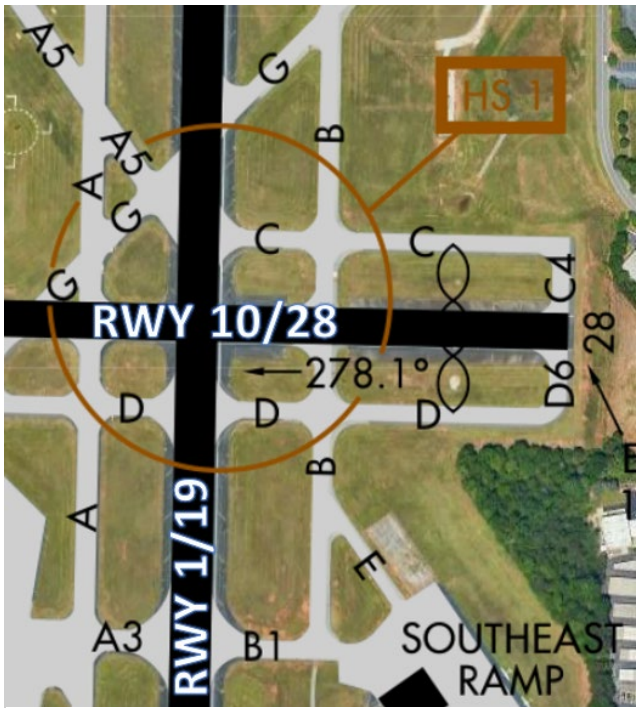
View the FAA's From the Flight Deck video to see actual KGMU airport runway approach and taxiway footage combined with diagrams and visual graphics to clearly identify hot spots and other safety-sensitive items.

Greenville Downtown Airport (KGMU) is a medium-sized general aviation airport located on the eastern edge of the city of Greenville, South Carolina. It primarily serves the general and business aviation community, air taxi traffic and a local Medivac network. This, combined with seven flight schools located on the airport, makes for a wide range of pilot experience and aircraft performance.

The airport is six miles southwest of the larger Greenville Spartanburg International Airport (KGSP) and five miles north of the Donaldson Field Airport (KGYH). Pilots have confused these airports primarily when operations are in a north configuration.

The airport configuration consists of two intersecting runways designated RWY 1/19 and RWY 10/28.
A complex taxiway system provides access to all businesses on the field, including the FBO and ramp areas which are in all four quadrants of the airport. There is a high number of vehicular traffic, including slower aircraft under tow and golf carts.

KGMU Tower
Hours of Operation – 0700L-2200L
Administrative Office
Open 0700L to 1500L - M through F
Business Phone 864-271-2033



The **airspace** at KGMU is **Class D** and underlies Greer Class C airspace. (Refer to Sectional Chart.)

Cautions

Hot Spots

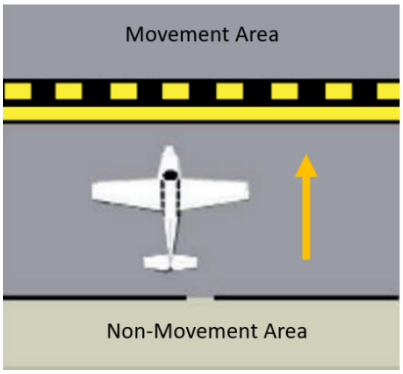
HS 1 Maintain vigilance complex RWY and TWY Intersection.

- ✓ Multiple TWYs converge at this Hot Spot and a RWY intersection adds to the complexity.
- ✓ It is necessary that the pilot follows controller instructions.
- ✓ Maintain outside vigilance and utilize the TWY and RWY signs and markings to adhere to your clearance.
- ✓ There have been several RWY incursions at this intersection.
- ✓ Always ask the controller if you are in doubt.

Hot Spot 1

Wrong Surface TWY Landing

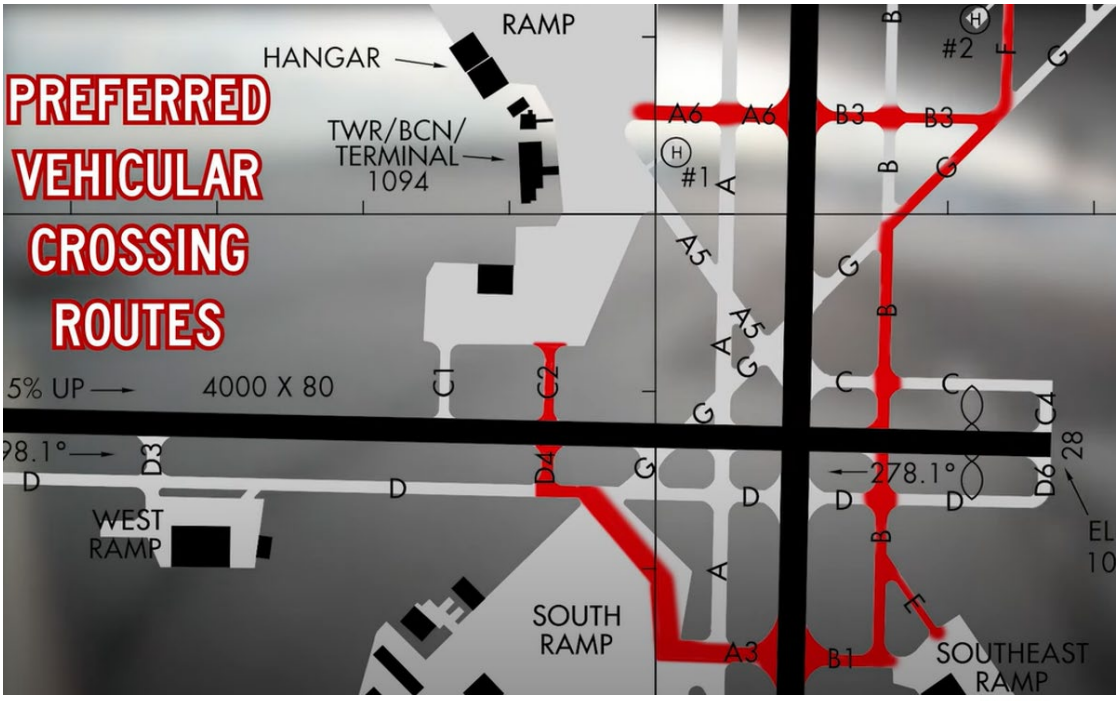
- ✓ The risk of landing on a TWY exists at airports with TWYs that parallel the adjoining RWY.



Landing

- ✓ RWY 10/28 thresholds are displaced.
- ✓ When exiting the RWY, do not **stop short** or **not completely** across the Hold Short Line. You are not clear of the RWY until every part of your aircraft is across the Hold Short Line. Not clearing the RWY may cause following aircraft to go-around.

Surface Risk – Movement Area Cautions



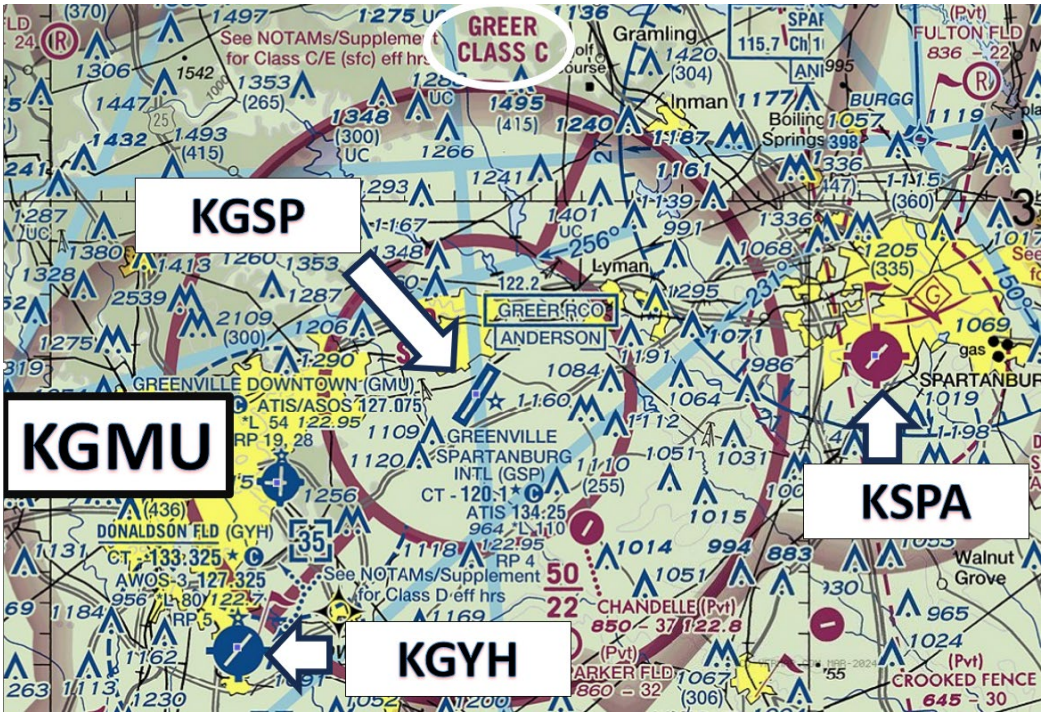
- ✓ You may receive instructions to **cross multiple runways** in a **single clearance** from TWR or Ground Control. This will only occur when the crossings are close to each other and should be obvious on the airport diagram. This procedure is designed to reduce verbiage and frequency congestion. <u>Always remember to ask the TWR if you are unsure of your clearance.</u>

- ✓ KGMU has numerous non-movement areas.
- ✓ Movement areas are **controlled.**
- ✓ All pedestrians, vehicles, or aircraft **must** obtain clearance from TWR or Ground Control to enter all movement areas.

Do Not Cross the Solid Yellow Line without Clearance from TWR or Ground Control

- ✓ KGMU has a very high-volume of vehicle operations. 5 ramp areas located in all quadrants of the airport have led to the establishment of preferred vehicular crossing routes. These are designed to provide the common and most direct routes for vehicular traffic accessing different locations on the airport. Aircraft have priority over vehicle traffic but knowing where you will likely encounter such traffic is helpful.

Additional Cautions



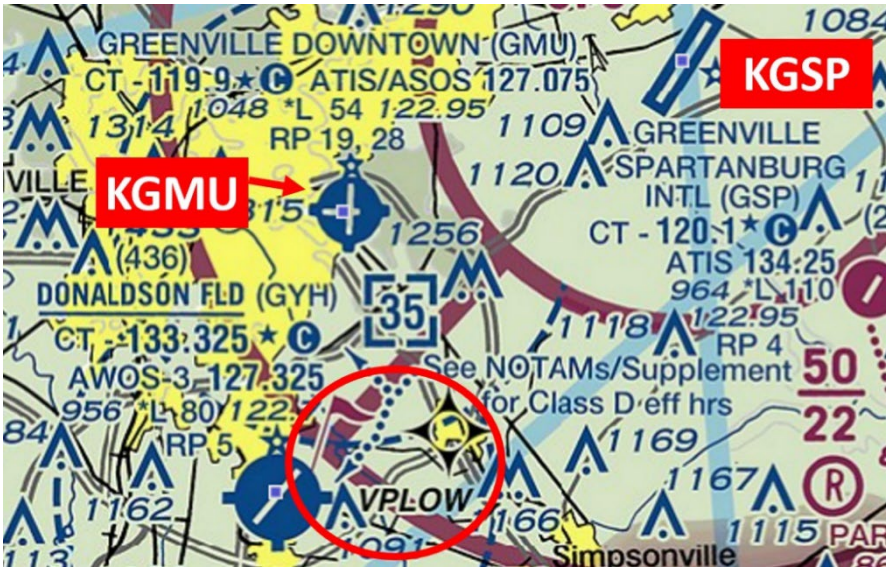
- ✓ Aircraft operating south thru east of the airport should be alert for jet and conventional traffic descending on the KGSP localizer course.
- ✓ Aircraft inbound from the SSW or on ILS RWY 1 approach, be alert for traffic 4.5 miles south operating in the Donaldson Field Airport (KGYH) traffic pattern at 1800´ or below.
- ✓ No aircraft are permitted on TWY C or TWY D when an aircraft greater than 12,500 lbs. is operating on RWY 10/28.
- ✓ RWY 10/28 restricted to small aircraft less than 12,500 lbs., when an aircraft is operating on TWY C or TWY D.
- ✓ Noise abatement procedures in effect, contact airport manager 864–242–4777.
- ✓ Engineered Material Arresting System (EMAS) is installed at the departure end of RWY 1. This system is designed to slow down or stop an aircraft in the event of a RWY over-run. Plans call for installation at the departure end of RWY 19 in the future. Use caution when operating near the RWY end to avoid entering the EMAS surface in non-emergency situations. This can cause damage to its surface.

FROM THE KGMU TOWER CONTROLLERS

The following is local airport specific information that your TWR Controllers want to pass along.

General

- ✓ Near KGMU, there are three public-use airports (KGSP, KGYH and KSPA). These airports have overlapping airspace.
- ✓ Pilots flying into this area for the first time are encouraged to familiarize themselves prior to visiting.



Traffic Patterns

- ✓ Pattern altitude 1800’ MSL/800’ AGL.
- ✓ Large aircraft pattern altitude 2000’ MSL/1000’ AGL

Takeoff/Departure

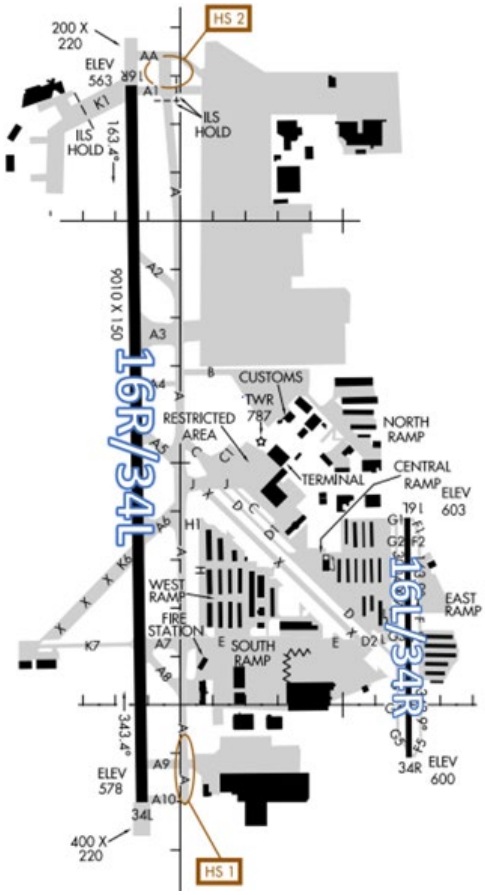
- ✓ VFR departures must remain clear of GSP Approach Control Airspace.
- ✓ When KGSP is on a north operation, (using RWY 4), all VFR departures wishing for an on course heading of 010° to 190° are required to depart via **VFR waypoint VPLOW** (GMU 165/4.5). See illustration below or accept VFR Flight Following with a VFR squawk.

Arrival/Landing

- ✓ Arrivals must be alert for VFR pattern aircraft at the KGYH airport approximately 5 miles south of KGMU.
- ✓ KGMU arrivals should not descend below 2300 MSL while over-flying KGYH Class D airspace.

This information is subject to change. Not for navigation or legal pre-flight action. Refer to official pre-flight materials such as, but not limited to, NOTAMs, Airport Diagrams, Chart Supplement and VFR charts for the current airport-specific details.

KNOW Before You Go



KNOW BEFORE YOU GO

This information is subject to change. Not for navigation or legal pre-flight action.

View the FAA's From the Flight Deck Video to see actual KPAE airport runway approach and taxiway footage combined with diagrams and visual graphics to clearly identify hot spots and other safety-sensitive items.

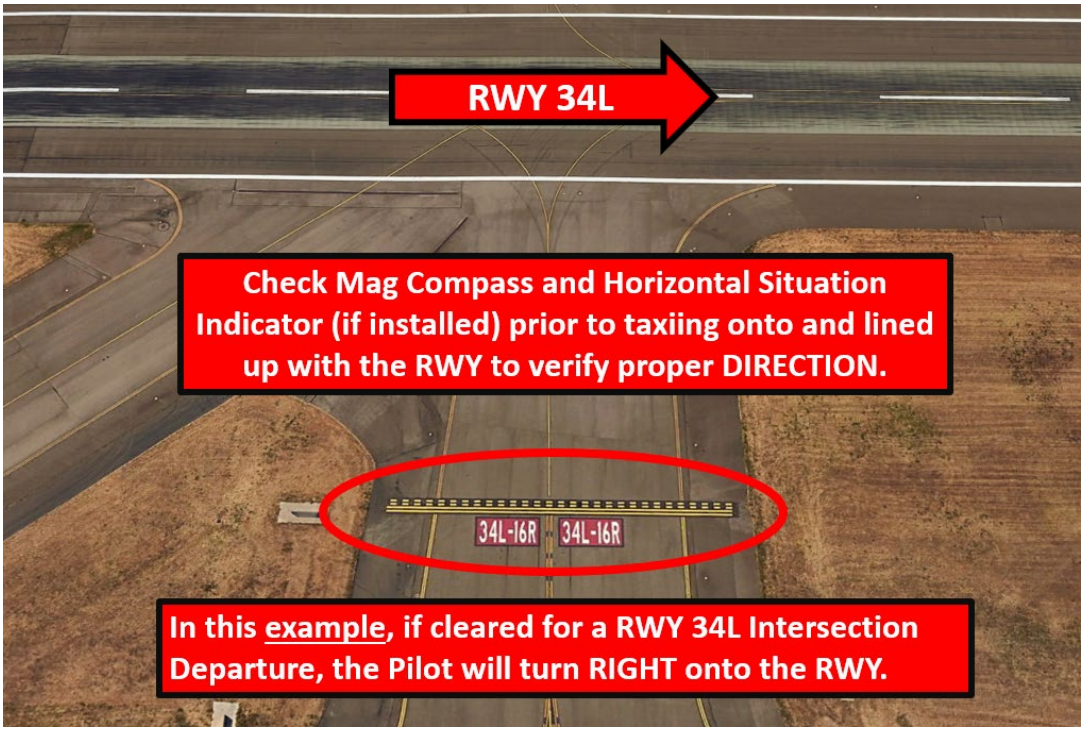
Seattle Paine Field International Airport (KPAE) is a medium sized multi-use airport, located approximately 25 miles north of Seattle's Sea-Tac International Airport (KSEA), and just east of the Puget Sound in Everett, WA. While it is primarily a general aviation airport, there is a large Boeing Aircraft manufacturing facility on the field. Test flights and taxi tests with large and heavy jet traffic are common. KPAE has daily air carrier operations as well as several flight schools located on the airport.

- ✓ The airport configuration consists of two parallel RWYs with staggered thresholds designated RWY 16L/34R and RWY 16R/34L.
- ✓ There is a full-length parallel TWY associated with both RWYs.
- ✓ TWY system provides access to all services, terminals, and businesses, primarily located between the RWYs.

The **airspace** at KPAE is **Class D** and partially underlies Seattle Class B airspace. (Refer to Sectional Chart.)

KPAE TWR
Hours of Operation – 0700L-2100L
Administrative Office
Open 0700L to 1500L - M through F (may vary)
Business Phone 425-923-1400

Cautions

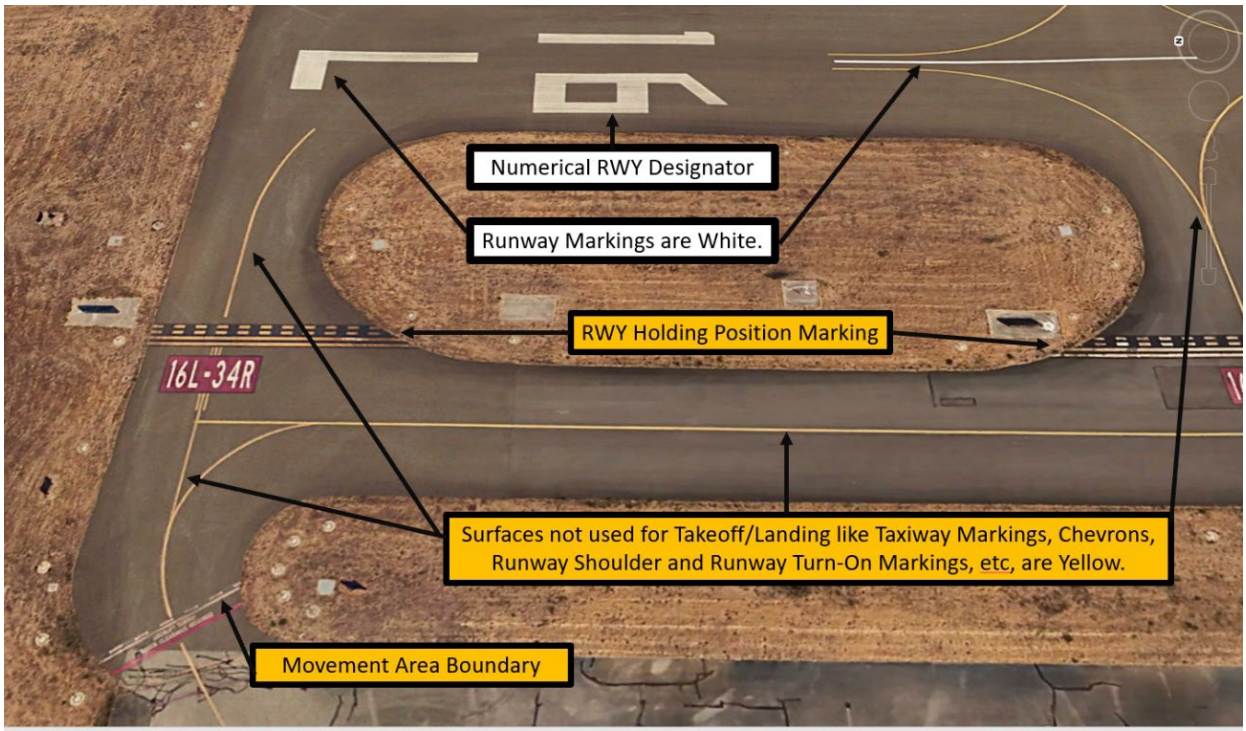


Hot Spots

HS 1 TWY A between TWY A9 and TWY A10 not visible from ATCT.
HS 2 Enter RWY 16 full length via TWY A1 unless TWY AA specified by ATC.

Wrong Surface Intersection Takeoff

- ✓ Pilots lining up or turning in the wrong direction when cleared for an intersection



takeoff is a **recurring issue** at KPAE.

- ✓ **Apply the above example to your situation**. If taxiing from the opposite direction the RWY markings will have the numbers reversed.

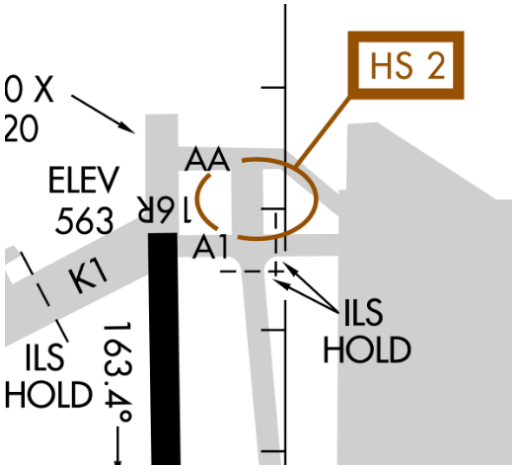
Wrong Surface Taxiway Takeoff

- ✓ When TWYS parallel RWYs, the potential exists for **taking off on a TWY**.

Wrong Surface Landing

- ✓ At airports with parallel RWYs, the potential exists for landing on the wrong RWY.
- ✓ RWY 16L/34R is half the size of the larger RWY 16R/34L.

- ✓ Staggered RWY thresholds at KPAE increase the risk of mis-identifying and landing on the wrong RWY. See Arrival Alert Notices for more graphics and information.



Surface Risk – Movement Area Cautions

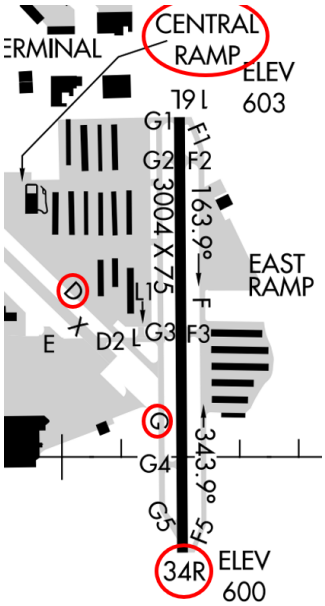
- ✓ Hot Spot 1 is located at the south end of TWY A between TWYs A9 and A10. This area is not visible from the TWR. Pilots are urged to provide precise position reports in this area when taxiing to RWY 34L .

Hot Spot 1

- ✓ Hot Spot 2 is located at the approach end of RWY 16R. TWY A1 is the normal route for aircraft taking off on RWY 16R.
- ✓ Pilots requiring TWY AA for the full length of RWY 16R must have TWR approval prior to taxiing north of TWY A1.

Hot Spot 2

FROM THE KPAE TOWER CONTROLLERS

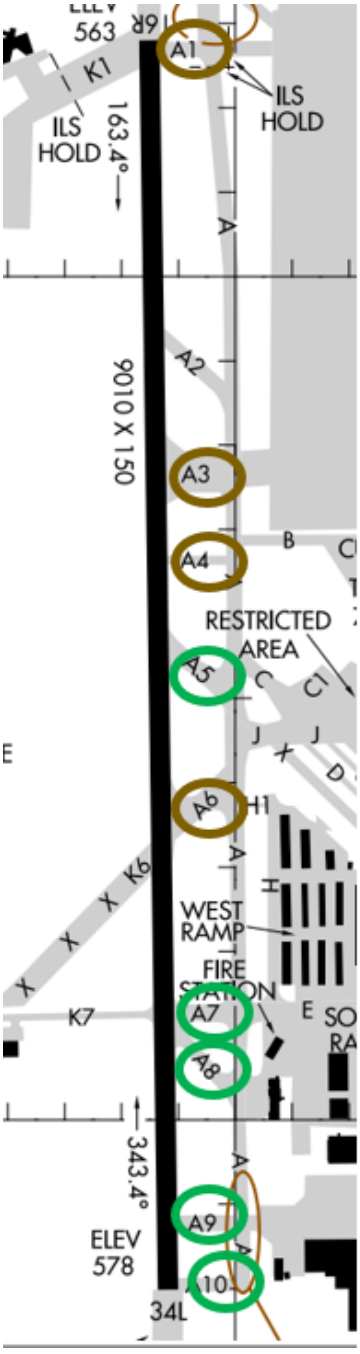


The following is local airport specific information that your TWR Controllers want to pass along.

Traffic Patterns

- ✓ Given the nature of mixed type aircraft operating at KPAE, pattern entries to aircraft may be amended by ATC to better accommodate all users. This includes, but is not limited to, amending pattern entries, holding aircraft outside of Class Delta airspace, or changing runway assignment.
- ✓ RWY 16L/35R is closed when TWR is closed. Use CTAF 132.95.

Ground Control



- ✓ Aircraft waiting to leave the central ramp to taxi to RWY 16L/34R may need to specify if they are closer to TWY G or TWY D on initial call up.
- ✓ Sometimes taxi instructions to RWY 34R are issued utilizing TWY D to TWY G and some aircraft will utilize TWY G only.
- ✓ Providing this detail can help alleviate issues with potential taxi conflicts and minimize frequency congestion during busy traffic periods.

- ✓ Aircraft requesting the full length on RWY16R/34L may need to give way to taxiing jets which may include moving aircraft to the TWY A9 intersection for RWY34L, requesting they conduct a run up closer to the Boeing North Ramp or by the TWY AA intersection for RWY16R, if requested by ATC.

Takeoff/Departure

- ✓ KPAE has experienced **Wrong Surface Intersection Departures**, especially when departing RWY16R/34L because of the angle of the TWYs.
- ✓ In these events, the aircraft involved read back the appropriate information to the controller but either started take-off roll or lined up in the **wrong direction**.

- ✓ To mitigate this, **RWY16R intersection departures will be assigned TWYs A1, A3, A4 and A6 intersections.**
- ✓ **RWY 34L intersection departures will be assigned TWYs A10, A9, A8, A7 and A5 intersections.**
- ✓ Pilots should always verify that their heading indicator aligns with the assigned RWY.
- ✓ When departing RWY16L/34R, advise TWR that you are ready for take-off only when you are number one at the hold short line for your respective intersection. This alleviates unnecessary frequency congestion since aircraft are unable to taxi past one another here.

Arrival/Landing

- ✓ Remain vigilant to your **assigned** RWY. KPAE has experienced wrong surface landings.
- ✓ Ask ATC for clarification immediately if you are not sure of your assigned RWY.

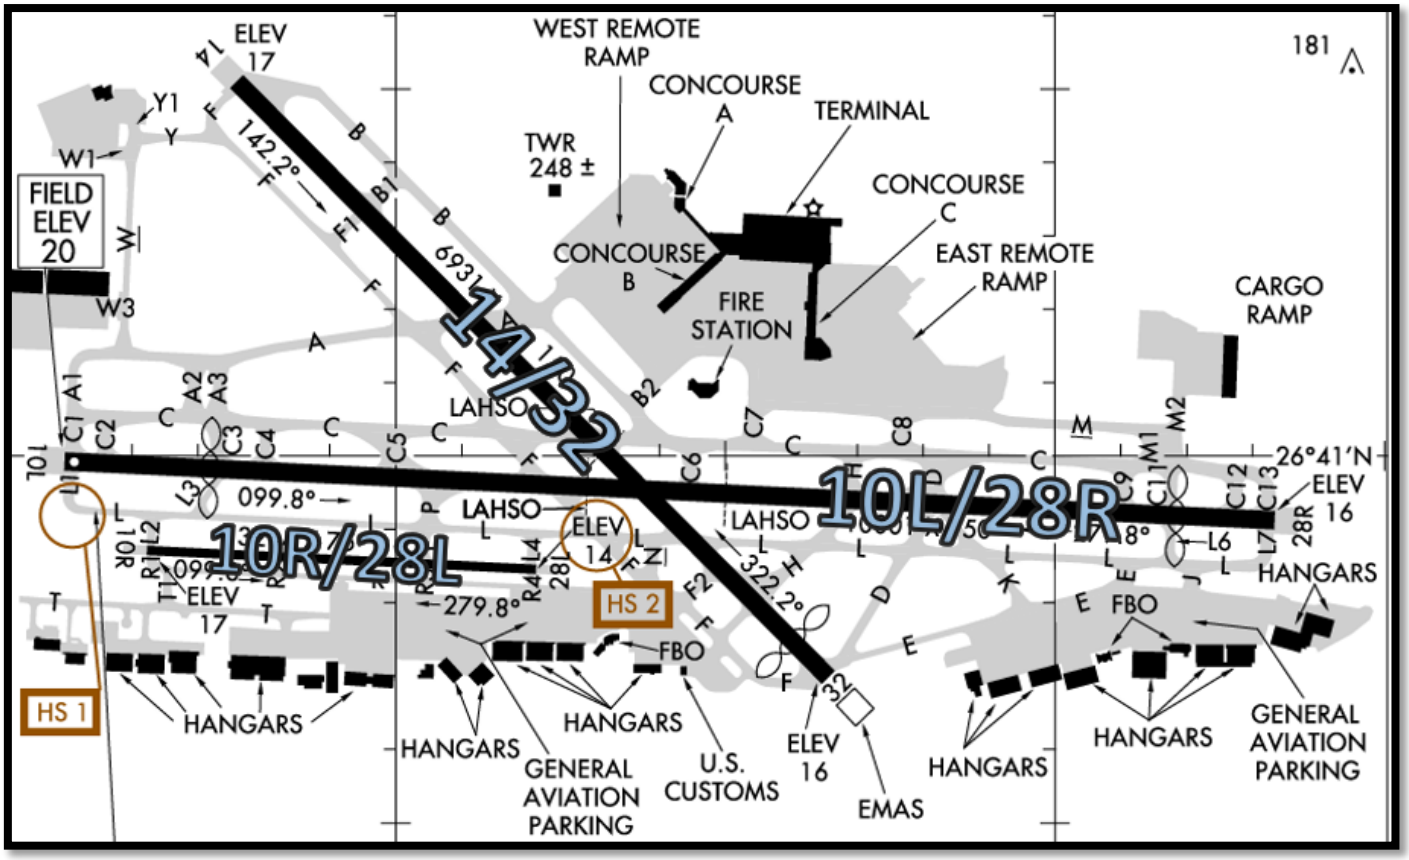
- ✓ Airport Road, which is a four-lane highway that runs north-south from the Boeing Fwy and the Boeing plant, may be confused as RWY16L before it makes a slight turn to the southeast. Pilots who are not familiar with the airport or the area, when making a “straight-in” approach from the north or turn a one/two-mile left base for the runway should be aware of this. This confusion is increased during sunset when visibility is impacted by the sun.
- ✓ The intersection of RWY16L/34R and TWYs G and TWY G3 is a place of frequent congestion.
- ✓ Arriving aircraft exiting the RWY at TWY G3 may receive complex taxi instructions to allow following aircraft to exit at TWY G3.
- ✓ Certain aircraft, like the Embraer 135 and the Boeing 737, are equipped with a Traffic Alert and Collision Avoidance System (TCAS), that may trigger an avoidance maneuver if that system senses a potential collision. This may involve a change of direction and altitude. To avoid this from happening in the traffic pattern, TWR may direct aircraft to make some adjustments like extending or widening pattern legs or even executing a 360-degree turn.

Special Traffic (Military / Commercial / Helicopter, etc.)

- ✓ Boeing test aircraft may have requests that are not routine.
- ✓ Accommodating regular commercial service may cause brief delays for other users to RWY 16R/34L.
- ✓ Aircraft may be asked to make a full stop taxi back or change to RWY 16L/34R if reasonable to accommodate these requests.

Additional Information

- ✓ Limiting cockpit distractions may reduce hear-back/read-back errors and help to reduce ATC workload and increase overall safety.
- ✓ Noise sensitive airport; for noise abatement procedure and traffic procedure call airport operations 425-388-5125. It is required that pilots adhere to noise abatement procedures unless otherwise instructed by ATC.
- ✓ First 1000'of RWY 16R is concrete.
- ✓ Avoid low level overflight of Boeing ramp and NE corner of airport due to jet blast.



This information is subject to change. Not for navigation or legal pre-flight action. Refer to official pre-flight materials such as, but not limited to, NOTAMs, Airport Diagrams, Chart Supplement and VFR charts for the current airport-specific details.

KNOW BEFORE YOU GO

This information is subject to change. Not for navigation or legal pre-flight action.

View the FAA's From the Flight Deck Video to see actual KPBI airport runway approach and taxiway footage combined with diagrams and visual graphics to clearly identify hot spots and other safety-sensitive items.

Palm Beach International Airport (KPBI) is a medium-sized, mixed-use airport located on the east coast of Florida, between the cities of West Palm Beach and Lake Worth. Pilots who are not familiar with the area should be aware that North Palm Beach County General Aviation Airport (F45) is located approximately 10 miles northwest with a very similar RWY configuration. The traffic mix at KPBI consists of air carrier, corporate, and general aviation. Several flight schools use KPBI to expose student pilots to towered airport operations.

- ✓ KPBI has two parallel RWYs designated RWY 10L/28R and RWY 10R/28L.
- ✓ Note that RWY 10L/28R is much longer and wider than parallel RWY 10R/28L.
- ✓ RWY 10R/28L has staggered thresholds at both ends.
- ✓ A third RWY designated RWY 14/32 intersects RWY 10L/28R.

There is a complex TWY system that provides access to all facilities. General aviation and corporate facilities are located on the north and south sides of the airport.

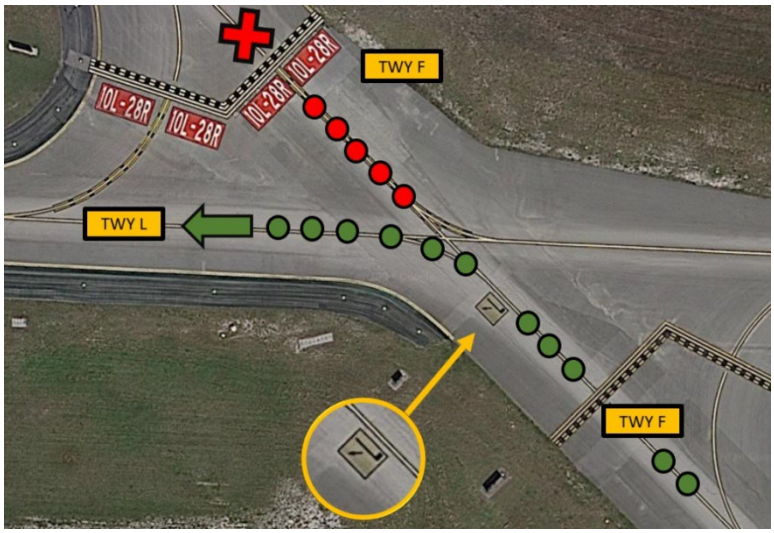
The **airspace** at KPBI is **Class C**. (Refer to Sectional Chart)

KPBI TWR
Hours of Operation – 24 hours
Administrative Office
Open 0730L to 1600L - daily
Business Phone 561-275-1401

CAUTIONS

Hot Spots

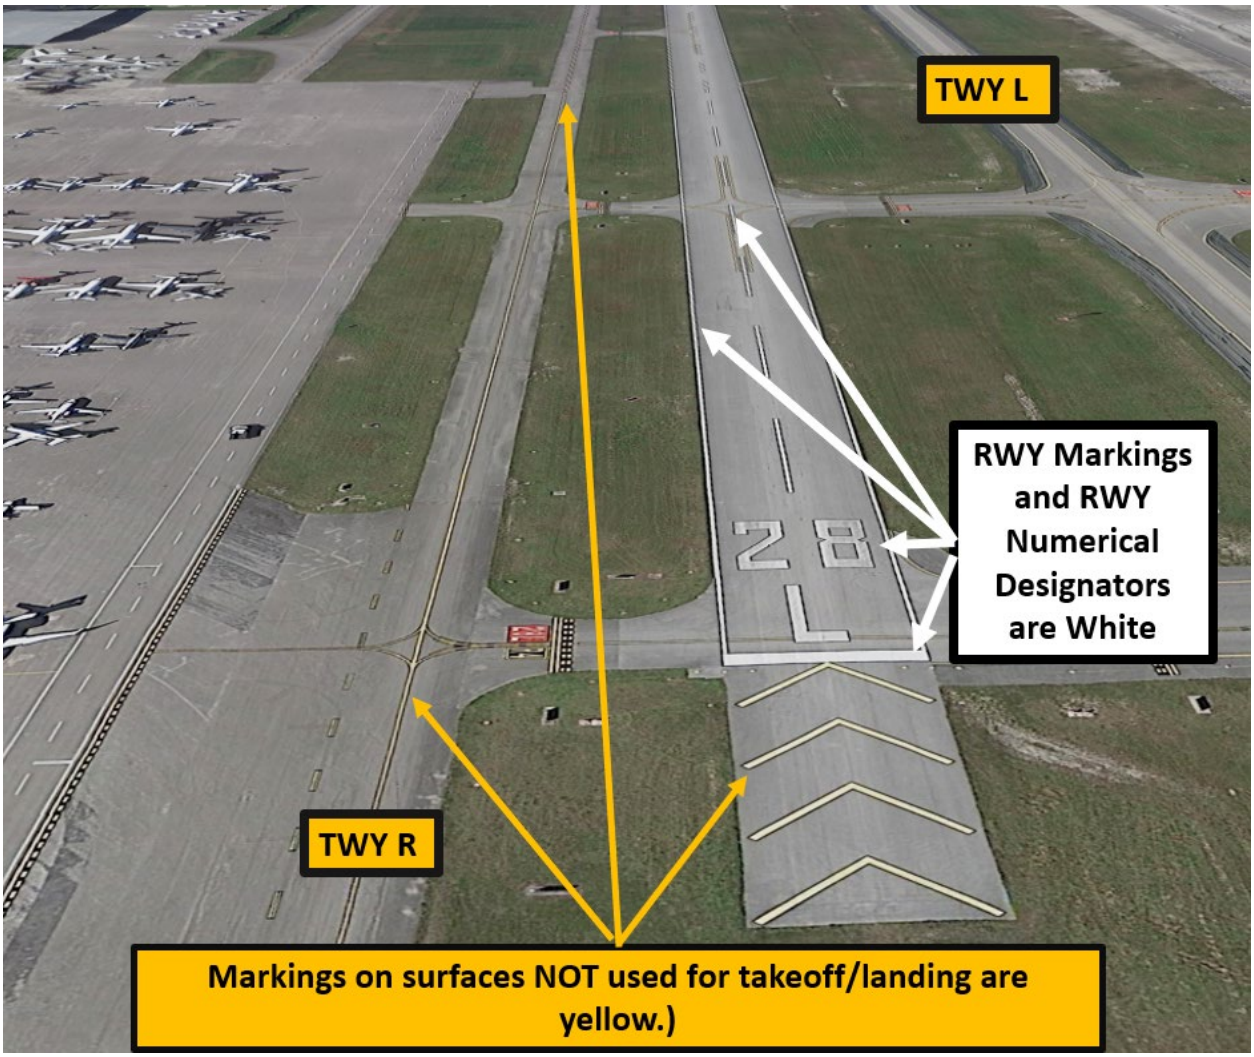
HS 1 RWY 10L hold short line on TWY L is located prior to the bend in the TWY.



- ✓ Pilots have failed to recognize that the hold short line is located on TWY L and have made the turn onto TWY L1 and entered the Runway Safety Area for RWY 10L.

Hot Spot 1

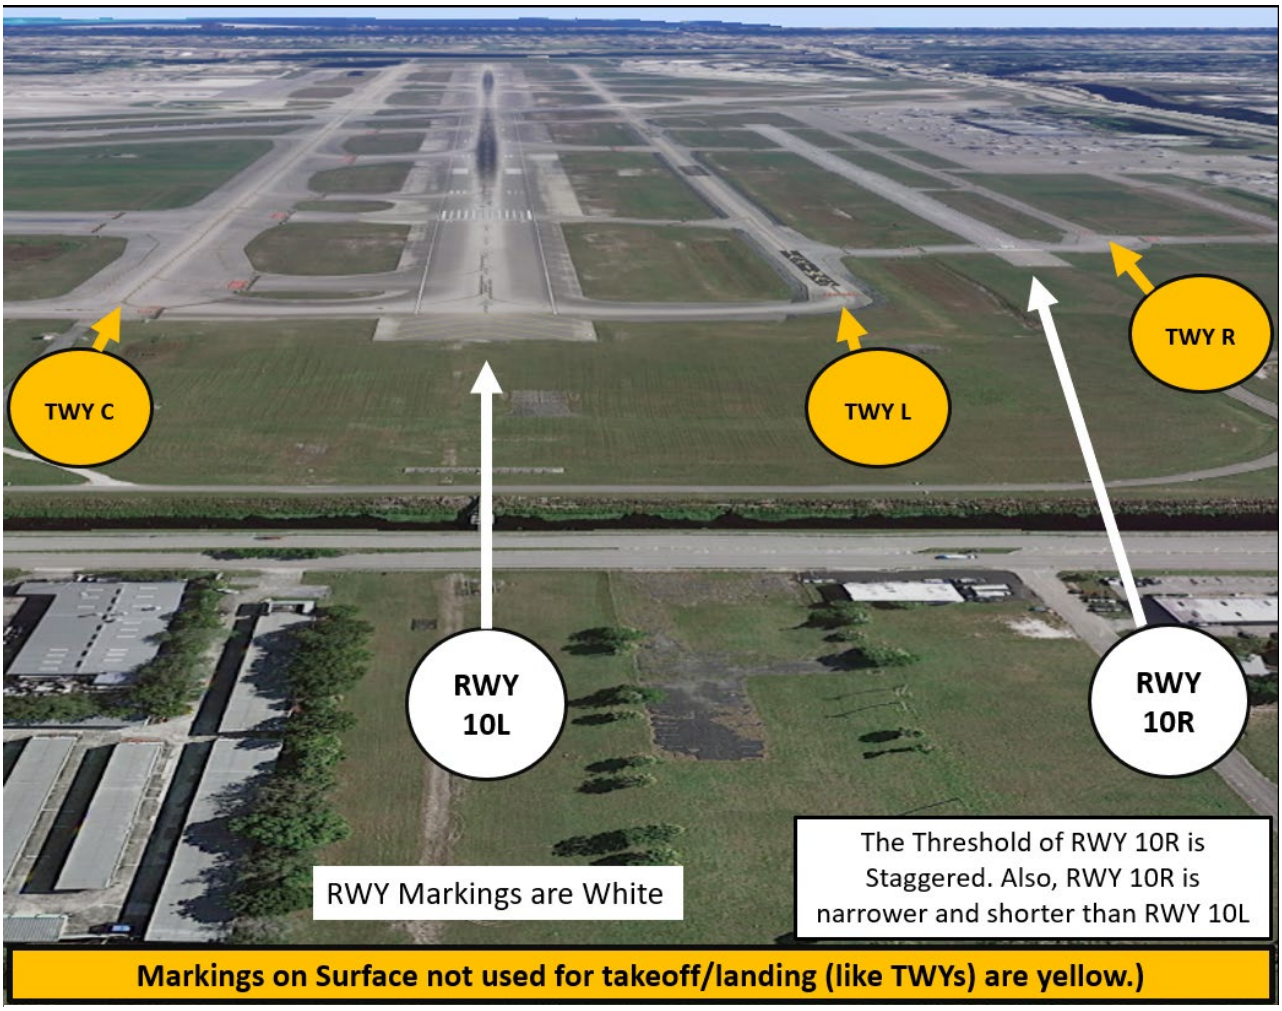
HS 2 Aircraft NW-bound on TWY F missing left turn onto TWY L.



- ✓ Pilots taxiing from the south side of the airport and cleared to RWY 10L via TWY F to join TWY L have missed the turn and entered RWY 10L/28R.

Hot Spot 2

Wrong Surface TWY Takeoff

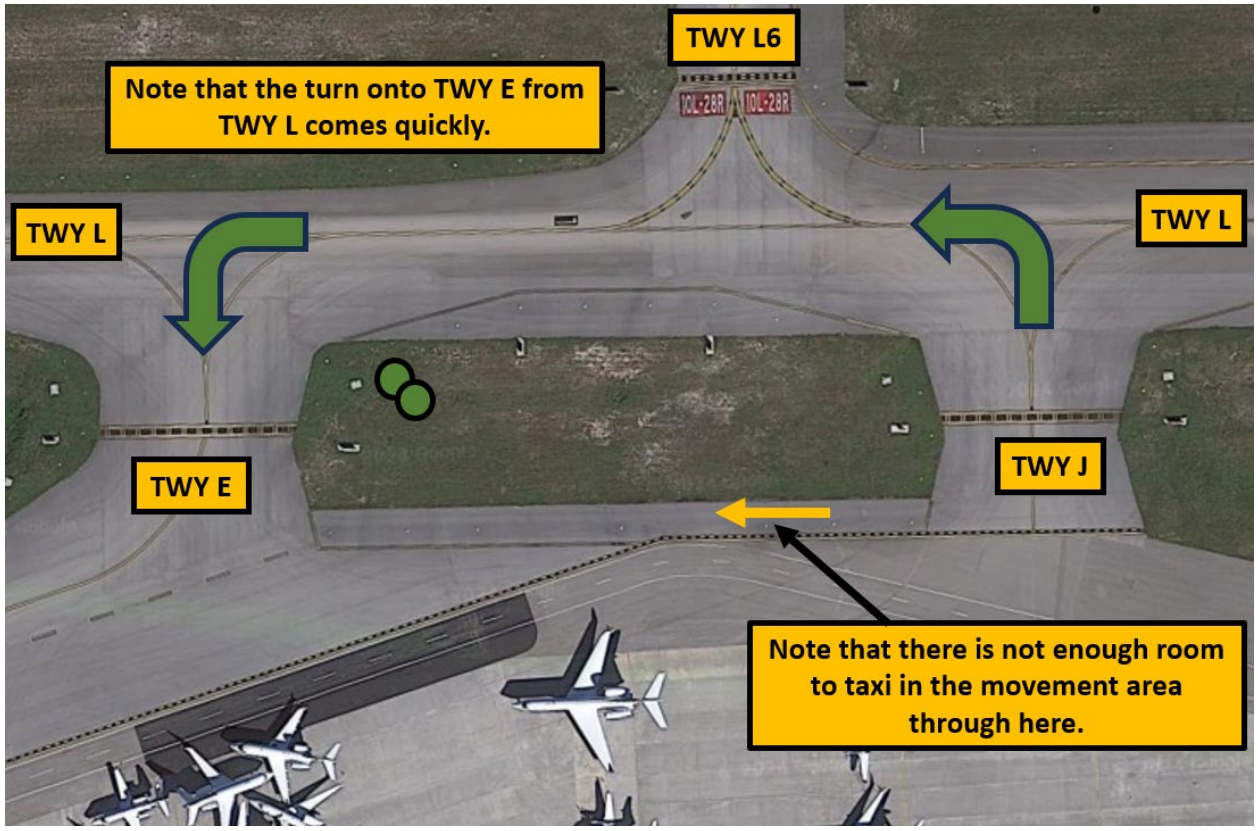


- ✓ Numerous TWYs parallel all RWYs at KPBI.
- ✓ Some of these run full length and can be mistaken for a RWY.
- ✓ The potential exists for a pilot to take off on a TWY.
- ✓ The illustration below is an example that illustrates TWY R and its position relative to RWY 28L.
- ✓ Note that this example applies to any airport.

Parallel TWY R and RWY 28L

Wrong Surface RWY Landing (See Arrival Alert Notices.)

- ✓ Parallel RWYs with staggered thresholds increase the risk for a Wrong Surface RWY Landing. The pilot may be drawn to the first RWY that comes into view when the thresholds are staggered.
- ✓ The pilot may land on the larger or more dominant RWY.
- ✓ If available, programming the instrument approach procedure to the RWY may help to identify the correct RWY.



Parallel RWYs with Staggered Thresholds and Parallel TWYS

Wrong Surface TWY Landing

- ✓ Like taking off on a TWY, (see "Wrong Surface TWY Takeoff" above), the risk of **landing** on a TWY increases whenever a TWY runs parallel to a RWY.
- ✓ Programming an instrument approach procedure may prevent the pilot from lining up and landing on a TWY.

Surface Risk – Movement Area Cautions

- ✓ Aircraft coming out of Jet Aviation, during east traffic operations, and instructed to taxi via TWY J, TWY L, TWY E should note that **TWY E comes up very quickly** once you have turned onto TWY L. (See illustration below.)

- ✓ There is a **vehicle service road** near the customs ramp. This is not a TWY. (See illustration below).

Do not confuse this Vehicle Service Road with TWY F.

Additional Cautions

- ✓ Land and Hold Short Operations (LAHSO) may be conducted on:

Landing RWY	Hold Short Point
RWY 10L	14/32
RWY 14	10L/28R
RWY 28R	14/32

- ✓ Noise abatement procedures are in effect.
- ✓ RWY 14 has Engineered Material Arresting System installed at Departure End.

FROM THE KPBI TOWER CONTROLLERS

The following is local airport specific information that your TWR Controllers want to pass along.

Ground Control

- ✓ During periods of busy departure demand (i.e., Sundays from December – April), PBI will normally open Gate Hold for air carrier and business traffic.
  - Generally, once an aircraft receives their clearance, they will be instructed to contact Gate Hold for an engine start time once they are ready to depart.
  - Gate hold will then instruct the aircraft to monitor Ground Control at the appropriate time.
  - Generally, Gate Hold tries to meter aircraft in 15-minute increments with an attempt to keep 7-10 aircraft at the end of the runway, ready for departure.
- ✓ Frequency congestion on Ground Control becomes an issue when ground stops or re-routes are initiated, because aircraft then start requesting re-routes or new times.
  - It is recommended that you contact clearance delivery if you want to inquire about a new route or time.
  - Do not contact ground control, as they are focused on aircraft movement on the airfield.
- ✓ As a best practice, it is best to be patient and wait for the controller to reach out to you, versus tying up the frequency while other aircraft are attempting to get their initial clearances.
- ✓ Another best practice is to monitor ground control (versus checking in) when instructed by gate hold. By monitoring ground control, the ground controller can ensure he/she talks to the right aircraft at the right time to set up the sequence for local control based on miles in trail, EDCTs, etc.
- ✓ Aircraft that taxi from Jet East ramp can expect taxi instructions via Juliette, Lima, Echo for runway 10L, 14, or 10R.
  - Use caution for a quick left turn from Lima onto Echo.

Runway Crossings

- ✓ The controllers at PBI will be specific with runway crossing instructions.
- ✓ Ensure you readback all runway crossing instructions [with call sign].

Departure/Takeoff

- ✓ Aircraft should expect to fly the RNAV SIDS unless otherwise instructed or equipment limitations prevent this.
    - During periods of heavy departure demand, you may be issued an initial departure heading and altitude. In these cases, expect to resume the assigned SID.

Arrival/Landing

- ✓ Runway 10R/28L is hard to see and the threshold for 10R/28L does not align with runway 10L/28R [staggered – see illustration below].
- ✓ Many aircraft mistake taxiway Lima for runway 10R/28L.
- ✓ Ensure you have runway 10R/28L clearly in sight prior to short final.
  [TWY L is located between RWYs 10L/28R and RWY 10R/28L – see illustration below.]
  [TWY L is wider and longer than RWY 10R/28L.]
  [Do not confuse TWY L for the RWY - See illustration below.]

RWY 10R/28L parallels TWY L to the north and TWY R to the south.

Weather

- ✓ KPBI airspace is exposed to thunderstorms predominantly from June through October.
- ✓ LLWAS equipment is available at KPBI to help detect windshear around the field.
- ✓ PIREPs are always appreciated, including PIREPs for no significant weather when thunderstorms are forecast for the area.

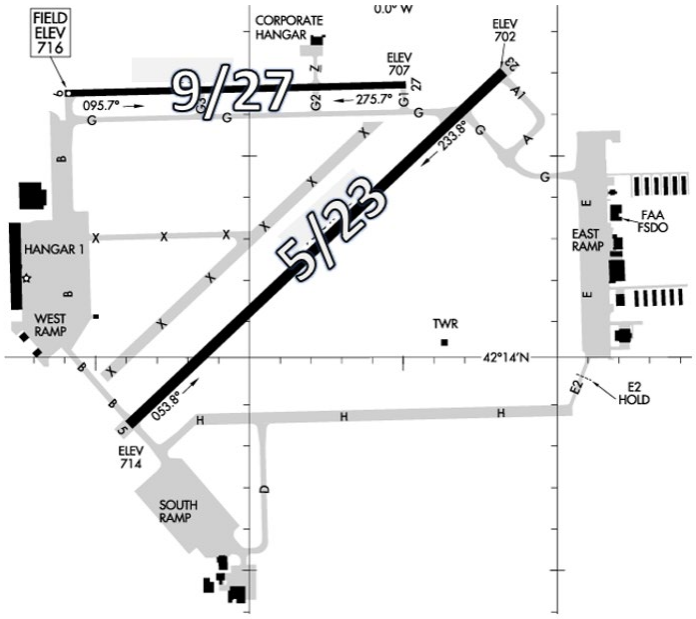
Special Traffic

- ✓ KPBI has a variety of helicopters on the field, including law enforcement, local news, agriculture, and medevac.
- ✓ Use caution for low flying helicopters as you approach the field from the east and west.
- ✓ KPBI uses a “shoreline” transition procedure to allow VFR aircraft to transition from north to south (or vice versa) at low altitudes. Generally, these aircraft will be at 500’ over the shoreline or 1,000’ 1NM offshore.
- ✓ Use caution when departing runway 10L for these low flying aircraft.

Additional Information

- ✓ Due to the location of KPBI, expect frequent TFRs for VIP movement and special events.
  - Always check NOTAMs prior to flying in/around KPBI airspace to ensure these TFRs are not in effect.
  - TFR restrictions will be listed in the NOTAM.
  - These TFRs are subject to frequent change.
- ✓ During periods of high volume at KPBI, expect excessive delays for practice approach requests.
- ✓ KPBI will initiate programs to manage traffic inbound to KPBI during periods of high arrival traffic. During these times, pilots changing their destination from a different airport to KPBI may have their request denied.

This information is subject to change. Not for navigation or legal pre-flight action. Refer to official pre-flight materials such as, but not limited to, NOTAMs, Airport Diagrams, Chart Supplement and VFR charts for the current airport-specific details.



KNOW BEFORE YOU GO

This information is subject to change. Not for navigation or legal pre-flight action.

The FAA will release a From the Flight Deck Video which will highlight actual KYIP airport runway approach and taxiway footage combined with diagrams and visual graphics to clearly identify hot spots and other safety-sensitive items.

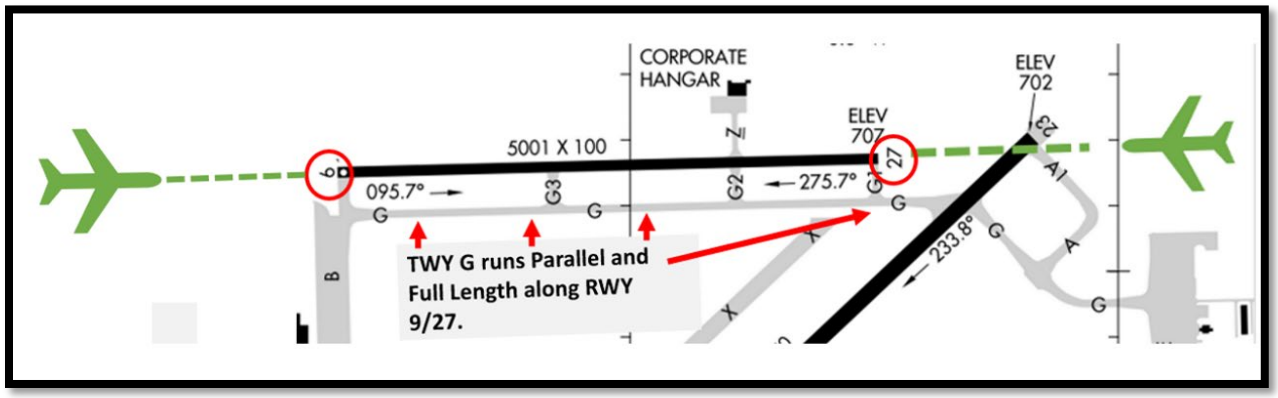
Willow Run Airport (KYIP) is a general aviation airport located on the eastern edge of the city of Ypsilanti, Michigan, and approximately eight miles west of the Detroit Metro Wayne County Airport (KDTW). It serves local and transient general aviation, business, air taxi and military operations. Combined with several flight schools located on the airport, the traffic mix makes for a wide range of pilot experience and aircraft performance.

The airport configuration consists of two runways (RWYs) designated RWY 5/23 and RWY 9/27. These RWYs converge at the northeast end of the field but do not intersect.

A complex taxiway (TWY) system provides access to all businesses on the field, including the FBO and ramp areas which are in all four quadrants of the airport.

KYIP Tower
Hours of Operation – 24 hours
Administrative Office
Open 0730L to 1700L - M through F
Business Phone 734-961-6845

The **airspace** at KYIP is **Class D** and underlies Detroit Class B airspace. (Refer to Sectional Chart.)



Cautions

Hot Spots

There are no Hot Spots at KYIP.

Wrong Surface TWY Takeoff and Landing

- ✓ Be alert to TWYs that parallel RWYs. They have been mistaken for the adjoining RWY for both takeoff and landing.
- ✓ **At KYIP, TWY G runs full-length and lies just south of RWY 9/27 (see illustration below).**
- ✓ Always use the Airport Markings and Signage along with the published Airport Diagram to verify your position.
- ✓ Surface "Markings" for RWYs are always WHITE. Markings on surfaces that are not used for takeoff or landing are painted YELLOW.
- ✓ Additionally, RWYs are identified by a WHITE number painted at the approach end.

TWY G in relation to RWY 9/27

- ✓ **Another potential for a Wrong Surface Landing exists on a closed surface marked with X's.**
- ✓ This surface parallels and lies just north of RWY 5/23.

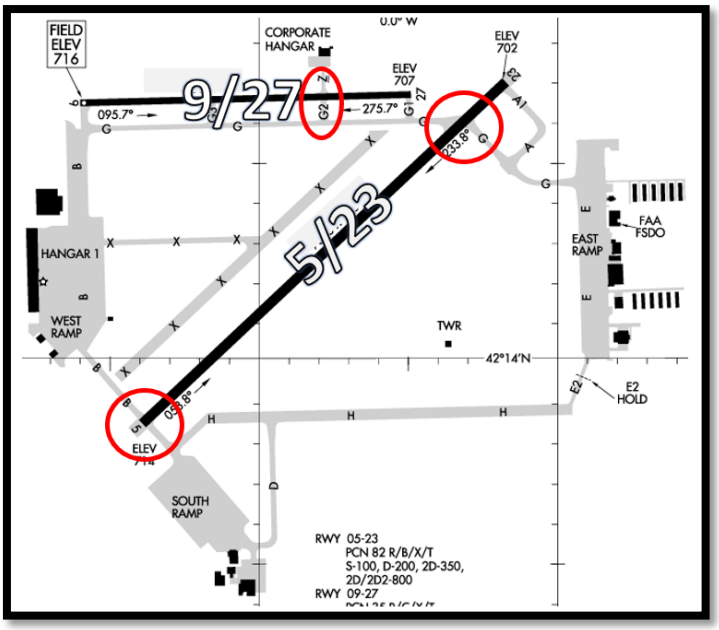
FROM THE KYIP TOWER CONTROLLERS

The following is local airport specific information that your TWR Controllers want to pass along.

General

- ✓ KYIP is home to two flights schools, MANG Aero Flying Club, ATP Flight School, and Crosswinds Aviation.

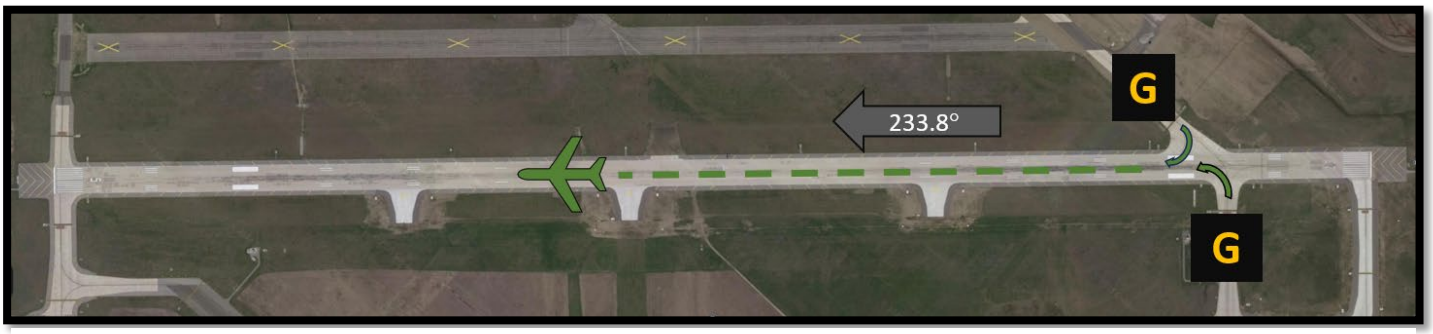
Traffic Patterns



- ✓ TWR will assess the current hourly winds and based upon them they will conduct either left or right traffic on RWYs 5/23 and/or RWYs 9/27.
- ✓ Please fly a standard traffic pattern in accordance with the AIM and the FAA Airplane Flying Handbook unless otherwise approved or directed by the controller.
- ✓ Request early turns and non-standard traffic patterns from the controller.

Ground Control

- ✓ You can contact KYIP Ground Control on 119.975. They also monitor Clearance Delivery on 118.175.
- ✓ KYIP east, west, and south ramps are uncontrolled. All aircraft must contact Ground Control for instructions onto active TWYs.
- ✓ Readback of all hold short instructions are mandatory.



RWY Crossings

- ✓ RWY crossings take place at three locations.
  - TWY Z and G2 (RWY 9/27).
  - TWY G (RWY 23 approach end),
  - TWY B (RWY 5 approach end).

Takeoff/Departure

- ✓ TWR frequency is 125.275 (VHF) and 256.9 (UHF).
- ✓ When KYIP is departing RWY 23, intersection takeoffs at TWY G are available upon request.
- ✓ When pattern work is being conducted on RWY 9/27, departing RWY 23 from TWY G will be the most expeditious (upon request).

TWY G Intersection Takeoff RWY 23

- ✓ Distance remaining on RWY 23 at TWY G intersection is 6,700 ft.
- ✓ At an intersection, the white numerical RWY Designators may not be visible.
- ✓ Use the red RWY Holding Position markings/signs to identify the RWY.
- ✓ Before entering the RWY and when lined up on the RWY, **check** the Magnetic Compass and the Horizontal Situation Indicator (HSI), if installed, to **verify** that the aircraft is pointed in the **correct direction**.

Arrival/Landing

- ✓ Detroit Approach will normally sequence all IFR aircraft to RWY 5/23. YIP ATCT may change this RWY assignment and/or sequence due to VFR traffic in the KYIP Class D airspace, normally upon initial contact.
- ✓ VFR Practice Instrument Approaches are covered in Letter to Airmen: LTA-D21-32 which can be found in NOTAMS.
- ✓ **When inbound to RWY 9/27, ensure that you are lined up with the numbered RWY surface and not the parallel TWY.** (See Wrong Surface TWY Takeoff and Landing section above.)

Special Traffic (Military / Commercial / Helicopter, etc.)

- ✓ Helicopter operations are not permitted or conducted on the south ramp.

This information is subject to change. Not for navigation or legal pre-flight action. Refer to official pre-flight materials such as, but not limited to, NOTAMs, Airport Diagrams, Chart Supplement and VFR charts for the current airport-specific details.

U.S. DEPARTMENT OF TRANSPORTATION
FEDERAL AVIATION ADMINISTRATION

National Policy

ORDER NUMBER 5300.1G
Effective Date: 9/29/17

SUBJ: Modifications to Agency Airport Design, Construction, and Equipment Standards

1. Purpose of this Order. This order establishes the process for the initiation, revision, coordination, and management of Modifications of Standards (MOS) applicable to airport design, construction material, and equipment projects. This order is the foundation of a web-based automated application of MOS. The automated application for submitting MOS is a step-by-step process facilitated within Airports Geographic Information System (AGIS).

2. Applicability. This order is applicable to all projects funded under the Airport Improvement Program (AIP) and Passenger Facility Charge (PFC) programs at all obligated airports, or as required to support any public approach procedure. Eligibility determinations under AIP or PFC are independent of any approval action for an MOS. New MOS requests initiated after March 31, 2018, must use the automated MOS process. Manual MOS processing must follow applicable sections of this order as it applies to current regional procedures until the automated tool is accessible.

3. Cancellation. This order cancels Federal Aviation Administration (FAA) Order 5300.1F, *Modifications to Agency Airport Design, Construction, and Equipment Standards*, dated June 30, 2000.

4. Audience. This order applies to all Office of Airports (ARP) personnel.

5. Definitions.

a. Design Standards. Standards applying to the dimensional criteria of runways, taxiways, and location of associated infrastructure found in Advisory Circular (AC) 150/5300-13, *Airport Design*; and current 150/AC series.

b. Construction Standards. Standards applying to installation methods and tolerances found in AC 150/5370-10, *Standards for Specifying Construction of Airports*.

c. Equipment Standards. Standards applying to snow removal, Aircraft Rescue and Fire Fighting (ARFF) and other equipment ACs among the 150/series.

d. Materials Standards. Standards applying to the approval of type, properties, or characteristics of materials found in AC 150/5370-10.

e. Modification of Standards (MOS). Any deviation from, or addition to standards, applicable to airport design, material, and construction standards, or equipment projects resulting in an acceptable level of safety, useful life, lower costs, greater efficiency, or the need to accommodate an unusual local condition on a specific project through approval on a case-by-case basis.

6. Exemptions. This order does not cover exemptions from Title 14 Code of Federal Regulations (CFR) Part 139, *Certification of Airports,* or from Part 77, *Safe, Efficient Use, and Preservation of the Navigable Airspace.*

7. Background. Laws, regulations and Airport Sponsor Grant Assurances require compliance with current FAA standards. The following provisions require an airport to meet FAA standards:

a. Airport and Airway Improvement Act. The Airport and Airway Improvement Act of 1982 ("the Act"), Public Law 97-248, codified in subchapter I of Chapter 471, Title 49 of the United States Code, as amended, requires an airport requesting an AIP grant to comply with FAA standards. The statute states in part, "An application for a project grant under this subchapter may propose airport development only if the development complies with standards the Secretary prescribes or approves, including standards for site location, airport layout, site preparation, paving, lighting, and safety of approaches."

b. Airport Improvement Program (AIP) Grant Funded Projects. Grant Assurance No. 34, *Policies, Standards, and Specifications*, requires a federally obligated airport to "carry out the project in accordance with policies, standards, and specifications approved by the Secretary, including but not limited to, the advisory circulars listed in the current Advisory Circulars for AIP Projects, ... and in accordance with applicable state policies, standards, and specifications approved by the Secretary."

c. Obligated Airport. Title 49 U.S.C. § 47107(a)(16) and Grant Assurance No. 29, *Airport Layout Plan*, require the airport to maintain an up-to-date Airport Layout Plan (ALP) depicting existing and future airport facilities as referenced in paragraph 12.b. AC 150/5070-6, *Airport Master Plans*, establishes standards for ALPs, which includes the requirement to identify unusual design features and/or modifications to FAA Airports design standards. FAA approval of an ALP indicates the existing or proposed development depicted on the ALP conforms to FAA airport design standards or that an approved modification to standards has been issued.

d. Passenger Facility Charges (PFC). Title 14 CFR Part 158, *Passenger Facility Charges, Appendix A — Assurances 9, Standards and Specifications*, states, "The public agency hereby assures and certifies, with respect to this project that: ...It will carry out the project in accordance with FAA airport design, construction, and equipment standards and specifications contained in advisory circulars current on the date of project approval."

e. Runway Safety Areas (RSAs).

(1) A MOS is not issued for RSA dimensions. Instead, the Regional Airports Division Manager will evaluate RSAs and issue a RSA determination in accordance with FAA Order 5200.8, *Runway Safety Area Program*, and FAA Order 5200.9, *Financial Feasibility and Equivalency of Runway Safety Area Improvements and Engineered Material Arresting Systems*, for each affected runway at federally obligated airports and airports certificated under 14 CFR Part 139 within their geographic purview. For further information on RSA design standards, see AC 150/5300-13.

(2) To capture operational mitigations and establish an acceptable level of safety where parallel taxiways are within the RSA, use a runway to parallel taxiway separation MOS.

(3) A MOS may be considered for RSA grading where existing conditions may not allow for a feasible cost beneficial solution.

f. Procurement Requirements for Federally Assisted Projects. The procurement requirements for Federally assisted projects are typically conveyed to prospective bidders in two locations in a sponsor's procurement document: 1) General Provisions, AC 150/5370-10 sections 10–90, and 2) the sponsor's front end procurement documents (e.g. instructions-to-bidders, bid form, supplementary conditions, etc.). Proposed changes to the General Provisions of AC 150/5370-10 require conformance to this order. Proposed changes to AIP procurement standards (2 CFR §§200.318-200.326), applicable regulatory provisions such as Disadvantaged Business Enterprise requirements (49 CFR Part 26) or AIP statutory requirements such as Buy American Preference (49 U.S.C § 50101) require the airport to directly coordinate with the FAA Airports District Office for allowability and course of action for FAA review.

8. Policy. A national policy for MOS ensures uniformity in the application of standards.

a. An airport must submit a request for a modification of design standards for:

(1) Any proposed deviations from standards during the review of airport design and siting standards.

(2) Any proposed design elements on an airport project not meeting standards.

(3) Any proposed (new scheduled) operations of a higher category of aircraft, regardless of the number of operations, or an increase in service level (for example from CAT I to CAT II) proposed to operate on existing infrastructure that does not meet the standards.

(4) MOS may also be necessary as part of a proposed waiver, Air Traffic Control (ATC) Standard Operating Procedure (SOP), or a Letter of Agreement (LOA).

b. Subject to the limits of paragraph 10, an airport must submit a modification of materials specifications request if available materials cannot meet the requirements of the specification or are at a significantly higher cost.

c. An airport must submit a request for a modification of construction installation method and tolerances (best practices) when it result in cost savings or greater efficiency without sacrificing safety or useful life, and is subject to the limits of paragraph 10.

d. An airport must submit a modification of equipment standards request only when justified by unusual local conditions.

e. An airport may submit a request for a modification from the general provisions of AC 150/5370-10 if the proposed changes are required to conform to local laws and regulations. An airport may bundle all of the revisions in the general provisions sections 10 – 110 into one request.

f. Duration of an MOS Approval:

(1) MOS that are applicable to material and/or construction standards are approved for the life of the project.

(2) All MOS associated with design standards expire no later than 5 years from the approved date. The airport must re-submit the MOS for review and approval if an extension is requested.

(3) All MOS associated with design standards must be reviewed whenever there is an opportunity to meet standards, when situations change, or if a MOS is no longer required.

g. An approved MOS cannot be modified. The airport must submit a new MOS if changes are needed.

h. Approval or Disapproval of a MOS Requests at any level:

(1) The FAA documents the reason for disapproval and determination by including it in the comment box in Airports GIS. For disapproval, it must include any recommendations or suggestions to improve the request.

i. An MOS is not applicable for:

(1) Non-standard RSA dimensions.

(2) Non-standard Obstacle Free Zone (OFZ) surfaces.

(3) Non-standard approach / departure surfaces.

(4) To match existing equipment owned by the airport.

(5) Impermissible land use within Runway Protection Zone (RPZ) limits. See AC 150/5300-13 for details.

j. State standards must be prepared in accordance with AC 150/5100-13, *Development of State Standards for Nonprimary Airports*. Once the FAA has approved the use of a State Standard, the standard approved under AC 150/5100-13 may be used for nonprimary airport development without a MOS in the state where the standard was approved. Use of the state standard in states other than where the standard was approved is prohibited.

9. Approval Letters. MOS approval letters must contain the following for each modification:

- A reference to the standard being modified
- Conditions associated with the MOS approval, when necessary
- The effective period of the modification
- A statement that the modification is subject to review at any time if conditions originally justifying the modification changes, or if the FAA deems re-evaluation as being in the public's best interest.

10. Determining the Appropriate FAA Review Authority.

a. Headquarters Office. The Director of Airport Safety and Standards, AAS-1 (or designee), must approve a MOS for the following areas listed below, and as specified in Appendix A.

(1) All MOS for runway to parallel taxiway separations.

(2) Standards for siting navigational or lighting aids.

(3) Standards for marking, lighting, and signs on airport runways, taxiways, taxilanes, and aprons.

(4) Equipment specifications in AC 150/5345-53, *Airport Lighting Equipment Certification Program.*

(5) New, updated, or modified construction methods and material specifications where there is no previous MOS approval.

(6) Quality control or acceptance criteria of materials and finished products.

(a) Quality control criteria, including all performance tests to determine if adjustments are necessary to stay within specification limits. This includes aggregate gradation within tolerance for subbase, base, and surface courses; asphalt content for bituminous mixes; and slump and air content for concrete mixes.

(b) Acceptance testing, including all criteria and performance tests to determine acceptability of the material or finished product, includes: density and thickness for subgrade, sub-base, base courses, and bituminous pavement; flexural strength and thickness for concrete pavement; and surface tolerances for subbase, base, and surface courses.

b. Regional Office. The Regional Airports Division Manager may approve modifications described below and as listed per Appendix A. The Division Manager may choose to delegate the following MOS types to the Airports District Office (ADO) manager:

(1) Modifications of equipment standards (except signs or lighting equipment) on a case-by-case basis when the modification provides an acceptable level of safety and an economically feasible alternative, based on unique local conditions (Note that meeting existing equipment does not constitute a unique local condition.)

(2) Modifications of construction standards having previous AAS-1 approval for use within a region on a case-by-case basis without further review by AAS-1.

(3) Modifications of material standards having previous AAS-1 approval for use within a region on a case-by-case basis without further review by AAS-1.

(4) Modifications based on current Engineering Briefs (EBs).

(5) General Provisions under AC 150/5370-10.

11. **The MOS Process.** For process flow information and diagrams about initiating, viewing, delegating authority, and approving a MOS using Airports GIS, see the Airports GIS online help located at https://airports-gis.faa.gov.

a. Airports District Office Review.

(1) The ADO is responsible for validating and accepting the airport's initiation of the MOS. The ADO is also responsible for reviewing the MOS for accuracy, completeness, and providing their recommendation for approving, disapproving, and coordinating with the region and other lines of business.

(2) An airport's request must include a certification that:

(a) Modifications to materials, construction or equipment standards will provide a product that will meet FAA standards for acceptance and that the finished product will perform for its intended design life, based on historical data.

(b) Modifications to standards will provide an acceptable level of safety.

(c) The modification is necessary to conform to local laws and regulations (if applicable).

(d) Unique local conditions require the MOS.

b. Airports District Office (or Block Grant State) Review. Once the airport has created a MOS, reviewed and electronically signed the MOS, Airports GIS forwards it to the ADO or State Block Grant (SBG) for the appropriate action.

c. Airports Regional Office (RO) Review. The RO (or ADO or SBG if delegated) is responsible for coordinating with regional lines of business. The RO will review the MOS. If required per Appendix A, the RO must forward the MOS electronically along with the Regional recommendation to Headquarters for Headquarters review.

(1) Airspace Review.

(a) Construction or alterations affecting navigable airspace may require an Obstruction Evaluation/Airport Airspace Analysis (OE/AAA) review to fulfill the requirements outlined in 14 CFR Part 77. This may also be coordinated by the ADO.

(b) RO must coordinate modifications that may impact existing or future aircraft operations, instrument flight procedures, navigational aids, or facilities associated with instrument procedures as necessary with Flight Standards, the Air Traffic Organization (ATO) Technical Operations/Engineering Service, the ATO Mission Support Services Aeronautical Navigation Products and appropriate Air Traffic Control Tower (ATCT) where applicable and the Service Center Operations Support Group and Flight Procedures Team.

(c) An aeronautical study in OE/AAA is conducted by the appropriate FAA lines of business before the approval of a MOS. In order to document an airspace or OE/AAA review, the RO/ADO must attach the review and findings to the airport's MOS request in Airports GIS, in a non-editable format such as Portable Document Format (PDF). Include the Nonrule Making Airport (NRA) case number for tracking purposes.

(2) Safety Management System (SMS) / Safety Risk Management (SRM) Review.

(a) The RO must perform an appropriate level of SRM on the MOS request.

(b) A positive SRM result does not automatically mean that a MOS should be approved. Attach SRM documentation to the MOS package in Airports-GIS.

d. Headquarters Office Review. Once the RO reviews the MOS, if necessary per paragraph 10.a, it is then forwarded electronically via Airports GIS to the Headquarters (AAS100) Manager's general delivery mailbox for appropriate action.

12. Documentation.

a. All records pertaining to the MOS, including documents, pictures, and/or approval letters, will be maintained within the Airports GIS MOS Tool.

b. The airport must update the ALP to reflect approved modifications of airport design standards. The airport must include in the ALP a table listing the approved MOS. The table must include the approval letter dates and identify associated airspace review case numbers.

13. The Airports GIS MOS Tool. For process flow information and diagrams about initiating, viewing, delegating authority, and approving a MOS using Airports GIS, see the Airports GIS online help located at https://airports-gis.faa.gov.

John R. Dermody
Director of Airport Safety and Standards

Appendix A

Aurora Airport Resiliency Plan

Prepared by:

Aurora Airport Improvement Association
14497 Keil Road
Aurora, Oregon 97002

June 18, 2021 updated 8/30/2024

- *"Resiliency to disasters means a locale can withstand an extreme natural event with a tolerable level of losses."* Dennis S. Mileti, *Disasters by Design*, American Academy of Sciences Report, 1999.

Resiliency Plan Introduction

This Aurora Airport Resiliency Plan provides detailed description and background concerning the enormous assets that the Aurora Airport and immediate surrounding properties can or will be providing to Marion County, the State of Oregon, and the NW region following any major environmental disaster. This is especially true for "the big one" – the Cascadia Event earthquake.

When other primary transportation modes – roads and rail lines – are disrupted by landslides, broken pavement, and unusable bridges, it will be air transportation that is essential in the delivery of supplies, and medical help. During those times air transportation will also provide the transportation for workers equipment to repair bridges, major power lines, gas pipe lines, and other basic infrastructure. Thus, as will be explained in this plan, the Aurora Airport will play a major role in the recovery of the north Marion County area, as well as parts of southwestern Clackamas and Multnomah Counties. Aurora Airport may turn out to be the closest operational airport even to large parts of the City of Portland. It will become one of the primary logistical hubs to support response and recovery periods that follow an event.

Much attention is given to the possibility of an 8.0-9.0 magnitude Cascadia Subduction Zone (CSZ) earthquake occurring in the Pacific Northwest, along the CSZ fault line, which stretches from southern British Columbia to northern California. History has shown, and scientists confirm, this quake occurs, on average, once every 200 to 500 years. The last major CSZ earthquake and tsunami occurred in 1700. Geologists say that most of the intervals between these events have been less than the 310 years since the last one. So it is not a matter of if, but of when.

The danger of these large CSZ earthquakes has been known for some time, but it is only recently that citizens are taking it seriously. Probably the most important document that changed

people's thinking on this was the 2015 New Yorker article titled The Really Big One[1] by Kathryn Schulz. In that article, the director of FEMA's Region X (the division responsible for Oregon), is quoted as saying:

"Our operating assumption is that everything west of Interstate 5 will be toast."

That shocking statement got the Oregon public's attention in a big way. The public interest generated support for the Governors and Legislatures in Oregon, Washington, British Columbia, and California to begin major disaster planning for this CSZ event in earnest.

Aurora Airport is just a little east of Interstate 5, so by FEMA's view, does that mean it won't be "toast?" Of course not; but there are a whole bunch of reasons why Aurora Airport is expected to not only survive the event, but will likely actually remain operational.

Equally important to the Willamette Valley region, Aurora Aiport will be a particularly important airport to provide disaster services for the region, following "the really big one," due to the major aviation and infrastructure services it provides on a day-to-day basis. These will be essential services after the seismic event. This paper describes the detail of those essential services, and establishes next steps for making the Aurora Airport even more resilient as a lifesaving tour de force for the Willamette Valley region, following the seismic event.

[1] https://www.newyorker.com/magazine/2015/07/20/the-really-big-one

1.0 Existing Airport Infrastructure and Its Basic Resilience

- *"Sustainability means that a locality can tolerate – and overcome – damage, diminished productivity, and reduced quality of life from an extreme event without significant outside assistance,"* Dennis S. Mileti, *Disasters by Design*, American Academy of Sciences Report, 1999.

1.01 War Effort Federally Funded Original Heavy-duty Infrastructure

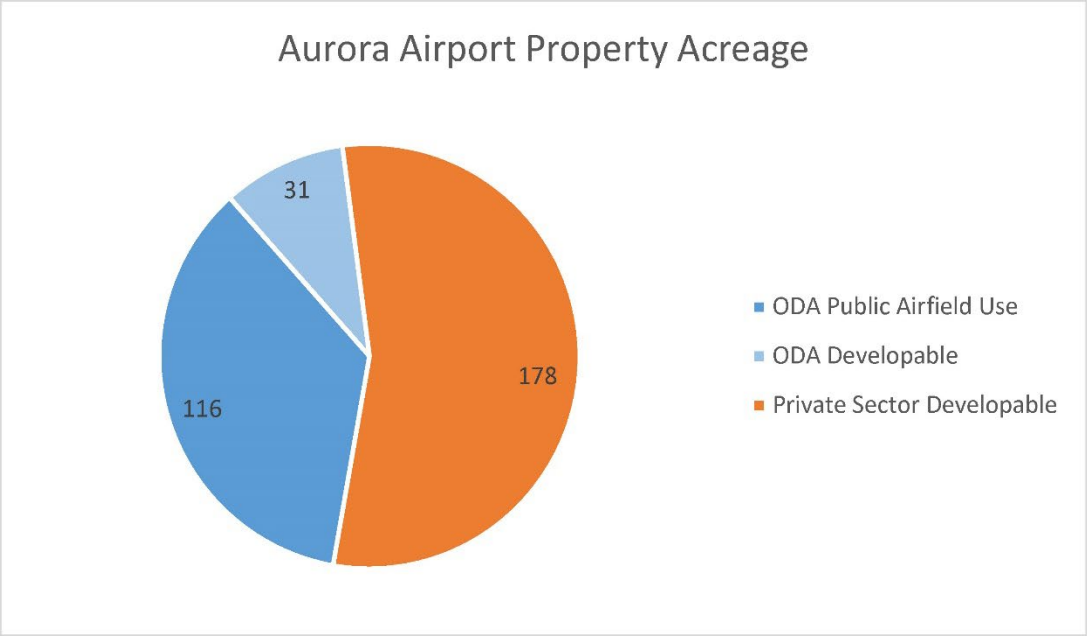
Aurora Airport was constructed in 1943, during World War II by the United States Army Air Forces. At that point in the war the outcome was still in serious question. Just a year prior, a Japanese submarine along the south Oregon coast had launched a floatplane that had dropped incendiary bombs inland, trying to start major forest fires. Another Japanese submarine had fired shells at Fort Stevens near Astoria. It was recognized by the Federal government that there was an essential need to be able to patrol and defend the West Coast with military aircraft from numerous locations in western Oregon. Aurora Airport was constructed and during its initial period was used for patrolling the coast, looking for enemy ships and aircraft, and for pilot training.

Aurora Airport from its beginning, represents a major investment of public tax dollars, to create essential public infrastructure. As a military airport, Aurora Airport was designed, and construction specified, using the standard military criteria of that era. It was established as a 150 foot wide by 4,104 foot long runway. The asphalt pavement was built upon a very thick, heavy gravel base, designed to accommodate the loads of military aircraft. This included the ability to handle medium and heavy bombers such as B-25, B-26, B-17, B-24 and cargo aircraft such as C-45, C46, and C-54.

1.02 Federal Aviation Trust Fund Continued with Solid Infrastructure Improvements

Following the war, Aurora Airport was managed by the United States Bureau of Public Roads. In 1953 the State of Oregon Highways Division then became the operator of the Airport. In 1973 ownership was transferred to the Aeronautics Division. From this point forward most funding has come from the Federal Aviation Administration (FAA) through their Aviation Trust Fund that is created from taxes on aviation fuel. The first FAA Airport Master Plan was prepared in 1976, followed by major improvements in 1977-78, which included construction of a parallel taxiway, installation of a rotating beacon, runway reconstruction and a narrowing of it from 150 feet to 100 feet, runway lighting, and tiedown apron construction.

The1976 Plan identified the need for an air traffic control tower and a runway extension to a full 6,000 feet. In 1995, the runway was lengthened from 4,104 feet to 5,004 feet, and the FAA installed (and to this day maintains) a non-precision Localizer Landing System instrument for Runway 17. In 2001 the Aurora Airport Water Control District was formed to create a fire protection water system for the airport. The water district put in water storage tanks, a pump

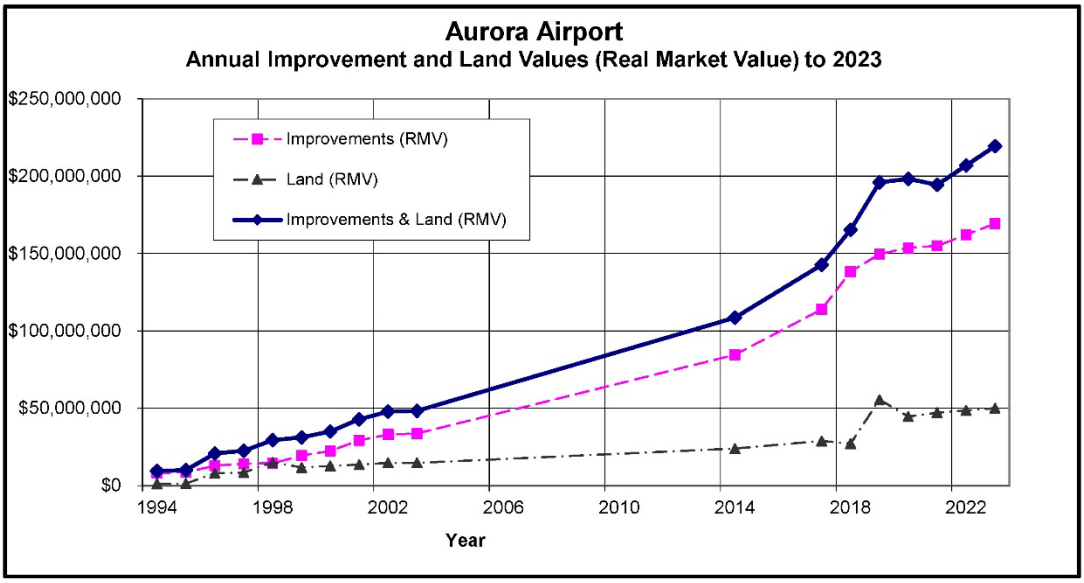


house, and a fire hydrant system that serves the developable lands of the airport. The same system provides water for fire sprinklers in the hangars, as required by the state fire marshal.

In 2004, the runway was reconstructed and in 2009, the parallel taxiway was relocated to meet FAA's design standard for runway-taxiway centerline separation. The 2012 Airport Master Plan Update confirmed the need for construction of a control tower and extension of the runway to the planned 6,000 feet as had previous updates called for. In 2015 a control tower was constructed and became operational. The runway extension is scheduled to have its environmental assessment study performed in 2022 and construction to occur in the following two years.

Virtually all of these airport improvements continue to be funded mostly with federal funds that come from a tax on aviation fuel. Thus, the airport improvements costs do not take any funds from schools, social programs, or other general fund tax sources. They are entirely funded by funds created by the aviation industry itself – thus a tax on itself.

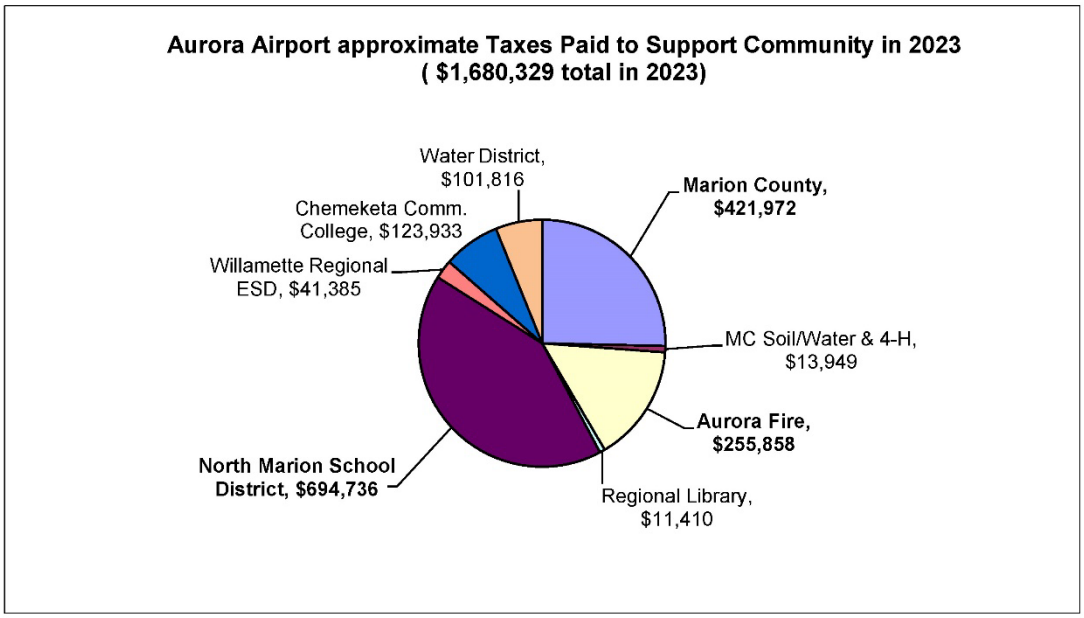
1.03 Resiliency from a Unique Public-Private Partnership



Aurora Airport has a unique resiliency, in that more than half of its land is privately owned and thus functions as a unique public-private partnership. Of the overall approximately 325 acres of airport-use property, the State of Oregon owns 45% (147 acres) and private sector owns 55% (178 acres). Of the state's 147 acres approximately 116 acres are for aircraft operations areas of runway, taxiway, and clear zones, while 31 acres are developable for aircraft tiedowns and hangars. The pie chart below shows this graphically.

The total area available for development of aircraft tie-downs, hangars, internal taxilanes, internal vehicular roads, parking, and other uses is approximately 154 acres, of which 20% (31 acres) is on public land and 80% (123 acres[2]) is on private land.

The availability of private land with access to a public airport creates a great benefit for the creation of aviation-related jobs for a community. This is because the business community can invest in buildings and equipment on private land though normal financing methods that are not available on leased land. In 2005, the Oregon Legislature recognized the unique ability of airports to create jobs in a community, and named Aurora Airport as one of three airports in Senate Bill 680, which encouraged this type of community partnership between the public and private sectors.



Aurora Airport is the model airport for this kind of economic development effort that is possible. Marion County tax records show that businesses at Aurora Airport now have an investment of approximately $216 million in facilities.[3]

These facilities not only provide airport services essential for the aviation industry. They also provide a return to the community in the form of jobs and taxes. Tax records show that the airport development property tax base provides an annual payment of over $1.68 million in per year to local schools, police, fire, and county government agencies. Next year this will undoubtedly rise even further.

[2] Note that a portion of the "developable" public and private properties facing the runway or runway approaches has some restrictions to development due to required airspace clearances and/or are usable only for aircraft tiedown and cannot have buildings.

[3] Note this value does not include the development costs of the runway and taxiway, or of internal public roads which if constructed from scratch likely have a construction value of at least $100,000,000.

Equally import, the approximately 1,000+ highly skilled mechanics, pilots, medics, aircraft designers, and aviation-related innovators who are employed by the aviation businesses at the airport, provide an income tax base that further supports all state and local government services.

The public-private partnership is an important component of the resiliency of Aurora Airport, because it shows the strong economic connection between the airport and the community, in providing jobs and tax support. It means that following a natural disaster, the human component of the airport will be ready and able to carry on the important work of disaster recovery. The importance of public-private partnerships in disaster recovery is well documented in the paper: *Achieving Resilience in Disaster Management: The Role of Public-Private Partnerships*.[4]

As will be seen in a following section of this report, the aviation businesses who chose to invest and grow at the airport, are ones that by their nature are important to providing the services needed during a seismic event or other natural disaster. These businesses are here to stay, because they are owners of their facilities. They are part of the community.

1.04 Resiliency provided by the Soils Underlying the Airport

Three recent detailed geotechnical studies on the soils around the Aurora Airport, show that the soils are not prone to significant liquefaction during an earthquake. Each of these studies were

[4] Nathan E. Busch and Austen D. Givens, *Achieving Resilience in Disaster Management: The Role of Public-Private Parnerships*, Journal of Strategic Security, Volume 6 Number 2, 2013. https://scholarcommons.usf.edu/cgi/viewcontent.cgi?article=1231&context=jss

performed by drilling approximately 100 feet down and studying the soil profiles. In each case a second cone penetration test was performed to approximately 100 feet deep. These studies established that:

> *"Our analysis indicates that total post-liquefaction settlement at the existing ground surface will be negligible during a design-level earthquake."*

This means that it is highly likely that the pavement of the runway, taxiways, aircraft aprons, and vehicular roads will be fully functional after an earthquake. For the airport buildings, which have heavy loads on their footings, the reports predict an approximate one-half inch of differential settlement. This is a remarkably small amount of settlement, and indicates that for buildings designed using current structural codes, they too will likely be fully functional following an earthquake.

1.05 Resiliency based on demonstrated Runway Load Capacity

The Aurora Airport runway was originally constructed as a military airport, with a strong rock base. The rock base forms the essential backbone for the runway, and military planners know this. Thus, they start with an exceptional rock base design, knowing that the pavement can always be repaired, added to, and otherwise improved, but the base cannot easily be redone.

From the above geotechnical information, we know that the underlying soil also has a remarkable stability. In 2019, a geotechnical study using falling weight deflectometer (FWD) testing, core explorations, and engineering analyses was conducted in accordance with FAA Advisory Circular 150/5335-5C, *Standardized Method of Reporting Airport Pavement Strength – PCN*. Using that FAA methodology, it determined that the runway is capable of being regularly used with single wheel main gear loads of 102,000 pounds or dual wheel main gear loads of 145,000 pounds.

Since the runway was originally designed to military standards, this should be expected. It indicates that during disaster recovery work, typical medium weight military cargo aircraft that meet these weight limitations can use the runway.

1.06 Resiliency based on available Control Tower

Good communications systems are essential during disaster recovery periods. The FAA Control Tower was installed in 2015 ensures that Aurora Airport has a direct linkage to the larger FAA airspace control system, in addition to the normal ability to use aviation frequencies to communicate with aircraft in the air approaching the airport, and on the ground for coordination during taxiing operations. The control tower does have an emergency generator system, so can remain functional during power outages.

1.07 Resiliency based on access to I-5

Aurora Airport is located a 3 minute drive from the I-5 Exit 278 ramp. Thus, the airport is strategically located to coordinate with vehicular traffic once I-5 is operational following a regional disaster.

1.08 Resiliency lacking for Runway Lights and Electrical Service

Aurora Airport has a medium intensity runway and taxiway lighting system, an airport rotating beacon, and includes an Omni-Directional Approach Lighting (ODAL) system for instrument approaches to Runway 17. These are appropriate for an airport that that is intended to provide resiliency services following a major earthquake event. However, none of these lighting systems have emergency generator power, which will need to be remedied in future resiliency upgrades. It is noted than the FAA Localizer for Runway 17 also does not have emergency power.

The service provider to Aurora Airport is PGE. AIAA is working with PGE and has determined power lines feed the airport come from multiple directions, which can be important when power is disrupted as with addition of appropriate power line switches it can allow power availability from one direction to Aurora Airport while the other direction is out of service. AAIA is currently exploring resiliency methodologies of backup power for parts, if not all of the airport. These include, but are not limited to, solar, fossil fueled generation, and battery backup systems.

1.09 Resiliency lacking for Building and Facilities Electrical Service

The existing buildings, hangars, fuel systems, and other facilities at the airport do not have emergency generators. AAIA is developing a plan for having all airport buildings provided with manual transfer switches and standardized plugs to be added to each building. This will make all buildings have the capability of connecting to a mobile generator or adding a generator during/after an event It is important to realize some buildings may be re-purposed and thus for some things an empty building is more valuable than a full one. Several owners of significant hangars on the airport have indicated their willingness to share space for aviation operations and logistical support.

As a phase two of this work, the AAIA is considering acquiring and maintaining a collection of generators that can be used at particular buildings on an as-needed basis. A plan will be developed for how to quickly bring in additional generators from other parts of the country, so that all facilities have emergency power capability.

1.10 Summary of Existing Infrastructure Resiliency

The exceptional resiliency of the existing Aurora Airport infrastructure comes first from its excellent soils and from its origin as a military airport from World War II era. The airport has continued to have major upgrades of an initial 1,000 foot runway extension, along with a well-constructed parallel taxiway, lights, and an FAA control tower, all funded largely by FAA grants from the dedicated airport trust fund. A future 1,000-foot runway extension is approved by the

state and FAA per the 2012 Master Plan and is awaiting final environmental review and construction – both expected to be completed in the next three to five years.

The airport is a mixture of public and privately owned lands. This has promoted major investment in aviation facilities at the airport, which has resulted in major aviation service, maintenance, and repair capabilities being available. As a community resource, the airport also provides important tax base for public schools and government agencies. As such, it has a particularly strong positive relationship with the larger community, and is an important partner.

The runway has good strength for cargo and other aircraft that would need to use the airport as part of disaster recovery efforts. Geotechnical studies show that the airport is likely to be fully functional following a major earthquake, as there will be negligible settlement due to liquefaction. The one major weakness of the existing infrastructure is that only the control tower has emergency generator power. Future resiliency upgrade plans should focus on adding emergency power to the airfield lights and localizer. Plans for developing emergency power capability for the fuel systems and buildings at the airport, is also part of the planning effort for improved Aurora Airport sustainability.

2.0 The Airport Businesses that will help in Regional Recovery and their Capabilities and Resources

- *Building and maintaining partnerships is one of the primary strategies FEMA identifies for implementing the Whole Community Framework. Partnerships that include the public and private sectors have the potential to enhance the efficiency and effectiveness of efforts undertaken by individual firms and public agencies. Working together, partners can advance new efforts that build on the unique knowledge and capabilities present among actors from the public and private sectors.* Southeast Disaster Recovery Partnership & NOAA, *For the Long Haul: Public-Private Partnerships for Long-Term Disaster Recovery, 2018*.

2.01 Introduction

The Aurora Airport public-private partnership has created a setting where major aviation-related business can own their land and facilities, which allows them to make much bigger investments in their facility needs, than can occur on leased land. This is because in lieu of the investment value going to zero as the end of the 10, 20, or 30 year lease period ends, the value of the property and development increases over time. This also promotes a business to keep maintaining and investing in upgrades to its facilities, keeping it at the cutting edge of innovation and competitiveness on the world market.

2.02 Heavy Lift Helicopters & Roles in Disaster

Aurora Airport is a major headquarters and base of operations for the three largest heavy lift helicopter companies in the United States: Columbia Helicopters, Helicopter Transport Services (HTS), and Erickson. For Columbia and HTS these are the world headquarters, and their helicopters provide services to every continent of the world. These three companies will be providing essential supply transportation services following a major seismic event. Since their maintenance facilities are at the airport – Aurora Airport will remain their base of operations. This will provide essential sustainability to the Willamette Valley regions that are around the airport.

2.03 Medivac & Role in Disaster

Aurora Airport is the national headquarters for Life Flight Network, the principal emergency air medical service for the northwest United States region. Their service area includes Oregon and large parts of Washington, Idaho, and Montana. Their services will be critical to citizens of Marion County, Oregon and the region. Life Flight Network operates both helicopter and fixed wing aircraft, enabling them to support short, off airport missions as well as transportation of stabilized, but critical, patients out of the immediately affected event area.

2.04 Power Line Restoration & Role in Disaster

Aurora Airport is the base of operations for two companies that specialize in repair and modifications of major electrical grid power lines using helicopters: Wilson Construction Company and Winco Power Line Services Inc. In repairing downed and damaged power lines, following a natural disaster – whether it be fire or windstorm or earthquake - these service will be critical to the citizens of Marion County, Oregon and the region. These companies have well developed and active relationships with the heavy lift helicopter operators at Aurora Airport to work together in restoring power. This will be absolutely critical because, as evidenced by the recent ice storm, road access to works may become impassable.

2.05 Aerial Mapping and Data Collection & Role in Disaster

Aurora Airport is a base of operations for Oregon's premier aerial mapping company: Geo Terra, Inc. Their aircraft and equipment will be essential in providing high resolution aerial photography and mapping of regional infrastructure for the basic planning for recovery following a disaster. Also based at Aurora Airport is FLIR systems flight department. FLIR is the premier manufacturer of high-capacity infrared camera systems. Their fleet of aircraft are mounted with state of the art cameras that are used to locate existing infrastructure as well as identify problems after an event, to include the location of people in distress.

2.06 Fixed Base Operations for Aircraft Fuel and Service

Aurora Airport has two Fixed Base Operators (FBOs): Lynx and Willamette Aviation. These and others of the aircraft operations at the airport have a total fuel capacity of over 250,000 gallons in a combination of fixed tanks and mobile truck tankers. In addition, each FBO has a designated place for temporary fuel bladder tanks to be stored when brought in by heavy lift helicopters from Redmond Airport (as disaster planners are projecting), or other non-affected locations. The ground handling capabilities of these businesses will become critical immediately following an event as military and civil aircraft arrive to support. Their leadership is open and ready to coordinate with civil and military authorities.

2.07 Major Aircraft Maintenance Facilities

Aurora Airport has numerous businesses with major aircraft maintenance facilities. These facilities and their many FAA licensed mechanics and inspectors that have capability to repair all kinds of aircraft. They have ready to use test equipment, can rebuild engines and machinery, have spare parts inventory, have tools, and the skilled labor force necessary to maintain their aircraft. They also have repair and maintenance capability for specialty aviation accessories like aero-medical equipment, aerial photographic equipment. These businesses will be able to maintain – without help from outside – their equipment a full functional condition during a seismic emergency. That is the definition of "sustainability." The expertise of these businesses

means that they also will be available if needed by the military to assist in maintenance of their aircraft that are involved with the recovery efforts.

2.08 Availability of Specialty Manufacturing

Aurora Airport is the international headquarters of Vans Aircraft, the largest supplier of kit-built aircraft in the world today. Their facilities include computer aided design metal-cutting machines and large supplies of aluminum sheet. Should a recovery effort need the quick manufacturing of specialized aluminum devices, the Vans Aircraft machines can quickly be re-purposed and programmed to mass produce specialty devices, on an as-needed basis.

2.09 Availability of Large Spaces for as-needed Special Recovery Efforts

Aurora Airport has approximately 1,250,000 square feet of buildings. Of this approximately 70% is hangar space, and 30% is office/shop space. The size of buildings varies from long-span 200 foot wide with 28 foot high hangar doors on 160 foot deep space, to small 60 foot by 60 foot hangar units, to multi-story offices. These spaces are devoted to their prime use as aviation-related support facilities. However, if during a disaster event, regionally the need is for storage of essential products or equipment, some of these wide-open spaces can easily be repurposed for other uses – whether they be medical, or area planning, or communications. They can be quickly transitioned to highest and best use for emergency management operations.

Most emergency and military planners look for these combinations of operating airports, hangars and large vacant land next to a water source to plan the placement of temporary recovery assets. Aurora Airport is uniquely suited as it is proximate to the Metro area and will be intact and able to support in case of an event in addition to meeting these planning and placement criteria. This will be covered in more depth in section 3.0.

2.10 Availability of Equipment

These many essential businesses, also maintain an inventory of tools, lifts, ladders, and every type of equipment that will otherwise be difficult to obtain in an emergency. This provides resiliency to the operations of all of the combined businesses at the airport.

2.11 Conclusion

Aurora Airport has numerous businesses that will be essential for the region's recovery. This ranges from providing heavy lift cargo deliveries, to medical transport, to aircraft maintenance, to the mundane fuel and servicing of aircraft. These are essential ingredients to a sustainable region around the airport.

3.0 The Agricultural Land Surrounding the Airport and its Availability for Staging

Aurora Airport is surrounded by agricultural lands. Many of these lands are set up with large gravel pavement areas for the production, storage, and shipping of agricultural products. During an emergency these areas can be repurposed as staging areas for use by emergency management operations.

Immediately adjacent to the airport is zoned farmland to the east, north, west, and south. The farmland to the immediate east is clear and flat, lending itself to the natural placement of emergency medical facilities as well as logistical support and storage. The land is irrigated by pumped well water. The Pudding River flows parallel to the airport runway approximately 1 mile to the east.

Both of these geographic features and the wells will become extremely valuable during an event recovery as they can, and most likely, will be used for emergency medical facilities, logistical laydown, and storage/distribution of supplies. The military (specifically, the Oregon Army National Guard) operates water purification equipment with the ability to pull water from the

Pudding and/or from the wells, to purify and store significant quantities to support emergency needs in temporary emergency medical facilities. Water can also be made available to support and supplement surrounding communities.

AAIA is in the process of meeting with some of these surrounding farm operations. The goal is to have some pre-agreements for use of those facilities during a major earthquake or other natural disaster.

4.0 The Airport Current Status in County and State Preparedness Plans

The following emergency management and planning documents already acknowledge the important of Aurora Airport as part of preparedness plans:

- FSA Tier 2 (2017 Airport Resiliency Workgroup),
- Category 2 (Oregon Resilience Plan 2013),
- "Critical Transportation Facility" (Marion County Multi-Jurisdictional Hazard Mitigation Plan 2017),
- Type 2 FSA (Oregon Aviation Plan 2019), "National Airport" (FAA designation, only two in Oregon).

5.0 The Airport Future Role in County and State Preparedness Plans

Aurora Airport will be capable of providing unique, essential, major recovery assistance following a major natural disaster. The businesses in the airport specialize in disaster cargo, power line repair, aerial disaster mapping, and emergency medical treatment. The existing county and state preparedness plans do not yet acknowledge or appear to understand the essential resilience of Aurora Airport for self-contained operations during a disaster. Nor does it yet recognize the importance of the airport services to maintaining the resiliency of the Willamette Valley region. It is recommended that Aurora Airport be better integrated into state, regional, and county plans for recovery efforts.

Some local cities have expressed interest in coordinating with and supporting the resiliency of Aurora Airport. AAIA is in discussion with the cities of Woodburn and Canby in coordinating joint resiliency efforts.

6.0 Current User Planning for Improvements to Airport Resiliency

The following resiliency improvements to Aurora Airport are currently being pursued by AAIA:

- Coordination with Marion County to further the resiliency of Aurora Airport and North Marion County;
- Coordination with local cities expressing interest in supporting the resiliency of Aurora Airport and their local communities, including: the City of Woodburn and City of Canby.
- Addition of manual power transfer switches to most airport buildings and fuel facilities, all with a common plug when possible;
- Acquisition of generators to be available for use at the airport buildings and fuel facilities;
- Meetings with surrounding agricultural properties to pre-plan for potential shared use during a disaster; and
- Potential creation of a joint-use Fire Station/Emergency Operations Center/Airport Management building as part of the development of the Aurora Airport Business Center property.

7.0 Aurora Airport Resiliency and the Goals of the Aurora Airport Improvement Association (AAIA)

The AAIA is fully committed to improving the resilience of Aurora Airport. It recognizes that the airport is unique, and will play a major role in the resilience of the north Willamette Valley area. In fact, due to the unique nature of the heavy lift, power line, and emergency medical resources, it may play a major role to the recovery of the state. AAIA welcomes input on improving this resiliency plan, and looks forward to working cooperatively with our Marion County leaders, and our local communities.

AAIA's Aurora Airport resiliency plan focusses on:

- Promoting local responsibility by the airport businesses for creating the airport resiliency plan;
- Promoting a vibrant economy as part of the resiliency plan, so that the airport businesses provide jobs and tax base for schools and other essential services as part of their development;
- Using the airport's key unique state-of-the-art, innovative businesses as essential elements of the plan; and
- Working with Marion County and local communities to have a win-win for resiliency at the airport and at their communities.

BEFORE THE BOARD OF COMMISSIONERS -- *DRAFT*--

FOR MARION COUNTY, OREGON

RESOLUTION No.

In the Matter of Declaring)
that Aurora Airport shall be)
considered a key Resiliency)
Airport for use during a)
major seismic event.)

This matter is before the Board of Commissioners, as an essential emergency management infrastructure issue, to acknowledge the importance of Aurora Airport in providing services and support to the residents of Marion County following a major seismic event.

WHERAS, recently completed soils reports at the airport predict a negligible soil settlement following the largest predicted earthquake, which indicates that the runway, taxiways, and parking aprons will likely be fully operational with very little repair, following a major seismic event; and

WHEREAS, the airport is a major headquarters and base of operations for the three largest heavy lift helicopter companies in the United States, Columbia Helicopters, Helicopter Transport Services, and Erickson, and these helicopters will provide essential supply transportation services following a major seismic event; and

WHEREAS, the airport is the regional headquarters for Life Flight Network, the principal emergency air medical service for the northwest United States region that includes Oregon and large parts of Washington, Idaho, and Montana, and whose services will be critical to citizens of Marion County, Oregon and the region; and

WHEREAS, the airport is the base of operations for two companies that specialize in repair and adjustments of major electrical grid power lines, Wilson Construction and Winco Inc., and whose services will be critical to the citizens of Marion County, Oregon and the region; and

WHEREAS, these resiliency critical businesses all have major aircraft maintenance facilities at the airport, for their specialized aircraft, with ready to use test equipment, rebuild machines, spare parts inventory, tools, and the skilled labor

force necessary to maintain their aircraft, specialty aviation accessories, and aero-medical equipment in a full functional condition during a seismic emergency;

WHEREAS, the airport is surrounded by agricultural lands that during an emergency can be repurposed as staging areas for use by emergency management operations; and

WHEREAS, the airport has two Fixed Base Operators serving aircraft and the airport as a whole has fixed and truck-mounted tankage for up to 250,000 gallons Jet fuel and avgas, along with site locations for temporary fuel tanks to be stored when brought in by said heavy lift helicopters; and

WHEREAS, the airport runway was constructed as a military airport, funded by the U.S. government, with capability of landing heavier military type aircraft, and by independent testing has been found to currently be capable of supporting aircraft with up to 102 thousand pound single wheel main gear or 145 thousand pound dual wheel main gear loads; and

WHEREAS, the airport has approximately 1,250,000 square feet of aviation hangar, office, and shop space that can be quickly transitioned to highest and best use for emergency management operations; and

WHEREAS, there is current planning underway to have each airport building be retrofitted with a manual power transfer switch that will allow each to function with power from an emergency electrical generator if electrical power is lost; and

WHEREAS, the following emergency management and planning documents already acknowledge the important of the airport as: FSA Tier 2 (2017 Airport Resiliency Workgroup), Category 2 (Oregon Resilience Plan 2013), “Critical Transportation Facility” (Marion County Multi-Jurisdictional Hazard Mitigation Plan 2017), Type 2 FSA (Oregon Aviation Plan 2019), “National Airport” (FAA designation, only two in Oregon); and

WHEREAS, the airport has the support of the following Marion County cities for being considered an essential resiliency airport: [working on letters from Woodburn and Canby], now, therefore

IT IS HEREBY ORDERED that the Aurora Airport shall heretofore be designated by Marion County as a Tier 1 resiliency airport for purposes of planning for emergency services during periods of county-wide disaster.

IT IS HEREBY ORDERED that the Marion County Public Works/Emergency Management assist the Aurora Airport by supporting grant applications that further prepare the airport infrastructure to serve its important function of being a resiliency airport to resupply and support the citizens of Marion County during periods of disaster following a severe seismic event or other county-wide disaster.

DATED at Salem, Oregon, this ___ day of ___, 202_.

Chapter 17.171
P (PUBLIC) ZONE

Sections:

17.171.010 Purpose.

17.171.020 Uses.

17.171.030 Conditional uses.

17.171.040 Scale of commercial uses.

17.171.050 Prohibited and lawfully established existing uses.

17.171.060 Property development standards.

17.171.010 Purpose.

The purpose and intent of the P (public) zone is to provide regulations governing the development of lands appropriate for specific public and semi-public uses and to ensure their compatibility with adjacent uses. It is intended that this zone be applied to individual parcels shown to be an appropriate location for a certain public or semi-public use. If the use existing at the time the P zone is applied is discontinued or if a proposed use is not established, it is the intent that the land be rezoned to conform to surrounding zoning or be devoted to permitted uses. It is not intended that a property zoned public for one type of use be allowed to change without demonstrating that the proposed conditional use will be compatible with adjacent uses and the property is better suited to the proposed use than alternative locations. [Ord. 1271 § 5, 2008; Ord. 1227 § 4, 2006; Ord. 1191 § 4, 2004; Ord. 1139 § 5, 2001; Ord. 1131 § 5, 2000; Ord. 1118 § 5, 2000; Ord. 1055 § 4, 1997; Ord. 579 § 5, 1980. RZ Ord. § 171.010.]

17.171.020 Uses.

Within any P (public) zone, no building, structure or premises shall be used, arranged, or designed to be used, erected, structurally altered or enlarged except for the following purposes:

A. Farm use, but not including a medical marijuana processor (see MCC 17.110.376), medical marijuana producer (see MCC 17.110.378), or a medical marijuana dispensary (see MCC 17.110.374);

B. Forest use;

C. Dwellings (including mobile homes) and other structures customarily provided in conjunction with farm or forest use subject to the criteria in MCC 17.139.030;

D. Utility facilities necessary for public service except public power generation;

E. Wireless communications facilities, including attached, subject to the following development standards:

1. Notwithstanding other height limitations in this title omni-directional (whip) antennas not exceeding 20 feet in height and directional/parabolic antennas not exceeding seven feet in diameter or width and 15 feet in height may be attached to or located on existing structures;

2. Antennas and associated equipment shall be surfaced in a nonreflective color to match the structure on which they are located. An equipment enclosure may be set back from the edge of a roof by a distance at least equal to its height in lieu of screening;

3. Equipment enclosures shall be located within the building on which they are located wherever possible; otherwise, equipment enclosures shall be fenced by a six-foot-high fence, wall or hedge;

4. Antennas shall not be illuminated except as required by the Oregon State Aeronautics Division or the Federal Aviation Administration;

5. A wireless communications facility, attached, and equipment enclosure shall be removed by the facility owner or property owner within six months of the date it ceases to be operational;

6. Notwithstanding other height limitations in this code all lattice, monopole, guyed or other freestanding support structures shall be limited to a total height, including antennas, of 150 feet above natural grade;

F. *Repealed by Ord. 1397*;

G. Fire and emergency services stations and police substations; training facilities, administrative offices and living quarters for fire, emergency, and police services are permitted in conjunction with these uses, not to exceed 20 full-time persons and 200 day-use visitors. [Ord. 1397 § 4 (Exh. B), 2019; Ord. 1372 § 4 (Exh. A), 2016; Ord. 1271 § 5, 2008; Ord. 1227 § 4, 2006; Ord. 1191 § 4, 2004; Ord. 1139 § 5, 2001; Ord. 1131 § 5, 2000; Ord. 1118 § 5, 2000; Ord. 1055 § 4, 1997; Ord. 579 § 5, 1980. RZ Ord. § 171.020.]

17.171.030 Conditional uses.

When authorized under the procedure provided for conditional uses in this title, the following uses will be permitted in a P zone:

A. Airport and airport-related commercial and industrial uses;

B. Public ball park, exposition, fairground, museum, stock show and related commercial uses subject to MCC 17.171.040;

C. Cemeteries, crematoriums and mausoleums;

D. Dwelling for the caretaker or watchman; housing for the staff required for an approved conditional use;

E. Golf courses, public parks and playgrounds, recreational resorts and retreats, related camping and related commercial uses subject to MCC 17.171.040;

F. Religious organizations and related conference and residence facilities;

G. Schools, elementary and secondary (as defined in Chapter 17.110 MCC);

H. Military training facilities and armory;

I. Public instructions for detention or correction;

J. Residential facilities, institutions and schools for the handicapped or mentally retarded;

K. Public service buildings, structures and uses (e.g., field offices, outdoor storage of equipment, reservoir, water tower, pump station, sewage treatment plant, solid waste disposal site, power generation), except fire, police and emergency service stations;

L. Fire and emergency services stations and police substations; training facilities, administrative offices and living quarters for fire, emergency, and police services exceeding 20 full-time persons and 200 day-use visitors;

M. In the community of Brooks-Hopmere, educational institutions as defined in MCC 17.110.210 and including those in SIC 822. [Ord. 1454 § 4 (Exh. B), 2023; Ord. 1271 § 5, 2008; Ord. 1227 § 4, 2006; Ord. 1191 § 4, 2004; Ord. 1139 § 5, 2001; Ord. 1131 § 5, 2000; Ord. 1118 § 5, 2000; Ord. 1055 § 4, 1997; Ord. 974 § 4, 1994; Ord. 925 § 6, 1992; Ord. 579 § 5, 1980. RZ Ord. § 171.030.]

17.171.040 Scale of commercial uses.

A. New commercial uses in conjunction with public uses may be established up to a maximum of 3,500 square feet of floor area.

B. Lawfully established commercial uses existing as of the date of adoption of the ordinance codified in this title may be expanded up to 3,500 square feet of floor area, or an additional 25 percent of the floor area that existed as of the date of adoption of the ordinance codified in this title, whichever is greater.

C. Airport-related uses located at the Aurora Airport are not subject to the size limitations in subsections (A) and (B) of this section.

D. Except as established in subsection (B) of this section, for a commercial use to exceed the square foot limitations requires taking an exception to Goal 14. Such exception shall be processed as an amendment to the Marion County Comprehensive Plan. [Ord. 1271 § 5, 2008; Ord. 1227 § 4, 2006; Ord. 1191 § 4, 2004. RZ Ord. § 171.040.]

17.171.050 Prohibited and lawfully established existing uses.

A. The following uses are prohibited:

1. Uses of structures and land not specifically permitted in the public zone.

2. New residential dwellings, except when accessory to a primary use. However, a dwelling that legally existed at the time of adoption of the ordinance codified in this title shall not be a nonconforming use, and may be remodeled, expanded, or replaced.

B. Lawfully established commercial and industrial uses that existed prior to zoning or established through the applicable land use process on or before the date of the ordinance codified in this title, not otherwise listed in the zone, are allowed outright and shall not be classified as nonconforming uses.

C. All other lawfully established, existing uses and structures not specifically permitted in the public zone shall be considered nonconforming uses subject to the provisions of Chapter 17.114 MCC. [Ord. 1271 § 5, 2008; Ord. 1227 § 4, 2006; Ord. 1191 § 4, 2004. RZ Ord. § 171.050.]

17.171.060 Property development standards.

A. Height. No building or structure in a P zone shall exceed six stories or 70 feet; provided, that buildings or structures shall be set back from every street and lot line one foot for each foot of height of the building in excess of 35 feet in addition to all other yard and setback requirements herein specified.

B. Front Yard. Front yard shall be a minimum of 20 feet. No parking shall be permitted within the minimum front yard area.

C. Side Yards. Where the side of a lot in a P zone abuts upon the side of a lot in any R zone, there shall be a minimum side yard of 10 feet. Otherwise there shall be no minimum side yard setback. Where the side of a lot abuts upon a street there shall be a minimum side yard of 20 feet wherein no parking shall be permitted.

D. Rear Yard. In a P zone there shall be a rear yard that shall have a minimum depth of 30 feet.

E. Lot Area and Coverage. The minimum requirements in P zones for dwellings shall be one acre except 6,000 square feet inside an unincorporated community boundary where public sewer and water service is provided. No main building, including dwellings, shall occupy more than 30 percent of the lot area.

F. Open Storage.

1. All yard areas, exclusive of those required to be landscaped as provided in subsection (G) of this section, may be used for materials and equipment storage areas related to a use permitted in the P zone, provided such area is screened so it cannot be seen from public roads, or from dwellings on property in other zones.

2. The surface of open storage areas, including automobile and truck parking areas shall be paved or graveled and maintained at all times in a dust-free condition.

G. Landscaping. The area within 20 feet of a street shall be landscaped. As a condition of approval for a conditional use, additional landscaping may be required if necessary to make the use compatible with the area.

H. Performance Standards. No land or structure shall be used or occupied unless maintained and operated in continuing compliance with all applicable standards adopted by the Oregon Department of Environmental Quality.

I. Sewage Disposal. Demonstrate that the development will not exceed the existing carrying capacity of the local sewage disposal system or has an on-site sewage disposal site approved by Marion County or the Department of Environmental Quality.

J. Traffic Analysis. Demonstrate that the development will be consistent with the identified function, capacity, and level of service of transportation facilities serving the site. A transportation impact analysis, approved by the Marion County department of public works, may be required prior to building permit approval. [Ord. 1271 § 5, 2008; Ord. 1227 § 4, 2006; Ord. 1191 § 4, 2004. RZ Ord. § 171.060.]

Chapter 17.177
AIRPORT OVERLAY ZONE

Sections:

17.177.010 Purpose.

17.177.020 Definitions.

17.177.030 Airport districts.

17.177.040 Procedure.

17.177.050 Nonconforming uses.

17.177.060 Marking and lighting.

17.177.070 Variances.

17.177.010 Purpose.

The airport overlay zone is intended to minimize potential dangers from, and conflicts with, the use of aircraft at public airports based on the adopted master plans for each airport. It is to be used in conjunction with the underlying zone. If any conflict in regulation or procedure occurs with the underlying zoning districts, the more restrictive provisions shall govern. This section is intended to comply with Federal Aviation Agency Regulation FAR-77 and all other applicable federal and state laws regulating hazards to air navigation. [Ord. 602 § 5, 1981. RZ Ord. § 177.010.]

17.177.020 Definitions.

A. “Airport” means a public airport as defined in MCC 17.110.040.

B. “Airport elevation” means the highest point of an airport’s usable landing area measured in feet from mean sea level. This elevation above mean sea level shall be shown on the official zoning map.

C. “Airport surfaces” means the specific dimensions, slopes and elevations of the airport surfaces shall be delineated on the official zoning map.

1. “Primary surface” means the surface of the runway and adjacent land on each side of the runway centerline and 200 feet beyond the ends of the runway. The length of this surface is determined by using the existing runway length or the runway length identified in an adopted state airport master plan, if longer. The width is the same as the end of the approach surface that is closest to the runway.

2. Approach Surface. This surface begins at the end of the primary surface. From its initial width, that is the same as the width of the primary surface, it extends upward and outward on both sides of the projected centerline of the runway with a specified slope and terminates where it intersects the horizontal surface.

3. “Horizontal surface” is a horizontal plane which surrounds the airport 150 feet above the airport elevation. The interior portion of this surface terminates where it intersects with the transitional and approach surfaces. Its outer edge terminates where it intersects with the conical surface.

4. “Transitional surface” means an imaginary plane that extends upward and outward from the sides of the primary surface and approach surface to the horizontal surface.

5. “Conical surface” means a surface extending outward and upward from the periphery of the horizontal surface at a slope of 20 to one for a horizontal distance of 4,000 feet.

D. “Hazard to air navigation” means an obstruction determined to have a substantial adverse effect on the safe and efficient utilization of the navigable airspace.

E. “Height” is the highest point of any structure as further defined in MCC 17.110.260. The official zone map identifies the maximum height permitted for any obstruction calculated from the airport elevation as defined in subsection (B) of this section and from mean sea level.

F. “Obstruction” is any structure, tree or other object, including a mobile object, which extends above airport surfaces as defined in subsection (C) of this section.

G. “Runway” is a defined area on the airport prepared for landing and takeoff of aircraft along its length.

H. “Tree” means any natural vegetation. [Ord. 602 § 5, 1981. RZ Ord. § 177.020.]

17.177.030 Airport districts.

In order to carry out the provisions of this airport overlay zone, three airport development districts are provided within the airport overlay zone. These three districts are shown on the official zoning map showing the height limits adopted at the time the airport overlay zone is applied.

A. Airport Development District. This district consists of those lands, waters and airspace area at or below the primary, transitional and approach surfaces described in MCC 17.177.020(C).

1. Use Limitations. Any use, accessory use, buildings and structures otherwise allowed in the underlying zone shall be permitted provided the following requirements are satisfied:

a. No obstruction or object shall be permitted if it extends above the transitional and approach surfaces as defined in MCC 17.177.020(C).

b. Roadways, parking areas and storage yards shall be located in such a manner that vehicle lights will not result in glare in the eyes of the pilots, or in any other way impair visibility in the vicinity of the runway approach.

c. Sanitary landfills, sewage lagoons or sewage sludge disposal shall not be permitted closer than 10,000 feet to the airport runway.

d. No game preserve or game reservation shall be permitted if the animals or birds have the potential to become a hazard to air navigation.

e. No structure or use intended for public assembly shall be allowed except by a conditional use permit.

B. Horizontal Surface District. This district consists of the land, water and airspace underneath the horizontal surface as described in MCC 17.177.020(C).

1. Use Limitations. Any use, accessory use, building and structure allowed in the underlying zone shall be permitted provided the following requirements are satisfied:

a. No obstruction shall penetrate the horizontal surface as defined in MCC 17.177.020(C).

b. Sanitary landfills, sewage lagoons or sewage sludge disposal shall not be permitted closer than 10,000 feet to the airport runway.

C. Conical Surface District. This district consists of the land, water and airspace underneath the conical surface as described in MCC 17.177.020(C).

1. Use Limitations. Any use and accessory uses, buildings and structures allowed in the underlying zone shall be permitted; provided, that no obstruction penetrates the conical surface as defined in MCC 17.177.020(C). [Ord. 602 § 5, 1981. RZ Ord. § 177.030.]

17.177.040 Procedure.

A. An applicant seeking a building permit involving any use or structure regulated by the airport overlay zone shall provide the following information in addition to any other information required in the permit application:

1. Property boundary lines as they relate to the airport approach and the end of the runway;

2. Location and height of all existing and proposed buildings, structures, utility lines and roads.

B. Proposed buildings or structures shall be approved by the building inspector if it is determined that they will not extend above the airport surfaces as defined in MCC 17.177.020(C).

C. An applicant seeking rezoning, a conditional use permit or a variance involving any use, building or structure regulated by the underlying zone or the airport overlay zone shall be reviewed in accordance with the applicable procedure in this title. During this review process, the State Aeronautics Division shall be notified of the proposal and any public hearing, be given an opportunity to comment and be notified of the decision. [Ord. 602 § 5, 1981. RZ Ord. § 177.040.]

17.177.050 Nonconforming uses.

The regulations prescribed by the airport overlay zone shall not be construed to require the removal, lowering or other change or alteration of any structure or tree not conforming to the

regulations as of the effective date of the ordinance codified in this title, or otherwise interfere with the continuance of the nonconforming use except as provided in MCC 17.110.405. Nothing contained herein shall require any change in the construction, alteration or intended use of any structure, otherwise permitted, the construction or alteration of which was begun prior to the effective date of the ordinance codified in this title. [Ord. 602 § 5, 1981. RZ Ord. § 177.050.]

17.177.060 Marking and lighting.

The owner of any existing nonconforming structure or tree shall permit the installation, operation and maintenance thereon of such markers and lights as shall be deemed necessary by the Oregon Department of Transportation to indicate to the operators of aircraft the presence of such airport obstruction. Such markers and lights shall be installed, operated and maintained at the expense of the airport owner. [Ord. 602 § 5, 1981. RZ Ord. § 177.060.]

17.177.070 Variances.

The provisions of this overlay zone may be varied subject to the procedures and criteria for considering variances set forth in Chapter 17.122 MCC. Variances may be allowed where it is found that the proposal will not create a hazard to air navigation, and will be in accordance with the spirit and intent of this overlay zone. [Ord. 602 § 5, 1981. RZ Ord. § 177.070.]

Advisory Circular

Subject: Change 2 to Airport Master Plans **Date:** 1/27/2015 **AC No.:** 150/5070-6B
Initiated by: APP-400 **Change:** 2

1. PURPOSE. This Change 2 incorporates additional guidance on passenger convenience, ground access, and access to airport facilities, as identified in Section 131 of Public Law 112-95, "FAA Modernization and Reform Act of 2012 (49 U.S.C. § 47101(g)(2))." Additional provisions of Public Law 112-95 such as Section 132 (b) which amended the definition of airport planning to include plans for recycling and minimizing the generation of airport solid waste (49 U.S.C § 47102(b)(5)(C)), and Section 133 providing that master plans address issues related to solid waste recycling and waste minimization (49 U.S.C. § 47106(a)(6)(A)) have been addressed in separate FAA guidance. These and related considerations will be incorporated into a future change to this AC.

This change also incorporates relevant updates related to the recent changes to Advisory Circular (AC) 150/5300-13, Airport Design, and references to the new Standard Operating Procedures for preparation and submission of Airport Layout Plans.

2. PRINCIPAL CHANGES. Changed text is indicated by vertical bars in the margins. The primary revisions are contained in Chapters 8 and 10 and Appendix B of this AC. In addition, limited editorial and text revisions since the release of Change 1 to this AC in 2007 are incorporated throughout. A full revision to this AC is underway.

Advisory Circular

Consolidated AC includes Changes 1 and 2

Subject: Airport Master Plans

Date: July 29, 2005 **AC No.:** 150/5070-6B
Initiated by: APP-400 **Change:**

1. PURPOSE. This Advisory Circular (AC) provides guidance for the preparation of master plans for airports that range in size and function from small general aviation to large commercial service facilities. The intent of this AC is to foster a flexible approach to master planning that directs attention and resources to critical issues. The scope of each master plan must be tailored to the individual airport under evaluation.

2. CANCELLATION. This publication cancels Advisory Circular 150/5070-6A, *Airport Master Plans*, dated June 1985. Chapter 10 and Appendix F of this document cancel Chapter 1, Section 5, *Airport Layout Plan*; Appendix 6, Section 2, *Typical Airport Layout Plan*; and Appendix 7, *Airport Layout Plan Components and Preparation*, of Advisory Circular 150/5300-13, *Airport Design*, dated September 1989.

PART I: THE PROCESS OF PREPARING MASTER PLAN STUDIES

Chapter 1 Introduction

101. PURPOSE AND APPLICATION

This Advisory Circular (AC) provides guidance for the preparation of master plans for all airports. Its intent is to foster the development and adoption of a flexible approach to master planning that devotes resources and attention to critical issues. Planners should tailor an individual master plan to the unique conditions at the study airport. As a result, master plans for individual airports will vary in what elements they include and in the level of detail.

An airport master plan is a comprehensive study of an airport and usually describes the short-, medium-, and long-term development plans to meet future aviation demand. The category of study that includes master plans and master plan updates can therefore be thought of as a continuum that varies by level of detail and associated effort.

The elements of a master planning process will vary in complexity and level of detail, depending on the size, function, issues, and problems of the individual airport. The technical steps described in this AC are generally applicable, although each step should be undertaken only to the extent necessary to produce a meaningful product for a specific airport. However, study elements for large and/or complex airports may involve unique technical analyses beyond those detailed in this AC. The sponsor, the sponsor's consultant, and FAA representatives must carefully prepare a scope of work that reflects the circumstances of the individual airport.

102. INTENDED USERS

This publication is intended primarily for use by members of the aviation community, especially those directly involved in preparing master plans: airport sponsors, airport staff, airport consultants, FAA representatives, and state aviation officials. It will also be useful to airport board members; municipal officials; state, regional, and local planning personnel; and the general public.

103. NEED FOR NEW GUIDANCE

Methods and techniques associated with airport master plan studies have evolved since the last version of this AC was published in 1985. This update incorporates current industry methods and procedures commonly employed in the preparation and documentation of master plan studies.

104. FUNCTION OF MASTER PLAN STUDIES

a. Airport master plans are prepared to support the modernization or expansion of existing airports or the creation of a new airport. The master plan is the sponsor's strategy for the development of the airport.

b. The goal of a master plan is to provide the framework needed to guide future airport development that will cost-effectively satisfy aviation demand, while considering potential environmental and socioeconomic impacts. The FAA strongly encourages that planners consider the possible environmental and socioeconomic costs associated with alternative development concepts, and the possible means of avoiding, minimizing, or mitigating impacts to sensitive resources at the appropriate level of detail for facilities planning.

c. Each master plan should meet the following objectives:

1) Document the issues that the proposed development will address.

2) Justify the proposed development through the technical, economic, and environmental investigation of concepts and alternatives.

3) Provide an effective graphic presentation of the development of the airport and anticipated land uses in the vicinity of the airport.

4) Establish a realistic schedule for the implementation of the development proposed in the plan, particularly the short-term capital improvement program.

5) Propose an achievable financial plan to support the implementation schedule.

6) Provide sufficient project definition and detail for subsequent environmental evaluations that may be required before the project is approved.

7) Present a plan that adequately addresses the issues and satisfies local, state, and Federal regulations.

8) Document policies and future aeronautical demand to support municipal or local deliberations on spending, debt, land use controls, and other policies necessary to preserve the integrity of the airport and its surroundings.

9) Set the stage and establish the framework for a continuing planning process. Such a process should monitor key conditions and permit changes in plan recommendations as required.

105. ORGANIZATION AND USE OF THE ADVISORY CIRCULAR

a. **Structure of the Advisory Circular** – The Advisory Circular is presented in two parts:

1) ***Part I – The Process of Preparing Master Plan Studies*** provides an introduction to the Advisory Circular, an overview of master plan studies, and a summary of the pre-planning process.

2) ***Part II – Elements of Master Plan Studies*** provides a detailed discussion of the various elements of master plan studies, including the components of master plan technical reports and the plan drawings that accompany them.

b. As noted above, Part II of the AC details the individual elements of a master plan study. Although they are presented in the order found in a typical master plan report, issues in some chapters may have a direct bearing on those in other chapters. Environmental and financial feasibility considerations, for example, must be considered throughout the process. These cross-linkages are explicitly identified in the relevant chapters of Part II.

c. The AC includes several appendices of supplemental materials. Appendix A presents a glossary of terms that are commonly used in airport master planning. Appendix B provides a list of useful reference materials, including other advisory circulars, FAA orders, appropriate Code of Federal Regulations, Transportation Security Regulations, security-related publications, FAA reports, and general airport publications. Appendix C provides a listing of potential stakeholders in the public involvement program of the master planning process. Appendix D provides a discussion of environmental factors in airport master planning. Appendix E provides guidance on the site selection process. Appendix F shows the general guidelines in preparing the airport layout plan drawing set.

This page intentionally left blank.

Chapter 2 Content of Master Planning Studies

201. TAILORING STUDIES TO THE NEEDS OF INDIVIDUAL AIRPORTS

The guidance in this AC covers planning requirements for all airports, regardless of size, complexity, or role. However, each master plan study must focus on the specific needs of the airport for which a plan is being prepared and the scope of a study must be tailored to the individual airport. Therefore, in a given study certain master planning elements may be emphasized while others may not be considered at all. Although the FAA does not require airports to prepare master plans, it strongly recommends that they do so.

The intent of this AC is to foster a flexible approach in the preparation of airport master plans, enabling planners to focus their resources and effort on critical issues. As a scope of work is developed, the planners and airport sponsors must make decisions regarding two key questions: (1) what type of study should be conducted, and (2) what level of detail should be assigned to the individual elements of the study?

202. TYPES OF MASTER PLANNING STUDIES

a. The master planning process will vary with the size, complexity, and role of the study airport and may include a variety of supporting studies. However, all master planning studies will fall within one of two basic types: Airport Master Plans or Airport Layout Plan (ALP) Updates.

b. **Airport Master Plans** – An airport master plan is a comprehensive study of the airport and typically describes short-, medium-, and long-term plans for airport development. Master planning studies that address major revisions are commonly referred to as "Master Plans," while those that change only parts of the existing document and require a relatively low level of effort tend to be known as "Master Plan Updates." In common usage, however, the distinction refers to the relative levels of effort and detail of master planning studies. In most cases, the master plan will include the following elements:

1) ***Pre-planning*** – The pre-planning process includes an Initial Needs Determination, Request for Proposal and Consultant Selection, Development of Study Design, Negotiation of Consultant Contract, and Application for Study Funding.

2) ***Public Involvement*** – Once the consultant team is under contract and has been issued a notice-to-proceed, establish a public involvement program and identify and document the key issues of various stakeholders.

3) ***Environmental Considerations*** – A clear understanding of the environmental requirements needed to move forward with each project in the recommended development program.

4) ***Existing Conditions*** – An inventory of pertinent data for use in subsequent plan elements.

5) ***Aviation Forecasts*** – Forecasts of aeronautical demand for short-, medium-, and long-term time frames.

6) ***Facility Requirements*** – Assess the ability of the existing airport, both airside and landside, to support the forecast demand. Identify the demand levels that will trigger the need for facility additions or improvements and estimate the extent of new facilities that may be required to meet that demand.

7) ***Alternatives Development and Evaluation*** – Identify options to meet projected facility requirements and alternative configurations for each major component. Assess the expected performance of each alternative against a wide range of evaluation criteria, including its operational, environmental, and financial impacts. A recommended development alternative will emerge from this process and will be further refined in subsequent tasks. This element should aid in developing the purpose and need for subsequent environmental documents.

8) ***Airport Layout Plans*** – One of the key products of a master plan is a set of drawings that provides a graphic representation of the long-term development plan for an airport. The primary drawing in this set is the Airport Layout Plan. Other drawings may also be included, depending on the size and complexity of the individual airport.

9) ***Facilities Implementation Plan*** – Provides a summary description of the recommended improvements and associated costs. The schedule of improvements depends, in large part, on the levels of demand that trigger the need for expansion of existing facilities.

10) ***Financial Feasibility Analysis*** – Identify the financial plan for the airport, describe how the sponsor will finance the projects recommended in the master plan, and demonstrate the financial feasibility of the program.

c. **Airport Layout Plan Updates** – An update of the airport layout plan (ALP) drawing set should be an element of any master plan study. In fact, keeping the ALP current is a legal requirement for airports that receive Federal assistance. An update of the ALP drawing set will reflect actual or planned modifications to the airport and significant off-airport development. An accompanying ALP Narrative Report should explain and document those changes and contain at least the following elements:

1) Basic aeronautical forecasts.

2) Basis for the proposed items of development.

3) Rationale for unusual design features and/or modifications to FAA Airport Design Standards.

4) Summary of the various stages of airport development and layout sketches of the major items of development in each stage.

An ALP drawing set update is an appropriate alternative to a full master plan whenever the fundamental assumptions of the previous master plan have not changed. If there have not been any major changes in airport activity or improvements that have had unanticipated consequences, a master plan update is not necessary. Another situation where only an ALP update would be appropriate is the examination of a single development item, such as runway safety area improvements. As indicated above, an ALP update will typically involve fewer elements than a full master plan study, including only the aviation demand forecasts, an assessment of facility requirements, a facility implementation and financing plan, and an airport layout plan drawing set. If additional steps are required to complete the ALP update, a full master plan study is probably a better choice.

203. LEVEL OF STUDY DETAIL

Although almost every master plan includes the full list of elements discussed above, the complexity of the individual elements will vary, depending on an airport's size, function, and particular issues and problems. Each element should be analyzed only to the extent required to produce a meaningful product for that particular airport. The planning process should consider the facility planning needed to enable a seamless transition to subsequent projects.

The scoping process used by the airport sponsor, the sponsor's consultant, and the FAA to develop a work program for the planning study should determine the appropriate level of detail for each study element. The availability of planning information from Federal, state and local organizations may eliminate the need to develop similar information in a study effort. Chapter 3 contains additional information on the scoping process, while Part II provides greater detail on the various elements of an airport master plan.

204. PRODUCTS OF THE MASTER PLANNING PROCESS

a. The products of the master planning process will vary with the complexity of the effort. Master plans can include the following deliverables:

1) ***A Technical Report*** contains the results of the analyses conducted during the development of the master plan. For complex studies, interim reports may be produced to facilitate coordination with various government agencies, tenants, users, the general public, and other interested parties. At the conclusion of the study, the interim reports are assembled into the final technical report.

2) ***A Summary Report*** is useful in bringing together pertinent facts, conclusions and recommendations for public review.

3) ***An Airport Layout Plan Drawing Set*** contains a graphical representation of the proposed development in the master plan and is typically produced as a separate set of full-sized drawings. In addition, the ALP drawing set is typically included in the Technical Report in reduced form.

4) ***A Web Page*** – Many airport sponsors maintain a public access web page with general information about the governmental unit involved and specific information regarding

the airport or airports operated by the sponsor. The Internet provides an excellent forum for the distribution of information on the progress of the study and its final findings and recommendations.

5) ***Public Information Kit*** – Throughout the master plan study, airport sponsor representatives may be asked to speak to community associations, civic clubs, and other organizations with an active interest in the airport. Visual aids such as models, summary brochures, or computer presentations are excellent tools to use at these events to maintain support for the airport development program.

b. The master plan technical report, summary report, and airport layout plan may be produced as paper versions and/or in an electronic format, as determined by the airport sponsor and the FAA. The electronic format will ease distribution of the final reports after the initial printing is exhausted.

c. It is again emphasized here that the level of complexity of each of these products should be determined during the development of the study design. The airport sponsor and the FAA have the flexibility to assess the level of detail that is appropriate for the individual airport and may identify other deliverables that should be produced to support the study effort.

205. MASTER PLAN REVIEWS BY THE FAA

a. The recommendations contained in an airport master plan represent the views, policies and development plans of the airport sponsor and do not necessarily represent the views of the FAA. Acceptance of the master plan by the FAA does not constitute a commitment on the part of the United States to participate in any development depicted in the plan, nor does it indicate that the proposed development is environmentally acceptable in accordance with appropriate public law. The FAA reviews all elements of the master plan to ensure that sound planning techniques have been applied. However, the FAA only approves the following elements of airport master plans:

1) ***Forecasts of Demand*** – The master plan forecast should be reviewed to ensure that the underlying assumptions and forecast methodologies are appropriate. Paragraph 704.h of this guidance should be used to determine consistency of the master plan forecast levels and the Terminal Area Forecast (TAF). Inconsistencies between the master plan forecast and TAF must be resolved, and the forecast approved, before proceeding with subsequent planning work.

2) ***Airport Layout Plan*** – All airport development at Federally-obligated airports must be done in accordance with an FAA- and sponsor-approved ALP. Furthermore, proposed development must be shown on an approved ALP to be eligible for Airport Improvement Program (AIP) funding. FAA approval of the ALP indicates that the existing facilities and proposed development depicted on the ALP conforms to the FAA airport design standards in effect at the time of the approval or that an approved modification to standard has been issued. Such approval also indicates that the FAA finds the proposed development to be safe and efficient.

Chapter 3 Pre-planning

Planners, along with airport sponsors, must make two major decisions in tailoring a study to the needs of an individual airport: what type of study to conduct and what level of detail to use for the individual elements of the study. This chapter outlines these and other steps of the pre-planning process.

301. INITIAL NEEDS DETERMINATION

a. **Identifying General Need for Study** – The airport sponsor usually identifies the need for a planning study, based on existing or potential shortcomings in the existing plan or airport. These deficiencies may be the result of demand exceeding capacity, the introduction of new aircraft types, or the emergence of a critical environmental problem. The airport sponsor's strategic vision or business plan for the airport may drive the need for a planning study. In addition, national, state, or regional planners may have identified issues requiring the airport sponsor's attention. Alternatively, airport users, such as the scheduled airlines and general aviation pilots, may have identified needs that prompted the airport sponsor to undertake a study. The airport sponsor should formulate priorities to establish which issues are most important. Periodic meetings between the airport sponsor and FAA representatives offer an excellent opportunity to review these issues.

b. **Determining Type of Study** – Deciding whether the study in question will lead to a master plan or to an ALP update largely determines the elements to be included and the required level of effort. Even at this early stage of the process, the airport sponsor and the FAA should be able jointly to determine what type of study is appropriate. The sponsor usually will not make decisions regarding specific variations on the basic study type until the consultant has come on board. Although a master plan study will always include a technical report and an airport layout plan drawing set, supplemental products, which may often be related to public outreach efforts, will usually be determined during the scoping process.

302. REQUEST FOR QUALIFICATIONS AND CONSULTANT SELECTION

a. The current version of AC 150/5100-14 *Architectural, Engineering and Planning Consultant Services for Airport Grant Projects* provides important guidance for consultant selection, and its use is recommended. Another useful reference is "Guidelines to Selecting Airport Consultants" published by the Airport Consultants Council, an aviation industry trade association.

b. As a general rule, airport sponsors hire a consultant to prepare planning studies. Before soliciting statements of qualifications (SOQs) from consultants, the airport sponsor should have a clear understanding of the issues that have defined the need for the study. This information should be provided in the Request for Qualifications (RFQ) that the airport sponsor will issue.

c. The sponsor should assemble an unbiased and technically qualified selection panel to conduct the consultant selection. The qualifications of a firm should be judged on its

experience in similar work and its staff's professional credentials. The planning team that is proposed by the consultant should include firms with relevant experience that can commit to complete the study in the amount of time specified. It is not uncommon for several firms to join together in a master planning effort for the purpose of providing specialized skills or local knowledge and expertise.

d. The sponsor should avoid the use of elaborate submittal requirements or interviews, which add substantially to the cost of the selection process for both the sponsor and the prospective consultants. If the sponsor determines that interviews or requests for additional information are necessary, the sponsor should limit this activity to a short list of three to five firms selected by the evaluation panel.

e. If sponsors anticipate an Environmental Assessment (EA) or Environmental Impact Statement (EIS), they should consult with the local FAA Airports office to determine the appropriate time to begin the consultant selection process. If a sponsor or the local FAA Airports office anticipates the need for an Environmental Assessment, the sponsor should select a qualified environmental contractor to prepare the EA. Sometimes, it may be appropriate for the sponsor to expand the scope of the master plan consultant's responsibilities to include the EA. When the sponsor or the FAA have substantial concerns that the EA may suggest that an action may cause significant impacts, the appropriate FAA Airports office should select the contractor to prepare the EA. This is because if the EA shows that significant impacts would occur, the FAA must select the contractor to prepare its EIS. FAA's selection of the EA contractor in this case saves time by eliminating the need for later contractor selection to prepare the EIS.

303. DEVELOPMENT OF STUDY DESIGN

a. The second decision in designing an effective planning study is to determine the level of detail or depth of analysis for each element. The airport sponsor and the selected consultant should negotiate these basic decisions as the work program is established.

b. The airport sponsor, the consultant, the FAA, and others (as appropriate) begin this process by (1) identifying the airport development issues to be addressed in the master plan and (2) determining the types of analyses and level of effort needed to address each issue individually. Known as "scoping," this is an important step in designing any planning study.

c. The sponsor and the selected consultant should address a broad range of topics during the scoping process. As the scoping process proceeds, the planners must remember that each master plan study is unique and the appropriate scope of work will vary from airport to airport. The airport sponsor is encouraged to develop a scope of work that is appropriate to the circumstances of the individual airport. Some of the specific topics that should be addressed at this time include:

1) ***Goals and Objectives*** – Discuss key airport development issues that the master plan will attempt to resolve. This discussion should answer questions such as: "Why is this master plan study being conducted?," "What are the key issues that need to be addressed in the future development of the airport?," and so forth.

2) ***Data Availability*** – Review the availability of activity forecasts and capacity assessments produced by state and regional system plans and FAA Terminal Area Forecasts and decide how to use them. If these data are not used, the reasons should be discussed with and accepted by all parties, including the FAA. This is especially true for low activity airports where demand/capacity relationships are usually not a critical consideration. Current inventory data may also be available to the consultant as a result of continuous planning efforts by the airport sponsor. Use of these data may reduce the need for new data collection efforts or surveys by the consultant.

3) ***Forecast Horizons*** – Although 5-, 10-, and 20-year time frames are typical for short-, medium-, and long-term forecasts, some studies may want to use different time frames. For any forecast horizon, the short-term forecast should support a capital improvement program, the intermediate-term a realistic assessment of needs, and the long-term a concept-oriented statement of needs. Schedules for airport development that are directly related to demand levels should be tied to those demand levels, rather than dates, since the actual demand will often vary from that forecast, particularly as the time frame increases. At some airports, it may be necessary to look beyond the 20-year time frame to protect the airport from incompatible land use development. The need to do longer range planning must clearly be justified during the scoping process.

4) ***Environmental Considerations*** – Identify the level of environmental documentation that is likely to move forward with the recommendations of the completed master plan study. Sponsors, in consultation with the appropriate FAA Airport's environmental specialist, should identify whether an Environmental Assessment (EA) or Environmental Impact Statement (EIS) may be required or whether categorical exclusions may apply. As noted previously, if sponsors anticipate an EA or EIS, they should consult with the local FAA Airports office to determine the appropriate time to begin the consultant selection process. Consideration should also be given to the appropriate state environmental regulations and the need to develop applicable documentation.

5) ***Schedules*** – Agree upon schedules showing milestones for the completion of technical products and for coordination and review. The schedule should clearly indicate decision points beyond which work should not proceed without FAA or airport sponsor approval, such as FAA review and approval of the master plan forecast.

   Realistic schedule development is important. From a practical standpoint, adhering to the schedule for a complex study, such as a long-range plan for a high activity airport, is very difficult. Less complex studies should not have such a problem. In any case, the schedule for a master plan study should be firm so that all reviewers are aware of their responsibilities with respect to it. The airport sponsor should emphasize the importance of meeting planning process deadlines.

6) ***Deliverables*** – The specific draft and final products of the planning process, and the general level of detail, should be listed in the scope of work and include the number, type, and format of paper reports, drawings, and electronic files.

7) ***Coordination and Public Involvement Program*** – For less complex studies, the FAA, the airport sponsor and the consultant may be the only participants as long as they coordinate with appropriate local officials, stakeholders, and ensure citizen participation through public information sessions. These sessions may be conducted separately or in conjunction with other public meetings. Often written updates for regional or state aviation, transportation and comprehensive planning agencies will be sufficient.

   For complex studies, it may be necessary to organize formal policy, technical, and review committees that meet regularly and use structured communications systems, including public hearings, public information workshops, and web-based information sharing tools. The committee membership may consist of representatives of local, state, and Federal government agencies as well as airport tenants, user groups, community associations, and business organizations. In addition, the active participation of the FAA concerning airspace management, navigational aid and approach aid installation, designation of instrument runways, potential financing of planning and development, and safety and security matters is essential.

   The local FAA Airports office can coordinate the involvement of the FAA organizations that are interested in the development of the airport. Advice from the airlines concerning aircraft types they plan to use and other operational and financial matters will also be essential to the development of an effective plan.

   The airport sponsors staff probably will participate in the day-to-day activities of the planning study. A large airport sponsor will likely have a more extensive management and staff structure than the sponsors of smaller airports.

8) ***Budget*** – Development of the work scope and the associated fees is usually an iterative process. The work scope contemplated in early draft narratives may require fees that exceed a sponsor's budget. Planners must adjust the scope of work, the proposed fees, or the available budget until all three components have been balanced to the satisfaction of the sponsor, the consultant, and the FAA.

d. Careful attention to the development of the scope of work for the master plan study sets the stage for a successful study. Establishing a sound scope of work will also allow the sponsor, consultant, and the FAA to develop a budget that meets the goals and objectives of the study. Failure to do so may result in a study that is lacking vital details that affect the decision making process. It is important to note that Federal planning grants cannot be amended to cover increased costs. If additional work is needed beyond the original scope of work, an additional grant would probably be required. Many of the decisions made at this point will have an impact on the degree of difficulty that is encountered as the development program moves from planning to implementation.

304. NEGOTIATING CONSULTANT CONTRACTS

After scoping the study and negotiating a price for the consulting services, a contractual arrangement must be negotiated.

a. The recommended type of agreement between the airport sponsor and the consultant is a firm, fixed price contract. This is advisable whenever the level of effort can be fairly well predicted and where reasonable fees can be established at the outset. This type of contract imposes a minimum administrative burden and provides incentives for effective cost control and contract performance.

b. Where the level of effort or duration of the study is uncertain, a cost plus fixed-fee contract or a time and materials contract may be required. Also, some airport sponsors, recognizing that master planning often uncovers unanticipated issues that need study, add an on-call component to their consultant contract, which allows the scope and fees to be developed as new tasks are identified. These contract provisions typically provide for payment on a time and materials basis, but not to exceed a specified amount. The use of such contracts must be well justified if Federal financial assistance will be provided. The FAA does not recommend contracts based on a cost-plus percentage of cost and they are not permitted if Federal financial assistance will be provided for the study.

c. Advisory Circular 150/5100-14, *Architectural, Engineering and Planning Consultant Services for Airport Grant Projects,* is also a good reference for guidance on the options for a contract format. The procedures in this AC must be followed if Federal funds are involved.

305. APPLICATION FOR FEDERAL FUNDING

The point at which a sponsor submits a grant application to the FAA varies with the individual study. For large and complex master plans, the sponsor should divide the total grant funding into two phases. The initial phase can fund early tasks such as the definition of issues, inventory of existing conditions, preparation of forecasts, and determination of facility requirements. The second phase grant application could be prepared after the study team has gained a better grasp of the key issues and a more precise cost estimate of the effort needed to complete the master plan. The FAA should be involved in the overall process as early as possible. The FAA can advise the sponsor on the best strategy for obtaining funding and on questions of the eligibility of the elements of the proposed scope of work.

PART II: ELEMENTS OF MASTER PLAN STUDIES

Part II of this Advisory Circular provides detailed discussions of the elements of a typical master plan study. As noted in Chapter 1, the elements to be included in a particular study will vary depending on the size, function, and challenges facing the study airport. The following key elements of master plan studies are discussed in Part II of this Advisory Circular:

- Chapter 4: Public Involvement Program
- Chapter 5: Environmental Considerations in Airport Master Planning
- Chapter 6: Existing Conditions
- Chapter 7: Aviation Forecasts
- Chapter 8: Facility Requirements
- Chapter 9: Alternatives Development and Evaluation
- Chapter 10: Airport Layout Plans
- Chapter 11: Facilities Implementation Plan
- Chapter 12: Financial Feasibility Analysis

Each chapter in Part II ends with a section titled "Documentation Guidelines." These guidelines are not mandatory, and planners should use their discretion in adopting only the guidelines that are consistent with their negotiated scope of work. Planners also have the flexibility to adopt other documentation guidelines that they feel are better suited to the particular circumstances of a study. Appendix B contains a comprehensive listing of other planning documents and guidelines that may be helpful.

This page intentionally left blank.

Chapter 4 Public Involvement Program

The first task in a master plan study, after the consultant receives a notice-to-proceed, is the creation of a public involvement program. The level of public involvement in airport planning should be proportional to the complexity of the planning study and to the degree of public interest. Most planning studies will fall between the minimal requirements of a small airport study and extensive public involvement required of a large and complex study. Particularly complex studies may merit the use of a consultant experienced in the public involvement process.

Figure 4-1: Public Meeting

Source: Portland Airport Project Advisory Committee

Over the course of the study, the public involvement program will encourage information-sharing and collaboration among the airport sponsor, users and tenants, resource agencies, elected and appointed public officials, residents, travelers, and the general public. Collectively, these various groups form the stakeholders who have an interest in the outcome of the study. An effective public involvement program should provide these stakeholders with an early opportunity to comment, before major decisions are made; provide adequate notice of opportunities for their involvement; and should provide for regular forums throughout the study.

401. TIMING

Public involvement has its greatest impact during the early stages of the planning process, before irreversible decisions have been made and while many alternatives can be considered. When the stakeholders become involved before major decisions or commitments are made, the planners can better deal with issues of community concern and improve the chances of reaching a consensus on controversial matters. If stakeholders become aware that the important decisions were made before they were invited to participate, they may distrust the planners. In addition, when public involvement opportunities are not provided until late in the planning process, there may not be enough time to make significant changes. The tendency, instead, will be for planners to merely defend previously determined courses of action, rather than exploring any new alternatives. An effective public involvement program will usually avoid such an undesirable outcome.

402. TOOLS AND TECHNIQUES

The study team may use a variety of forums, such as committees, public information meetings, small group meetings, and public awareness campaigns in a public involvement program. The selection of a specific platform depends on the particular complexities associated with the airport, the expected public interest in the master plan, the practices and policies of the airport sponsor, and budget considerations. In addition, it may be necessary to consider the special needs and sensitivities of low income and minority populations, consistent with the provisions in Executive Order 12898, *Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations*. Although the public involvement program is important to the master plan effort, planners must balance the need for stakeholder involvement with the costs of such a process. Complex, large, or unfocused stakeholder groups can impede meaningful input, unnecessarily raise study costs, and frustrate participants as they struggle to communicate with the study group.

a. **Committees** – Committees that facilitate the public involvement program often include a Technical Advisory Committee (TAC) and a Citizen's Advisory Committee (CAC). The TAC is responsible for providing input and insight on technical issues. Committee members typically have a high level of technical competency associated with some aspect of aviation or airport operations and are major stakeholders in the airport's operation. The CAC serves as a sounding board and information exchange group for stakeholders, reviews the planning team's plans and proposals, interacts with the planning team members during the review, makes consensus recommendations to the planning team, and finally gives its recommendations on the finished plan to the airport sponsor. The membership of the CAC should be representative of all stakeholders.

   In reviewing the master plan, the TAC will evaluate its technical merit, while the CAC will weigh the recommendations against community goals, values, and needs. The committees are advisory, however, and have no decision making power of their own. In establishing these committees, the airport sponsor does not delegate its authority and responsibilities to them. The specific roles of such committees should be clearly defined at the outset and carefully explained at the initial meeting to prevent later misunderstandings. The size of both the TAC and CAC should be kept manageable. In some cases, it may be appropriate to combine the committees into a single group.

   The public involvement program should also include a management/policy/oversight committee to advise the planning team on policy decisions that will likely need to be made throughout the study. Committee members would typically include senior airport or airport sponsor staff that have the responsibility for decision making for the airport.

b. **Public Information Meetings** – Traditional public hearings, where stakeholders are given the opportunity to make public statements about the study, are not a good forum in which to conduct a continuing discussion of issues and alternatives because of the formal and inflexible nature of such hearings. An "open house" format with interactive information stations staffed by knowledgeable staff or consultants is more informal, yet a very effective method by which to engage the public and stakeholders in soliciting their opinions on development options. A public information meeting using the open house format will permit stakeholders to visit a meeting site at their convenience and visit with

planners on an informal one-on-one basis. A short slideshow or videotape, which all attendees can view upon arrival at the open-house site, may be a useful introduction to the study process. If a more formal meeting is desired, starting with an open house and moving into a more formal forum can be effective.

The number of public information meetings to be held over the course of the study can vary depending on the complexity of the study. It may also be necessary to hold meetings in more than one location to provide adequate geographic coverage for communities affected by the planning proposals. Public information meetings are typically held in the evening to provide most people the opportunity to attend. In some unique conditions, such as with a large elderly population, a day meeting may be needed. Complex projects may require that these meetings be scheduled throughout the day.

c. **Small Group Meetings and Briefings** – Small group meetings may be held throughout the study to provide opportunities for detailed discussions of plan alternatives. These informal sessions allow study team members to learn about local concerns. Such meetings may be scheduled with community boards, elected officials, civic organizations, and other interested organizations.

d. **Public Awareness Campaign** – An effective public awareness campaign is an essential part of the public involvement program. It is instrumental in generating initial stakeholder involvement, in maintaining stakeholder interest throughout the program, and in keeping the general public informed of the progress of the study.

1) ***Informational and Educational Materials*** – Informational materials designed to educate a broad audience about all aspects of the study may be distributed to stakeholders. These materials might include fact sheets, flyers, press releases, newspaper ads, and general information packets. Planners should provide translations of this material if the airport is located in an area where English is not the first language for a large percentage of the residents. A mechanism should be provided for individuals or organizations to add their names to a mailing list to receive these materials.

2) ***Web Pages*** – Web pages, with interactive or self-guided presentations, as well as electronic copies of study documents, are increasingly used as part of a public awareness campaign. Planners often link the master plan web page to the airport's web site.

e. Public involvement programs can place special requirements on an airport planning team. The team must be sensitive to the interests of stakeholders and have a positive attitude toward their participation in the planning process. The members of the team must also be aware of the extra time and personal effort that will be required, since they will have to meet regularly with the stakeholders at committee and public information meetings.

The same planners who work with the stakeholders at the various stakeholder forums should do the actual planning. Experience shows that planners must gain the confidence of the stakeholders and overcome their initial concerns before any real progress can be

achieved. Extensive public involvement from start to finish in the planning process enhances all plans and proposals and satisfies the goals of long-range planning.

403. IDENTIFY THE STAKEHOLDERS

The types of stakeholders will vary at each airport, depending on the size of the airport and the complexity of the planning issues. The following is a list of the general categories of potential stakeholders, from which a list of appropriate participants can be developed:

- Users and tenants
- Groups and individuals from within the sponsor's organization
- FAA personnel from the appropriate Regional and Field offices
- Resource agencies and other governmental units with regulatory or review authority
- Other interested groups

The individuals from a particular stakeholder group must be able to effectively represent their interests in discussions with the master plan preparation team. Furthermore, they should present the consensus view of the stakeholder group and not a special interest minority opinion. Although planners should make every effort to identify and communicate with all appropriate stakeholders early in the master plan process, it may also be necessary to add stakeholders as the study progresses. They must also be able to take study information back to their group to keep them informed throughout the planning process. Appendix C contains a more detailed list of potential stakeholders.

404. IDENTIFY KEY ISSUES

a. The identification of key issues is an early product of a well-designed public involvement program. Recall that the pre-planning activities identified in Chapter 3 included establishing which issues are of greatest concern to the airport. The results of that effort are essential in determining the type of study to be completed and in developing the scope of work. These will probably not include all issues that are of concern to each of the stakeholders. Discussions with the stakeholders (through use of the tools and techniques described earlier in this chapter) will help identify a broader set of problems, challenges, and opportunities that should be examined. These key issues will shape policy decisions, influence technical criteria and standards, and help identify development alternatives.

b. Once the key issues are identified, the sponsor may want to modify the study approach to address any important issues that had not been previously included in the proposed study. Some issues may be raised during this process that are not appropriate to include in the master plan study; these should be addressed outside of the master plan effort. The airport sponsor may establish a separate forum to handle such issues.

405. DOCUMENTATION GUIDELINES

a. **Document Key Issues** – Accurate documentation of the key issues is essential, because stakeholders will track how the planning team addresses them throughout the study. Grouping the critical issues into major functional categories, such as facilities, business,

operational, properties, and environmental issues, will help planners understand the stakeholders' concerns. The documentation should divide issues into those that will be addressed by the master plan study and those that will be addressed in a different forum.

b. **Document Public Involvement Program** – Documentation of the public involvement program should appear in an appendix to the Master Plan. Copies of committee rosters, meeting minutes, advertisements, newsletters, and other elements of the Public Awareness Campaign can be placed in an appendix as the official record of the public involvement program. This documentation should be revised regularly over the course of the study rather than being prepared at the end of the process.

This page intentionally left blank.

Chapter 5 Environmental Considerations

501. GENERAL

a. The purpose of considering environmental factors in airport master planning is to help the sponsor thoroughly evaluate airport development alternatives and to provide information that will help expedite subsequent environmental processing. By using existing maps of the airport area, prior environmental documents, and the Internet, planners and environmental specialists can get an excellent overview of sensitive environmental resources in and around the airport. The planner should understand that the consideration of environmental factors in the evaluation of alternatives should be tailored to each airport's size, unique setting, and operating environment, and will typically not be as detailed as that in subsequent environmental reviews. The consideration of environmental factors in the planning process will typically result in an inventory (overview) of the airport's environmental setting, the identification of potential environmental impacts of airport development alternatives, and the identification of environmentally related permits that may be required for recommended development projects.

b. The FAA recommends that the planning process consider the needs of subsequent environmental review processes. The master plan should include thoroughly supported project justifications and thorough documentation of alternatives that meet the planning need and are reasonable and feasible (environmentally as well as technically); and should note any effects of the airport development alternatives on sensitive environmental resources. Considering environmental factors in master planning provides useful information and planning principles that will help expedite the environmental review of projects.

c. Planners should develop each chapter of the master plan with environmental considerations in mind. Normally the environmental considerations should not be in a stand-alone chapter, but should be incorporated into the appropriate chapters, such as existing conditions and alternatives development and evaluation.

d. When considering environmental factors in master planning, the planner and environmental specialist do not need to follow the specific impact categories outlined in FAA Order 5050.4, NEPA Implementing Instructions for Airport Projects. Rather, FAA Order 5050.4 should be consulted as a guide to help planners identify potential environmental impacts specific to the study airport that should be considered as planning continues.

e. During the master plan scoping process, planners and environmental specialists should attempt to identify key environmental issues that will be involved in analyzing airport development alternatives to ensure that the master plan budget provides enough resources to analyze them. If such early identification is not possible, planners should propose an initial budget for the issues that may be identified during the master planning inventory and data collection process. If additional environmental issues are uncovered later in the planning process, the planner can prepare a separate scope and budget for a more detailed

analysis. However, sponsors and planners should be aware that Federal planning grants cannot be amended and the more detailed analysis would need to be accomplished in a separate study.

f. Planners, in consultation with environmental specialists, should consider appropriate Federal environmental laws and regulations when analyzing proposed airport development alternatives. There are approximately 40 Federal laws, executive orders, and regulations protecting particular parts of the environment, such as the Clean Air, Clean Water, and Endangered Species Acts, and an Executive Order on Protection of Wetlands. There are also many state and local environmental laws and regulations that should be considered in the master planning process.

g. During the master plan scoping process, planners should try to identify any potential short-term capital development projects that might be recommended in the master plan that are known to trigger additional environmental processing, such as safety related projects. For such projects, the airport sponsor should consider beginning the environmental processing before the master planning process is completed. Otherwise, the various agencies and public involved may perceive that the NEPA analysis is biased because a recommended alternative was selected in the master plan before the NEPA process began. This guidance can be extended to longer-term projects in the case of new airports or major reconfigurations of existing airports.

h. Planners should recognize the need to achieve a balance between the manmade and the natural environment. Although every proposed development project will have some impact on the natural environment, the use of prudent planning criteria, along with sound environmental data and analysis, will help minimize unavoidable environmental impacts and the delay of project design and construction.

502. ENVIRONMENTAL CONSIDERATIONS IN MASTER PLANNING ALTERNATIVES ANALYSIS

a. In the airport master planning process, the planner, along with an environmental specialist, should identify potential key environmental impacts of the various airport development alternatives so that those alternatives that avoid or minimize impacts on sensitive resources are considered. The planner should understand that the consideration of environmental factors in the evaluation of alternatives should be tailored to each airport's size, unique setting, and operating environment, and will typically not be as detailed as that in subsequent environmental reviews. The evaluation of potential environmental impacts should only be done to the level necessary to evaluate and compare how each alternative would involve sensitive environmental resources.

b. Project justifications and the analysis and selection of alternatives, including an explanation of why certain alternatives were not carried forward, should be completed and documented in the master plan before the NEPA process is started. Only those alternatives that could solve the identified problems and have aeronautical utility should be forwarded for NEPA analysis. (See Appendix E, "Consideration of Environmental Factors in Airport Master Planning," for additional discussion of this topic.)

c. Environmental factors should be considered during the development and analysis of airport project alternatives. This evaluation can help an airport sponsor identify a recommended alternative that the FAA may eventually select as its preferred alternative during the NEPA review process. It also facilitates the decision making process the FAA must complete as part of its project approval process.

1) The facility requirements and alternatives analysis chapters of the master plan should provide sufficient documentation regarding the justification for each project so that these chapters may serve as the basis for the purpose and need section of any environmental document.

2) Planners and environmental specialists should identify the potential key environmental impacts of each development project as part of the master plan alternatives analysis. Categories of potential impacts are defined in FAA Order 1050.1, *Environmental Impacts: Policies and Procedures* and FAA Order 5050.4, FAA Airports guidance for complying with NEPA. A matrix showing each alternative and its potential environmental impacts may be useful for subsequent environmental processing.

3) For some airports, only a few of the environmental impact categories will need to be discussed in the alternatives analysis (such as noise, wetlands, and social impacts), based on location-specific environmental issues identified in the environmental overview. Planners do not need to list each specific impact category mentioned in FAA Order 5050.4, but only those resources the alternatives would likely affect. In many cases, a simple environmental screening will be sufficient to identify those impacts. Detailed impact analyses will be conducted in any Environmental Assessment or Environmental Impact Statement that follow the master plan.

d. Permits that may be needed for each proposed project should be identified in the alternatives analysis. Although such requirements can vary greatly from state to state and within each locality, some of the permits that are usually necessary include:

- Clean Water Act, Section 404 Dredge and Fill Permit
- Air Quality Permit for on-site batch plants or other construction-related activities
- Local government construction permits
- Growth Management Permits
- United States Fish and Wildlife Service, National Marine Fisheries Service opinions, or State Wildlife and Game Commission Permits, if protected and endangered species could be impacted
- Clean Water Act, National Pollution Discharge Elimination System Permits

503. FURTHER GUIDANCE ON CONSIDERATION OF ENVIRONMENTAL FACTORS IN AIRPORT MASTER PLANNING

Appendix D, "Consideration of Environmental Factors in Airport Master Planning," contains recommendations on how to evaluate environmental factors for large or complex projects in airport master planning. It contains a discussion of the interaction of the airport planning and environmental processes and recommendations on how to effectively integrate these processes. The appropriate treatment of environmental factors in airport master planning can make subsequent detailed environmental processing more efficient and speed the completion of airport development. Although Appendix D is primarily intended for large and complex projects, many of the techniques in the guide can be applied to all levels of master planning.

504. DOCUMENTATION GUIDELINES

a. The existing conditions chapter should document the airport's environmental setting. The alternatives analysis chapter should document the potential environmental impacts associated with each development project alternative. In addition, the master plan should identify potential Federal, State, and local permits that may be required for each project alternative. Planners, with the help of environmental specialists, should include a matrix in the alternatives analysis chapter of the master plan that lists each development project alternative and its associated potential environmental impacts and required permits. This will be beneficial in subsequent environmental processing.

b. Planners should use appendices for the majority of the technical documentation, such as noise analysis, wetland mapping, and threatened and endangered species reports to improve the readability and organizational flow of the alternatives analysis chapter.

c. The potential environmental impacts of the proposed airport development alternatives should be addressed in a candid manner and written so that the public easily understands them.

Chapter 6 Existing Conditions

601. GENERAL

a. Most data gathering for a master plan study takes place when planners evaluate existing conditions. Typical broad categories of information to be collected include: the history of the airport; description and condition of physical facilities on the airport including buildings and airfield pavement; the regional setting of the airport and surrounding land uses; the environmental setting of the airport; socioeconomic and demographic data for the airport service area; historical aviation activity; and airport business affairs.

b. To initiate data collection, planners should carefully review the scope of work and verify the type and quantity of data needed for subsequent analyses. It is easy to collect information that is not really necessary or to fail to gather critical information needed for later analyses. Planners can avoid these mistakes by carefully reviewing the scope of the study.

c. To avoid unnecessary data gathering, planners should use existing data as much as possible. Previous master plans, other recent planning studies, and regional planning agencies can provide useful information that should be reviewed before any data gathering begins. However, planners should ensure the validity of the existing data before using them for the master plan study.

602. BACKGROUND SECTION

a. The background section should provide a brief overview of the history of the airport, describe its aeronautical role in the national aviation system, and identify its role in the community's infrastructure. Many sponsors periodically assemble information about the economic benefits of their airport, such as employment, direct salaries, and air service, which can be summarized in the background section.

b. Major milestone events in the history of the airport, such as ownership changes, construction of significant facilities, and the introduction of air service can be identified. A timeline, like that shown in Figure 6-1, may be used to present this information.

603. INVENTORY AND DESCRIPTION OF EXISTING FACILITIES

a. A significant portion of the inventory will be devoted to identifying the existing physical facilities at the airport. Drawings and other documents in FAA databases and on file with airport management are a good source of data and should be reviewed early in the inventory effort. These data may need to be supplemented with field observations, personal interviews with tenants and users, Internet searches, and surveys of passengers and employees.

Figure 6-1: Timeline of Events

1928 – Original land donation

1934 – Airport officially opened

1934

1937 – First commercial airline flight

1941 – Additional 40 acres donated

1953 – Dedication of new terminal building and ATCT

1975

1960 – VORTAC installed

1970 – Passenger terminal expanded

1975 – New ATCT constructed

1987 – Airport Authority established

1990 – Airport master plan updated

1998 – Terminal expansion began

1998

b. Classifications that are commonly used to organize this information include the following:

1) ***Airfield/Airspace*** – The functional use and geometry of runways, taxiways, and holding aprons; lighting, marking, and signing of runways and taxiways; navigational aids; visual approach aids, and instrument approach procedures. Information on the use of the airspace and how air traffic is managed should also be collected, including operational limitations resulting from traffic interaction with other airports or reserved airspace, obstructions to air navigation, noise abatement procedures, and airfield or navigational aid shortcomings. Planners should also compile historical data on weather conditions, such as prevailing wind direction and speed, as well as the occurrence of critical combinations of ceiling and visibility. The existence of, and the need for, Remain-Overnight-Parking (RON) should also be determined.

2) ***Commercial Passenger Terminal Facilities*** – Inventory of terminal building space by functional use and size: check-in hall/ticket lobby, number of gates, lineal feet of gate frontage, aircraft parking apron area, restaurants and other concession space, and passenger security screening procedures. Surveys conducted in hold rooms are often used to gather information about passenger characteristics that can be useful in determining future facility requirements.

3) ***General Aviation Facilities*** – The quantity and type of hangars; transient aircraft parking apron areas, tie-down positions; general aviation terminal facilities; aircraft parking aprons; fixed base operators; flight schools; pilot shops; and the number and mix of based aircraft.

4) ***Cargo Facilities*** – The quantity and area of air cargo buildings and aircraft parking aprons. At airports with significant air cargo activity, freight forwarders and other support functions are often located in areas adjacent to the airport. These should be identified on the airport layout plan.

5) ***Support Facilities*** – The quantity and type of support facilities at an airport that encompass a broad set of functions that ensure smooth and efficient airport operation, include Aircraft Rescue and Fire Fighting stations, airport administrative areas, airport maintenance facilities, airline maintenance hangars, flight kitchens, aircraft fuel storage, heating and cooling systems, FAA facilities. For airport towers, determine their hours of operation.

6) ***Access, Circulation and Parking*** – The quantity and type of ground access systems and commercial areas that serve the airport, or are served by it, such as on-airport access roads, circulation and service roads, parking and curb space, including information on their alignment, condition and capacity. Also include information on public transportation services, such as bus, rail, taxi and limousine, and the split between personal and public transportation. Consultation with state and local transportation agencies responsible for planning and operating surface transportation systems should produce data on proposed highway and transit plans, as well as traffic density statistics relative to surface systems leading to and from the airport. Furthermore, include information on rental car facilities and activity. It may difficult

to obtain information from rental car companies, but rental car facility planning is typically a critical element of planning for the terminal area and parking facilities, even at smaller airports.

7) ***Utilities*** – Description of major elements of the infrastructure that service the airport's utility demands for water, sanitary sewer, communications, heating and cooling, and power. Historical consumption data may be necessary to quantify future utility loads. Storm-water drainage, deicing and industrial waste disposal systems should also be included.

8) ***Other*** – Non-aeronautical uses such as recreational facilities and parks, industrial parks, agricultural or grazing leases, and retail businesses.

c. The inventory of existing facilities need not include all the classifications described above. That list is a general outline that should be modified to conform to the specific circumstances of an individual airport. For example, a general aviation master plan does not need a section on commercial passenger terminal facilities. Similarly, a plan for a large commercial service airport with little general aviation or air cargo activity could include the inventory of those facilities in a subsection describing support facilities.

d. Whatever format is used to describe existing conditions should be followed in subsequent chapters, using a parallel structure, to describe demand/capacity and determination of facility requirements, identification and evaluation of alternatives, presentations of estimated capital costs, and the airport plans chapter.

e. The inventory of existing conditions at an airport is a critical task in a master plan study and must be closely managed. Data should be collected only when there is a clear understanding of the need for the information to support the demand/capacity analyses and determination of facility requirements.

604. DESCRIBE REGIONAL SETTING AND LAND USE

a. A master plan study should examine the regional setting of an airport and the land use patterns around it. This is a critical task, because the impact of airport planning decisions can extend well beyond the airport property line.

b. Collect information on the political boundaries of the airport and the political entities with jurisdiction over the operation of the airport and adjacent land uses. Identify the airport service area and the presence and role of airports that might compete with the study airport.

c. Collect all applicable documents, such as official maps, the latest area-wide comprehensive land use and transportation plan, applicable municipal zoning ordinances and other land use controls and unusual building code provisions, including height zoning ordinances, noise overlay zones, and airport overlay districts. The development of practical land use strategies requires an understanding of the political context and local preferences regarding land use.

d. Identify the land uses in areas that will be exposed to airport operations. Land use is a continuously changing process, particularly in urban environments, so the land use inventory should collect information on planned and proposed land uses, as well as on existing uses. Note if there are any governmental programs designed to direct land use patterns in the area under review. For example, if the airport sponsor has completed a noise compatibility-planning program, it should contain valuable information on land use.

e. Identify land uses that may affect the safe operation of the airport or influence its expansion. Structures that could obstruct air navigation, or the presence of other airports that may interfere with the study airport, are the principal safety concern. Also identify areas located near the airport that may represent a potential hazard to aircraft, such as flood control areas, stockyards, and sanitary landfills.

f. Use geographic information systems (GIS), aerial photographs, topographical maps, obstruction charts, aeronautical charts, approach plates and other mapping tools to examine and display land use details. Many local governments have comprehensive GIS systems that contain electronic files for land use analysis and zoning.

g. Consider off-airport drainage and flood control issues, which may be affected by airport development.

605. ENVIRONMENTAL OVERVIEW

a. The principal objective of an environmental overview is to document environmental conditions that should be considered in the identification and analysis of airport development alternatives. In the past, master plan studies often focused only on the environmental consequences of the recommended development plan. In those cases, much of the environmental overview would be conducted while other technical analyses were already underway and the environmental data would not be considered in the formulation of alternative development concepts. Current practice is to develop the alternatives with the subsequent environmental processes in mind and to consider environmental data in the evaluation of the alternatives. As a result, the master plan may aid in the formation of the purpose and need statements in subsequent environmental documents.

b. Noise levels and air and water quality are the most common environmental concerns. However, other environmental conditions in and around the airport should also be examined, including: solid waste generation and disposal; toxic material disposal; floodplains and wetlands; endangered and threatened species of flora and fauna; biotic communities; parklands and recreational areas; historic, architectural, archaeological and cultural resources; and prime and unique farmland. Planners should refer to the current version of FAA Order 1050.1, *Environmental Impacts: Policies and Procedures,* for a complete list of environmental impact categories that may need to be examined. In addition to NEPA requirements, planners should consider appropriate state environmental regulations. Past and current uses of airport property should be examined to identify areas that may be contaminated, including fuel farms, chemical or agricultural aerial application refilling stations, and hangar areas used for various industrial processes such as aircraft maintenance and plating.

c. Planners should ask local resource agencies to provide any information they think should be considered in the process of identifying and evaluating alternative development options.

d. Any existing airport noise or environmental programs should be discussed in the environmental overview.

e. When cost effective, data collected in the environmental inventory can be placed in a GIS database for better data visualization, communication, and analysis.

606. DEVELOP SOCIOECONOMIC DATA

a. Socioeconomic data serve two purposes in a master plan study: to ascertain the nature of the community and market the airport serves and/or impacts and to provide specific inputs for the preparation of aviation demand forecasts, particularly econometric demand models.

b. An effective understanding of the community is helpful in ensuring that the planning is responsive to its long-term needs. Planners should focus on those socioeconomic factors that affect the community's need for air transportation. For example, an economy based on tourism would have air transportation needs that would be quite different from those of an agricultural region.

c. A vast array of socioeconomic data are available from many different sources, including a number of commercial vendors; the U.S. Bureau of the Census; metropolitan planning commissions; and state, county, or local agencies. Planners should be careful when using different sources of socioeconomic data to ensure compatibility.

607. ASSEMBLE HISTORICAL AVIATION ACTIVITY

a. The historical data necessary for forecasting aviation demand are generally available in the records maintained by the airport. At airports with FAA airport traffic control towers, FAA records of operations by commercial service, air taxi, military, and general aviation aircraft and revenue passenger enplanements are available in the Air Traffic Activity Data System (ATADS) on the FAA Policy Office's data system website at http://www.apo.data.faa.gov/. At airports without control towers, airport records, FAA Form 5010, *Airport Master Record,* and airport system plan studies are good sources of information.

For commercial service activity, planners should collect data that identify the air carriers; the proportion of operations and enplanements by each; markets served; the number of originating, terminating, and connecting passengers; the proportions of domestic and international passengers; and air cargo activity. It will also be useful to have a breakdown of the fleet mix of aircraft using the airport.

For general aviation activity, planners should collect data that identify the category and class of aircraft, types of fuels those aircraft use, the type of airport services used, and the availability of hangars for tenant and transient aircraft.

b. Master plans for large airports often involve the use of computer simulation models. For an airfield simulation, planners will need a detailed schedule of arrival and departure times for all commercial operations. Records for average or peak days can often be obtained from airport tower records, radar tapes, or noise monitoring systems. Commercial vendors such as the *Official Airline Guide* can also be helpful. For terminal and landside simulations, planners will need the passenger flow volumes in each terminal associated with the aircraft schedules.

608. FINANCIAL DATA

Airport master planners must examine an airport's financial resources, including its basic business model, operating revenues and expenses, and sources and uses of capital funds.

a. **Airport Business Model** – Summarize the airport's basic business model to help planners organize the vast amount of financial data available at most airports. The business model summary should describe the financial operations of the airport, including how its costs and revenues are charged or credited to airport users and how any operational surplus or deficit is handled. In addition, the business model summary should outline how the airport typically funds capital projects (i.e., with AIP and other grants, Passenger Facility Charges, airport revenue bonds, and so forth). If the airport sponsor owns and operates a multi-airport system, the business model summary should discuss how the financials for the study airport are addressed in relation to the whole airport system.

b. **Operating Revenues and Expenses** – Summarize broad categories of operating revenues and expenses. The FAA requires all commercial service airports to submit financial information to the FAA annually on FAA Form 127 and these reports may provide a good starting point. Airport managers often divide operating revenues into airline revenues and non-airline revenues. Non-airline revenues are often subdivided into categories such as terminal concessions; rental car; parking; hangar, land, and other rentals; other; and tax revenues. Operating expenses are often divided into broad categories such as personnel, maintenance, utilities and supplies, other, and debt service.

c. **Capital Funding** – Summarize the airport's ongoing capital improvement program and how it funds its capital development program. The capital improvement program can be funded from many sources, including revenues from the airlines, concessionaires, other airport tenants, tax levies (if applicable), passenger facility charges, AIP grants, other federal and state grants-in-aid, and airport revenue bond proceeds.

The financial feasibility of the capital improvement program will be determined largely by the magnitude and reasonableness of the charges, rents, and taxes paid by airport users, tenants, and others. The information collected in this inventory will be used to prepare a financial plan for the recommended development program.

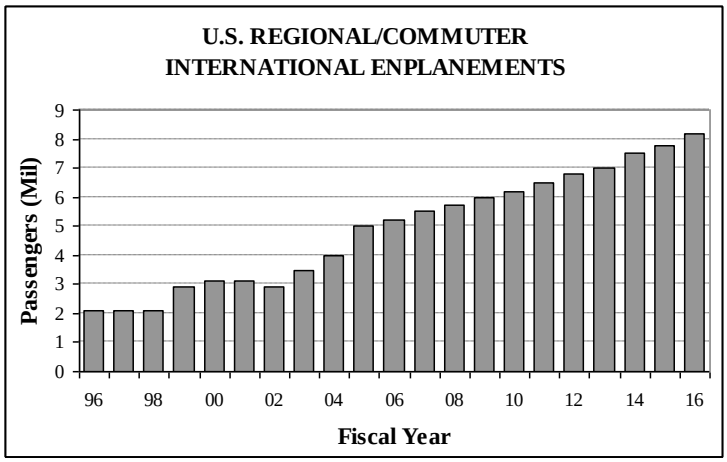
Much of the information discussed in the preceding paragraphs relates primarily to the financial data for commercial service airports and larger general aviation airports. Many

smaller general aviation airports will not have such data readily available; however, such information may be part of the financial records of the sponsor.

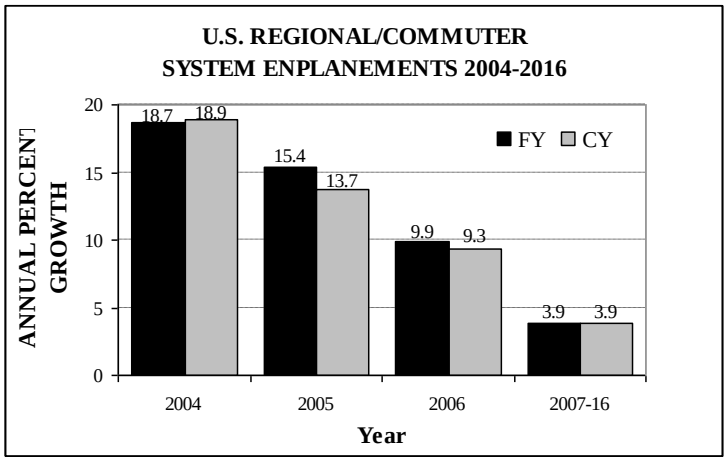
609. DOCUMENTATION GUIDELINES

a. The documentation of existing airport conditions should make liberal use of drawings, tables, aerial photographs, and exhibits produced from geographic information system databases. Presented in this manner, such information is easy to understand, interpret, and locate for later reference.

b. Planners do not need to include all collected information in the report. Some should simply remain in work files until needed to support the technical analyses.



Chapter 7 Aviation Forecasts



701. GENERAL

a. **Purpose of Aviation Forecasts** – Forecasts of future levels of aviation activity are the basis for effective decisions in airport planning. These projections are used to determine the need for new or expanded facilities. In general, forecasts should be realistic, based upon the latest available data, be supported by information in the study, and provide an adequate justification for airport planning and development. Any activity that could potentially create a facility need should be included in the forecast.

Planners should prepare a reliable activity baseline, select an appropriate forecast methodology, develop a forecast, compare it to other forecasts for reasonableness, and submit the forecasts to the FAA for approval. The planning agency should use appropriate statistical techniques to estimate activity where actual operations counts are not available.

Figure 7-1: Sample of FAA Forecast Graphs

Source: FAA Aerospace Forecasts, Fiscal Years 2005-2016, U.S. Department of Transportation, Federal Aviation Administration, Office of Aviation Policy & Plans, March 2005

b. **Level of Forecast Effort** – The level of effort required to produce a planning forecast will vary significantly from airport to airport. Considerable effort, including the use of elaborate forecasting tools and techniques, may be warranted in the case of more complex projects. An existing forecast, on the other hand, may be all that is required for simpler projects. Planners should determine the appropriate level of forecasting effort in the course of pre-planning and scoping the study.

   A number of forecasts are readily available for use in developing and evaluating the master plan forecast. These include the Terminal Area Forecast (TAF), state aviation system plans, and other planning efforts.

c. **Use of the Forecasts** – Prior to use in the master plan, the proposed forecasts must be submitted to the FAA for review and approval. Once approved, the forecasts may be used to provide an initial timetable for facility improvements, as a basis for the development of alternatives to meet the projected demand, and as a basis for environmental analyses and economic and financial plans

702. FORECAST ELEMENTS

a. **Types of Aviation Activity** – To establish the demands likely to be placed on airport facilities, forecasts should include all relevant aviation demand elements, including both the type and level of aviation activity expected at the airport over the planning horizon. The specific activity elements to be forecast will vary depending on the size and category of an airport and the objectives of the master plan study. Planners should note if the forecast projects the introduction of jet aircraft at the study airport, since this will be important to the future environmental review process.

   Aviation demand forecasts typically include aircraft operations and identify the critical aircraft. Forecasts for commercial service airports will also include, at a minimum, passenger enplanements, while forecasts for general aviation airports will include the number and type of based aircraft. The aviation demand elements to be forecast are shown below in Figure 7-2.

Figure 7-2: Aviation Demand Elements

Required	Included Where Appropriate
Operations (annual) Itinerant Air Carrier Air Taxi and Commuter (Regional) General Aviation Military Local General Aviation Military	 Domestic vs. International Annual Instrument Approaches IFR vs. VFR Operations Air Cargo Aircraft Operations Touch and Go Operations (Training) Helicopter Operations Average Load Factor Fuel Use
Passengers (annual) Enplanements Air Carrier Commuter Enplanements Originating Connecting	 Passenger and Cargo Data Domestic vs. International General Aviation Passengers Helicopter Air Taxi Other Number of Student Pilots Number of Hours Flown
Aircraft Based Aircraft Aircraft Mix Critical Aircraft	 Average Seats/Aircraft

b. **Term of Aviation Forecasts** – Prepare forecasts for short-, medium- and long-term periods and specify the existing and future critical aircraft. Short-term forecasts, for up to five years, are used to justify near-term development and support operational planning and environmental improvement programs. Medium-term forecasts (a 6- to 10-year time frame) are typically used in planning capital improvements and long-term forecasts (beyond 10 years) are helpful in general planning.

c. **Peak Period Forecasts** – Forecasts of annual aircraft operations or passenger activity may not adequately describe the needs of individual airport facilities. Because they average demand levels over the course of an entire year, annual metrics are only useful when activity tends to be evenly distributed over the hours, days, and months of a particular airport facility's operation. However, most airports have peak periods where demand far surpasses those averages. Stresses arising from activity peaks are critical at commercial service airports serving as hubs or that have substantial international traffic. Master plan forecasts must include appropriately defined peak period activity levels for facilities planning, such as terminal buildings and ground access systems.

703. FACTORS AFFECTING AVIATION ACTIVITY

Planners preparing forecasts of demand or updating existing forecasts should consider socioeconomic data, demographics, disposable income, geographic attributes, and external factors such as fuel costs and local attitudes towards aviation.

a. **Economic Characteristics** – The economic characteristics of a community will affect the demand for air traffic. In addition to national and regional economic activity, these include specific, identifiable, local activities that distinguish the geographic area served by the airport. The type of industry in an airport's service area also will affect aviation demand, with manufacturing and service industries tending to generate more aviation activity than resource industries such as mining.

b. **Demographic Characteristics** – The demographic characteristics of an area's population also affect the demand for aviation services. Demographic characteristics influence the level, composition, and growth of both local traffic and traffic from other areas. Factors such as leisure time and recreational activity are important in estimating activity, but can be difficult to measure. Another important demographic characteristic is the level of disposable income, usually measured on a per capita basis, which is a good indicator of the propensity to travel and general aviation aircraft purchases and use.

c. **Geographic Attributes** – The geographic distances between populations and centers of commerce within the airport's service area may have a direct bearing on the type and level of transportation demand. The existence of populations and centers of commerce beyond an airport's service area may indicate the need for additional airports that serve transportation demand. The physical characteristics of the area and the local climate may also be important, since they may stimulate holiday traffic and tourism. The role of the airport within the airport system and its relationship to other airports may also have an effect on the services that are demanded at the airport.

d. **Aviation-related Factors** – Business activity, changes in the aviation industry, and local aviation actions can markedly affect the demand for airport services. Business developments in the airline industry, such as consolidations, mergers, and new marketing agreements, can affect airline operations at a particular airport, while fractional ownership can affect others. Wider industry trends, such as the introduction of new low-fare service, the introduction of new classes of aircraft, and the growth or curtailment of airline hubbing, may also alter the level and pattern of demand. To the extent that such actions affect all aviation activity in a region or the country, their effects will be captured in the FAA's forecasts. If, however, only the demand at a particular airport is affected, appropriate adjustments should be made in that airport's forecast. Actions taken by local airport authorities, such as changes in user charges, ground access policies or their support services can also stimulate or hinder the demand for airport services. Investment decisions made as a result of the planning process itself can also produce change by removing physical constraints to airport growth, which should be reflected in the forecasts.

e. **Other Factors** – External factors may also influence the demand for airport services. These include economic actions such as fuel price changes, availability of aviation fuels, currency restrictions, and changes in the level and type of aviation taxes. Political developments, including rising international tensions, changes in the regulatory environment, and shifting attitudes toward the environmental impacts of aviation, may also impact future demand and should be considered in developing or updating airport forecasts.

704. STEPS IN THE FORECAST PROCESS

The forecast process for airport master plan studies consists of a series of basic steps that may vary from airport to airport, depending on the issues to be addressed and the level of effort required to develop the forecast. Steps in this process include the identification of parameters and measures to forecast, review of previous forecasts, determination of data needs, identification of data sources, collection of the data, selection of the forecast methods, preparation of the forecasts, and evaluation and documentation of the results.

Planners should refer to a report prepared by the FAA's Office of Aviation Policy and Plans (APO-110), *Forecasting Aviation Activity by Airport*, dated July 2001, to help them determine what approach to use. That report can be accessed at http://www.faa.gov/data_research/aviation_data_statistics/. The APO data systems web site, at http://www.apo.data.faa.gov, provides historical traffic counts, forecasts of aviation activity, and delay statistics. The forecast process can be summarized as follows:

a. **Identify Aviation Activity Measures** – The aviation activity measures that planners need to forecast are the level and type of activities that are likely to affect facility needs. For airfield planning, the most important activities are aircraft operations and the fleet mix, since these define the runway and taxiway requirements. As a general rule, plans for general aviation airports require forecasts of aircraft operations and based aircraft. Airports with commercial service require forecasts of aircraft operations, fleet mix, and passenger enplanements. Passenger levels are particularly important, since they determine the size of the terminal building and other important elements of airport infrastructure such as parking facilities and access roads. Planners should forecast instrument operations and instrument approaches, since these data will be needed if they expect to add or upgrade navigational aids and instrument landing systems. For some airports, additional forecast elements may be required, including peak hour operations and peak hour passenger flows.

b. **Review Previous Airport Forecasts** – Planners should review the latest published FAA Terminal Area Forecast for the study airport and any forecasts from an earlier master plan. Contact regional planning bodies and state aviation agencies to determine whether they have conducted airport system planning studies that included forecasts of demand for the study airport.

c. **Gather Data** – Determine what data are required to prepare the forecasts, identify the data sources, and collect historical and forecast data. What data to gather, and for what time period, will depend not only on the parameters to be forecast but also on what data are available from previous airport forecasts. In some cases, it may be necessary to conduct additional activity counts.

d. **Select Forecast Methods** – There are several appropriate methodologies and techniques for forecasting aviation activity at a specific airport. The selection and application of appropriate methodologies and techniques requires professional judgment. A forecast effort may involve a number of different techniques. The FAA report referenced above provides a detailed discussion of several forecasting techniques. The most common techniques include the following:

1) ***Regression Analysis*** – A statistical technique that ties aviation demand (dependent variables), such as enplanements, to economic measures (independent variables), such as population and income. Regression analysis should be restricted to relatively simple models with independent variables for which reliable forecasts are available.

2) ***Trend Analysis and Extrapolation*** – Typically uses the historical pattern of an activity and projects this trend into the future. This approach is useful where unusual local conditions differentiate the study airport from other airports in the region.

3) ***Market Share Analysis or Ratio Analysis*** – This technique assumes a top-down relationship between national, regional, and local forecasts. Local forecasts are a market share (percentage) of regional forecasts, which are a market share (percentage) of national forecasts. Historical market shares are calculated and used as a basis for projecting future market shares. This type of forecast is useful when the activity to be forecast has a constant share of a larger aggregate forecast.

4) ***Smoothing*** – A statistical technique applied to historical data, giving greater weight to the latest trend and conditions at the airport; it can be effective in generating short-term forecasts.

e. **Apply Forecast Methods and Evaluate Results** – After the list of activities to forecast has been identified, the appropriate forecast methods have been selected, and necessary data have been assembled, the actual forecasts can be prepared. If several methods are used to project specific aviation activities, they will probably produce different estimates. Therefore, an evaluation of the reasonableness of the results and their consistency with other forecasts should be conducted.

A useful procedure in such an evaluation is to prepare a time line showing both forecast results and historical trends. Similarly, one might compare the history and forecast for the airport with the FAA national history and forecast for the same activity parameter. If the comparison of the growth rates shows a significant difference, the planners must be able to explain it. Forecast results may also be evaluated by comparing them with other forecasts prepared for the airport, such as those contained in state or regional aviation system plans. One might also review the operational factors and events implicit in the forecast to determine if differing assumptions regarding those factors have affected the forecast results. For example, a constraint on operations associated with runway and apron limitations at the airport could affect the results. Therefore, it is useful to evaluate forecasts both with these constraints and with the constraints removed, i.e., a constrained and an unconstrained forecast.

If demand levels are likely to be particularly sensitive to one or more factors, the planner should estimate the impact of reasonable changes in the underlying assumptions about those factors. For example, if expected growth in aircraft operations is highly dependent on the continued operation of a fixed base operator (FBO) and there is a reasonable possibility that the FBO will close, the planner should estimate how much that closing would change the predicted demand. The planner should also examine general aviation hangar activity, including the airport hangar waiting list, and estimate how much increased hangar space would change predicted demand.

If the timing of important demand-generating factors (specific local or national events or activities resulting in an increased demand for aviation services) is uncertain, the forecaster can construct a time line showing the period of uncertainty, during which demand constraints or the diversion of traffic to another airport may be needed. In this respect, the actual number of operations or enplanements in any specific future year is less important than the certainty that a particular threshold will be reached during the planning period. This approach acknowledges that demand is expected to exceed the airport's capacity, but that there is a range of time (with a range of forecast error costs, i.e., costs in terms of delays and reduced service levels as a result of airport capacity not keeping up with aviation demand because of forecast inaccuracy) during which this problem needs to be considered.

When preparing forecasts for airports with declining activity, the forecast should identify the underlying cause for the decline, including a review of national and local trends. A sudden decrease in activity may be temporary, particularly if local income and population are steady or advancing. If the drop in activity takes place more gradually and is sustained, the decline is more likely to continue during the forecast period.

To document an expected upward trend in activity, planners should get letters of support from airlines, fixed base operators, or other users; information from the *Official Airline Guide*, general aviation associations, news articles that document changes at nearby airports, survey data for aircraft activity, and trend data for based aircraft. Such letters should state that the writers plan changes in their operations at the study airport.

Most forecasts should include a sensitivity analysis to measure likely variations in activity if the factors influencing activity change. One method of measuring the uncertainty in the forecast is to use a number of alternative assumptions in preparing it. The use of alternative scenarios should be discussed with FAA staff during master plan study scoping.

It is often useful to provide a range of activity forecasts, that is, to forecast a high level of activity as well as a lower level and to try to determine where within this range the most likely forecast will be found. If a plan uses scenario forecasting and other techniques that develop alternative projections, the airport sponsor can then provide the most likely forecast projections to the FAA for its approval. Having a range of forecast activity allows airport planners to develop flexibility in facilities to accommodate different activity levels.

It may also be useful to develop Planning Activity Levels (PALs) based on the forecast. PALs are selected activity levels that the planner believes may trigger the need for additional airport capacity or other development and may be used for analyzing the benefits of proposed development alternatives. They may also be used to establish thresholds for the implementation of airport development projects. The use of PALs focuses the airport sponsor and the public on the need to plan for aviation activity levels rather than specific timelines.

f. **Compare Forecast Results with the FAA's Terminal Area Forecasts** – Planners should compare their forecast results with those contained in the most recent Terminal

Area Forecast. To facilitate this comparison, the FAA recommends completing the template in Appendix C of the document titled *Forecasting Aviation Activity by Airport* (July 2001).

g. **Approval of the Forecasts** – The general requirement for FAA approval of the master plan study's forecasts is that they are supported by an acceptable forecasting analysis and are consistent with the TAF. Master plan forecasts for operations, based aircraft, and enplanements are considered to be consistent with the TAF if they meet the following criteria:

1) Large, Medium, and Small Hub Airports

a) Forecasts differ by less than 10 percent in the 5-year forecast and 15 percent in the 10-year period, or

b) Forecasts do not affect the timing or scale of an airport project.

2) Other Commercial Service Airports

a) Forecasts differ by less than 10 percent in the 5-year forecast and 15 percent in the 10-year period, or

b) Forecasts do not affect the timing or scale of an airport project, or

c) Forecasts do not affect the role of the airport as defined in the current version of FAA Order 5090.3, *Field Formulation of the National Plan of Integrated Airport Systems*.

3) General Aviation and Reliever Airports

Where the 5- or 10-year forecasts exceed 100,000 total annual operations or 100 based aircraft:

a) Forecasts differ by less than 10 percent in the 5-year forecast and 15 percent in the 10-year period, or

b) Forecasts do not affect the timing or scale of an airport project, or

c) Forecasts do not affect the role of the airport as defined in the current version of FAA Order 5090.3, *Field Formulation of the National Plan of Integrated Airport Systems*.

When the 5- or 10-year forecast is for less than 100,000 total annual operations or 100 based aircraft, the forecast does not need to be reviewed at FAA Headquarters, but the data should be provided to the FAA for the annual update of the TAF.

Further guidance on FAA review and approval of aviation forecasts is defined in a memorandum dated June 2008 that can be found at http://www.faa.gov/airports/planning_capacity/.

Any substantial differences between the master plan forecasts and the TAF must be resolved before moving onto subsequent parts of the master plan. If the planner expects the master plan forecasts to be inconsistent with the TAF for any reason, the FAA's Project Manager should be contacted early in the forecast development process to discuss the implications of the variance.

Locally prepared forecasts may contain a more detailed analysis of local economic conditions or development that is not considered in preparing the TAF. Therefore, airport sponsors should review the FAA's TAF for their airport on a regular basis and notify their FAA Planner/Planning Program Manager when they believe local conditions merit a revision to the TAF. When requesting a change to the TAF, the airport sponsor should provide reliable historical data and letters from individuals with the authority to affect operations, which document planned changes in operations.

705. DOCUMENTATION

Present the results of the forecast process and a description of the process itself as a separate chapter in the master plan report. The forecast chapter should contain extensive documentation. The level of detail provided should be sufficient to enable both the FAA to analyze the results, for planners to use them later in the planning and environmental process, and so the forecast can be adapted for future planning efforts.

The master plan report should summarize each forecast element, explain the forecast methods used, highlight significant assumptions, clearly and concisely present the forecast results, and provide an evaluation of the forecast. Tabulations of historical and forecast data should be included for each forecast element; graphical presentations of key time series and forecasts are usually helpful. FAA recommends completing the template of the report titled *Forecasting Aviation Activity by Airport* dated July 2001. Explanations should be provided if major variances from historic trends are forecast. For complicated forecasts, an appendix to the technical report should provide detailed documentation of the methodology.

706. SOURCE DATA

The following sources may provide assistance for planners in preparing forecasts for master plan studies:

a. **Terminal Area Forecasts** – The FAA's Terminal Area Forecast (TAF) contains historical data for at least the past 10 years and forecast data for the next 15 years. The TAF summary report for each airport includes, as appropriate: aircraft operations (landings and takeoffs, local and itinerant; total operations; and air carrier, commuter/air taxi, general aviation, and military operations), enplanements (total, air carrier and commuter), and total instrument operations. The TAF presumes an unconstrained demand for aviation services.

b. **National Forecasts** – The FAA's Office of Aviation Policy and Plans publishes two other major forecasts, the FAA Aerospace Forecasts and the FAA Long-Range Aerospace Forecasts. The FAA Aerospace Forecasts are estimates of national aviation demand for the next 12 years.

Figure 7-3: Sample Table from Terminal Area Forecast Summary Report

Summary of Enplanements and Airport Operations at FAA Towers and Contract Towers

Enplanements at Towered Airports

	Count	2003	2010	2020	Annual Compound Growth Rate 2003-2010	2010-2020
Large Hubs	33	460,486,763	623,735,048	832,432,922	4.43	2.93
Medium Hubs	35	113,930,143	146,148,406	191,273,310	3.62	2.73
Small Hubs	66	43,914,690	63,050,236	80,139,022	3.69	2.43
Non Hub Towers	351	17,122,217	19,602,930	23,380,002	1.95	1.78
Total	485	635,453,813	852,536,620	1,127,225,256	4.17	2.83

Operations at Towered Airports

	Count	2003	2010	2020	Annual Compound Growth Rate 2003-2010	2010-2020
Large Hubs	33	14,356,535	17,766,287	22,010,896	3.09	2.17
Medium Hubs	35	6,972,068	7,846,402	9,413,334	1.70	1.84
Small Hubs	66	8,217,052	8,788,618	9,838,151	0.97	1.13
Non Hub Towers	351	33,230,486	35,369,207	40,008,626	0.90	1.24
Total	485	62,776,141	69,770,514	81,271,007	1.52	1.54

Source: Terminal Area Forecast Summary Report, Fiscal Years 2004 – 2020, Prepared March 2005, U.S. Department of Transportation, Federal Aviation Administration, FAA-APO-05-1

c. **Historical Data** – The FAA's Air Traffic Activity Data System (ATADS) contains historical aviation operations data for operations at Air Route Traffic Control Centers and FAA- and contract-towered airports. Monthly and annual counts of aircraft operations and instrument operations by user group are available at the facility, state, regional, and national level. These data can also be accessed at the APO website.

d. **Historical Data at Non-towered Airports** – Estimating current activity at non-towered airports can be difficult. The traditional method of using operations data from a similar towered airport to estimate the activity at a non-towered airport has been found to be unreliable. Records of fuel sales at the non-towered airport may be a more reliable indicator. However, the most reliable method has been found to be using a relatively inexpensive acoustical aircraft activity counter to obtain a series of cluster samples systematically drawn throughout the year and estimating the annual activity from these samples. The samples not only provide information on total annual operations, but also on the seasonal variability and peaking characteristics of the activity. For further information on this subject, see Transportation Research Record 958: "Ford-Shirack Study," *Estimating Aircraft Activity at Non-towered Airports: Results of the Aircraft Activity Counter Demonstration Project*.

The characteristics of operations at a non-towered airport, such as whether the operations are local or itinerant and what type of aircraft are using the airport, are as important as the number of operations. Visual surveys to determine these and other observable

characteristics can be expensive. A statistical sample can greatly reduce the cost. In 1987, the Oregon Department of Transportation published the results of a study in which the characteristics of operations at non-towered airports were determined through statistical sampling. See *Statistical Sampling and Estimating Procedure for Aircraft Activity Characteristics*, Oregon Aeronautics Division, Oregon Department of Transportation, April 1987.

e. **State and Regional Airport System Planning Data** – State and regional airport system plans can provide information, direction, and policy guidance for airport master planners. An airport system plan (at least for all NPIAS airports) provides forecasts and describes the roles of the various airports in the area and the distribution of traffic among them.

f. **Socioeconomic Data** – Planners should use recognized sources of socioeconomic data available from local, regional, state, and federal planning organizations. Key data elements include population, employment, income, and other measures. If possible, data should be presented on an historical basis and projected into the future.

g. **Other Data Sources** – Additional sources of data that should be reviewed are the *Official Airline Guide (OAG)*, FAA Form 5010, Airport Master Record, and other existing studies or reports.

The local FAA Airports office can provide additional guidance on using forecasting tools, techniques, and methods. Whether the aviation forecasts are being prepared by the airport planning staff or by consultants, early consultation and periodic discussion with FAA airports and forecasting staff are encouraged. Such discussions are particularly important when planners are considering using significantly different forecast assumptions and methods in developing the basis for a specific airport master plan or where there are differences between existing forecasts. These early discussions will be especially useful when the forecasts indicate that federal grants for airport improvements at the study airport would be justified sooner than called for in the existing TAF.

Chapter 8 Facility Requirements

801. GENERAL

a. Planners should determine what, if any, additional facilities will be required to accommodate forecast activity. This task begins with an assessment of the ability of existing facilities to meet current and future demand.

In some cases, the airport sponsor may decide that it is in the community's best interest for the airport not to continue to grow to accommodate forecast activity, or to accommodate forecast activity only up to a point. In these cases, the master plan should document this decision and indicate the probable consequences of the decision (e.g., demand will be capped, the demand will go unmet, or the demand will be diverted to another airport).

This analysis needs to clearly define the aviation problems and why the airport needs to resolve them. Findings supporting a problem, and the potential solutions to that problem, must be clearly documented. Planners should ensure that this needs analysis provides information sufficient to provide a basis for describing the purpose and need for proposed Federal actions. Care should be taken that the facility requirements are not so narrowly defined that they point to a single solution.

b. Although this AC provides guidance on the facilities commonly found at airports of all sizes, planners should limit their efforts to those elements that are applicable to the study airport. Preparation of an appropriate scope of work in the pre-planning process will ensure that both the airport sponsor and the planners understand what elements should be studied.

c. The requirements for new or expanded facilities reflect the unique circumstances of each airport, such as, but not limited to, the following:

1) Capacity shortfalls, which are commonly driven by growing demand.

2) Enhanced security requirements mandated by the Transportation Security Administration, including the flexibility to respond to changes in threat levels.

3) Updated standards developed and adopted by the FAA or other regulatory agencies, to correct existing non-standard conditions and eliminate existing modifications to standards. If there are approved modifications to standards, planners should review the reasoning that led to those adjustments. The facility requirements chapter should indicate if those deviations will continue or will be eliminated in the new master plan.

4) The airport sponsor's strategic vision for the airport. Such needs are typically associated with a sponsor's strategic business plan, mission statement, or similar plans that will require modification of the airport.

5) The outdated condition, arrangement, or functionality of existing facilities.

d. At some airports, planners can use simulation models to help determine facility requirements. For large airports, simulations can model major components of an airport, including the airfield system, airspace environment, passenger and baggage flows in the terminal, and ground access networks. For smaller airports, simulations can model usage projections, passenger flows, and other support requirements including fixed base operator, maintenance, flight school, and fuel support requirements.

e. Many of the significant improvements needed at an airport are actually driven by the demand level, not a time frame or a specific year. Therefore, planners should identify what demand levels will trigger the need for the expansion or improvement of a specific facility. In this way, the sponsor can monitor growth trends and expand the airport as demand warrants. (For a discussion of the use of Planning Activity Levels, see Section 704.e.)

f. The findings from capacity analyses and facility requirement determinations help develop alternatives that can best meet future demand. Since critical investment decisions will be based on these analyses, the planner, airport sponsor, and FAA should consider the cost of inadequate analysis in determining the level of effort and sophistication of the capacity and delay analyses. If the analyses are not sophisticated enough, development funds could be wasted on alternatives that do not meet future demand. On the other hand, planning funds can be wasted by capacity and delay analyses that are more sophisticated than they need to be. Future facility needs and investment are to be based on these analyses and it is critical that these analyses be adequate, supportable, and defendable. Therefore, the need for more refined analysis is an important consideration during master plan scope of work development.

802. EMERGING TRENDS

a. The aviation industry is always evolving, and these changes affect the size, quantity, and type of airport facilities needed to accommodate future demand. The FAA, airport management, and planning professionals must remain aware of changes that impact airport planning and development, some of which currently include:

1) Airline industry consolidation, changes in air service patterns, and aircraft fleet decision making.

2) The continued introduction of new generation aircraft, which may present airport-aircraft compatibility challenges for airports as some may need to adapt their airside and terminal facilities to accommodate longer and wider aircraft with greater seating capacity than the aircraft they replaced.

3) Transformation of the National Airspace System (NAS) by Next Generation Air Transportation System (NextGen) initiatives. NextGen is the FAA's plan for modernizing the national air transportation system. Airspace optimization and performance-based navigation are key components of NextGen. NextGen initiatives may affect airspace and airfield capacity, airfield and terminal area operations,

aircraft equipage requirements, and on- and off-airport obstruction management requirements. Airport master plans should consider the specific NextGen initiatives and related technologies and flight procedures that may be implemented over the planning horizon.

4) Enhancements in information technology that are enabling more data to be transferred faster, influencing everything from airline scheduling and weather planning to advances in self-service passenger processing such as ticketing and check-in. Terminal automation systems will affect both functional space requirements in the terminal building as well as space allocation among tenant airlines and others.

5) Greater focus on sustainability. In the master plan, the planner should identify or consider practices that will enhance the airport's overall sustainability. These may include initiatives that maximize linkages with public transportation to reduce private vehicle trips to the airport, promote recycling and waste minimization, increase energy efficiency (including the use of alternative energy sources), reduce airport-related emissions, facilitate airport-related community and economic development, and increase community engagement in the airport planning and development process. Specific sustainability goals and objectives and strategies or measures may be identified during the planning process.

b. Planners should examine emerging industry trends and identify those that may influence airport capacity and facility needs, bearing in mind that not all trends will affect all airports in the same manner (and some may not be affected at all). Where considerable uncertainty about future demand or the role of the airport exists, plans that can be implemented in phases or adapted to new industry requirements and demands will allow the airport to meet future needs in a timely and sustainable manner.

803. DESIGN HOUR DEMAND

a. For master plans, estimates of annual and peak-hour demand for airline passengers, aircraft operations, cargo, and vehicle trips should be used to identify future facility needs. Peaking characteristics can provide insight on seasonal and time-of-day variations in demand; failure to consider these characteristics can result in high congestion and low levels of service during peak hours.

b. In the U.S., the evaluation of peak-hour demand is often based on the peak hour of the average day of the peak month. This approach provides sufficient facility capacity for most days of the year, but recognizes there will be some very busy days that experience congestion, queues, and delays, and that it is important that facilities are neither under nor overbuilt. However, for some critical airport systems, the peak hour of the average day of the peak month can substantially understate the demand at peak times, resulting in unacceptable levels of service or overloading of systems to a point that may approach gridlock. Some components of the passenger terminal complex, such as baggage handling systems and security screening checkpoints, are particularly sensitive to this issue.

c. To address these problems, planners may wish to consider alternate methodologies for determining peak-hour demand, such as the percentile of busy hours throughout the year (for example, 90th or 95th percentile). A facility sized to meet such demands should have sufficient capacity and service levels during 90 percent or 95 percent of the hours throughout the year. The specific percentile will depend on the facility being evaluated, the desired level of service, and the unique demand characteristics of the study airport. Methodologies for calculating peak hour demand are further descripted in ACRP Report 82, *Preparing Peak Period and Operational Profiles – Guidebook.*

804. SECURITY CONSIDERATIONS

Security requirements have become very important in planning airport facilities. Planning for security early in the development process can produce designs that accommodate security requirements in a more efficient, less costly, and less intrusive manner. However, specific measures for implementing security requirements will vary in response to shifting threats, evolving technology, and the physical and operational circumstances of individual airports. Planners should meet with representatives of the Transportation Security Administration (TSA) early in the process and be familiar with the current versions of applicable documents, including TSA's *Recommended Security Guidelines for Airport Planning, Design, and Construction* and relevant sections of the Transportation Security Regulations (TSRs). Appendix B, Useful Reference Materials, has a list of applicable TSRs and other security-related publications.

Security requirements will vary depending on the role and service provided at the airport. The information contained in 49 CFR Part 1542, *Airport Security,* describes the security rules and requirements for commercial service airports. Operators of general aviation airports are encouraged to use the recommended guidelines in appropriate TSA publications discussing security at general aviation airports to enhance the security of their facilities. Both commercial service and general aviation airports are extremely diverse and appropriate security measures can be determined only after careful examination of an individual airport.

Terminal facilities also have extensive security requirements, particularly with regard to the location of passenger and baggage screening. Ground access facilities, such as roadways and parking structures, may be subject to security-based siting considerations, including terminal proximity limitations. Security requirements are also becoming an increasingly important element in planning air cargo and general aviation facilities.

805. AIRFIELD AND AIRSPACE REQUIREMENTS

The determination of airfield and airspace requirements includes an assessment of the airports' ability to handle forecast activity levels, analysis of its compliance with design and safety standards, and a determination of design standards for new facilities or the improvement of existing facilities.

FAA Advisory Circular 150/5300-13, *Airport Design*, is a key resource for the planner in virtually all analyses to determine airfield requirements and is frequently referenced in this chapter.

a. **Airfield Capacity Analysis** – Airfield capacity is expressed in terms of the number of aircraft operations that can be conducted in a given period of time. Capacity is most often expressed as annual capacity (or annual service volume) and hourly capacity (or throughput capacity) for a particular runway and taxiway configuration.

   At low activity airports, airfield capacity often exceeds the anticipated level of demand and only a minimal analysis is necessary. For airports with higher activity levels, several techniques for determining airfield capacity are available to airport planners. The methodology in FAA Advisory Circular 150/5060-5, *Airport Capacity and Delay*, commonly referred to as the "handbook methods," yields hourly capacities and annual service volumes (ASV) and permits the estimation of aircraft delay levels as demand approaches and exceeds the throughput capacity of each airfield configuration. The handbook methods are typically used for long range planning and the results should be discussed with FAA representatives.

   Although the handbook methodology is adequate for many master plans, congested airports may incur higher levels of delay than are typically used in the ASV definitions. ASVs may not be appropriate to use at airports with a 24-hour operation, such as late night cargo operations. For such airports, computer simulation modeling may be necessary to provide the depth of analysis necessary to support major airfield investment decisions. There is no universally adopted simulation tool that must be used in airfield capacity analyses. The FAA's Technical Center supports the simulation engine for the most current version of the FAA Airport and Airspace Simulation Model, which is available to the public free of charge. Both public domain software and proprietary software developed by the private sector are also available for modeling. If simulation modeling is employed, planners must be careful to explain modeling capabilities and limitations, and review key assumptions, inputs, operating configurations and results with appropriate representatives of the FAA.

   Aircraft operational delay costs or savings are often used as the measure for comparing various airfield development alternatives. Delay is typically expressed in minutes per aircraft operation, which can be translated into hours of annual delay and easily converted into dollar estimates to be used as a basis for comparison. Traditionally, four to six minutes of average delay per aircraft operation is used in ASV calculation. This can be considered as an acceptable level of delay. When the average annual delays per aircraft operation reaches four to six minutes, the airport is approaching its practical capacity and is generally considered congested.

   The selection of a particular airfield capacity analysis technique should be made in the pre-planning phase of the master plan study. The selected technique should be clearly defined in the negotiated scope of work. At the conclusion of the airfield capacity analysis, planners will have a sense of whether an additional runway or taxiway should be included in the alternatives analysis.

b. **Runway Requirements** – Existing and future runways should be examined with respect to dimensional criteria, orientation, length, width, and pavement design strength:

1) ***Dimensional Criteria*** – FAA guidance on dimensional standards is based on a coding system known as the Runway Design Code (RDC). This system is used to relate critical design criteria to the operational and physical characteristics of the aircraft that will utilize a runway. Existing and future RDC classifications are determined from a review of the aviation demand forecasts and an understanding of the airport's existing and future role in the air transportation system. While the RDC classification is assigned to a specific runway, it is appropriate to apply a less demanding RDC to other runways that will not be used by the primary critical aircraft. See FAA AC 150/5300-13, *Airport Design*, for more information on appropriate RDC codes and dimensional criteria requirements.

2) ***Orientation*** – Runway orientation is primarily a function of wind coverage requirements for the existing and projected aircraft fleet mix. Historical wind and weather data can be obtained from the National Oceanic and Atmospheric Administration (NOAA). This analysis is used to determine if additional runways are needed to provide the necessary wind coverage. See FAA AC 150/5300-13, *Airport Design,* for guidance on wind coverage analysis techniques.

   Planners should also review runway designation. Periodic changes in magnetic declination may necessitate renumbering the runways. A declination calculator can be found at http://www.ngdc.noaa.gov/seg/geomag/jsp/Declination.jsp. The existence of obstructions and environmental and physical features, either man-made or natural, in approach and departure routes should also be considered in determining runway orientation.

3) ***Length*** – The length of a runway is a function of many factors, the most notable of which are the selection of an appropriate design aircraft and the longest nonstop distance to be flown by the design aircraft from the airport. Aircraft-specific runway length requirements are a function of aircraft physical characteristics at time of flight, weather conditions, and runway conditions. See FAA AC 150/5325-4, *Runway Length Requirements for Airport Design,* for guidance on this analysis. Other common resources for runway length assessments are the aircraft characteristics information published by aircraft manufacturers, consultation with aircraft operators at the airport, and the FAA document, *Best Practices: Planning Airports for Business Jets*. Aircraft manufacturers may be able to provide airport-specific runway length requirements for their aircraft, especially at airports with severe conditions such as high temperatures or high airport elevations.

4) ***Width*** – The required width of a runway is a function of the approach minimums, airplane approach category, and airplane design group for the design aircraft using the runway and is discussed in FAA AC 150/5300-13, *Airport Design*.

5) ***Pavement Design Strength*** – What aircraft types and the critical aircraft expected to use the airport should be used to determine the required pavement design strength, or weight bearing capacity, of airfield surfaces. The required pavement design strength is an estimate based on average levels of activity, and is expressed in terms of aircraft landing gear type and geometry (i.e., load distribution). The pavement design strength is not the maximum allowable weight. Limited operations by heavier aircraft

than the critical aircraft may be permissible. Pavement design and load distribution assumptions can be found in FAA AC 150/5320-6, *Airport Pavement Design and Evaluation*.

c. **Taxiway Requirements** – The taxiway system must provide safe and efficient aircraft movement between the runways and the aprons that serve passenger terminals, cargo, and general aviation facilities. Planners must consider 'cockpit-over-centerline' as the taxiway method for safe and efficient taxiing throughout the airport.

1) The Taxiway Design Group (TDG) relates to the undercarriage dimensions of the aircraft. Taxiway width and fillet standards may require a specific runway to taxiway, and taxiway to taxiway/taxilane separation. Aircraft Design Group (ADG) separation criteria are based on aircraft wingspans and tail heights. ADG separation criteria is the minimum separation criteria for avoidance of collisions, however greater separation may be recommended based on TDG for efficiency in ground maneuvering. Planners should consider upgrading intersections designed using slower judgmental oversteer taxi method to accommodate cockpit-over-center line taxi. Advisory Circular AC 150/5300-13, Airport Design, provides specific fillet geometry to accommodate cockpit over centerline maneuvering at existing runway to taxiway and taxiway to taxiway/taxilane separations. It is appropriate for a series of taxiways on an airport to be planned to a different TDG than another based on expected use. As traffic increases, the taxiway system can become the limiting operational factor, especially if the airfield configuration results in frequent runway crossings by taxiing aircraft, or does not provide sufficient access or bypass capability. The location of taxiway exits may also reduce runway occupancy time, thereby increasing capacity.

2) Planners should re-examine intersections with more than three possible turns "three-node" intersection (see Taxiway Design, AC 150/5300-13), the location and type of runway exit/entrance taxiways as well as the location of parallel taxiways, crossover taxiways, bypass taxiways, perimeter taxiways, and holding pads. At congested airports, computer simulation can aid this analysis.

d. **Electronic, Visual, and Satellite Aids to Navigation** – Aids to navigation provide pilots with information to assist them in locating the airport and provide horizontal and/or vertical guidance during landing. Navigational aids also permit access to the airport during poor weather conditions. The need for new or additional navigational aids is a function of the fleet mix, the percentage of time that poor weather conditions are present, and the cost to users of not being able to use the airport when it is not accessible. Important navigational aids include instrument landing systems (ILS), approach lighting systems (ALS), Precision Approach Path Indicators (PAPI) or other visual approach slope indicators, and global positioning systems (GPS), such as the Wide Area Augmentation System (WAAS). Airport users can assist planners in identifying the need for navigational aids and the development of WAAS approaches. The installation of new navigational aids may require airspace coordination.

e. Air traffic control facilities include air surveillance radars, airport surface detection equipment, remote transmitters and receivers, wind shear detectors, weather observing

equipment, and others. The general siting of future air traffic control facilities should take place during the master plan process so that adequate space is reserved for them and their critical areas are protected from development that would interfere with their operation.

f. **Airspace Requirements** – For complex master plans, particularly for a commercial service airport located near another commercial service airport, determining airspace requirements may require a detailed investigation, often using computer simulations. Such efforts need to be carefully coordinated with FAA air traffic representatives so as to reach agreement regarding key modeling assumptions. In addition, if the airfield capacity analyses call for new runways or major airfield reconfigurations, significant airspace changes or redesign may be required and FAA air traffic representatives should participate in the discussions.

In most master plan studies, however, the focus will be on reviewing the airport's existing airspace classifications and determining if growth at the study airport or at neighboring airports could require an upgrade to a higher airspace classification.

At non-towered airports, the master plan should determine if the growth in aircraft operations will exceed threshold values for the establishment of an airport traffic control tower. For towered airports, line of sight investigations may reveal that the airport traffic control tower should be relocated. See FAA Order 6480.4, *Airport Traffic Control Tower Siting Criteria*, for help in making such a determination.

Planners should identify penetrations of imaginary surfaces (as defined in 14 CFR Part 77, *Objects Affecting Navigable Airspace)* to determine their disposition. Obstacle clearance surfaces associated with *United States Standard for Terminal Instrument Procedures (TERPS)*, and obstacle clearance requirements found in FAA AC 150/5300-13, *Airport Design*, should be evaluated as appropriate. In some cases, the TERPS surface may be the controlling airspace surface.

With the ongoing implementation of NextGen technologies and flight procedures including new approaches using Wide Area Augmentation Systems (WAAS), Localizer Performance with Vertical Guidance (LPV), and area navigation (RNAV) and Required Navigation Performance (RNP), the master plan should evaluate existing and potential future approach capabilities and include airspace obstruction analysis to ensure appropriate planning for existing and future approach procedures.

806. COMMERCIAL SERVICE PASSENGER TERMINAL COMPLEX

a. The commercial service passenger terminal complex extends from the aircraft parking positions on the airside interface to the vehicle curbside on the landside interface. The role of an airport in the national, state and regional air transportation systems will influence passenger terminal facility requirements. A major connecting hub, for example, will need terminals that are functionally different from those at an origin and destination airport. Similarly, airports serving major tourist destinations or business centers may have special needs.

The scope of analysis will be based on a number of factors, including but not limited to, the size and type of airport, available land, state of existing facilities, activity levels (passengers and aircraft operations), demographics of the passengers served, airport goals and objectives, and funding considerations. Planners should also consider the level of detail needed for the master plan. It may be appropriate to provide only the general location and footprint of a future terminal complex in the master plan, and complete a more extensive terminal requirements analysis in a separate study, especially if existing facilities will not accommodate future demand or industry requirements.

1) ***Airside Requirements*** –

a) Planners should identify the number and type of aircraft gates and parking positions that will be needed to accommodate future activity. The mix of aircraft expected to operate at the airport during the design hour will determine the linear feet of apron frontage and the gate dimensions. The location of aircraft parking positions relative to air traffic movement areas should be considered to avoid or limit the effects of aircraft pushbacks on aircraft taxiing flows. Aircraft gate requirements should include consideration of the functionality of jet bridges to serve the current and forecast aircraft fleet mix.

b) The availability of and need for remain-overnight (RON) aircraft parking should be evaluated. RON aircraft parking may be provided at aircraft gates or in proximity to the passenger terminal building or in remote locations (remote hardstands).

c) For airports that experience cold winter weather, deicing facilities should be evaluated.

d) The parking and storage of ground service equipment should also be considered in determining apron frontage requirements. Planners should strive to separate ground vehicle movement areas from aircraft movement areas as much as possible to ensure safety.

e) Some airports operators are exploring the possibility of accommodating commercial space activities, including the possibility of either horizontal or vertical launch capabilities as well as reentry activities.

In such cases, it is important for the airport planning process to consider a broad range of associated issues, particularly in order to prevent or minimize any potential impacts to the safety, efficiency or utility of the airport, including (but not limited to) airside facilities. The FAA will address associated issues in future guidance and policy documents, addressing not only airport planning but also environmental, financial, safety and compliance issues.

2) ***Passenger Terminal Building Requirements*** –

a) Within the terminal building, requirements are commonly expressed in terms of square footage for major functional elements, such as ticket counter/kiosk areas, security screening checkpoints, aircraft gates and holdroom/departure lounges, concessions, airline operations, baggage makeup, baggage claim, circulation, public space, restrooms, airport offices, and mechanical space. Airports that serve international flights also require facilities for customs and immigration. Planners should evaluate the special requirements for these facilities by referencing the latest guidance from U.S. Customs and Border Protection (CBP) and the Centers for Disease Control and Prevention (CDC).

b) Understanding the space requirements of these elements will assist planners in configuring the terminal complex. In master plans where terminal building expansion or reconfiguration may be recommended for the long term, it may be appropriate to provide only a general location and footprint of the future terminal building, rather than specific functional area requirements. Industry planning, design and level of service standards are often used to develop generalized gross terminal space requirements necessary to properly size the terminal footprint (refer to Section 806.c for relevant reference materials).

3) ***Landside Requirements*** –

a) The length of curbside area required is a function of the modal splits of originating and terminating passengers, pedestrian circulation, dwell time assumptions and occupancies for the vehicles at the curbside, and the assignment of different types of vehicles to the curbside. Airport sponsor policies regarding dwell time and other airport roadway management practices (including use of inner and outer and upper and lower level roadways and curbs for specific roadway users such as arriving and departing passengers, taxi/limousine, shared ride, hotel/parking/rental car shuttles, etc.) will influence curbside requirements. The availability of convenient, short-term parking within walking distance of the passenger terminal building, the availability of public transit, the extent of consolidation among the various door-to-door shuttles, and the use of cell-phone waiting areas or parking lots will reduce the amount of curbside area required.

b) To facilitate the flow of traffic in front of the terminal, the number of lanes should be assessed.

b. **Passenger Convenience and Access to Airport Facilities** – Section 131 of the FAA Modernization and Reform Act of 2012 (49 U.S.C. § 47101(g)(2)) requires airport master plans to consider passenger convenience, access to airport facilities, and ground access. In accordance with this provision, the following sections identify some of the considerations that an airport master plan may evaluate in order to improve the overall passenger experience – enhancing the passenger's sense of convenience and facilitating access to and from and through the airport complex. Section 810.i provides specific information on passenger convenience as it relates to ground access.

1) ***Passenger Convenience*** – Key measures of passenger convenience focus on passengers being processed in an efficient amount of time and with minimal imposition. Passenger convenience also may be evaluated in terms of comfort. It will be perceived differently by every passenger at every phase of travel, and is a function of a passenger's demographic characteristics, place of residence, trip purpose, and travel habits. Passengers with mobility and sensory impairments, language barriers, elderly travelers, families traveling with small children, and nursing mothers traveling on business may face more hurdles when traveling, leading to negative perceptions about convenience.

   Many aspects of the traveler's experience don't fall wholly within the direct control of the airport sponsor, and are influenced to a greater or lesser degree by airlines and other service providers at the airport. In 2009 and 2011, in response to a series of significant delays in which passengers were held on board aircraft for lengthy periods (and also in response to the high incidence of flight delays and other consumer problems), the U.S. Department of Transportation issued two final rules entitled Enhancing Airline Passenger Protections (74 FR 68983 and 76 FR 23109), which became effective on April 29, 2010, and August 23, 2011, respectively. These two rules put in place a number of consumer protection measures to "improve the air travel environment for consumers" (see Federal Register Notice dated April 25, 2011, announcing the Final Rule (https://federalregister.gov/a/E9-30615 and https://www.federalregister.gov/articles/2011/04/25/2011-9736/enhancing-airline-passenger-protections).

1) Even with these new consumer protection rules for air travelers, within the terminal complex, passengers often continue to experience long wait times or delays due to problems with facilities or staffing at key points in their journey (such as during the check-in and/or baggage drop-off process, at TSA or CBP checkpoints, at baggage claim, and at rental car facilities) or other inconveniences due to facility design (such as long unassisted walking distances, which often contribute to passenger complaints regarding their travel experience).

   Airports do, however, have a lot of influence over other aspects of the passenger experience including the overall balance between airside, landside and terminal facilities; airport signage and messaging systems; curbside management; various aspects of the airport concessions program; and decision making related to other facilities and amenities within the airport's public areas.

   a) As appropriate to the level of detail included in the overall terminal plan, planners should consider the basic types of services provided to travelers at various points within the terminal building, as well as the degree of congestion, waiting and processing times during each phase of the journey from airport curb to aircraft gate. Shorter wait times and walking distances, intuitive way finding, accessible and reliable flight information displays, and sufficient and accessible restrooms, and reasonable distribution of space for a variety of concessions, among other

considerations, may enhance the passengers' overall travel experience and contribute to a sense of convenience.

b) Providing amenities to make passenger wait-time more productive, comfortable or more entertaining may improve the passenger experience and perceptions of convenience. Amenities should be shown as appropriate to a level of detail to determine rough blocked-out areas for these functions. Examples include comfortable holdroom seating, dedicated work areas, accessible power connections, Wi-Fi, full-service restaurants, children's play areas, facilities for nursing mothers (such as lounges or non-bathroom spaces)[1], family restrooms, gym/fitness centers with shower facilities, library/reading rooms, public art and museum exhibits or displays, and entertainment options. The types of amenities offered by an airport in or in close proximity to their passenger terminal complex will vary greatly depending on the airport's passenger characteristics, airline composition, facility layout, and other factors.

c) Planners should also consider an appropriate balance of pre-security screening facilities and amenities for airport employees, airport visitors, and meeters and greeters. At a minimum, restroom requirements and at least limited concessions (such as a coffee kiosk and news and gift store) should be evaluated. The type and quantity of these pre-security screening amenities will depend on the characteristics of the airport and the local market.

d) Many publications describe common metrics and accepted standards for evaluating the passenger experience at an airport. Some of these publications are listed in Appendix B of this AC. Planners should consult the appropriate publications depending on the size and scope of the project. Airport surveys or comment kiosks can also be useful in determining the public's perception of the functionality and convenience of the terminal facility. Airport customer service representatives, airport passengers, airport duty managers and airline station managers, Travelers Aid agencies and the United Service Organization (USO) also provide valuable insight to improvements needed in terminal facilities.

2) ***Access to Airport Facilities*** – Access to airport facilities refers to the ease with which passengers can navigate and travel through the airport complex. Passengers should be able to access the airport's landside facilities and terminal building, and travel between each, in a seamless flow.

a) Planners should evaluate parking and curbside capacity and designated areas for travelers waiting for their next mode of transportation. Access to shuttles, buses, trains, and automated people movers (APM) where warranted should be evaluated, as well as the frequency of service relative to aircraft arrival and departure times.

[1] In addition to facilities for passengers, in accordance with Section 4207 of the Affordable Care Act (the Health Care Reform Act), many airports and airport employers are required to provide reasonable break time and a private, non-bathroom place for nursing mothers to express breast milk during the workday. These requirements became effective on March 23, 2010.

b) Inside the terminal building, planners should evaluate passenger pathways, vertical transitions, clarity of signage and wayfinding, space and queue lengths at check-in and security, space and wait times at baggage claim, access to airport information and airline schedules, and convenience of restrooms, concessions, and departure lounges.

c) Planners at international airports should evaluate CBP facilities where immigration and infectious diseases are addressed. This evaluation should include an assessment of passenger processing times to ensure that the facilities and associated staffing levels provide acceptable levels of service throughout the day. Coordination with CBP is important during the planning study and on an on-going basis to ensure that the facilities and staffing continue to meet the needs of the traveling public.

d) Access to airport facilities for people with disabilities, impairments, and limited mobility can be particularly challenging. Planners should evaluate whether airport facilities meet the Americans with Disabilities Act (ADA) and other building code requirements. Existing facilities that are in noncompliance with these requirements should be remedied as required by law. New facilities should be planned and designed to improve accessibility and convenience for all passengers while meeting the special needs of disabled passengers. The master plan should identify requirements for service animal relief areas within the terminal complex. AC 150/5360-14, Access to Airports by Individuals will Disabilities, should be consulted for additional guidance.

e) Planners should be cognizant of the specific needs of passengers using wheelchairs or other types of mobility assistance, and those with specific medical requirements. Planners should identify any specific terminal layout requirements, amenities (including concessions, information booths, medical clinics, and restroom facilities) and staffing considerations necessary to best accommodate these passengers and improve their travel experience.

c. **Methodologies** – Information on methodologies that can be used to determine passenger terminal facility requirements is provided in several sources, including:

1) FAA Advisory Circulars 150/5360-13, *Planning and Design Guidelines for Airport Terminal Facilities,* and 150/5360-9, *Planning and Design of Airport Terminal Facilities at Non-Hub Locations*

2) *Airport Development Reference Manual*, published by the International Air Transport Association

3) *ACRP Report 25, Airport Passenger Terminal Planning and Design, Volume 1: Guidebook* (http://www.trb.org/Publications/Blurbs/163252.aspx)

ACRP Report 25, Airport Passenger Terminal Planning and Design, Volume 2: Spreadsheet Models and User's Guide
(http://www.trb.org/Publications/Blurbs/163171.aspx)

4) *Recommended Security Guidelines for Airport Planning, Design and Construction*, published by the Transportation Security Administration (http://www.tsa.gov/sites/default/files/assets/pdf/airport_security_design_guidelines.pdf)

5) Proprietary computer simulation modeling tools can also be used to evaluate passenger and baggage flows through airport terminals.

Additional references are provided in Appendix B.

807. GENERAL AVIATION REQUIREMENTS

a. General aviation (GA) encompasses a variety of users and activities, such as corporate flight departments, cargo operators, recreational flyers, business commuters, flight training, agricultural applications, law enforcement, emergency medical services, firefighting, and fixed base operators (FBOs). As a result of the variety of GA aircraft activity, GA needs include aircraft storage facilities, transient parking aprons, terminal facilities, automobile parking areas, and vehicle access from adjacent roads. Planners should consult appropriate publications for specific information regarding GA airport facilities planning, such as FAA AC 150/5300-13, *Airport Design* and applicable ACRP reports.

1) ***Aircraft Storage Facilities*** – Physical requirements of GA users vary from tie-down aprons to large conventional hangars with major maintenance services and transient aircraft aprons. Conventional hangars and T-hangars protect aircraft from the weather and provide security against vandalism or theft. Planners should evaluate the demand for outdoor aircraft parking versus covered aircraft parking and storage facilities in t-hangars or enclosed hangars. The demand for enclosed hangars may be higher in areas of the country that experience extreme winter and summer weather conditions.

2) ***Transient Aircraft Parking Aprons*** – Temporary parking for visiting aircraft may be provided on a transient apron adjacent to the terminal building, or on aprons managed or leased by an FBO. Parking apron requirements should be based on the regular use needs of the airport.

3) ***Terminal Facilities*** – Terminal buildings at GA airports range from very modest structures with little more than a waiting room and a telephone to multistory buildings with extensive amenities, such as pilot briefing rooms and lounges, restaurants, gift shops, conference and training rooms, and rental car counters. At GA airports, the terminal building may also house administrative offices. At commercial service airports, general aviation terminal facilities are often provided by one or more FBOs. In such cases, the facilities are provided principally for customers of the FBO and access for the general public is limited.

b. Planners should analyze existing and forecast activity, including based aircraft activity and transient aircraft operations, and the types of users when assessing future facility requirements at GA airports. The role of the GA airport in the region as well as the also

may influence facility requirements. More information on evaluating airports as part of a system is provided in FAA AC 150/5070-7, *The Airport System Planning Process.*

c. Planners should be aware of factors that may influence existing demand for GA facilities. For example, if facilities are in disrepair compared with facilities at nearby airports with overlapping service areas, demand may shift from the study airport to the nearby airport. The airport sponsor's pricing policies may also affect demand. A useful barometer of facility needs, particularly short-term needs, is the existence of waiting lists for hangars, T-hangars, and aircraft tiedown positions.

d. Planners should carefully evaluate the existing and future GA aircraft fleet mix. Business jets have different facility and service requirements than single-engine aircraft.

e. Additionally, in accordance with (49 U.S.C. § 47101(g)(2)), passenger convenience considerations for GA facilities at commercial service airports and at GA airports include automobile parking, rental car facilities, aircraft parking (transient and long term), signage, comfort and cleanliness of FBO facilities, services such as aircraft maintenance and catering, and dedicated work areas for pilots.

808. AIR CARGO REQUIREMENTS

a. For commercial service airports and larger GA airports, air cargo activity is generated by a diverse collection of companies with differing business strategies and market roles, including the following:

1) ***Integrated Carriers***, which transport freight from door-to-door using their own fleet of trucks and aircraft.

2) ***Freight Forwarders***, which act as brokers that link shippers with freight carriers; they coordinate the shipment of freight, but do not transport it.

3) ***All-Cargo Operators***, which sell space to freight forwarders or individual companies and ship the air cargo on their aircraft.

4) ***Combination Carriers***, which carry both passengers and freight on a single aircraft, typically with a reconfigured cabin.

5) ***Belly Freight Carriers***, which carry cargo in the baggage compartment or belly of a passenger aircraft.

Airport planners should assess the capacity of existing cargo processing facilities and determine future requirements for buildings, aircraft parking aprons, and ground access facilities. Each type of cargo operation has somewhat different site requirements, so a range of spaces will need to be provided for cargo development. In planning for future air cargo facilities, planners should consider: (1) the existing air cargo market and demand at the airport including existing fleet mix and activity (operations and tonnage) and facilities (on- and off-airport office, warehousing and sorting facilities, truck/loading dock areas, airside apron and aircraft parking areas, and employee parking), (2) the type and number of cargo companies expected to expand or initiate

operations; (3) annual air cargo operations projected for all cargo operators; (4) the number of existing apron parking spaces; (5) projected growth in annual enplaned cargo tonnage; (6) the availability of ground access for the heavy commercial trucks associated with cargo activity; (7) the availability of ground access and parking for employees in air cargo facilities, and (8) any security needs and requirements. Planners should consider providing a means of separating cargo trucks from other airport traffic for security purposes.

b. At most GA airports, air cargo facilities are included in the broad category of general aviation facilities. Air-cargo-related activities are accommodated in the hangar, apron, and ground access facilities of the general aviation tenants and operators. In such cases, an independent analysis of air cargo needs is unnecessary.

809. SUPPORT FACILITIES

a. Support facilities at an airport encompass a broad range of functions that ensure the smooth, efficient, and safe operation of the airport. As applicable, the future requirements for the following support facilities should be assessed:

1) ***Aircraft Rescue and Firefighting*** – For airports that require 14 CFR Part 139 certification, planners should review the aircraft operations forecast to determine if the airport's Aircraft Rescue and Firefighting (ARFF) index will change during the planning period. If 14 CFR Part 139 certification is not currently provided at the study airport, but will be required during the planning period, the applicable ARFF building and equipment requirements should be defined in the master plan. See 14 CFR Part 139, *Certification of Airports*, particularly sections 139.315 through 139.319, for ARFF index definitions, and FAA AC 150/5210-15, *Aircraft Rescue and Firefighting Station Building Design*, for standards and guidance in planning an ARFF station. Planners should also consider if multiple ARFF stations will be required to meet response time requirements as defined in 14 CFR Part 139. For airports that do not require 14 CFR Part 139 certification, planners should identify any existing mutual aid agreements with local authorities for emergency response services, or the lack thereof.

2) ***Airport Maintenance*** – Airports provide a wide variety of services to ensure a a safe, efficient, and reliable environment for airport tenants and users. The facilities needed to support these services include administrative offices, buildings for storage and maintenance of airport equipment, shop space, and buildings for supply storage. Northern airports need equipment for snow removal operations (refer to FAA AC 150/5220-18A, *Buildings for Storage and Maintenance of Airport Snow and Ice Control Equipment and Materials).*

3) ***Fuel Storage*** – FBOs often provide fuel storage and supply at general aviation airports. At some airports, unattended self-service facilities may be provided when activity does not warrant full-time attendants. At commercial service airports, fuel storage facilities provide jet fuel if the supply through pipelines or tanker trucks is interrupted. To support general aviation, planners should address the types of approved aviation fuel needed to meet current and future public demand.

4) ***Aircraft Maintenance*** – For the general aviation community, aircraft maintenance is typically provided by an FBO. The types of services provided include, but are not limited to, airframe and power plant repair by an FAA-certified repair station. The facilities required to sustain these services include: (1) an aircraft maintenance hangar with sufficient work space for any aircraft upon which maintenance is being performed; (2) suitable storage and shop space for equipment and tools; (3) office space, customer lounge, restrooms, and telephone; (4) apron area with pavement type and strength adequate to support the expected aircraft fleet; (5) adequate automobile parking and ground access; and (6) proximity to the engine run-up area to limit taxiing times and fuel costs. At larger airports, a tenant airline may have established a maintenance base for the periodic inspection and maintenance of its aircraft. To determine the space requirements for such a maintenance facility, planners should ask airline representatives about the types of aircraft they plan to service at the airport and their expected facility needs.

5) ***Deicing*** – Airports in locations with winter weather conditions that can cause accumulation of frost, snow, slush, or ice on aircraft surfaces must have aircraft deicing facilities. These airports should consider deicing pads to maintain departure flow rates and avoid unacceptable aircraft delays. Any new aircraft deicing facility must have runoff mitigating structures to collect deicing fluid runoff, and must comply with U.S. Environmental Protection Agency (EPA) requirements. See FAA AC 150/5300-14B, *Design of Aircraft Deicing Facilities,* for standards and guidance in planning deicing facilities.

Guidance for assessing the future needs of aviation support facilities is provided in the referenced ACs. In many cases, planners may rely on interviews with airport management and airport tenants and users to better understand existing and future facility requirements..

810. GROUND ACCESS, CIRCULATION, AND PARKING REQUIREMENTS

One of the key elements in choosing a mode of travel to the airport is the total trip time between the passenger's point of origin and their destination. Travelers are particularly sensitive to the duration of the ground access portion of an air travel trip. The regional roadway network, on-airport circulation roadways, and parking facilities are the principal components of the ground access system. The capacity and reliability of this system will determine the levels of service and convenience provided to air travelers during the ground access segment of their trips.

a. **Regional Transportation Network and Public Transportation** – Coordination with local transportation planning agencies during the review of existing conditions should produce enough information to enable an assessment of ground access capability, and to confirm whether or not the existing and planned networks can accommodate projected aviation demand.

   At airports where the capacity of the airport ground access or regional roadway system may be a concern, discussions between the airport and local transportation planning agencies may help in identifying roadway capacity needs and potential roadway improvements or management techniques to improve roadway level of service and reduce congestion. At busy and complex airports, planners can benefit from the use of a variety

of analytical computer models and simulation models to evaluate existing conditions, analyze future scenarios, and consider alternative strategies to manage future airport roadway and curbside demand.

b. Larger commercial-service airports may implement strategies or policies to reduce the number of single-occupant private vehicle trips and to encourage greater use of high-occupancy vehicles. In major urban areas, the Metropolitan Planning Organization (MPO) or other regional planning agency may be able to provide assistance to airport planners. Where roadway congestion is determined to be a constraint, a separate ground access study may be required to identify near-term and long-term improvements or traffic management techniques to manage demand.

   Public transportation has the potential to reduce roadway congestion and the amount of land required for automobile parking while reducing total air pollutant emissions and other environmental impacts. Public transportation services, including scheduled bus and passenger rail, or other alternate modes of transportation, are often examined as part of an airport master plan.

   Airport plans (for new roadways, transit/rail corridors, and other transportation improvements) should be integrated into regional and state transportation plans to ensure that these long-range plans reflect future airport-related transportation improvements.

c. **On-Airport Circulation Roadways** – This roadway access system is shared by a wide range of users having different trip purposes, which include:

   1) ***Originating and terminating airline travelers*** who most often arrive at the airport in a private vehicle, but may also use a taxicab, limousine, courtesy bus, mass transit, charter bus, door-to-door shuttle, rental car, or bicycle.

   2) ***Employees*** who travel to and from the airport each day using private vehicles, public transportation, shuttles from remote parking facilities, or bicycles.

   3) ***Delivery vehicles*** that supply the goods and materials consumed or purchased at the airport.

   4) ***Other vehicles*** that may require access to air cargo facilities, general aviation facilities, support facilities, and other activity centers.

d. Each user group has a different pattern of arrival and departure times for its airport trips. Analytical methods and computer models may be used to evaluate roadway capacities and the levels of service they provide. Such analyses should also identify potential capacity increases in the form of additional lanes or operational modifications. Security provisions for vehicle screening may be required. Other users of the roadway facilities that should be evaluated may include:

   1) ***Taxicab/Limousine/Courtesy Shuttle Staging Areas*** – Locations where vehicles can be parked and dispatched as needed to pick up passengers at terminal curbsides. A

staging area is a critical resource at busy airports where terminal curbside space is scarce.

2) ***Rental Car Facilities*** – At smaller airports, the rental car ready and return parking spaces are often located in lots adjacent to the terminal building or in the public parking garage. At larger airports, ready and return spaces may be provided in a consolidated rental car facility or at remote locations that are accessed via courtesy shuttles or buses. Rental car operations also require space for cleaning, fueling, maintaining, and storing vehicles.

3) ***Courtesy Shuttles and Buses*** – Courtesy buses and other types of shuttles serving on- and off-airport rental car facilities, hotels, and parking facilities are major users of on-airport roadways. At the larger commercial service airports, courtesy vehicles are often allocated dedicated curbside space to pick up and drop off passengers.

4) ***Charter Bus Operations*** – Airports that are gateways to major tourist destinations may accommodate high volumes of charter bus operations. Cruise ships, for example, may impose extraordinary passenger surges on airport facilities when they use charter buses to transfer passengers between the airport terminal and the marine port.

e. **Public Parking Facilities** – Public parking facilities at general aviation airports are generally small surface lots located next to the terminal building, while parking facilities at commercial service airports range from surface lots next to the passenger terminal to a combination of structured parking facilities and surface lots for short-term hourly, daily, and long-term parkers. Close-in parking often includes separate areas for hourly and daily parking. At larger airports, remote parking facilities with shuttle bus service may need to be considered.

f. **Cell Phone Waiting Lots –** At many airports, cell phone lots for meeters and greeters of arriving passengers reduce the amount of recirculating traffic on airport roadways. These lots may include amenities such as flight information displays, restrooms and concessions depending on the volume of traffic to support such facilities.

g. **Employee Parking** – At small commercial service airports, parking for employees whose worksite is inside the commercial passenger terminal building can usually be accommodated in small surface lots near the terminal. At larger airports, however, public parking in surface lots or garages is often given higher priority over terminal area employee parking. In these cases, planners should evaluate existing and future employee parking requirements to determine the the need for terminal area employee parking and remote employee parking, and associated employee parking facility shuttle bus service requirements. Employee parking and ground transportation surveys provide useful data to aid in establishing future facility requirements.

h. **Bicycle Lanes and Racks/Storage** – Planners should evaluate the extent of bicycle use by passengers and employees within the airport complex to determine requirements for

bicycle lanes and bicycle storage (racks and storage lockers). Consider co-locating bicycle storage within transit and parking facilities.

i. **Ground Access Passenger Convenience Considerations** – Per 49 U.S.C. § 47101(g)(2), planners should examine the various components of the airport's ground access system (including roadways, curbside, ground transportation services, signage, and parking facilities) in terms of passenger convenience. Passengers that need to travel to and from an airport must select a mode of transportation for that travel, taking into account mode efficiency and comfort, cost of trip, duration of trip, vehicular traffic, complexity of routing, and potential impacts of road closures and accidents.

On the airport, signage should be simple, concise, and uniform to aid in wayfinding. At airports with multiple terminal facilities, roadway and curbside signage identifying airline locations is critical. Poor signage can reduce the level of service provided to airport patrons and result in increased recirculating traffic (refer to FAA AC 150/5360-12E, *Airport Signing and Graphics).* Passengers traveling by automobile will be most concerned with how easy it is to find parking, parking options and costs, signage and wayfinding to/from rental car facilities if renting a vehicle, and signage denoting airline terminal assignments. Variable or dynamic message signs may provide real-time information to passengers in the event of roadway closures, detours, or changes in airline terminal assignments or other facility locations that are not yet captured by the airport's signage system.

Good connectivity between an airport terminal and the various modes of transportation is essential. Public transportation options should be examined for frequency, travel time, cost, and number of segments (additional time required for connections), as well as type of intermodal facilities available on the airport to provide seamless and convenient connections for passengers on the next leg of their journeys. Walking distances to parking garages, frequency of shuttles to rental car facilities and nearby hotels on and off airport, and amount of curbside for vehicle staging should be examined for passengers not using public transportation.

811. UTILITIES

The master plan should address existing and future utility needs, such as for water, sanitary sewer, drainage and deicing, industrial waste, communications, power supply, and back-up power and water in case of emergencies. Existing systems should be evaluated and their capacity verified at the airport boundary. Historical ratios of utility demand to the level of enplanements or aircraft operations can form the basis for projecting future demand. Since an airport can be a large consumer of utility services, planners should discuss their projections with local utility providers to ensure that the airport's needs are included in their long-term service plans. Planners should also consult local building codes to ensure any specific local requirements are identified during the planning phase.

812. OTHER REQUIREMENTS

Many airports have significant acreage devoted to non-aeronautical uses, such as industrial parks, recreational uses, agricultural or grazing leases, or retail businesses. Some uses are considered temporary, to remain only until a higher aviation use materializes, while others are expected to remain as surplus to anticipated aviation needs. In either case, the revenue from these activities provides supplemental revenue to the airport and improve the airport's overall financial position. The planner should review the infrastructure needs of such activities and identify improvements that preserve the revenue-generating performance of a valuable asset.

813. DOCUMENTATION GUIDELINES

a. A stand-alone chapter of the technical report should describe the analyses and techniques used to determine future facility requirements. A summary at the beginning or end of the chapter and in the report's executive summary should highlight findings for key components.

b. Planners should use appendices to improve the readability and organizational flow of the documentation. However, they should avoid making the appendices a depository for unnecessary information, which can result in lengthy reports that may confuse and discourage the reader.

c. It is not necessary for the chapter documentation to mirror the outline of major sections provided in this chapter of the AC. However, it should follow the structure of the chapter of the technical report that describes existing conditions.

This page intentionally left blank.

Chapter 9 Alternatives Development and Evaluation

901. GENERAL

a. This chapter brings together many different elements of the planning process to identify and evaluate alternatives for meeting the needs of airport users as well as the strategic vision of the airport sponsor. Airports have a wide variety of development options, so an organized approach to identifying and evaluating alternative development options is essential for effective planning. The key elements of this process are:

1) Identification of alternative ways to address previously identified facility requirements.

2) Evaluation of the alternatives, individually and collectively, so that planners gain a thorough understanding of the strengths, weaknesses, and other implications of each.

3) Selection of the recommended alternative.

Planners should carefully organize the analysis because it is easy to consider alternatives that do not meet the airport's needs, or fail to consider certain long-term development options, particularly if one highly visible issue seems to overshadow other planning elements. Both of those outcomes can be avoided by the careful review of the scope of work, and by verifying that the facility requirements (including timing) are complete; that other considerations, such as the sponsor's strategic development objectives, unusual site or environmental consideration and other factors are documented and understood; and that there has been sufficient stakeholder participation.

b. Planners should also review the scope of work to ensure that the alternatives process conforms to the overall study design. In simple master plans, alternatives development may be limited. In these instances, facility improvements are simply an extension of existing land use patterns and can be best addressed in the Airport Layout Plan.

c. Planners should meet the airport's development needs in order to improve the airport as a system, while remaining responsive to environmental, fiscal, and other objectives. To do so, the planner must balance competing needs among the airport's various functional elements. Although the process varies by airport, planners typically consider the airside first; terminal, general aviation, and cargo facilities next; and then airport access. Since a master plan covers a 20-year time frame, planners should recognize that the recommended alternative should be functional through various stages of the plan. For example, it would not be a good idea to develop a new location for general aviation operations early on if the airside improvements needed to support it would not be provided until a later phase. A 20-year plan should also have the flexibility to meet unforeseen future conditions.

In some cases where it is appropriate to identify major development alternatives, such as a new runway, that meet demand beyond a 20-year time frame. For example, if an airport is experiencing urban encroachment that would lead to land use incompatibility,

planners should assess alternatives that would help protect aviation assets from that encroachment, or to plan for long-term land acquisition. However, planning beyond the 20-year period should be general in nature and in much less detail than that for the short- or even mid-term development. For example, if planning for a future runway, the master plan might only indicate the general location and potential length of the runway. The alternatives analysis would only consider key evaluation criteria and would be at a low level of detail.

d. Effective facility planning must consider environmental issues in the alternatives identification, evaluation, and selection effort. The early consideration of the potential environmental impacts of alternatives can avoid later problems. Some master planning efforts will produce short-term recommendations that will require an Environmental Assessment or Environmental Impact Statement. In these situations, the master plan must provide a good technical foundation for the subsequent environmental process. In some complex situations, it may be helpful to include an environmental consultant or FAA Airports Environmental Specialist as an advisor to the master plan. However, the planner should carefully review the master plan scope of work to avoid undertaking tasks better suited for the follow-on environmental analysis, such as wetland delineation or cultural resources surveys. To better understand how a master plan alternatives analysis fits within the overall development process, planners should concurrently review the following FAA guidance:

   1) FAA Order 5050.4, FAA Airports guidance for complying with NEPA,

   2) FAA Order 1050.1, *Environmental Impacts: Policies and Procedures*

   3) AC 150/5300-13, *Airport Design*

   4) Chapter 5 of this AC, *Consideration of Environmental Factors in Airport Master Planning*

   Master plans that address controversial undertakings, such as capacity projects at larger airports, should pay particular attention to environmental factors and the National Environmental Policy Act (NEPA) process during alternatives identification, analysis, and selection. The plan's environmental evaluation is intended to support the NEPA process. The planning and environmental review will be less likely to experience delays if the master plan supports the subsequent NEPA analysis.

   Although master planning is not part of the NEPA process, the master plan alternatives development and evaluation can provide an important component of an efficient NEPA process. In complex cases, the careful scope of work preparation (with assistance from an environmental consultant or FAA Airports Environmental Specialist) can ensure that the master plan provides information useful to subsequent environmental analyses under NEPA. Items of particular interest during planning include the types of reasonable alternatives that the sponsor and FAA can implement. The analysis of these alternatives must be consistent and well documented.

e. The alternatives effort should also consider fiscal issues. Planners must be aware of the practical fiscal limitations imposed on the airport by the availability of grant funds, passenger facility charges (PFCs), user fees and other sources of development dollars and their development options should reflect the fiscal capabilities of the airport. Cost should not be a factor in rejecting an alternative unless the cost of the alternative makes the alternative infeasible. A plan that is not realistic in terms of what can be funded will not provide much benefit to the sponsor or airport users. Note, however, that under NEPA, cost alone is not necessarily a valid reason for rejecting an alternative.

f. The alternatives identification, evaluation, and selection process should be the most collaborative portion of the master plan study as part of an effective public involvement program. The foundation for a successful effort in the alternatives analysis process is careful consideration of this task in the pre-planning activities. The level of detail to be undertaken in this task will greatly affect the cost of the master plan study.

902. ALTERNATIVES ANALYSIS PROCESS IN AIRPORT MASTER PLANNING

a. A general process of identifying, analyzing, and recommending alternatives is illustrated in Figure 9-1. The steps shown are an example of a comprehensive process that can be used on large and complex projects. For many airport planning projects, some of the steps may not be applicable. The process should be adapted to the needs of the study airport and the level of detail may vary considerably from study to study. The alternatives analysis process may be adapted in several ways, but variations should be clearly described in the study's scope of work; they may include changes such as:

1) What airport elements are included in the process

2) How the elements are ranked in the planning hierarchy

3) What type and level of analysis will be used to differentiate among the alternatives

b. Where a particular functional element does not exist, it can be eliminated from the alternatives analysis process; for example, planners need not consider an airline passenger terminal at general aviation airports. In addition, if there are no facility needs associated with a functional element, it is not appropriate to consider alternatives for that element. Thus, it is possible, if there are no facility improvements for primary elements and those for secondary elements are simply extensions of existing land use patterns, that the alternatives analysis process can be materially reduced or even skipped altogether.

c. The alternatives analysis process planning hierarchy that addresses the primary analysis first examines recommended alternatives for those elements that require large land areas and must be considered as a functional whole. For most airports, this will include the airside. For larger airports, airline passenger terminal and ground access elements may be included. For smaller airports, general aviation facilities may be included in the primary analysis.

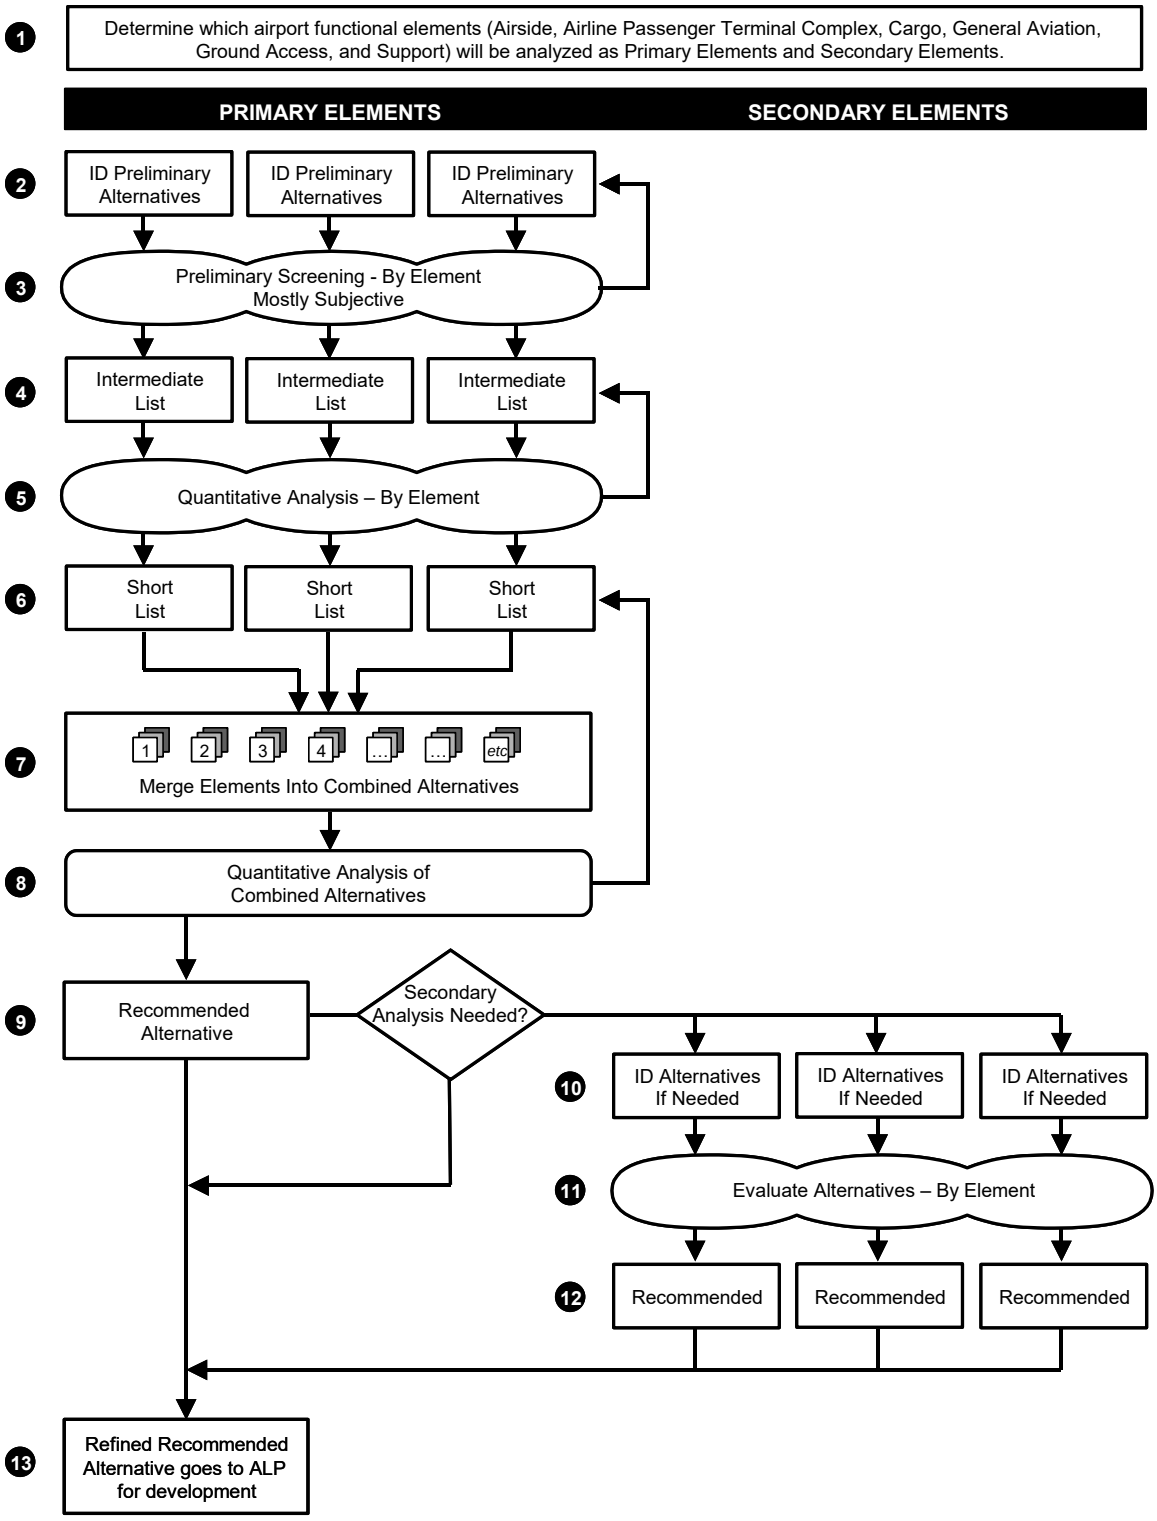
The secondary analysis addresses elements that have greater planning flexibility, however, not all airport planning will have secondary analysis. For example, the support

facilities at some airports will include an Aircraft Rescue and Fire Fighting (ARFF) building. While an ARFF building will have specific size, location, and functional requirements, these requirements are significantly easier to satisfy than those for a new runway or passenger terminal.

The order of the elements in the planning hierarchy may vary by airport. For example, at an airport with particularly complex airside, airline passenger terminal, and cargo situations, but a very simple ground access element, the alternatives analysis process would be adapted to make the ground access element a secondary analysis element while making the cargo element a primary analysis element.

d. Planners may also adapt the analysis to the unique circumstances of the study airport. For example, an airport may have ample airfield capacity, but significant terminal and ground access congestion. In such a case, planners might conduct a relatively simple airfield capacity analysis, or none at all, while the airline passenger terminal and ground access elements would get a more intensive analysis, including computer simulation.

e. The alternatives analysis process is an iterative process, intended to be flexible enough to permit creative thinking about the future of the airport, but sufficiently structured to ensure consideration of all pertinent factors. The planner, in following this process, should focus on issues that shape how the airport will function as a system, as well as on narrower technical analyses.



f. The alternatives analysis process should incorporate the public involvement program. Although the appropriate level of public involvement will vary, a meaningful involvement program is important and will provide a number of important benefits.

g. As shown in Figure 9-1, the alternatives analysis process should start with a broad group of alternatives for the primary elements and progressively screen them to produce reasonable alternatives that meet the planning need. The sponsor may identify a recommended single alternative.

1) ***Determine Primary and Secondary Elements (Step 1)*** – Determine which functional elements (airside, airline passenger terminal complex, cargo, general aviation, ground access, and support) should be considered in the primary analysis and which ones can be in the secondary analysis. Primary elements require large, contiguous land areas. Secondary elements have greater planning flexibility, can often be subdivided, and fill-in around the primary elements.

2) ***Identify Preliminary Primary Element Alternatives (Step 2)*** – After the principal elements for primary and secondary analysis are identified, select preliminary alternatives for the primary elements.

Figure 9-1: Alternatives Analysis Process Example

3) ***Screen Alternatives for Intermediate List of Primary Element Alternatives (Steps 3 and 4)*** – Screen the preliminary alternatives, using a mostly subjective, qualitative analysis, to make an intermediate list of alternatives. This screening will eliminate some alternatives for each of the primary elements, and may introduce others. Any subsequent environmental analysis will be aided by clear documentation of this screening, focusing on why alternatives were eliminated.

4) ***Quantitative Analysis for Short List of Primary Element Alternatives (Steps 5 and 6)*** – As appropriate, subject the selected alternatives to a more rigorous, and often quantitative, analysis to get a short list of alternatives by element. Again, clear documentation of this analysis will help in any subsequent environmental analysis.

5) ***Combine and Analyze Primary Element Alternatives (Steps 7 and 8)*** – Identify combined alternatives, consisting of the logical matching of the individual primary element alternatives, and subject them to a further analysis, based on previous work.

6) ***Select Preferred Primary Element Alternative (Step 9)*** – Select and document the recommended alternative for the primary elements. Note that subsequent environmental processing will materially benefit from clear documentation of this selection with a focus on why alternatives were eliminated.

7) ***Identify Alternatives for the Secondary Elements (Step 10)*** – Identify alternatives or options for the secondary elements. In some cases, the simplicity of the situation may eliminate the need for some or all of the secondary component alternatives.

8) ***Evaluate and Select Recommended Alternatives for Secondary Elements (Steps 11 and 12)*** – As appropriate, evaluate secondary elements alternatives, typically using a mix of qualitative and quantitative analysis, and select and document reasonable alternatives or options. Note that subsequent environmental processing will materially benefit from clear documentation of this analysis. It provides a focus on why some alternatives were eliminated and why reasonable alternatives were retained for consideration and environmental analyses.

9) ***Prepare Refined Recommended Alternative (Step 13)*** – The final step in the process is the combination of the recommended alternatives for the primary and secondary elements.

h. During the alternatives analysis process, planners will get new information and input that will help refine the alternatives or result in the introduction of new alternatives. Therefore, planners should view the alternatives analysis process as an iterative one.

903. IDENTIFICATION OF ALTERNATIVES

a. The alternatives identification (steps 2 and 10 in Figure 9-1) should consider only those alternatives meeting the sponsor's planning need and that the FAA or the airport sponsor will be able to implement. Planners should examine each identified alternative's technical feasibility, economic and fiscal soundness, and aeronautical utility (i.e., build and operated safely). Alternatives not meeting those criteria should be dismissed, while

providing reasons for their respective dismissals. The master plan should include reasons why planners rejected any alternative that would avoid environmentally sensitive resources or that would require extensive mitigation. This planning information is critically important to efficient project development. It is also critical to streamlining the subsequent NEPA process, since that process must consider the above master plan alternatives and those outside the FAA's or sponsor's jurisdiction.

b. To avoid an unnecessarily complex alternatives analysis process, the planner should carefully select different ways of addressing the identified need that are not simply variations on the same basic approach. Alternatives should have discrete, measurable, and materially different impacts on the established alternative evaluation criteria. Early work should consider a number of ideas, but these should be reduced to a manageable number of true alternative approaches through the initial steps of the process, taking care to adequately document what concepts were examined and why certain ones were dismissed. The need to work with a manageable number of alternatives in the master plan must be balanced with NEPA requirements to consider all reasonable planning alternatives to avoid or minimize impacts to environmental resources.

   Planners should understand the condition of the airport, the business relationships between the airport and tenants, the future vision of the airport sponsor, the environmentally sensitive features of the airport, and other factors that make each airport unique.

c. There should be a direct link between the facility requirements and the development alternatives. Not all facility requirements are related to capacity shortfalls, as some will improve operations, comply with standards, or meet the sponsor's strategic objectives. However, the basis for all facility requirements should be clearly documented.

d. The alternatives should address those airport elements that are the focus of the particular master plan (airside, airline passenger terminal, or ground access) and de-emphasize functional elements that are less important to the airport's overall function.

e. The process of identifying alternatives should be iterative. It should begin with the identification of a broad range of possibilities, often generated by using a collaborative brainstorming approach. The focus should be on the primary elements. The elements should be reviewed to ensure that necessary interrelationships are considered (i.e., make sure there is a ground access option and airside option that supports each terminal option). The elements may conflict (i.e., a terminal option may conflict with an airside option). Initial screening should narrow the range of possibilities to those reasonable alternatives that meet the planning need for each element, which will then undergo more intensive development and evaluation.

f. As the alternatives are evaluated, planners may need to apply more specialized skills. In some cases, they may need to conduct airspace reviews to determine an alternative's aeronautical utility. In very complex cases, they may need to conduct preliminary engineering studies and prepare cost estimates.

g. In many cases, the secondary element may not require the formulation and analysis of alternatives, but may be integrated directly into the recommended primary element alternative. This is particularly true when the secondary element can follow an extension of an existing land use pattern and no environmental resources are affected.

904. EVALUATION OF ALTERNATIVES

The evaluation of alternatives (steps 3, 5, 8 and 11 in Figure 9-1) should be adapted to each airport's unique situation. Sophisticated and expensive analyses should be done only when deemed necessary to differentiate among alternatives. In all cases, the analysis should follow generally accepted planning practices, be replicable, consistently applied, and well documented.

The alternatives analysis process uses increasing levels of detail as the evaluation of alternatives proceeds. The initial rounds of evaluation should be qualitative and more subjective, based on a combination of good planning judgment, relatively simple-to-use models and simplified calculations. However, subsequent rounds of analysis should be more rigorous.

Evaluation criteria should be determined in advance, but may be adjusted based on information uncovered as part of the alternatives analysis process. Since the selection of appropriate evaluation criteria involves a significant degree of subjectivity, planners must be careful to achieve a balanced evaluation, while still being responsive to the various study participants' points of view. The planner must carefully consider factors of particular importance at the study airport, but make sure that the evaluation addresses all aspects of the alternatives. Therefore, the planner should include a broad range of evaluation criteria to ensure the adequate consideration of all aspects of the alternatives.

Evaluation criteria are divided into four broad categories: operational performance, best planning tenets and other factors, environmental factors, and fiscal factors. For most airports with relatively straightforward planning issues, a simple analysis across a broad range of evaluation categories will be sufficient. The following evaluation criteria should be adapted for each airport to achieve a balance between the need for a thorough evaluation and the inefficiency of over-analysis:

a. **Operational Performance** – How well the airport functions as a system can be evaluated from several perspectives, including capacity, capability, and efficiency.

   1) ***Capacity*** – Test for the capability of accommodating future activity levels. Various capacity techniques can be applied to the airside, terminal, and ground access elements. Consistent application of the technique to each alternative will permit the planner to compare them.

   2) ***Capability*** – Test for the capability of meeting specific functional objectives, such as accommodating the design aircraft, providing the required number of aircraft parking positions or gates, or allowing space for the runway length requirement.

   3) ***Efficiency*** – Test how well the alternatives work as a system by examining combined alternative elements. For example, airfield taxiing efficiency can be evaluated by

combining terminal and airside alternatives to measure which combination yields the lowest weighted average aircraft taxiing time and the fewest runway crossings.

Several FAA offices have a role in assessing the aeronautical utility of various alternatives. These include the FAA's Air Traffic Organization (generally the terminal, technical operations, and planning units), Flight Procedures, and Flight Standards. Questions to be addressed may include the feasibility of approach procedures, navigational aid siting, and airspace interaction.

b. **Best Planning Tenets and Other Factors** – Planners should determine the relative strengths and weaknesses of the alternatives. The following best planning tenets will apply to the evaluation of alternatives at most airports, but others may be applicable at a specific airport:

1) Conforms to best practices for safety and security

2) Conforms to the intent of applicable FAA design standards and other appropriate planning guidelines

3) Provides for the highest and best on- and off-airport land use

4) Allows for forecast growth throughout the planning period

5) Provides for growth beyond the planning horizon, as applicable

6) Provides balance (typically capacity) between elements

7) Provides the flexibility to adjust to unforeseen changes

8) Conforms to the airport sponsor's strategic vision

9) Conforms to appropriate local, regional, and state transportation plans and other applicable plans

10) Technically feasible (limited site constraints)

11) Socially and politically feasible

12) Satisfies user needs

c. **Environmental Factors** – The potential environmental effects of the alternatives are an important consideration. The impact categories defined in FAA Order 1050.1, *Environmental Impacts: Policies and Procedures* and FAA Order 5050.4, FAA Airports guidance for complying with NEPA, offer significant insight about the likely impacts of various alternatives. At some airports, only a few of the items will be applicable, such as noise, wetlands, or social impacts and a simple approach will be sufficient to differentiate among the alternatives. Where an Environmental Assessment or Environmental Impact Statement is likely to be prepared, a more detailed evaluation of environmental factors will be useful. An environmental consultant may provide significant insight in such cases.

Early consideration of the environmental effects of the alternatives can help ensure that they remain responsive to the overall environmental objectives of the airport sponsor. If early examination indicates that the principal alternatives are likely to have extensive environmental effects, it may be appropriate to develop additional alternatives. If there are no additional alternatives, the decision to move forward with the existing alternatives should be made only after careful consideration by the airport sponsor.

d. **Fiscal Factors** – Preparing rough cost estimates is a very effective way to compare alternatives and should be done in all alternatives analyses. Cost estimates should account for any special differences among alternatives. For example, in comparing a green-field site versus the redevelopment of an existing site, the evaluation should consider the respective cost advantages and disadvantages. A green-field site might have cost premiums associated with site work, installation of support infrastructure, and access roadways. At the same time, redevelopment might have cost premiums associated with demolition, phasing, and relocations.

Early fiscal analysis may also be necessary to determine if the alternatives are responsive to the fiscal constraints of the study airport. The identification of likely funding sources and their funding potential are important factors in determining the feasibility of the alternatives. If early estimates indicate that the principal alternatives are beyond the realistic fiscal capability of the airport, planners should include that information in the master plan and develop more fiscally responsible alternatives.

Planners may also prepare a preliminary benefit-cost analysis, following the current benefit/cost analysis guidance from the FAA Office of Airports. However, for most alternatives reviews, a summary analysis using reasonable estimates and judgment will be sufficient. Planners should conduct any required benefit-cost analyses in accordance with FAA guidelines when the development and financing plans are sufficiently refined to allow a more accurate estimate of the costs, benefits, and other factors.

905. SELECTION OF A RECOMMENDED ALTERNATIVE

a. The selection of an airport sponsor's recommended alternative (steps 9 and 12 in Figure 9-1) will usually be based on a combination of efforts, including: summation of the alternative evaluation criteria, supplemental analyses and evaluations, stakeholder input through the public involvement process, and sponsor preferences. The level of complexity of the selection process typically reflects the complexity of the airport's situation. However, in all cases the reasons for the selection of the recommended alternative should be clearly documented.

b. Summation of the alternative evaluation criteria can take many forms. Because this effort typically relies heavily on the judgment of the planning team, particular care must be taken to ensure that the summation process is clear and understood by the airport sponsor and study participants. In simple situations with relatively few evaluation criteria, a recommended alternative can often be selected with little or no summation of the evaluation criteria. In more complex settings, a matrix of findings can be effective in selecting a recommended alternative. In addition, a matrix of findings can document

matters of judgment; facilitate the sponsor's, the FAA's, and others' participation in the decision making process; and build consensus regarding the recommended alternative.

In master plans that are controversial or will lead to an Environmental Assessment or that may require an Environmental Impact Statement, the planner should ensure that the process used to select a recommended alternative is comprehensive, logical, well documented, and has meaningful public participation. The public involvement process during a master plan serves an important function, but it does not replace the public involvement process required by NEPA and described in FAA Order 1050.1, *Environmental Impacts: Policies and Procedures* and FAA Order 5050.4, FAA Airports guidance for complying with NEPA. If the master plan contains short-term development projects that are known to require additional environmental processing, the airport sponsor should consider beginning the environmental processing prior to selecting a recommended alternative. Selecting a recommended alternative prior to beginning the environmental processing may complicate the NEPA process because the various agencies and public involved may perceive that the NEPA analysis is biased.

906. AIRPORT SITE SELECTION

The emphasis in airport planning is normally on the expansion and improvement of existing airports. Sometimes, however, an existing airport cannot be expanded to meet the future demand and a new or supplemental airport is required. In these cases, a new airport site may be selected as part of the airport planning process. The process of identifying, evaluating, and selecting a potential site for a new airport is similar to the process of identifying, evaluating, and selecting alternatives for individual airport projects. Appendix E contains guidance on the airport site selection process. If planners want to use Federal financial assistance under the AIP for follow-on planning or site acquisition and development, the FAA must approve the selected site before any additional planning work is started.

907. DOCUMENTATION GUIDELINES

a. The documentation of the alternatives identification, evaluation, and selection process should be a separate chapter in the master plan technical report. The planner should provide a summary at the beginning of the chapter that describes the recommended alternative and its principal benefits.

b. Planners should move technical information to appendices to improve the readability and organizational flow of the documentation.

c. Since this documentation may be heavily relied upon in a subsequent Environmental Assessment or Environmental Impact Statement, the planner should ensure that the documentation is logical and thorough. It should make clear what alternatives were considered, why particular alternatives were eliminated from further consideration, and why the recommended alternative was selected.

Chapter 10 Airport Layout Plans

1001. GENERAL

a. This chapter provides guidance for the preparation of the drawings that make up the Airport Layout Plan (ALP) drawing set. The ALP depicts existing airport facilities and proposed developments as determined from the planners' review of the aviation activity forecasts, facility requirements, and alternatives analysis. The process outlined in this chapter also applies to ALPs that are prepared without a master plan.

b. FAA Order 5100.38, *Airport Improvement Program Handbook*, provides supplemental guidance for the preparation of an ALP. United States Code (USC) 47107(a) requires, in part, a current ALP approved by both the sponsor and FAA prior to the approval of an airport development project. USC 47107(a)(16) requires that the airport sponsor maintain an ALP that ensures the safety, utility and efficiency of the airport. Grant assurance number 29 requires that the sponsor keep the ALP up to date at all times. As stated in Order 5100.38, an ALP remains current for a five-year period, or longer, unless major changes at the airport are made or planned.

c. The minimum elements of the ALP drawing set are defined in Appendix F, *Airport Layout Plan,* of this AC. This chapter complements the ALP drawing set requirements in Appendix F.

d. The ALP preparer must work closely with the airport sponsor, the responsible FAA office, and if appropriate, the applicable state agency, to define the requirements, standards, and criteria to be employed. To ensure that the ALP is comprehensive, all parties must agree to its content and standards. ARP Standard Operating Procedure (ARP SOP) 2.00, FAA Review and Approval of Airport Layout Plans (ALPs), and ARP SOP 3.00, FAA Review of Exhibit 'A' Airport Property Inventory Maps, should be referenced for specific ALP review and approval procedures and additional preparation guidance. Current versions of these SOPs are located at http://www.faa.gov/airports/resources/sops/.

e. The five primary functions of the ALP that define its purpose are:

1) An ALP creates a blueprint for airport development by depicting proposed facility improvements. The ALP provides a guideline by which the airport sponsor can ensure that development maintains airport design standards and safety requirements, and is consistent with airport and community land use plans.

2) The ALP is a public document that serves as a record of aeronautical requirements, both present and future, and as a reference for community deliberations on land use proposals and budget resource planning.

3) The approved ALP enables the airport sponsor and the FAA to plan for facility improvements at the airport. It also allows the FAA to anticipate budgetary and

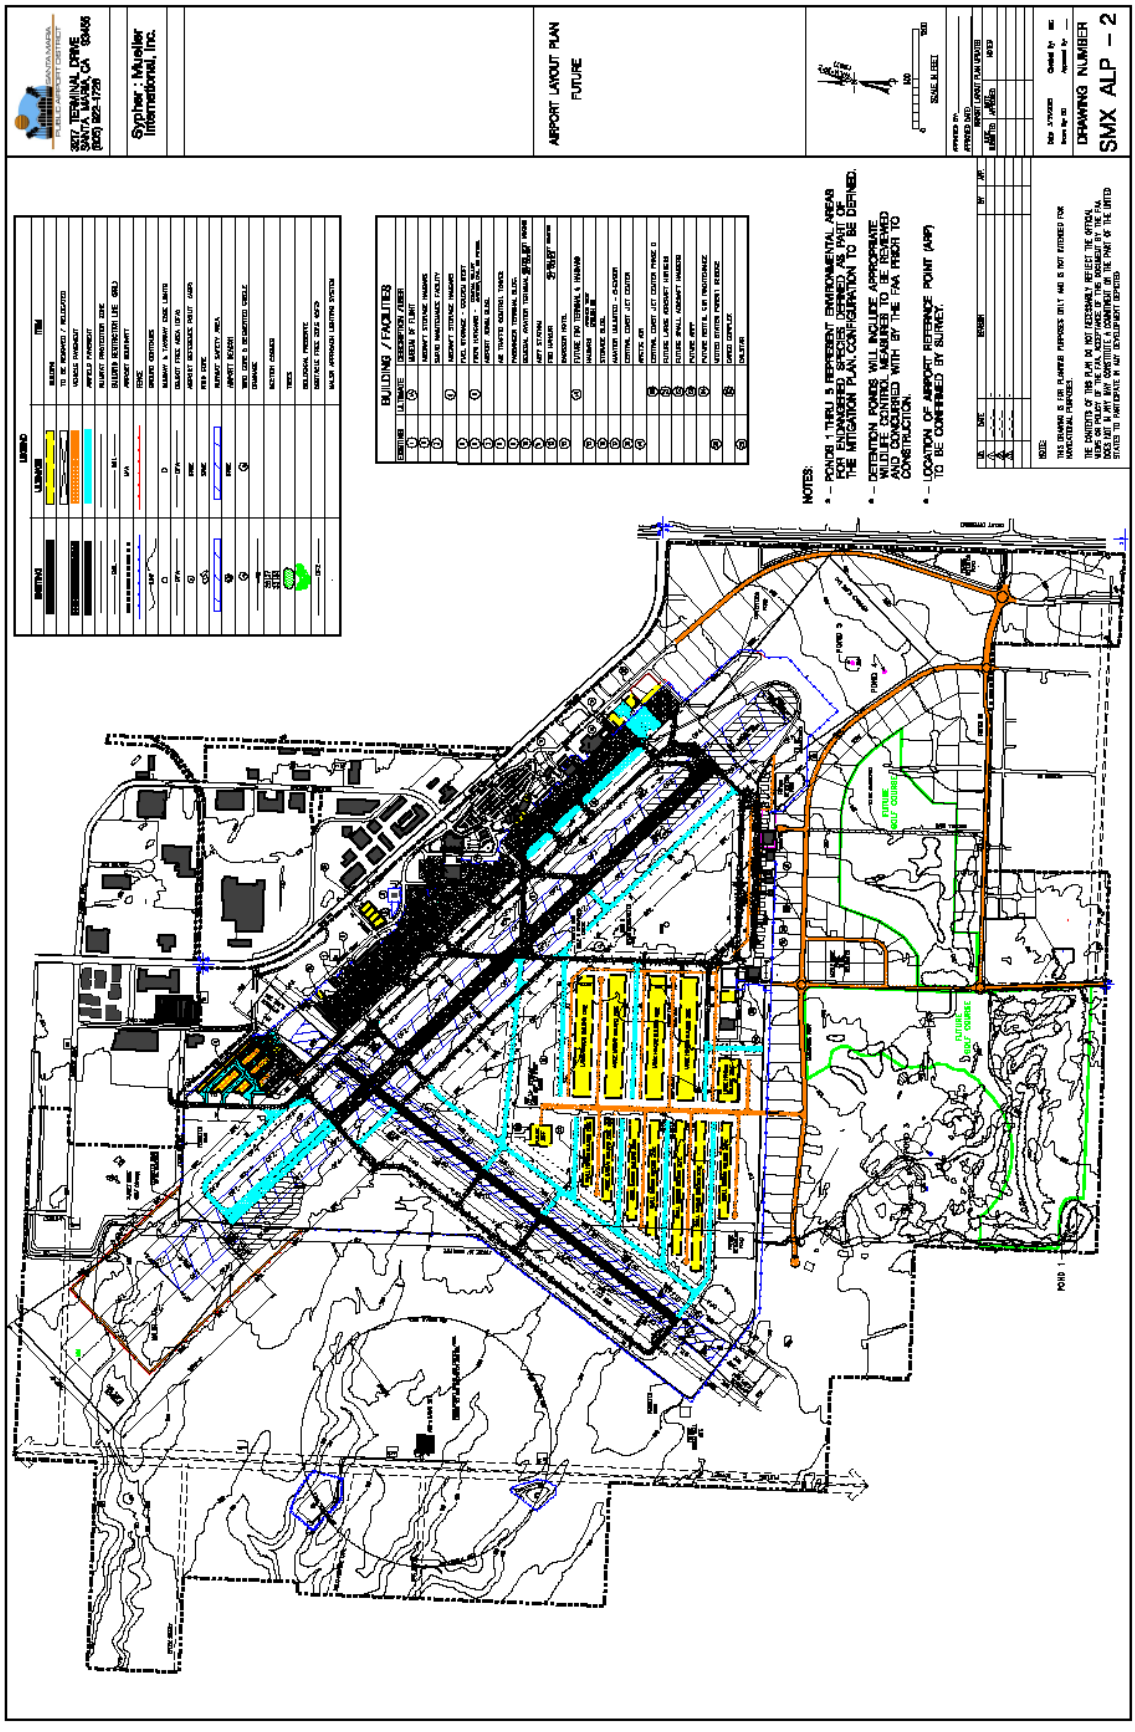
procedural needs. The approved ALP will also allow the FAA to protect the airspace required for facility or approach procedure improvements.

4) The ALP can be a working tool for the airport sponsor, including its development and maintenance staff.

5) An approved ALP is necessary for the airport to receive financial assistance under the terms of the Airport and Airway Improvement Act of 1982, as amended, and to be able to impose and use Passenger Facility Charges. An airport must keep its ALP current and follow that plan, because those are grant assurance requirements of the AIP and previous airport development programs, including the 1970 Airport Development Aid Program (ADAP) and Federal Aid Airports Program (FAAP) of 1946, as amended.

f. The ALP drawing set is a set of planning drawings and is not intended to provide design engineering accuracy. Individual items such as runway coordinates, obstruction survey data, and application of airport design standards must comply with Federal survey standards. The ALP preparer will need to define accuracy requirements for specific elements of the ALP in cooperation with the airport sponsor and approving agencies.

g. Airport Layout Plans are prepared either as first time ALPs, formal revisions based on changes to the airport, or informal revisions based on minor improvements to the airport. Informal revisions, often referred to as pen-and-ink revisions, can be made to individual sheets of the ALP drawing set, although the responsibility for review and approval must still be coordinated with the FAA. These and other requirements are discussed in FAA Order 5100.38, *Airport Improvement Program Handbook*.



1002. AIRPORT LAYOUT PLAN DRAWING SET

a. The individual sheets that comprise the Airport Layout Plan drawing set will vary with each planning effort. The ALP preparer, airport sponsor, FAA and any other approving agency must determine which sheets are necessary during the project scoping activities. ARP SOP 2.00, Appendix A, ALP Review Checklist, may be used to guide the scope development. The following sheets are described further in the SOP:

1) ***Cover Sheet*** – A separate cover sheet, with approval signature blocks, airport location maps, and other pertinent information as required by the local FAA Airports office.

2) ***Airport Layout Plan*** –A drawing depicting the existing and future airport facilities. The drawing should include the depiction of all applicable design standards contained in the latest version of Advisory Circular 150/5300-13, including but not limited to, landing areas, movement areas and aircraft parking areas (e.g., runways, taxiways, helipads, aprons, etc.), required facility identifications, description labels, imaginary surfaces, Runway Protection Zones, Runway and Taxiway Safety Areas, Runway and Taxiway Object Free Areas, Runway Obstacle Free Zones and basic airport and runway data tables. It may be necessary to include the data tables on a separate sheet. Figure 10-1 is an example of an ALP drawing.

Figure 10-1: Airport Layout Plan Drawing

Source: Santa Maria Airport (SMX), prepared by Sypher:Mueller.
Note: This is a draft airport layout plan and has not yet been reviewed or approved by FAA.

3) ***Data Sheet*** – A separate sheet containing basic airport and runway data tables.

4) ***Facilities Layout Plan*** – A drawing that depicts existing and future facilities, and only critical, non-overlapping clearance criteria, with minimal text. It is essentially a simplified ALP.

5) ***Terminal Area Plan(s)*** – This plan consists of one or more drawings that present a large-scale depiction of areas with significant terminal facility development. Such a drawing is typically an enlargement of a portion of the ALP. At a commercial service airport, the drawing would include the passenger terminal area, but might also include general aviation facilities and cargo facilities.

6) ***Airport Airspace Drawing*** –14 CFR Part 77, *Objects Affecting Navigable Airspace*, defines this as a drawing depicting obstacle identification surfaces for the full extent of all airport development. It should also depict airspace obstructions for the portions of the surfaces excluded from the Inner Portion of the Approach Surface Drawing.

7) ***Inner Portion of the Approach Surface Drawing*** –Drawings containing the plan and profile view of the inner portion of the approach surface to the runway and a tabular listing of all surface penetrations. The drawing will depict the obstacle identification approach surfaces contained in 14 CFR Part 77, *Objects Affecting Navigable Airspace*. The drawing may also depict other approach surfaces, including the threshold-siting surface, those surfaces associated with United States Standards for Instrument Procedures (TERPS), or those required by the local FAA office or state agency. The extent of the approach surface and the number of airspace obstructions shown may restrict each sheet to only one runway end or approach.

8) ***On-Airport Land Use Drawing*** – A drawing depicting the land uses within the airport property boundary.

9) ***Off-Airport Land Use Drawing*** – A drawing depicting land uses and zoning in the area around the airport. At a minimum, the drawing must contain land within the DNL 65 db noise contour and to the extents of the future RPZs, if they extend beyond the airport property. For general aviation airports or low activity commercial service airports, where noise issues are less important, on-airport land use and off-airport land use drawings may be combined.

10) ***Airport Property Map*** – A drawing depicting the airport property boundary, the various tracts of land that were acquired to develop the airport, and the method of acquisition. This drawing is only required for those airports that have acquired land with Federal funds or through an FAA-administered land transfer program; however, it may be useful to all airport sponsors. If any obligations were incurred as a result of obtaining property or an interest therein, they should be noted. Obligations that stem from Federal grant or an FAA-administered land transfer program, such as surplus property programs, should also be noted. The drawing should also depict easements beyond the airport boundary. An airport property map is not a substitute for an Exhibit A unless it is prepared in accordance with AC 150/5100-17, *Land Acquisition and Relocation Assistance for Airport Improvement Program Assisted Projects.*

11) ***Runway Departure Surface Drawing*** – This drawing depicts the applicable departure surfaces as defined in Table 3-2 and Figure 3-4 in FAA AC 150/5300-13. The surfaces are shown for runway end(s) designated primarily for instrument departures. The one-engine inoperative (OEI) obstacle identification surface (OIS) should be shown for departure runway end(s) supporting air carrier operations.

12) ***Utility Drawing*** – This drawing depicts the location and capacity of major utilities on the airport and in the surrounding area.

13) ***Airport Access Plans*** – If access to the airport is a significant issue, a separate airport access drawing should be created, depicting the major routes of various modes of transportation that serve the airport. Such a drawing could also include proposed improvements to the system.

14) ***Other Plan(s)*** – Drawings that address a specific, unique need at the airport. For example, these drawings may include a Well Site Plan for on-airport oil and gas extraction, or a Launch Site Boundary for commercial spaceport facilities[2], etc.. The sponsor, FAA and other approving agencies must discuss and agree to include them.

1003. COMPUTER-AIDED DESIGN STANDARDS

a. ALP drawings may be produced electronically using design software. The sponsor and responsible reviewing agency will select what program to use. Design standards should be established and may include defined line types, line weight/thickness, lettering styles, symbols, and file-naming conventions. The sponsor, FAA and/or state agency must determine which standards must be followed in development of the Airport Layout Plan drawing set.

b. Following computer design standards will facilitate the review and approval of the drawings by the responsible agency, reduce the chance of someone misunderstanding the drawings, produce drawings that are useful for the reviewing agency and the airport sponsor, and produce drawings that may be used in subsequent planning and design efforts.

1004. GEOGRAPHIC INFORMATION SYSTEMS APPLICATIONS

a. Geographic Information Systems (GIS) allows users to visualize, question, analyze, interpret, and understand data to reveal relationships, patterns, and trends. GIS may be used by the airport sponsor for a number of purposes, including the inventory and maintenance of airport facilities, preparation for emergency services, planning for airport improvements, the inventory of airport property, and the inventory of sensitive environmental areas.

b. The ALP may be linked to an existing GIS or the airport sponsor may implement a new GIS incorporating the ALP. Airports are required to submit digital geospatial data in

[2] See FAA's publication entitled "Proposed commercial space facilities and operations at Federally-obligated or Part 139 airports," dated October 20, 2014, available online at http://www.faa.gov/airports/airport_safety/

conformance with the most current version of AC 150/5300-18, *General Guidance and Specifications for Submission of Aeronautical Surveys to NGS: Field Data Collection and Geographic Information System (GIS) Standards*.

1005. BASE MAPPING AND DATA SOURCES

Base mapping and data source issues should be discussed as part of the master plan scoping, since they may affect not only the ALP drawings, but also subsequent environmental matters. These issues might include the following:

a. **Base Mapping** – The level of detail required for the base mapping of the ALP must be determined by the airport sponsor, FAA, state agency, and the ALP preparer. Although some sponsors may already have the necessary data, new base mapping will often be required. Base mapping is typically done at the outset of the planning effort and is used in the facility requirements determination and alternatives analysis and selection. Since these processes ultimately establish the total area that will be depicted on the drawings, the preparer should establish the area that must be mapped by considering the following:

- Potential airport expansion beyond the existing boundaries
- The extent of noise contours
- Location of other potential environmental impact areas
- The area required to address ground access issues
- The area to be depicted on the Approach Surface Drawing
- Implications of the use of GIS

The ALP preparer will need to determine, based on topography, budget, and future uses of the base mapping, what intervals of topographical contours to use on the maps. Topographic issues may be important in the alternatives analysis, which may require that reduced contour intervals be used. The ALP preparer should also consider how to analyze airspace obstructions and violations. If aerial photogrammetry is used for the obstruction analysis, mapping can be paired with it, but parameters for both products must be established.

b. **Airspace Obstruction Identification and Analysis** – An assessment of airspace obstructions near the airport should be included on the Approach and Departure Surfaces Drawings and the Airspace Drawing. The ALP preparer and reviewing agency must establish data sources and parameters for this assessment. Obstruction data sources include airport obstruction removal programs, previous obstruction survey data, the airport's Obstruction Chart, and the FAA Digital Obstacle File. Numerous methods may be used for inventorying new obstructions or for verification of identified obstructions, including a physical site survey using traditional methods, aerial photogrammetry; and laser mapping. Obstruction analysis parameters include the extent of the approach surfaces to be surveyed and analyzed, and the survey of areas off the sides of the runways. Existing obstruction clearing and maintenance programs at the airport may minimize the need for extensive obstruction surveying. Conversely, development of a new airport, construction of new runways, and the extension, reclassification, or approach procedure revisions to existing runways may require additional surveying. Surveys should be done in accordance with FAA Advisory Circulars 150/5300-16, 17, and 18.

c. **Off-Airport Property** – The airport property map will identify the parcels that were acquired to develop the airport. The airport alternatives analysis may benefit from an inventory of parcels surrounding the airport boundary, particularly in areas of anticipated airport development. Being able to identify these parcels by size and use may also benefit potential subsequent environmental studies. The ALP preparer, the responsible agency, and airport sponsor should determine if expanding the property map to include these areas is necessary.

1006. CHECKLISTS

a. ARP SOP 2.00, Standard Procedure for FAA Review and Approval of Airport Layout Plans (ALPs) should be referenced for the most current ALP Checklist for use in scoping the ALP and managing the ALP review and approval process. This SOP replaces earlier checklists provided by individual Regions and District Offices.

b. For airports not included in the NPIAS, the FAA's checklist may not apply; states may have separate requirements.

c. Planners must verify that the ALP checklist is current, since it is continually revised to reflect changing Federal and state standards.

d. Once the applicable checklist has been identified, the ALP preparer should consult with the reviewing agencies to define the specific items on the checklist that are applicable to the project. The checklist is comprehensive and not all items are applicable to a specific project.

1007. APPROVALS

a. The ALP drawing set approval process may vary, depending on the requirements of the state aviation agency. The airport sponsor, FAA, state, and ALP preparer need to identify a review and approval process at the outset of ALP preparation.

b. FAA Order 5100.38, *Airport Improvement Program Handbook*, states that FAA review and coordination of the ALP will cover Federal interests and must consider any required coordination that was not completed at the local or state level.

c. The review of the Airport Layout Plan drawing set will typically be completed through multiple submittals. Milestones must be determined by the reviewing agency, but typically include:

1) ***Preliminary ALP submittal*** – The drawing set should be submitted to the sponsor for review and comment to ensure that the graphic depictions correctly present the sponsor's goals.

2) ***Draft ALP Submittal*** – The drawing set and support documentation should be submitted to the FAA and state aviation agencies for review and comment. Supporting documentation will include the ALP checklist and must be predetermined

with reviewing agencies. Review comments may be addressed prior to submittal of the Draft ALP drawing set for airspace review.

3) ***Draft ALP Airspace submittal*** – The Draft ALP drawing set should be submitted to the reviewing agency for distribution to various FAA offices for airspace review. As noted above, in some cases the FAA or state may require that the Draft ALP drawing set be submitted for review and comment and then resubmitted for airspace review after their comments have been addressed. In other cases, the FAA may conduct the airspace review at the same time as its general review of the Draft ALP drawing set.

4) ***Final ALP submittal*** – The ALP drawing set should be revised, as needed, based on the airspace determination and review comments if these were not addressed prior to submitting the Draft ALP drawing set for airspace review. The final ALP drawing set and accompanying narrative (Master Plan Report or ALP Narrative Report) should be sent to the reviewing agency for distribution.

d. Conditional Approval – The FAA may approve the ALP drawing set conditionally, based on specific components that will be subject to further review and approvals prior to funding and implementation. See Chapter 5 for additional information regarding master plan environmental review and ALP approval.

e. Unconditional Approval – The FAA may unconditionally approve the ALP drawing set when all proposed development projects are either categorically excluded from additional environmental processing, have received a Finding of No Significant Impact resulting from an Environmental Assessment, or have received a Record of Decision resulting from an Environmental Impact Statement.

1008. DOCUMENTATION GUIDELINES

a. The requirements for documentation of the ALP drawing set must be determined with the airport sponsor and the reviewing agency or State agency. Documentation will typically include a complete reduced-size set of the ALP drawing set and the accompanying text. The master plan will provide the narrative if the ALP is prepared as part of a master plan. If the ALP is prepared separately as an ALP Update, an ALP narrative is required. The narrative will typically describe ALP development criteria and the rationale for the development shown on the ALP. Examples of these include airport reference code-related design criteria unique to specific areas of the airfield, or known or proposed modifications to FAA design standards. (See Section 202.c of this AC for further guidance on the ALP Narrative Report.)

b. The quantity and form of ALP drawing sets must also be defined by the airport sponsor, FAA and state agencies. A reproducible, signed original copy and multiple paper copies of the drawings set may be required. Distribution requirements should be established during the project scoping.

c. Electronic files of the Airport Layout Plan drawing set may be prepared. These files are typically provided to the reviewing agency and may also be provided to the sponsor.

d. Once approved by the sponsor and approving agency, the ALP becomes a legal document and the sponsor should consider placing security controls on the ALP drawing set to prevent unauthorized changes to the drawings.

Chapter 11 Facilities Implementation Plan

1101. GENERAL

a. The facilities implementation plan provides guidance on how to implement the findings and recommendations of the planning effort. Facility implementation plans will vary considerably, depending on the complexity of the projects and the airport sponsor's preferences. In some cases, a simple schedule, listing of key projects, project descriptions, timing of key activities, estimated development cost, interrelated projects, and any special considerations will be sufficient. Other situations may warrant a detailed implementation plan that includes a comprehensive master schedule for the implementation of the major projects, a detailed coordination plan outlining key activities and responsibilities, and detailed project descriptions in the form of project data sheets or project booklets for each major project. In all cases, an implementation plan should provide the airport sponsor and FAA with the information they will need to integrate the master plan's recommendations with the daily activities of the airport.

The airport sponsor, FAA, and other involved parties may use similar terms to describe somewhat different components of the facility implementation plan, particularly in regard to what makes up a Capital Improvement Plan (CIP). Airport sponsors maintain a "capital improvement program" or a "capital improvement plan" that includes all of their airport planning and development projects, both eligible and ineligible for AIP funding. The FAA considers actual funding requests through the Airports Capital Improvement Plan (ACIP) process.

Regardless of the terms used, the facilities implementation plan must address all of the airport's planned capital projects (even those projects that are not associated with the recommendations of the master plan) to ensure that adequate fiscal, staff, scheduling, and other resources are available. In addition, all documentation should be prepared so that it will be clearly understood by all parties.

The facilities implementation plan must balance funding constraints; project sequencing limitations; environmental processing requirements; agency and tenant approvals and coordination processes; business issues, such as leases and property acquisition; and sponsor preferences. The plan must also be coordinated with the master plan ALP and the airport's financial plan.

The facilities implementation plan may change from year to year in response to changing conditions. Therefore, the facility implementation plan should be prepared so that it is easy to update after the master plan is completed. For example, future aviation activity may grow more quickly than the initial facilities implementation plan anticipated, requiring modification of the plan to allow earlier implementation of projects. It should be more detailed in its early years than in the later years to reflect the imprecise nature of long-range facility planning.

1102. FORMULATION OF THE CAPITAL IMPROVEMENT PLAN

a. A new or revised Capital Improvement Plan (CIP) is a key element of the facility implementation plan. The projects illustrated on the ALP should be more precisely described in the sponsor's CIP. While the ALP illustrates facility improvements for broad time periods, (5, 10, and 20 years), those descriptions must be refined into specific projects for the CIP. The airport sponsor will then be able to integrate the master plan projects into its overall program of facility improvement projects, repair projects and maintenance projects. In some cases, planners may need to significantly revise the sponsor's existing CIP if it includes projects that are no longer relevant to the airport's development as a result of changes in the master plan. At large airports, where there may be many ongoing development projects, it can be difficult to integrate the projects identified in the master plan into the sponsor's existing CIP. The planner should work with the sponsor to define ongoing projects with regard to schedule, scope, and sources and uses of funds in order to integrate the master plan projects into a realistic CIP.

b. Given the wide variability in project descriptions and CIP processes, the planner needs to understand the requirements of the sponsor, FAA, and other applicable agencies before undertaking this task. Effective coordination among the planner, FAA, and the sponsor is essential. The airport's CIP contains all projects including those that may not be reflected in the FAA's planning module of SOAR. The level of detail in the sponsor's CIP may also vary considerably, depending on the complexity of the study airport and sponsor preference.

   Specific projects, based on the ALP, should be divided into smaller projects that reflect how projects are approved, designed, and constructed. Planners should maintain an appropriate project scope in designing individual projects. For example, if the master plan recommends the extension of a runway, the project would include extending the runway, as well as associated projects such as extending the parallel taxiway and adding associated navigational aids, electrical systems, and service roadways. However, if the master plan recommends the relocation of a passenger terminal, the subsequent projects associated with that could be extensive in themselves, including projects to address access roadway modifications, terminal area parking, terminal curb and roadway, terminal building and concourse, terminal apron, access taxiways, and miscellaneous support infrastructure. In all cases, however, the standard descriptions outlined in the SOAR planning module should be used for projects submitted to the FAA for funding consideration. Each component of an overall project should be described. For example, the land acquisition that is part of a runway extension should be described as "Extend Runway – Land Acquisition, Phase 1."

   Specific projects can be described as project listings on a master table, on individual project data sheets, or in projects booklets. The approach used will vary with the level of detail needed to support the sponsor's needs. Project descriptions may include the following types of information:

   - Project identification (name and project number)
   - Project scope (detailed project description and illustrations)
   - Concise project purpose or objective (why the project is needed)

- Project schedule (begin/end dates for pre-design, design, construction, close out, and start-up)
- Prerequisites, dependent, and interrelated projects
- Project budget (construction cost estimate, including quantities and unit costs, soft costs, and contingencies)
- Environmental processing required
- Funding information (AIP grant and PFC estimates, other funding source),
- Special considerations (lease considerations, property acquisition requirements, known environmental mitigation requirements, and site constraints)
- Identification of responsibilities (key activities and when they must be completed, by agency, organization, position, or person)
- Benefit/cost information (see Chapter 12 for a discussion of the FAA's *Airport Benefit Cost Analysis Guidance*)

1103. PROJECT SEQUENCING AND THE COMPREHENSIVE MASTER SCHEDULE

a. Airport projects may be complex, so the implementation plan should consider the interrelationships among the projects in the sponsor's existing and revised CIP. Planners should examine all projects to establish interrelationships, determine a sequence to minimize conflicts, and establish a master schedule to ensure the sequence is maintained throughout the implementation plan.

The facility implementation plan should cover the same years as the forecasts in the planning effort. Typically, detailed information should be provided for the five-year horizon, with less detail provided for the longer planning periods.

In addition to the technical aspects of designing and constructing the projects, the project sequencing plan or master schedule should reflect the sponsor's overall financial, environmental, and strategic plans. Developing the project-sequencing plan is an iterative process and may result in the reformulation of projects or revisions to the airport's financial, environmental, and strategic plans.

Since activity rarely grows exactly as forecast in the master plan, establishing triggers for key improvements, such as an aircraft apron expansion, additional aircraft storage hangars, or additional runway capacity, is recommended to allow a sponsor to respond to actual activity levels as they occur. The project-sequencing plan should document these triggers along with the year in which planners expect them to be reached. Such an approach will be particularly useful for the longer-range part of the implementation plan.

Preparation of the project-sequencing plan should be undertaken with a full understanding of how the airport sponsor will use the implementation plan. Given the high levels of complexity associated with such an effort, planners should ensure that planning resources are efficiently used to meet the sponsor's needs. In many cases, a plan that simply highlights the order of the projects and key activity triggers will be sufficient. In more complex situations, an implementation plan should include the preparation of an actual master schedule that incorporates project sequencing, key activities, and the identification of the responsible parties.

1104. KEY ACTIVITIES AND RESPONSIBILITIES

a. The implementation plan should provide information regarding key activities and responsibilities. Because the lead-time associated with many projects is significant, the early identification of key activities and responsibilities can help ensure that essential preparatory activities are completed on a timely basis. As with other elements of the implementation plan, the level of detail regarding key activities and responsibilities will vary, depending on the sponsor's needs and the complexity of the program.

The key activities and responsibilities will vary from airport to airport, but will include many of the following:

1. ***Sponsor-specific project approval activities***, such as airport board, council, or other administrative body approvals; various budgetary approvals and funding appropriations; and similar sponsor-specific items
2. ***Airline and other tenant approvals*** and lease modifications
3. ***Project funding activities***, such as FAA and other agency grant applications, PFC application, and long-term debt financing.
4. ***Environmental processing activities***, as appropriate, under current versions of FAA Order 1050.1, Environmental Impacts: Policies and Procedures and FAA Order 5050.4, FAA Airports guidance for complying with NEPA.
5. ***Land acquisition activities***
6. ***Sponsor-specific project implementation process activities*** associated with designing and constructing the projects
7. ***Agency coordination activities***, including the FAA, local metropolitan planning organization or its equivalent, Transportation Security Administration, Department of Defense, and other agencies that may have direct involvement with the airport
8. ***Public Coordination activities*** that carry the public involvement process into the project implementation phase

At a minimum, the listing of key activities and responsibilities should include what activities should be undertaken, by what party, and when. In more complex situations, it may be useful to provide a schedule of activities or to incorporate the key activities and responsibilities into the overall sponsor's CIP master schedule.

1105. DOCUMENTATION GUIDELINES

a. The documentation of the facilities implementation plan will vary, depending on the complexity of the study airport and sponsor objectives. Because the implementation plan may be read as a stand-alone document, planners should provide enough source documentation so the plan can be independent of the master plan. Planners should use appendices to improve the readability and organizational flow of the documentation, particularly if project data sheets, project booklets, or benefit/cost analyses are included. The documentation should include any electronic spreadsheets and files so as to facilitate the modification of the facilities implementation plan as needed. Prior coordination with the local FAA Airports office will facilitate the integration of the sponsor's CIP into the planning module of SOAR.

b. The documentation of the facilities implementation plan should normally include a new or revised CIP for at least the short-term airport development projects. Planners should address major developments in sufficient detail so the sponsor will know how to fund each project in the CIP. The plan should clearly indicate other agencies that are anticipated to provide grants-in-aid so they can determine the appropriate level of their involvement.

This page intentionally left blank.

Chapter 12 Financial Feasibility Analysis

1201. GENERAL

a. This chapter provides guidance on what will be required to demonstrate the airport sponsor's ability to fund the projects in the master plan. Planners should emphasize the projects that they expect to implement over the near-term, as presented in the capital improvement plan (CIP). A more general discussion of the funding of the medium- and long-term projects is more appropriate because of the uncertainty of future funding and - possible shifts in the importance of those projects.

b. The sponsor's ability to fund the recommended projects should be a major consideration in preparing the CIP and facilities implementation plans. The financial feasibility analysis should take place concurrently with the development of the CIP and the facilities implementation plan.

c. The level of effort necessary to conduct a financial feasibility analysis will vary considerably, based on the size of the airport. In general, items to consider are: the funding sources for the CIP, a projection of revenues and expenses (pro forma cash flow analysis) for each year of the CIP, and methods to enhance airport revenues.

d. During the scoping process for the master plan, planners may determine that the financial feasibility analysis need not be a stand-alone chapter. The CIP and facilities implementation plan should provide adequate information on how the projects in the CIP will be funded.

1202. SOURCES OF FUNDING

a. Airport development can be financed from several sources, including Federal and state grants-in-aid, private financing or third party development, passenger facility charges, customer facility charges, a variety of bonds, and local funds.

1) **Federal Funding** – Some airport projects are eligible for FAA funding through the Airport Improvement Program (AIP), which provides entitlement funds for primary airports (based upon their annual enplaned passengers), airports supporting significant cargo activity (based upon the proportion of landed cargo weight), state apportionment and nonprimary entitlement funds. Additional AIP funds, designated as discretionary, may also be available for eligible projects, based on the FAA's national priority system and several other factors.

Although the AIP has been reauthorized several times and the funding formulas have been periodically revised to reflect changing national priorities, the program has remained essentially the same. Public use airports included in the NPIAS and that serve civil aviation may receive AIP funding for eligible and justified projects, as described in FAA Order 5100.38, *Airport Improvement Program Handbook*. The airport sponsor must fund the remaining project cost, using a combination of the funding sources discussed in this section.

2) **State Funding** – Many states have programs to assist in airport capital development. The administration of these funds depends on the mechanisms established in each state. The most common source is a state aeronautics commission or department. State funds are often used to provide some part of the non-Federal share of projects supported by the FAA and for other projects that have been included in the state airport or aviation system plan. Most states have established a priority system for the allocation of state funds. Some states also provide limited funding to airports to support local economic development.

3) **Third Party Development** – Third party financing may be appropriate in a case where an airport sponsor uses a third party developer or a tenant to finance a construction project. Only projects with a strong positive cash flow can support this type of financing. Generally, the third party would lease the structure for a period of years to the tenant paying the airport ground rents. According to the terms of the agreement, the airport sponsor receives ownership of the asset upon expiration of the lease. This method of financing preserves the airport sponsor's cash to fund higher priority projects. Examples of projects that are funded in this manner include the development of passenger terminals, general aviation hangars, corporate hangars, and cargo facilities.

4) **Passenger Facility Charge** – The Aviation Safety and Capacity Expansion Act of 1990 authorized the Secretary of Transportation to grant public agencies the authority to impose a Passenger Facility Charge (PFC) to fund eligible airport projects. PFC revenue may be used on a "pay-as-you-go" basis or leveraged to pay debt service on bonds or other debt used to pay for PFC-eligible projects. Although the FAA is required to approve the collection and use of PFCs, the program permits local collection of PFC revenue through the airlines operating at an airport and provides more flexibility to airport sponsors than AIP funds.

   To be eligible for PFC funding, a project must preserve, enhance, or make a significant contribution to the safety, security, or capacity of the national air transportation system; reduce noise or mitigate noise impacts resulting from an airport; improve local air quality in accordance with the Voluntary Airport Low Emission program; or furnish opportunities for enhanced competition between or among air carriers; reduce current or anticipated congestion; or other qualification that may be added to the program over time. Allowable project costs include only those incurred on or after November 5, 1990. Regulations associated with the imposition of a PFC are described in 14 CFR Part 158, as implemented through FAA Order 5500.1, *Passenger Facility Charge*.

5) **Customer Facility Charge** – A customer facility charge (CFC) is a fee paid by airport customers for the use of some non-aeronautical service at the airport. These charges are commonly collected from on-airport rental car agencies. The funds are collected by the rental car agency from their customers and then paid to the airport for use in paying the debt service on, for example, a consolidated rental car facility. The airport constructs the facilities on behalf of the agency, allowing them to finance major projects, but keeping the debt off their balance sheets.

6) **Bonds** – A variety of bonds can be issued to support airport development projects.

a) ***General obligation bonds*** are backed by the creditworthiness and taxing power of the municipality operating the airport. They usually bear low interest rates because of their high degree of security. However, state laws may limit a municipality's overall debt, and competition from other community financing requirements may preclude their use for an airport project. Some states have an exemption from the debt limitation rule for general obligation bonds because they are used for a revenue producing enterprise.

b) ***Revenue bonds*** pledge the revenues of an airport sponsor to the repayment of debt service. These are the most common source of funding at larger commercial service airports. Revenue bonds are popular because they do not burden the taxpayer or affect the bonding capacity of the municipality. However, their use is limited to airports with a sufficient operating surplus to cover the debt service. Projected Net Revenues must exceed debt service requirements by at least 1.25 times and up to 2.0 times, depending on the strength of the bond issuer and the underlying assumptions with respect to the market risk for the bonds. Interest rates are dependent on the coverage ratio, but in any case will be higher than for general obligation bonds. Other factors that may affect the interest rates on revenue bonds are the strength of the local passenger market and the financial condition of the airlines serving the market.

c) ***Special facility revenue bonds*** are normally issued by the airport sponsor for the construction of a facility for a third party and backed by the revenues generated from that facility. This method of funding can be used for such facilities as maintenance hangars, airline reservation centers, terminal buildings, and air cargo terminals.

d) ***Industrial development bonds*** can be issued by states, local government, or an airport authority to fund the construction of an airport industrial park or other facilities that may attract business and increase non-aeronautical leasing revenues at the airport.

7) **Local Funds** – The remaining portion of project costs must be funded from local sources. The local share of project costs can come from the annual cash flow at the airport or with unrestricted cash balances available to the airport sponsor. The local municipality may provide the local share from its annual cash flow or available cash reserves.

1203. FINANCIAL FEASIBILITY

a. **Prepare CIP Funding Plan** – The CIP and development-phasing plan for the CIP prepared in the facilities implementation plan should be summarized, with the potential funding sources clearly identified for each year of the financial plan. The planner should use realistic assumptions about the amount of external funding available so an accurate plan of finance can be carried forward in the financial feasibility analysis.

If the airport sponsor needs to issue debt for projects included in the CIP, it should identify the financing assumptions for the amount of bond proceeds needed to cover the local share and annual debt service requirements.

b. **Review Airport's Financial Structure** – Planners should analyze the financial structure of the airport to determine the composition of the airport's management, relevant airport leases, and other operating issues that will affect future cash flow at the airport.

1) Airports are typically operated under the jurisdiction of city or county government, with airport or aviation departments or public authorities dedicated either to airports or aviation, or with a department responsible for aviation or airports. The ability of the airport to finance capital improvement projects depends upon the political, management, and financial structure under which these entities operate. The airport's ability to support development is based on the likelihood of obtaining Federal and state aid, its ability and willingness to issue a financial instrument to fund a portion of the costs, and the amount of revenue from airport operations.

2) Revenue-producing areas, or direct cost centers, for a high activity commercial service airport typically include the landing area (airfield), aircraft aprons, terminal, (both space rental and concessions), parking and ground transportation, cargo buildings, aircraft maintenance facilities, fixed base operator facilities, and other leased areas. Many of these revenue-producing facilities will not exist at smaller airports.

Airports commonly use two mechanisms for the recovery of airport operating costs from airlines and other tenants in the airport terminal: the compensatory cost method and the residual cost method. The compensatory approach allocates all airport costs to cost centers and the rates and charges are assigned to airport tenants based upon recovering these costs in proportion to the tenant's use of these facilities and services. A residual methodology has one or more signatory airlines agree to pay the net costs of operating the airport not recovered from other tenants or other sources of airport revenue. One of the basic differences in these two funding mechanisms is the assignment of risk. In the compensatory cost method, the airport sponsor assumes the financial risk, whereas in the residual cost method the signatory airlines assume the risk. These two methodologies represent either end of the airline rate-setting methodology spectrum. Many "hybrid" allocation methodologies are used at commercial service airports.

3) Planners should examine the budgeting process used by the airport to establish the financial management plan for operating revenue, operating and maintenance (O&M) expenses, and capital expenditures.

4) At larger airports where the complexity of the financial analysis increases, the planner should recognize that constraints may occur because of the various legal documents relating to the airport, including any bond ordinance, airline use and lease agreements, and other operating agreements at the airport, such as:

a) ***A Bond Ordinance or Trust Indenture*** limits the amount of additional debt that an airport sponsor can issue to fund capital projects and may include the application of revenue, rate covenant, and additional bonds test. The application of revenue refers to the priority of the flow of funds of the airport's gross revenues. A rate covenant requires the airport sponsor to set rates, fees, and charges at the airport at a level that will produce net revenues that will satisfy the debt service coverage requirement. An additional bonds test is the documentation the airport sponsor must produce to prove that the airport can generate the necessary coverage before it can issue additional bonds.

b) ***The Airline Use and Lease Agreement (AULA)*** is the contractual relationship between the airport and the airlines serving the airport. Normally this agreement would specify the airfield facilities available to each airline, the terminal space leased by each airline, and the rates and charges for use of the various facilities, landing fees, apron fees and any other charges. In a residual cost center arrangement, the airlines often have majority-in-interest (MII) approval, which is a weighted "vote" to construct capital projects that are included in the airline rate base. This allows an airport sponsor to include the net cost of a capital project in the airlines' rate base if a majority of the airlines approves that project, based on the terms of the AULA.

c) ***Lease documents*** are established between the airport and aeronautical and non-aeronautical tenants, such as fixed based operators, concessionaires, and airport service providers. Normally these lease agreements specify the term of the lease, the specific assignment of space for these business enterprises, the rental rate or fees for use of the facilities, and a concession fee.

d) ***Analyze Historical Cash Flow*** – The planner should examine both the airport revenues and O&M expenses by cost center, where applicable, for the prior three-to-five years and a historical cash flow profile for the airport that describes financial operating trends. The planner may decide to exclude non-cash expenditures such as depreciation and amortization. The historical cash flow will be useful in projecting future revenues and O&M expenses.

e) ***Prepare Pro Forma Cash Flow Analysis*** – The planner should prepare a pro forma cash flow analysis that projects airport revenues, O&M expenses, existing and new debt service requirements, and other non operating revenues and expenses for each year of the CIP. The general test of financial feasibility applied throughout the planning process is the ability of the airport sponsor to cover the local cost of the CIP through airport cash flow.

(1) Planners for low activity airports should recognize their dependence on Federal and state aid for improvements, but should not rely on the availability of such funds. Instead, they should consider alternative strategies for financing in an effort to become more self-sufficient, in accordance with AIP grant assurances. The master plan should discuss the investment requirements and the benefits of the proposed development, so the airport sponsor can make

practical decisions predicated on availability of funds and public investment priorities.

(2) High activity commercial service airports usually generate sufficient revenue to support revenue bond financing for capital improvements. Such airports' need to supplement bond financing with Federal aid will vary in degree, usually depending on activity levels. High activity commercial service airports are usually self-sufficient and produce adequate cash flow from setting rates, fees, and charges at the airport in accordance with the Bond Ordinance, airline use and lease agreements, and other operating agreements.

(3) In conducting the pro-forma cash flow analysis, the planner should focus on the three to five year time frame that coincides with the CIP. The planner should also emphasize the first 10 years of development, since the CIP is generally better defined during that period. Discuss development during the 10 to 20 year horizon in a broader manner, because projects during this period are often demand driven and will have a neutral effect on the airport's cash flow. In addition, over the longer-term, priorities for airport capital projects may change and a new master plan or update may be completed.

(4) In analyzing the financial feasibility of an airport's CIP, the planner may choose to value construction expenses, operating revenues, and O&M expenses in current year dollars.

(5) The planner may decide to increase the capital cost from current year dollars to the year in which construction is expected. If the planner conducts the analysis in this manner, inflationary impacts must be included in the projection of revenues and O&M expenses, along with increases because of operational factors.

f) ***Conduct Sensitivity Analysis*** – In some cases, a sensitivity test may be warranted to assess financial risk. For example, the planner may want to test different rates of passenger growth to determine how sensitive the financial plan is to this, particularly where PFCs or revenue bonds are being heavily relied upon in the CIP.

1204. REVENUE ENHANCEMENT

a. Airports are often under pressure to improve their financial condition to keep user costs at reasonable levels. In preparing the pro forma cash flow analysis, the planner should compare the financial performance of the study airport to that of comparable airports to identify ways to increase concession, airline, and non-aeronautical revenues.

b. Increases in concession revenues will be subject to the terms of existing operating agreements. Certain concessions may not be subject to operating agreement constraints, including automobile parking rates, future land rental rates, fuel flowage fees, and aircraft tie down fees, but may be subject to others constraints.

c. The existing AULA may not allow the airport sponsor to recover the cost of operating the airport from the airlines, or the terms of the existing airline agreement may no longer meet the needs of the airport sponsor. Alternatively, the airport sponsor may have sufficient unrestricted funds and wish to reduce airline-operating costs. In either case, the master planning process is a good time for the airport sponsor to examine its AULA and make appropriate revisions, to the extent it is able, particularly if there are projects in the CIP that will require funding from the airlines.

d. Non-aeronautical revenues provide the best opportunity for an airport sponsor to establish new types of lease revenue, based on the use of existing land parcels at the airport. An example of such an arrangement is a short-term lease of land to grow hay, grass or to graze cattle, which would allow the airport sponsor to increase revenues while maintaining control of the future use of the land. The airport sponsor should be aware of the restrictions placed on these activities by 14 CFR Part 139, wildlife hazard concerns, and grant assurances.

1205. BENEFIT COST ANALYSIS

a. The FAA *Airports Benefit Cost Analysis (BCA)*, December 1999, states that when possible, airport sponsors should conduct a BCA as part of the development of the master plan. FAA utilizes BCA to assess aviation user benefits of a proposed investment against its estimated costs. In an October 24, 2011, Federal Register notice, FAA stipulated that formal BCA is required for projects that enhance capacity at an airport and are expected to receive $10 million or more in AIP discretionary funds or apply for a Letter of Intent. If the airport sponsor decides to submit a complete BCA to the FAA, more detailed cost estimates for a project(s) will be required than those prepared for the facilities implementation plan.

1206. DOCUMENTATION GUIDELINES

a. The documentation of this chapter in the master plan should clearly show the financial feasibility of the CIP.

b. The financial planning chapter of a master plan for a large commercial service airport will be more complex than one for a low activity general aviation airport. In this chapter, planners should consider the funding plan for the CIP, historical cash flow, existing and future debt service requirements, airline rates and charges, airline cost per enplanement, concession revenues per enplanement, and pro forma cash flow analysis.

c. If a BCA has been prepared during the master plan process, it should be included as an Appendix to the master plan report.

d. Documentation provided to the airport should include any electronic spreadsheets and files to facilitate planners in modifying the financial plan on an as-needed basis.

This page intentionally left blank.

Appendix A Glossary

Advisory Circular – External publications issued by the FAA consisting of non-regulatory material providing for the recommendations relative to a policy, and guidance and information relative to a specific aviation subject.

Aircraft Approach Category – An alphabetic classification of aircraft based upon 1.3 times the stall speed in a landing configuration at their maximum certified landing weight.

Aircraft Operation – The landing, takeoff or touch-and-go procedure by an aircraft on a runway at an airport.

Aircraft Rescue and Fire Fighting – A facility located at an airport that provides emergency vehicles, extinguishing agents, and personnel responsible for minimizing the impacts of an aircraft accident or incident.

Airfield – The portion of an airport that contains the facilities necessary for the operation of aircraft.

Airplane Design Group – A Roman numerical classification of aircraft based upon wingspan.

Airport Authority – A quasi-governmental public organization responsible for setting the policies governing the management and operation of an airport or system of airports under its jurisdiction.

Airports Capital Improvement Plan – The planning program used by the Federal Aviation Administration to identify, prioritize and distribute funds for airport development and the needs of the National Airspace System to meet specified national goals and objectives.

Airport Improvement Program – A program authorized by the Airport and Airway Improvement Act of 1982 that provides funding for airport planning and development.

Airport Layout Plan – A scaled drawing of the existing and planned land and facilities necessary for the operation and development of an airport.

Airport Master Plan – The airport's concept of the long-term development and use of an airport's land and facilities.

Airport Obstruction Chart – A scaled drawing depicting the Federal Aviation Regulation (FAR) Part 77 surfaces, a representation of objects that penetrate these surfaces, runway, taxiway, and ramp areas, navigational aids, buildings, roads and other detail in the vicinity of an airport.

Airport Reference Code – A coding system used to relate airport design criteria to the operational and physical characteristics of the airplanes intended to use the airport. It is a two character code consisting of the aircraft approach category and the airplane design group.

Airport Reference Point – The latitude and longitude of the geometric center of the runway system at an airport.

Airport Sponsor – The entity that is legally responsible for the management and operation of an airport including the fulfillment of the requirements of laws and regulations related thereto.

Airside – The portion of an airport that contains the facilities necessary for the operation of aircraft.

Air Taxi – An aircraft operated under an air taxi operating certificate for the purpose of carrying passengers, mail, or cargo for revenue in accordance with FAR Part 121 and FAR Part 135.

Airport Traffic Control Tower – A facility in the terminal air traffic control system located at an airport which consists of a tower cab structure and an associated instrument flight rules room, if radar equipped, that uses ground-to-air and air-to-ground communications and radar, visual signaling, and other devices to provide for the safe and expeditious movement of terminal area air traffic in the airspace and airports within its jurisdiction.

Annual Service Volume (ASV) – The number of annual operations that can reasonably be expected to occur at the airport based on a given level of delay.

Approach Surface – An imaginary obstruction limiting surface defined in FAR Part 77 which is longitudinally centered on an extended runway centerline and extends outward and upward from the primary surface at each end of a runway at a designated slope and distance based upon the type of available or planned approach by aircraft to a runway.

Apron – A specified portion of the airfield used for passenger, cargo or freight loading and unloading, aircraft parking, and the refueling, maintenance and servicing of aircraft.

Avigation Easement – A contractual right or a property interest in land over which a right of unobstructed flight in the airspace is established.

Based Aircraft – The general aviation aircraft that use a specific airport as a home base.

Benefit Cost Analysis (BCA) – An analysis of the benefit, cost, and uncertainty associated with a project or action. A formal BCA is required for capacity projects of $10 million or more in AIP discretionary funds.

Building Restriction Line – A line defined by specifications and displayed on an airport layout plan beyond which airport buildings must not be located to limit building proximity to aircraft movement areas.

Capital Improvement Plan – The individual airport sponsor's plan for the capital needs of the airport, typically including their planned capital funding sources. This is separate and distinct from the FAA's Airports Capital Improvement Plan (ACIP), which is the FAA's plan for how to allocate AIP funds. .

Cargo Service Airport – An airport served by aircraft providing air transportation of property only, including mail, with an annual aggregate landed weight of at least 100,000,000 pounds.

Citizen's Advisory Committee (CAC) – A group of individuals that weigh recommendations against community goals, values, and needs.

Commercial Service Airport – A public airport providing scheduled passenger service that enplanes at least 2,500 annual passengers.

Computer Aided Design – Software that is commonly used for drafting architectural and engineering drawings.

Conical Surface – An imaginary obstruction-limiting surface defined in FAR Part 77 that extends from the edge of the horizontal surface outward and upward at a slope of 20 to 1 for a horizontal distance of 4,000 feet.

Critical (Design) Aircraft – The most demanding aircraft with at least 500 annual operations that operates, or is expected to operate, at the airport.

Crosswind – A wind that is not parallel to a runway centerline or to the intended flight path of an aircraft.

Crosswind Component – The component of wind that is not parallel to the runway centerline or the intended flight path of an aircraft.

Discretionary Funds – Federal grant funds that may be awarded to an airport based upon designation by the Secretary of Transportation or Congress to meet a specified national priority such as enhancing capacity, safety or security, or mitigating noise.

Displaced Threshold – An aircraft runway landing area that begins at a point on the runway other than the designated physical end of the runway.

Enplanement – The boarding of a passenger, cargo, freight or mail on an aircraft at an airport.

Entitlement – Federal funds for which a commercial service airport may be eligible based upon its annual passenger enplanements.

Environmental Assessment – An environmental analysis performed pursuant to the National Environmental Policy Act to determine whether an action would significantly affect the environment and thus require a more detailed environmental impact statement.

Environmental Impact Statement – A document required of federal agencies by the National Environmental Policy Act for major projects or legislative proposals affecting the environment. It is a tool for decision-making describing the positive and negative effects of a proposed action and citing alternative actions.

Federal Aviation Regulations – The general and permanent rules established by the executive departments and agencies of the Federal Government for aviation, which are published in the Federal Register. These are the aviation subset of the Code of Federal Regulations.

Finding of No Significant Impact (FONSI) – A public document prepared by a Federal agency that presents the rationale why a proposed action will not have a significant effect on the environment and for which an environmental impact statement will not be prepared.

Fixed Base Operator – A business enterprise located at on airport that provides services to pilots including aircraft rental, training, fueling, maintenance, parking, and the sale of pilot supplies.

General Aviation – The segment of aviation that encompasses all aspects of civil aviation except certified air carriers and other commercial operators such as airfreight carriers.

General Aviation Airport – An airport that supports air service primarily for general aviation purposes.

Geographic Information System (GIS) – A GIS is a computer system capable of capturing, storing, analyzing, and displaying geographically referenced information according to location. It is a technology that manages, analyzes, and disseminates geographic data.

Global Positioning System – A satellite based navigational system that provides signals in the cockpit of aircraft defining aircraft position in terms of latitude, longitude and altitude.

Ground Access – The transportation system on and around the airport that provides access to and from the airport by ground transportation vehicles for passengers, employees, cargo, freight, and airport services.

Horizontal Surface– An imaginary obstruction-limiting surface defined in FAR Part 77 that is specified as a portion of a horizontal plane surrounding a runway located 150 feet above the established airport elevation. The specific horizontal dimensions of this surface are a function of the types of approaches existing or planned for the runway.

Instrument Flight Rules – Procedures for the conduct of flight in weather conditions below Visual Flight Rules weather minimums. The term IFR is often also used to define weather conditions and the type of flight plan under which an aircraft is operating.

Instrument Meteorological Conditions – Meteorological conditions expressed in terms of specific visibility and ceiling conditions that are less than the minimums specified for visual meteorological conditions.

Itinerant Operations – Operations by aircraft that leaves the local airspace.

Landside – The portion of an airport that provides the facilities necessary for the processing of passengers, cargo, freight, and ground transportation vehicles.

Local Operations – Aircraft operations performed by aircraft that are based at the airport and that operate in the local traffic pattern or within sight of the airport, that are known to be departing for or arriving from flights in local practice areas within a prescribed distance from the airport, or that execute simulated instrument approaches at the airport.

Military Operations – Aircraft operations that are preformed in military aircraft.

National Airspace System – The network of air traffic control facilities, air traffic control areas, and navigational facilities throughout the U.S.

National Environmental Policy Act (NEPA) – Federal legislation that establishes environmental policy for the nation. It requires an interdisciplinary framework for federal agencies to evaluate and disclose environmental impacts and contains procedures to ensure that federal agency decision makers take environmental factors into account.

National Plan of Integrated Airport Systems – The national airport system plan developed by the Secretary of Transportation on a biannual basis for the development of public use airports to meet national air transportation needs.

Navigational Aid – A facility used as, available for use as, or designed for use as an aid to air navigation.

Operation – The landing, takeoff or touch-and-go procedure by an aircraft on a runway at an airport.

Passenger Facility Charge (PFC) – The collection of PFC fees for every enplaned passenger at commercial airports controlled by public agencies to be used to fund FAA-approved projects that enhance safety, security, or capacity; reduce noise; or increase air carrier competition.

Peak Hour (PH) – An estimate of the busiest hour in a day. This is also known as the design hour.

Planning Activity Level (PAL) – Selected activity levels that may trigger the need for additional facilities or improvements.

Primary Airport – A commercial service airport that enplanes at least 10,000 annual passengers.

Primary Surface – An imaginary obstruction limiting surface defined in FAR Part 77 that is specified as a rectangular surface longitudinally centered about a runway. The specific dimensions of this surface are a function of the types of approaches existing or planned for the runway.

Record of Decision (ROD) – A public document that reflects the FAA's final decision, rationale behind that decision, and commitments to enforce and monitor mitigation.

Regression Analysis – A statistical technique that seeks to identify and quantify the relationships between factors associated with a forecast.

Reliever Airport – General aviation airports in major metropolitan areas that provide pilots with attractive alternatives to using congested hub airports.

Runway – A defined rectangular area at an airport designated for the landing and taking-off of an aircraft.

Runway Gradient – The ratio of the change in elevation divided by the length of the runway expressed as a percentage.

Scope – The document that identifies and defines the tasks, emphasis and level of effort associated with a project or study.

System Of Airports Reporting (SOAR) – The FAA Office of Airports integrated database that contains airport planning, development, and financial information.

Technical Advisory Committee (TAC) – A group of individuals that provide input on technical issues.

Terminal Area Forecast – The official forecast of aviation activity, both aircraft and enplanements, at FAA facilities. This includes FAA-towered airports, federally contracted towered airports, non-federal towered airports, and many non-towered airports.

Terminal Instrument Procedures – Published flight procedures for conducting instrument approaches to runways under instrument meteorological conditions.

Transient Operations – Operations by aircraft that are not based at a specified airport.

Transitional Surface – An imaginary obstruction-limiting surface defined in FAR Part 77 that extends outward and upward at right angles to the runway centerline and the runway centerline extended at a slope of 7 to 1 from the sides of the primary and approach surface.

Uncontrolled Airport – An airport without an air traffic control tower at which the control of Visual Flight Rules traffic is not exercised.

Visual Flight Rules – Procedures for the conduct of flight in weather conditions above Visual Flight Rules (VFR) weather minimums. The term VFR is often also used to define weather conditions and the type of flight plan under which an aircraft is operating.

Visual Meteorological Conditions – Meteorological conditions expressed in terms of specific visibility and ceiling conditions which are equal to or greater than the threshold values for instrument meteorological conditions.

Wide Area Augmentation System – An enhancement of the Global Positioning System that includes integrity broadcasts, differential corrections, and additional ranging signals for the purpose of providing the accuracy, integrity, availability, and continuity required to support all phases of flight.

Appendix B Useful Reference Materials

1. FAA ADVISORY CIRCULARS

Most of these Advisory Circulars are available for viewing and/or printing on the FAA website at http://www.faa.gov/regulations_policies/advisory_circulars/. See the most recent versions.

70/7460-1 Obstruction Marking and Lighting. Describes the FAA standards for marking and lighting structures to promote safety.

90-66 Recommended Standard Traffic Patterns and Practices for Aeronautical Operations at Airports without Operating Control Tower. Calls attention to regulatory requirements and recommended procedures for aeronautical operations at airports without operating control towers. It recommends traffic patterns and operational procedures for aircraft, lighter than air, glider, parachute, rotorcraft, and ultra-light vehicle operations where such use is not in conflict with existing procedures in effect at those airports.

90-98 Simultaneous Closely Spaced Parallel Operations at Airports Using Precision Runway Monitor (PRM) Systems. Notify pilots and operators about the establishment of specific air traffic procedures to conduct flight operations into airports identified for simultaneous closely-spaced parallel approaches using PRM systems.

150/5020-1 Noise Control and Compatibility Planning for Airports. Provides general guidance for noise control and compatibility planning for airports. Provides specific guidance for preparation of airport noise exposure maps and airport noise compatibility programs by airport sponsors for submission under FAR Part 150 and the Aviation Safety and Noise Abatement Act of 1979.

150/5060-5 Airport Capacity And Delay. Explains how to compute airport capacity and aircraft delay for airport planning and design.

150/5100-14 Architectural, Engineering, and Planning Consultant Services for Airport Grant Projects. Provides guidance for airport sponsors in the selection and employment of architectural, engineering, and planning consultants under Federal Aviation Administration airport grant programs.

150/5100-17 Land Acquisition and Relocation Assistance for Airport Improvement Program Assisted Projects. Provides guidance to sponsors of airport projects developed under the Airport Improvement Program to meet the requirements of the Uniform Relocation Assistance and Real Property Acquisition Act of 1970 (PL 91-646, as amended) and the regulations of the Office of the Secretary of Transportation, 49 CFR Part 24.

150/5100-19 Guide for Airport Financial Reports Filed by Airport Sponsor. Provides airport sponsors with guidance for complying with the airport financial reporting requirements required by 49 USC §47107(a)(15).

150/5190-4 A Model Zoning Ordinance to Limit Height of Objects around Airports. Provides a model zoning ordinance to be used as a guide to control the height of objects around airports.

150/5190-7 Minimum Standards for Commercial Aeronautical Activities. Provides basic information about the FAA's recommendations on commercial minimum standards and related policies.

150/5200-30 Airport Winter Safety and Operations. Provides guidance to assist airport owners/sponsors in the development of an acceptable airport snow and ice control program and to provide guidance on appropriate field condition reporting procedures.

150/5200-31 Airport Emergency Plan. Provides guidance for the preparation of emergency plans at civil airports.

150/5200-33 Hazardous Wildlife Attractants On or Near Airports. Provides guidance on locating certain land uses having the potential to attract hazardous wildlife to or in the vicinity of public-use airports.

150/5200-34 Construction or Establishments of Landfills Near Public Airport. Contains guidance on complying with new Federal statutory requirements regarding the construction of establishment of landfills near public airports.

150/5210-15 Airport Rescue and Firefighting Station Building Design. Provides standards and guidance for planning, designing, and constructing and airport rescue and firefighting station.

150/5220-18 Buildings for Storage and Maintenance of Airport Snow and Ice Control Equipment and Materials. Provides guidance for site selection, design and construction of buildings used to store and maintain airport snow and ice control equipment and materials.

150/5300-7 FAA Policy on Facility Relocations Occasioned by Airport Improvements or Changes. Reaffirms the aviation community of the FAA policy governing responsibility for funding relocation, replacement and modification to air traffic control and air navigation facilities that are made necessary by improvements or changes to the airport.

150/5300-9 Predesign, Prebid, and Preconstruction Conferences for Airport Grant Projects. Provides guidance for conducting predesign, prebid, and preconstruction conferences for projects funded under the FAA airport grant program.

150/5300-13 Airport Design. Contains the FAA’s standards and recommendations for airport design.

150/5300-14 Design of Aircraft Deicing Facilities. Provides standards, specifications, and guidance for designing aircraft deicing facilities.

150/5300-15 Use of Value Engineering for Engineering and Design of Airport Grant Projects. Provides guidance for the use of value engineering in airport projects funded under

the FAA's Airport Grant Program. This Advisory Circular should be used by sponsors of airport development projects considering the application of value engineering to projects involving grant funds.

150/5320-5 Airport Drainage. Provides guidance for engineers, airport managers, and the public in the design and maintenance of airport drainage systems.

150/5320-6 Airport Pavement Design and Evaluation. Provides guidance to the public for the design and evaluation of pavement at civil airports.

150/5325-4 Runway Length Requirements for Airport Design. Provides design standards and guidelines for determining recommended runway lengths.

150/5340-1 Standards for Airport Markings. Contains the FAA standards for markings used on airport runways, taxiways, and aprons.

150/5340-18 Standards for Airport Sign Systems. Contains the FAA standards for the siting and installation of signs on airport runways and taxiways.

150/5360-9 Planning and Design of Airport Terminal Facilities at Non-Hub Locations. Provides guidance material for the planning and design of airport terminal buildings at non-hub locations.

150/5360-12 Airport Signing and Graphics. Provides guidance on airport related signs and graphics.

150/5360-13 Planning and Design Guidelines for Airport Terminal Facilities. Provides guidelines for the planning and design of airport terminal buildings and related access facilities.

150/5390-2 Heliport Design. Provides recommendations and standards for heliport design.

150/5395-1 Seaplane Bases. Provides guidance to assist operators in planning, designing, and constructing seaplane base facilities.

2. FAA ORDERS

Virtually all of the following orders are available for viewing and/or printing on the FAA website at http://www.faa.gov/regulations_policies/orders_notices/.

1050.1 Environmental Impacts: Policies and Procedures. Provides policies and procedures to ensure FAA compliance with the provisions of the National Environmental Policy Act.

5050.4 National Environmental Policy Act (NEPA) Implementing Instructions for Airport Projects. FAA Airports guidance for complying with NEPA. Provides instructions and guidance for the preparation and processing of environmental assessments, findings of no significant impact, and environmental impact statements for airport development proposals and other airport activities.

5090.3 (current version) Field Formulation of the National Plan of Integrated Airport Systems. This order contains instructions for FAA Regional offices in the formulation and maintenance of the NPIAS computer database and on the preparation of the Secretary of Transportation's biennial Report to Congress.

5500.1 Passenger Facility Charge. Provides guidance and the processes to be used by FAA personnel in administering the Passenger Facility Charge program.

5100.38 Airport Improvement Program Handbook. Provides guidance and sets forth policies and procedures for the administration of the Airport Improvement Program by the FAA.

5100.39 Airports Capital Improvement Plan. Prescribes the development of the national Airports Capital Improvement Program that serves as the primary planning tool for systematically identifying, prioritizing and assigning funds to critical airport development and associated capital needs for the National Airspace Program.

8260.3 United States Standard for Terminal Instrument Procedures (TERPS). Contains criteria for instrument approach and departure procedures.

3. FEDERAL AVIATION REGULATIONS

Virtually all of the following Federal regulations addressing aviation are available for viewing and/or printing on the FAA website at http://www.faa.gov/regulations_policies/faa_regulations/.

14 CFR Part 77 Safe, Efficient Use, and Preservation of the Navigable Airspace

14 CFR Part 150 Airport Noise Compatibility Planning

14 CFR Part 158 Passenger Facility Charges (PFCs)

4. TRANSPORTATION SECURITY REGULATIONS

The following Transportation Security Regulations (TSRs) are available for viewing and/or printing on the Transportation Security Administration website at www.tsa.gov/.

TSR Part 1540 Civil Aviation Security: General Rules. Definitions and rules for all aspects of aviation.

TSR Part 1542 Airport Security. Requirements for airport security programs including establishment of secured areas, air operation areas, security identification display areas, and access control systems. Also describes requirements related to Security Directives.

TSR Part 1544 Aircraft Operator Security: Air Carriers and Commercial Operators. Applies primarily to operators holding certificates for scheduled and charter passenger operations. Details the requirements for security program and screening of passengers and property.

TSR Part 1546 Foreign Air Carrier Security. Discusses security and screening requirements.

TSR Part 1548 Indirect Air Carrier Security. Describes requirements for indirect carriers such as freight forwarders.

TSR Part 1550 Aircraft Security Under General Operating and Flight Rules. Applies to operation of all other aircraft such as general aviation aircraft.

5. SECURITY-RELATED PUBLICATIONS

Recommended Security Guidelines for Airport Planning, Design, and Construction. (Formerly DOT/FAA/AR-00-52, June 2001. TSA Revised May 2011.) Available from TSA at http://www.tsa.gov/aviation-security-advisory-committee.

Security Guidelines for General Aviation Airports (Information Publication A-001), Transportation Security Administration, May 2004. Available from TSA at http://www.tsa.gov/stakeholders/security-directives.

Integrated Security System Standard for Airport Access Control. (RTCA DO-230C, June 2011) Available from RTCA at http://www.rtca.org.

ACRP Report 77, Guidebook for Developing General Aviation Airport Business Plans, Airport Cooperative Research Program, November 15, 2012.

ACRP Report 79, Evaluating Airfield Capacity, Airport Cooperative Research Program, December 17, 2012.

ACRP Report 80, Guidebook for Incorporating Sustainability into Traditional Airport Projects, Airport Cooperative Research Program, November 4, 2012.

ACRP Report 82, *Preparing Peak Period and Operational Profiles – Guidebook*, Airport Cooperative Research Program, February 15, 2003.

Appendix C List of Potential Stakeholders

Users and tenants:

- Commercial service and charter airlines
- Air cargo airlines and operators
- Corporate aircraft owners
- Freight forwarders
- Airline ground handling and catering companies
- Airline maintenance base operators
- Aircraft fueling and storage operators
- General aviation aircraft owners
- General aviation hangar owners and tenants
- Fixed base operators
- Air tour operators
- Air ambulance and rescue operators
- Flight schools
- Flying clubs/Civil Air Patrol
- Military users and tenants of the airport
- Rental car operators
- Parking lot operators
- Concessionaires
- Ground transportation companies (taxi, shuttle bus, limousine operators, and public transportation)

Groups and individuals from within the airport sponsor's organization:

- Airport board or similar executive group
- Airport executive director or manager
- Airport executive management team (operations director, engineering/planning director, maintenance director, finance director, and others.
- Airport senior line operations and line maintenance personnel
- Airport senior fire and safety officer

FAA personnel from these offices:

- Airports District Office
- Air Traffic Organization
- Airport Traffic Control Tower
- Regional Technical Operations
- System Management Office
- Regional Flight Standards
- Runway Safety Office
- Flight Procedures Office
- NAS Implementation Center
- Flight Service Station

Resource agencies and other governmental units with regulatory or review authority:

- Federal Inspection Service agencies
- Federal agencies with responsibility for affected resources
- Transportation Security Administration
- Federal, state, regional, and local air quality, water quality, and wildlife agencies
- Representatives of local political jurisdictions
- State, regional, metropolitan and local planning office
- State, regional, metropolitan and local transportation and land use planning agencies
- State aeronautics office
- State and local environmental regulatory authorities
- Native American and Alaska Native tribes and pueblos
- On-airport law enforcement agency
- Local fire and police departments

Other interested groups:

- Private land owners and developers
- Airport hotel and business associations
- Local tourism board or authorities
- Chamber of Commerce and other economic development groups
- Citizens and others with a strong economic or social tie to the airport
- Non-government organizations
- Neighborhood associations
- Traveling public

Appendix D Consideration of Environmental Factors in Airport Master Planning

1. INTRODUCTION

This appendix presents practices that can be applied to airport master planning to make the planning process and subsequent environmental analysis more efficient. A more integrated and efficient planning and decision making process should reflect environmental values, result in less delay, and avoid conflicts in the completion of needed airport development.

The consideration of environmental factors by Federal agencies is delineated in Council on Environmental Quality (CEQ) regulations implementing the National Environmental Policy Act (NEPA), reference 40 CFR 1500.5(a) and 1501.2. The NEPA statute and CEQ regulations require all Federal agencies to integrate the NEPA process with other planning at the earliest possible time. This is to ensure that planning and decisions reflect environmental values. CEQ regulations require Federal agencies to "utilize a systematic, interdisciplinary approach which will insure the integrated use of the natural and social sciences and the environmental design arts in planning and in decision making which may have an impact on man's environment." Doing this early in the planning process helps incorporate environmental factors in project planning and development, avoid delays and second-guessing later in the NEPA process, and can head off potential conflicts.

This guidance is not intended to make master planning a part of the NEPA process. It is to ensure that supportable and consistent planning data and environmental, technical, economic and other planning analyses are provided for use in FAA decision making. Airport planning provides the basis for a project's purpose and need in environmental evaluation and the alternatives that the FAA will carry into its NEPA analysis.

a. **Applicability**

This guidance is primarily intended for complex and controversial undertakings such as capacity projects at larger airports. It may also be helpful in the planning of projects smaller in scope, and should be reviewed prior to starting an airport master plan that has the potential to impact resources. It is intended for airport development professionals (e.g., planners, environmental specialists, project managers, engineers) employed by airport sponsors, consultants, FAA and state agencies.

b. **Clarifications**

When this document refers to airport planners it means individuals engaged in airport planning, no matter their specific job title. When the document refers to environmental specialists it means individuals engaged in environmental analysis or review, no matter their specific job title. When the document refers to engineers it means individuals engaged in engineering, no matter their specific job title. The term "project (program) manager" is not used, although it is recognized that many organizations employ "project managers" in airport planning, environmental analysis, and engineering.

2. PRACTICE AND PROCESS

a. Background

This section summarizes the key points of NEPA as it relates to project planning. When the term "agency" is used, it refers to Federal agency.

CEQ regulations require agencies to identify environmental effects and values in adequate detail so they can be compared to economic and technical analyses. Agencies must study, develop and describe appropriate alternatives to recommended courses of action in any proposal that involves unresolved conflicts concerning alternative uses of available resources. To permit these, environmental analysis must be integrated early in planning along with other planning analyses.

In cases where actions are planned by private applicants or other non-Federal entities before Federal involvement, agencies must ensure that 1) policies or designated staff are available to advise potential applicants of studies or other information likely required for later Federal action; 2) applicants are aware of the Federal agencies need to consult with State and local agencies and Indian tribes and with interested private persons and organizations when its own involvement is reasonably foreseeable; and 3) the Federal agency commences its NEPA process at the earliest possible time after the project proponent or sponsor has completed planning sufficient to allow environmental impact analysis.

b. Timing of Airport Planning and Environmental Analysis

Environmental considerations are integral to the planning process, and should be identified and evaluated at the same time as economic and technical analyses and prior to commencing preparation of an EA or EIS. This will assist in defining those projects that are reasonably foreseeable, and therefore may be subject to the NEPA analysis.

Airport planning should be complete or nearly so when the airport sponsor begins preparing its EA or FAA begins preparing its EIS. If a sponsor selects a recommended alternative and completes its planning process before beginning environmental processing, the FAA is not obligated to select that recommended alternative as its preferred alternative. FAA will select its preferred alternative during the NEPA process. Starting preparation of a NEPA document immediately after the completion of planning may improve the likelihood that aviation forecast and modeling data remain current during the environmental analysis process. In the case of an Environmental Impact Statement, the start of the NEPA process would be considered the issuance of a Notice of Intent to prepare the EIS. For an Environmental Assessment, the start of the NEPA process (for the purpose of this guidance) should be considered the earlier of: the approval of an AIP grant for the EA; or the initiation of the environmental resource agency/community coordination. The airport sponsor and FAA should always complete (and document) the following prior to commencing preparation of an EIS or EA.

- Local aviation forecasts that are current and approved by the FAA
- Justification of the scope and timing of the project's planned facilities based on airport planning, operational requirements, and design standards
- Identification and consideration of all reasonable planning alternatives (within the sponsor's or FAA's jurisdiction), eliminating (and documenting) those not meeting the stated aeronautical need. If an alternative does potentially meet the aeronautical need, but is not considered reasonable, provide sufficient explanation as to why not
- Tentative identification of studies or other information likely required for later Federal action, as well as appropriate State and local agencies, Indian tribes, private persons and organizations likely to have an interest in the project.

Also, it is important that only those alternatives that have aeronautical utility (i.e., can be built and operated safely) are forwarded for analysis under NEPA. Sometimes it may be necessary to conduct airspace reviews (during planning) of various planning alternatives to determine their aeronautical utility and safety.

Additional discussion on forecasts, project requirements and alternative analysis is included below.

c. **Local Government and Community Involvement in Airport Planning**

Establishing long-term cooperative consultation between the airport sponsor and local, regional, and state governments and planning organizations with land use, zoning, and surface access responsibilities can improve consistency between community and airport planning. This consultation makes it easier to gain local agreement on individual airport projects. Such consultation enables the airport sponsor to voice its interests in future land compatibility, obstruction control, and surface transportation access. Local planners benefit by learning airport needs for the promotion of community access and the local economy. Information on the future airport expansion and improvement contained in an airport master plan should be incorporated into the development of comprehensive land use plans to ensure land use compatibility around airports.

History shows that successful projects involve the community early in airport master planning. This involvement educates and informs local citizens, and allows them to provide constructive input to guide the airport sponsor and FAA decision-making. Community involvement during master planning should include information on the airport's proposed project, its aviation need (problem) and possible alternative ways to address the need. Input should be solicited and questions from the community should be encouraged. Input received should be considered and timely responses to questions raised should be provided. The community includes the public and local government in the vicinity of the airport, including Native American Tribal Organizations, metropolitan and regional planning organizations, and airport businesses and tenants.

Community involvement in the planning process, as described above, should ensure community awareness of proposed action prior to commencing preparation of an EA or

EIS. The NEPA process should not be the first time that the community hears about the proposal. Community involvement during planning is a natural part of good planning and is separate and distinct from public comment under NEPA. In developing a community involvement process, the airport sponsor should strike a balance between soliciting meaningful participation and keeping the master plan process on track. Depending on the scope of the project and the degree of anticipated controversy, community involvement specialists may need to become involved. Early involvement is critical to getting a sense of perspective about where and how the airport fits within the community and what concerns the community has and why. Such involvement may be needed to develop local agreement, which is often necessary to secure support from local officials for the project. A public consultation plan should be prepared identifying the type, number, and timing of public forums and identifying the public sector(s) having concerns about the proposal. It is essential that the community be advised as to its role throughout the planning process.

AIP grant assurances require that airport sponsors take appropriate action, to the extent reasonable, to restrict the use of land adjacent to airports to activities consistent with normal airport operations. Zoning authorities should be strongly encouraged to put height limits in place to protect current and planned aircraft approaches. The airport sponsor should also emphasize to local officials the importance of zoning for airport-compatible land use, including noise sensitive areas and airport design surfaces, so that the airport may remain a transportation asset to the community. In addition, frequent coordination with local, regional, and state organizations responsible for surface transportation planning helps ensure that improvements in airport capacity are matched with commensurate improvements in surface access.

The "FAA Community Involvement Manual", document FAA-EE-90-03, should be consulted to help develop a community involvement program. This manual can be accessed in the "Communications Tools" section of the Airport Noise Compatibility Planning Toolkit at http://www.faa.gov/about/office_org/headquarters_offices/aep/planning_toolkit/. There are a number of State DOTs that have similar guidance. Additional discussion on community involvement can be found under the "Community Consultation" section of the FAA document "Best Practices Guide-Initiative 6 to May 2001 Report to Congress on Streamlining the Environmental Process," which is available at http://www.faa.gov/airports/environmental/.

d. **FAA Role in Airport Master Planning**

The primary responsible party for airport master planning is the airport sponsor. However, early coordination with FAA is essential to efficient project management. FAA is involved in airport planning to ensure that proposed airport development is safe, has utility, and meets airport design standards, and identifies obvious issues that could become environmental concerns. Additionally, if Airport Improvement Program (AIP) money is needed, FAA ensures that the scope and timing of the proposed development is appropriate for Federal financial participation. FAA carries out these requirements through the following actions:

- Review and approval of local aviation forecasts and design aircraft
- Review and approval of site selection studies
- Review and approval of airport layout plans, including completion of airspace studies*
- Review the adequacy of the planning alternative analysis for incorporation into the subsequent NEPA Analysis
- Review of capital improvement planning

**Refer to the FAA "Community and Environmental Needs Division" memorandum of November 18, 2003 for guidance on how to treat airport layout plans that show proposed development that is undergoing NEPA analysis and review.*

When AIP funds are involved, FAA ensures that the scope of a project's planned facilities is justified.

Finally, FAA reviews master plan work scopes where the airport sponsor is seeking AIP or Passenger Facility Charge (PFC) funds to help finance preparation of the master plan.

e. **EIS Conceptual Engineering**

For complex projects, it is often necessary to conduct some engineering analysis to enable the airport sponsor and/or the FAA to make planning and environmental decisions. To avoid prejudging alternatives, the engineering should be limited to that necessary to:

- Define alternatives within FAA or sponsor's jurisdiction for environmental analysis
- Assess aeronautical safety and utility of these alternatives
- Comparatively analyze environmental impacts
- Inform the public and environmental resource agencies
- Identify potential environmental mitigation during the environmental analysis, and
- Determine the order of magnitude of project costs

Early in the planning process, airport planners, environmental specialists and engineers should agree to the appropriate extent of conceptual engineering effort, the responsible parties for the effort, and the schedule for accomplishing such engineering.

f. **Facility Requirements/Purpose and Need**

"Facility requirements" is a term used in airport planning to describe the development required to address documented airport needs. The analysis and documentation supporting the facility requirements are normally contained in an airport master plan. This analysis needs clearly to define the aviation problem(s) and why the airport needs to solve it (them). Care should be taken that the facility requirements are not so narrowly defined so that they unreasonably point to a single solution.

"Purpose and Need" is a NEPA term that refers to a section of an environmental document, which describes the purpose of, and need for, the proposed Federal action. The problem to be addressed is identified (need), the requested Federal action is noted as a possible solution to the problem (purpose), and information that supports that a problem exists is presented (or referenced).

FAA planners should ensure that the "Facility Requirements" analysis provides information sufficient to provide a basis for describing the "Purpose and Need" for proposed Federal actions. FAA environmental professionals can be helpful in determining the adequacy of "Facility Requirements" documentation for use in defining purpose and need under NEPA.

As always, projects that are seeking AIP or PFC funding need to be justified on aeronautical grounds. Economic development should not be a basis for justifying AIP or PFC assistance.

g. **Alternative Analysis**

The master plan is not intended to establish a single project alternative for NEPA evaluation, but to identify alternatives that meet the airport's aeronautical needs. It may establish the sponsor's recommended alternative. It should consider all reasonable alternatives normally within the jurisdiction of the airport sponsor and the FAA, including operational alternatives. Those alternatives that do not meet the planning need (i.e., facility requirements), or are not feasible or prudent, should be dismissed, with the reasons for dismissal appropriately documented in the master plan. This should include reasons why planning did not consider alternatives that avoided or minimized environmental areas or conditions contributing to extensive mitigation. The master plan should also document the justification for any sponsor recommended alternative, as well as the reasons for not recommending others. An airspace review (i.e., NRA case) of alternatives may be necessary to determine if alternatives can be built and are operationally feasible before their environmental impacts are evaluated in a NEPA document. A preliminary cost estimate, similar in detail to cost estimates normally prepared in master plans and depicted in capital improvement plans, should be developed for all alternatives to be analyzed in a NEPA document.

Unlike the master plan, a NEPA document may consider alternatives that are not within the jurisdiction of the airport sponsor or the FAA, such as the development of alternative airports or the use of other transportation modes. As stated previously, NEPA requires Federal agencies to "utilize a systematic, interdisciplinary approach which will insure the integrated use of the natural and social sciences and the environmental design arts in planning and decision making which may have an impact on man's environment." In preparing NEPA documents, FAA typically considers environmental impact, cost and other factors in its alternative analysis. It is possible that during the NEPA process, FAA will identify alternatives not previously considered during the planning process. Airport planners should be called upon to advise the environmental specialists on whether additional alternatives developed during the NEPA process meet planning needs and can be constructed and operated safely and efficiently.

h. **Currency of Aviation Forecasts**

A master plan uses locally generated aviation forecasts as the basis for identifying the need and timing of airport development. FAA reviews the local forecasts and forecast methodology to ensure that they are appropriate and that they provide an adequate justification for the scope, and timing of proposed airport development. Local forecasts developed in a master plan can be adopted for use in an environmental impact analysis provided that the FAA has approved them. FAA field offices can approve local forecasts if the forecast methodology is reasonable and the forecast is consistent with the FAA's Terminal Area Forecast (TAF) or differences with the TAF have been resolved by the FAA. Consistency with the TAF is discussed in separate planning guidance provided by the FAA, which also has special provisions for FAA approval of forecasts at lower activity general aviation airports. It is important that the local forecasts of aircraft activity and enplanements used in NEPA analysis were recently approved by the FAA and, in the process of approving these forecasts, the most recent published TAF was used for comparison.

It is also important that the same forecasts be used throughout project formulation including project justification, airfield modeling, environmental analysis, and benefit cost analysis. Where updated forecasts are approved, or separate forecasting used, the new information should be clearly distinguished from a prior forecast.

3. TOOLS

a. Planning Team

Airport planners, environmental specialists, and engineers should work together throughout the project formulation and development processes. This includes from the beginning of the master plan, through the preparation of an EA or EIS and subsequent decision document, as well as through design and construction to ensure that mitigation measures are properly accomplished. The team should first meet with the airport sponsor during pre-planning to insure that important issues are identified early. The extent of planner, environmental specialist and engineer involvement would depend on project complexity and controversy.

When preparation of an EA or EIS is anticipated, environmental specialists should take an active role in determining the adequacy of the master plan's alternative analysis. This ensures that the master plan and the EA or EIS are consistent in data and in rationale on the reasonable alternatives. In addition, the environmental specialist may assist the airport planner in reviewing the scope of work for the master plan relative to the scope of environmental work to be performed, provide guidance on developing the overview of sensitive environmental features, assist in developing and conducting the public consultation and help in deciding that project justification is sufficient to develop a strong and clear purpose and need statement in the EA or EIS. The airport sponsor's planning consultant should include, as part of their team, a specialist familiar with NEPA and environmental analysis requirements for airport projects.

The airport planner's role in the NEPA process is to: review the planning aspects of the NEPA document for accuracy and consistency with airport planning, design standards, operational requirements and land use compatibility considerations; review the adequacy of discussions of technological solutions that address the purpose and need; and review the consistency of the local aviation forecasts with the TAF and with the aviation forecasts used in other project documents.

During the planning and environmental analysis, engineers should provide conceptual engineering, if required, provide "planning-level" project cost estimates, and if required determine the constructability of various alternatives, including construction sequencing and timing.

b. Overview of Environmental Features

A recommended practice for the airport sponsor/consultant is to prepare an "overview of environmentally sensitive features of an airport" as part of the airport master plan. Such an overview can help an airport sponsor judge if the airport's environmental features affect day-to-day decisions as well as longer-term development strategies. The level of detail would be airport specific as determined by the sponsor and its consultant after consultation with the local FAA Airports office. The overview should include readily available information including:

- Items known from prior environmental and planning documents, and from the expertise of environmental professionals, community planners, and resource agencies
- Items that can be easily seen during a walking survey of the airport or off-airport area.
- Information from various types of available environmental resource maps of the airport area.

The findings from the literature search and airport walking survey should be documented.

This overview is not intended to substitute for the "Affected Environment" section of an EA or EIS. It is intended to provide information on, or an overview of obvious environmental resources, which could affect the planning of the proposed development. Therefore, it is not necessary to carry out substantial investigations such as cultural resource studies or wetland delineations in order to define all environmental factors needed for master planning. If an airport sponsor wishes to conduct such detailed studies under a master plan, the local FAA Airports office should be consulted. If concurrence is provided the FAA should work with the sponsor to ensure that the selected consultant is, or selected consultants are, experienced in the discipline(s) being investigated.

The overview should also include easily seen and/or readily documented environmental features and resources beyond the airport property line. The area of consideration beyond the property line will vary depending on the environmental resource. For noise, it may be set at the DNL 65 dB contour, while for coastal zones it may stretch well beyond the airport boundaries. A text of the environmental overview should be included in the master plan report together with appropriate graphics. Sensitive features may also be

shown on a separate ALP drawing. Attachment 3 to this appendix lists suggested features that may be included as parts of the overview. Information on land uses or features that surround the airport and whether or not such uses are zoned compatibly with aviation uses should also be included. If not zoned compatible, the reasons should be investigated and the sponsor should provide information on its efforts to promote aviation-compatible land uses near the airport.

The master plan report and/or ALP should note the source (i.e., May 2004 walking survey, NWI maps, 2003 regional land use plan, etc.) of flood plain, wetland, or cultural resource information that is presented. This will ensure that resource data that is approximate, such as wetland locations based on a recent walk-through or older NWI maps, is identified as approximate data. For example, a possible ALP note for wetlands is: "Wetland areas bounded by dashed lines are based on an April 2003 NWI map and March 19, 2004 walk-through of the area. The walk-through suggests wetland presence due to standing water and certain vegetation. The NEPA analysis will include a wetland delineation of that area, if alternatives under consideration are located in this area."

This information will alert planning and environmental reviewers of the possible presence of sensitive resources. As a result, further investigation of these areas during the NEPA process may be necessary. Project layout or design could change based on further information obtained during preparation of a NEPA document. The master plan report and/or ALP should clearly note if the environmental overview uses data more than five years old or of questionable quality.

An environmental overview may provide the information necessary to: 1) determine if additional alternatives are needed to avoid or minimize the impact of the project to sensitive environmental features; 2) define future environmental coordination and analysis work to develop more thorough work scope for an EA or EIS and; 3) properly understand the anticipated costs of preliminary/final design as well as how best to estimate the cost of and schedule for the NEPA process.

c. Electronic Data Information Systems

Airport sponsors typically have a great deal of spatial information to support infrastructure development. Although electronic data sources such as Computer Aided Design (CAD), Geographic Information Systems (GIS), and other spatial data formats are common, there is often redundancy due to a lack of knowledge about existing data sets and differing standards. A common data source is more efficient in the identification of environmentally sensitive features such as residential areas, parks, and hazardous waste sites and in quantifying the potential impact of various proposed development. Therefore, airport sponsors should consider developing an electronic spatial data standard for all planning, environmental, and engineering documents. Although GIS is typically used to implement such a standard, also consider other options that may offer more ready access and basic skill requirements should be considered.

Notwithstanding the above, hard copies of ALP drawings and master plan reports shall be provided for FAA retention and use.

d. If AIP or PFC funds are to be used for the development of a GIS or similar format, the scope of the GIS development should be discussed with the FAA to ensure that eligibility is established. See FAA Order 5100.38, *Airport Improvement Program Handbook*. The GIS should be in a standard format that is consistent with the data formats used by the surrounding units of government.

4. NEPA DOCUMENTS OF OTHER FEDERAL AGENCIES

An airport development proposal may require that a Federal agency other than the FAA is the lead agency for NEPA purposes. Although this usually involves development by a military entity, such as the Air National Guard, it may involve such actions as a roadway funded by the Federal Highway Administration, an apron/hangar for the U.S. Forest Service, or a recreational area by the Army Corps of Engineers. The master plan should recognize such proposed development, ensuring that the proposal is an appropriate use for the airport, and that the FAA's Federal actions associated with the development, such as ALP revisions or approval of land releases, are adequately addressed in the lead agency's NEPA document. The master plan should also describe how the proponent's potential plans would ultimately affect the airport sponsor's proposed airport development. FAA's environmental role will vary from project to project. Normally the FAA will be either a joint lead agency, or at least a cooperating agency during the preparation of an environmental document. The "other" Federal agency should come to FAA early to see what we look for in our environmental documentation and processing. Some laws, such as Section 4(f) of the DOT Act, or policies, such as noise, apply to FAA but not to other agencies, and must be addressed in the NEPA document.

Appendix E Airport Site Selection

1. GENERAL

a. In some cases, the planner may determine that the existing airport cannot be expanded to meet the future demand and that a new or supplemental airport may be needed. In these cases, it may be necessary to look for a new airport site. The process of identifying, evaluating, and selecting new airport sites is very similar to the process of identifying, evaluating, and selecting alternatives for individual airport projects.

b. A comparison of new airport sites with the alternative of continuing operations at the existing airport may have been completed during the master plan alternatives analysis. In these cases, the site selection process may be a refinement of the preliminary investigation of alternatives for the existing airport. A site selection process may also result from the need for a new airport identified in a regional or state system plan study.

c. Prior to initiating a detailed site selection study, the planner should collect data that justifies the need for the new airport and its viability. Community and user support, along with an airport sponsor's legal and financial capability to build and operate the new airport, should be documented. There should be a consensus among Federal, state and local officials as to the intended role of the new airport, at least to the extent that its requirements and size can be determined. However, this does not rule out changing the role of the new airport as a result of the study findings.

2. SITE SELECTION PROCESS OVERVIEW

a. The scope of the site selection process will vary with the size, complexity, and role of the new airport. The sophistication of the analysis and the complexity of the decision making process can vary greatly.

b. If the planner determines that a new airport is needed, he or she should develop initial criteria that can be used to evaluate different sites and determine if each can function as an airport and meet the needs of the community and users. Such criteria might include that the sites are within a certain radius of the existing airport and are of a minimum size in terms of land area.

c. Once the preliminary sites have been identified, a screening process should be applied to each site. An evaluation of all potential sites that meet the initial criteria should be conducted, screening out those with the most obvious shortcomings. Screening factors might include topography, natural and man-made obstructions, airspace, access, environmental impacts, and development costs. If any sites are eliminated from further consideration, thorough documentation of the reasons for that decision is encouraged and will facilitate the subsequent environmental processing.

d. The remaining potential sites should then undergo a detailed comparison using comprehensive evaluation criteria. While the criteria will vary, the following should be considered:

- Operational Capability – the site should provide the operational capability necessary to serve the defined role of the airport and the needs of its users
- Capacity potential – If the new airport is needed to provide additional capacity, the capability of the site in providing long-term capacity growth is important.
- Ground access – an important factor is the ability of the users to get to and from the airport easily and in a timely manner.
- Development Costs – Simple cost estimates are useful in determining the financial feasibility of building a new airport.
- Environmental Consequences – The potential environmental impacts associated with a new site may be critical to gaining approval.

Consistency with Area-wide Planning – The site should be consistent with regional and local land use and transportation plans.

e. While a weighting of the evaluation criteria and a weighted ranking of the alternative sites may be used in selecting a site, planners should use caution in applying this technique since it introduces an element of subjectivity into the analysis. They should focus on providing decision makers with information on the various sites in a manner that is understandable and unbiased.

f. The site finally selected will be subject to the review of alternatives as required under NEPA. Planners will then make commitments on specific environmental mitigation measures. The selection will probably receive scrutiny through public information sessions, review by policy and advisory committees, and at public hearings.

g. The planner should not assume that the site selection process described here conclusively results in the selection of the best site. Overriding political, jurisdictional, institutional, environmental or financial considerations may influence the decision makers' choice of sites.

3. SITE APPROVAL

a. Once a site is selected, timely site approval by the airport sponsor who will develop and operate the new airport is important. Such action will permit the prompt establishment of the airport while the decision-making apparatus is politically and organizationally intact.

b. If state and regional approval procedures have been followed, an important next step will be Federal approval. FAA approval is necessary if planners intend to seek Federal financial assistance under the AIP for follow-on planning or site acquisition and development. Such approval must be supported by appropriate environmental documentation, public hearings, and evidence that the proposed airport will be reasonable consistent with local planning. The FAA must approve the selected site before any additional planning work is started.

c. Regardless of the applicability of Federal financial assistance in the planning or development of the airport, the FAA will advise on the aeronautical suitability of the site after having studied the site from the standpoint of airspace use as required by 14 CFR Part 157, *Notice of Proposed Construction, Alteration, Activation, and Deactivation of Airports.*

Appendix F Airport Layout Plan Drawing Set

The following list provides general guidelines in preparing the Airport Layout Plan drawing set. The individual sheets that comprise the Airport Layout Plan drawing set will vary with each planning effort. During the project scoping activities, planners must determine which sheets will be necessary. Refer to ARP Standard Operating Procedure (ARP SOP) 2.00, Standard Procedure for FAA Review and Approval of Airport Layout Plans (ALPs), and ARP SOP 3.00, Standard Operating Procedure (SOP) for FAA Review of Exhibit 'A' Airport Property Inventory Maps, for specific ALP review and approval procedures and additional preparation guidance.

1. AIRPORT LAYOUT DRAWING

a. Sheet size – Minimum 24" x 36"

b. Scale –Within a range of 1" = 200' to 1" = 600'

c. North Arrow

1) True and Magnetic North

2) Year of the magnetic declination

3) Orient drawing so that north is to the top or left of the sheet

d. Wind Rose

1) Data source and the time period covered

2) Include individual and combined coverage for:

a) Runways with 10.5 knots crosswind

b) Runways with 13 knots crosswind

c) Runways with 16 knots crosswind

d) Runways with 20 knots crosswind

e. Airport Reference Point (ARP) – Existing and ultimate, with latitude and longitude to the nearest second based on NAD 83

f. Ground contours at intervals of 2' to 10', lightly drawn

g. Elevations (Existing and Ultimate to 1/10 of a foot)

1) Runway

2) Displaced thresholds

3) Touchdown zones

4) Intersections

5) Runway high and low points

6) Roadways where they intersect the RPZ edges and extended runway centerlines

7) Structures on Airport – If a terminal area plan is not included indicate structure top elevations on this sheet.

h. Building limit lines – Show on both sides of the runways and extend to the airport property line or RPZ.

i. Runway Details (Existing and Ultimate)

1) Runway Design Code (RDC) designation

2) Dimensions – length and width within the outline of the runway

3) Orientation – Runway end numbers and true bearing to the nearest 0.01 degree

4) Markings

5) Lighting – Threshold lights only

6) Runway Safety Areas – Dimensions may be included in the Runway Data Table

7) End Coordinates – Note near end (existing and ultimate) of each runway end, to nearest 0.01 second

8) Displaced threshold coordinates, to the nearest 0.01 second

9) Declared Distances – For each runway direction if applicable. Identify any clearway/stopway portions in the declared distances

j. Taxiway Details (Existing and Ultimate)

1) Taxiway Design Group (TDG) designation

2) Taxiway widths and separation from the runway centerlines, parallel taxiway, aircraft parking, and objects

k. RPZ Details (Existing and Ultimate)

1) Dimensions

2) Type of property acquisition (fee or easement)

l. Approach slope ratio (20:1; 34:1; 50:1)

m. Airport Data Table (Existing and Ultimate)

1) Airport elevation (MSL)

2) Airport Reference Point data

3) Mean maximum temperature

4) Airport Reference Code for each runway

5) Design Aircraft for each runway or airfield component

n. Runway Data Table (Existing and Ultimate)

1) Percent effective gradient

2) Percent wind coverage

3) Maximum elevation above MSL

4) Runway length and width

5) Runway surface type

6) Runway strength

7) FAR Part 77 approach category

8) Approach type

9) Approach slope

10) Runway lighting (HIRL, MIRL, LIRL)

11) Runway marking

12) Navigational and visual aids

13) RSA dimensions

o. Title and Revision Blocks

1) Name and location of the airport

2) Name of preparer

3) Date of drawing

4) Drawing title

5) Revision block

6) FAA disclaimer

7) Approval block

p. Other

1) Standard legend

2) Existing and Ultimate airport facility and building list

3) Location map

4) Vicinity map

2. AIRPORT AIRSPACE DRAWING

a. Plan view of all FAR Part 77 surfaces, based on ultimate runway lengths

b. Small scale profile views of existing and ultimate approaches

c. Obstruction data tables, as appropriate

d. Sheet size – same as the airport layout drawing

e. Scale – 1" = 2,000' for the plan view; 1" = 1,000' for approach profiles; and 1" = 100' (vertical) for approach profiles

f. Title and revision blocks - same as the airport layout drawing

g. Approach Plan View Details

1) USGS for base map

2) Show runway end numbers

3) Include 50' elevation contours on all slopes

4) Show the most demanding surfaces with solid lines and others with dashed lines

5) Identify top elevations of objects that penetrate any of the surfaces. For objects in the inner approach, add note "See inner portion of the approach plan view for close-in obstructions."

6) For precision instrument runways, show balance of 40,000' approach on a separate sheet.

h. Approach Profile Details

1) Depict the ground profile along the extended runway centerline representing the composite profile, based on the highest terrain across the width and along the length of the approach surface.

2) Identify all significant objects (roads, rivers, and so forth) and top elevations within the approach surfaces, regardless of whether or not they are obstructions

3) Show existing and ultimate runway ends and FAR Part 77 approach slopes.

3. INNER PORTION OF THE APPROACH SURFACE DRAWING

a. Large scale plan views of inner portions of approaches for each runway, usually limited to the RPZ areas

b. Large scale projected profile views of inner portions of approaches for each runway, usually limited to the RPZ areas

c. Interim stage RPZs when plans for interim runways extensions are firm and construction is expected in the near future

d. Sheet size – Same as Airport Layout drawing

e. Scale – Horizontal 1" = 200'; vertical 1" = 20'

f. Title and revision blocks – Same as for Airport Layout drawing

g. Plan View Details

1) Aerial photos for base maps

2) Numbering system to identify obstructions

3) Depict property line

4) Identify, by numbers, all traverse ways with elevations and computed vertical clearance in the approach

5) Depict the existing and ultimate physical end of the runways. Note runway end number and elevation

6) Show ground contours, lightly drawn

h. Profile View Details

1) Depict terrain and significant items (fences, roadways, and so forth)

2) Identify obstructions with numbers on the plan view

3) Show roads and railroads with dashed lines at edge of the approach

i. Obstruction Table Details

1) Depict terrain and significant items (fences, roadways, and so forth)

2) Identify obstructions with numbers on the plan view

3) Show roads and railroads with dashed lines at edge of the approach

4) Prepare a separate table for each RPZ

5) Include obstruction identification number and description, the amount of the approach surface penetration, and the proposed disposition of the obstructions

4. TERMINAL AREA DRAWING

The need for this drawing will be decided on a case-by-case basis. For small airports, where the Airport Layout drawing is prepared to a fairly large scale, a separate drawing for the terminal area may not be needed.

a. Large scale plan view of the area or areas where aprons, buildings, hangars, and parking lots are located

b. Sheet size – Same as Airport Layout drawing

c. Scale – Range of 1” = 50’ to 1” = 100’

d. Title and revision blocks – Same as for Airport Layout drawing

e. Building Data Table – To list structures and show pertinent information about them. Include space and columns for:

1) A numbering system to identify structures

2) Top elevation of structures

3) Existing and planned obstruction markings

5. LAND USE DRAWING

a. Include all land uses (industrial, residential, and so forth), on and off the airport, to at least the 65 DNL contour

b. Sheet size – Same as Airport Layout drawing

c. Scale – Same as the Airport Layout drawing

d. Title and revision blocks – Same as for Airport Layout drawing

e. Aerial base map

f. Legend (symbols and land use descriptions)

g. Identify public facilities (such as schools, parks, and others)

h. Drawing details – Normally limited to existing and future airport features (i.e., runways, taxiways, aprons, RPZs, terminal buildings and navigational aids)

6. RUNWAY DEPARTURE SURFACES DRAWING

a. Large scale plan views of departure surfaces for each runway end that is designated primarily for instrument departures. The one-engine inoperative (OEI) obstacle identification surface (OIS) should be shown for any departure runway end supporting air carrier operations.

b. Large scale projected profile views of departure surfaces for each runway that is designated primarily for instrument departures.

c. Sheet size – Same as Airport Layout drawing

d. Scale – Horizontal 1" = 1000'; vertical 1" = 100' (runway departure surfaces); and Scale – Horizontal 1" = 2000'; vertical 1" = 100' (OEI obstacle identification surfaces)

e. Title and revision blocks – Same as for Airport Layout drawing

j. Plan View Details

7) Aerial photos for base maps

8) Numbering system to identify obstructions

9) Depict property line, including easements

10) Identify, by numbers, all traverse ways with elevations and computed vertical clearance in the departure surface

11) Depict the existing and ultimate physical end of the runways. Note runway end number and elevation

12) Show ground contours, lightly drawn

k. Profile View Details

4) Depict terrain and significant objects, including fences, roadways, rivers, structures, and buildings.

5) Identify obstructions with numbers on the plan view

6) Show roads and railroads with dashed lines at edge of the departure surface

l. Obstruction Table Details

6) Depict terrain and significant objects, including fences, roadways, rivers, structures and buildings

7) Identify obstructions with numbers on the plan view

8) Show roads and railroads with dashed lines at edge of the approach

9) Prepare a separate table for each departure surface

10) Include obstruction identification number and description, the amount of the departure surface penetration, and the proposed disposition of the obstructions

7. AIRPORT PROPERTY MAP

a. Sheet size – Same as Airport Layout drawing

b. Scale – Same as the Airport Layout drawing

c. Title and revision blocks – Same as for Airport Layout drawing

d. Legend

e. Data Table

1) A numbering or lettering system to identify tracts of land

2) The date the property was acquired

3) The Federal aid project number under which it was acquired

4) Type of ownership (fee, easement, federal surplus, and others)

f. Show existing and future airport features (i.e., runways, RPZs, navigational aids and so forth) that would indicate a future aeronautical need for airport property.

EARTH

The West Coast Is at Risk: New Megathrust Fault Research Indicates That the Next Big Earthquake Could Be Imminent

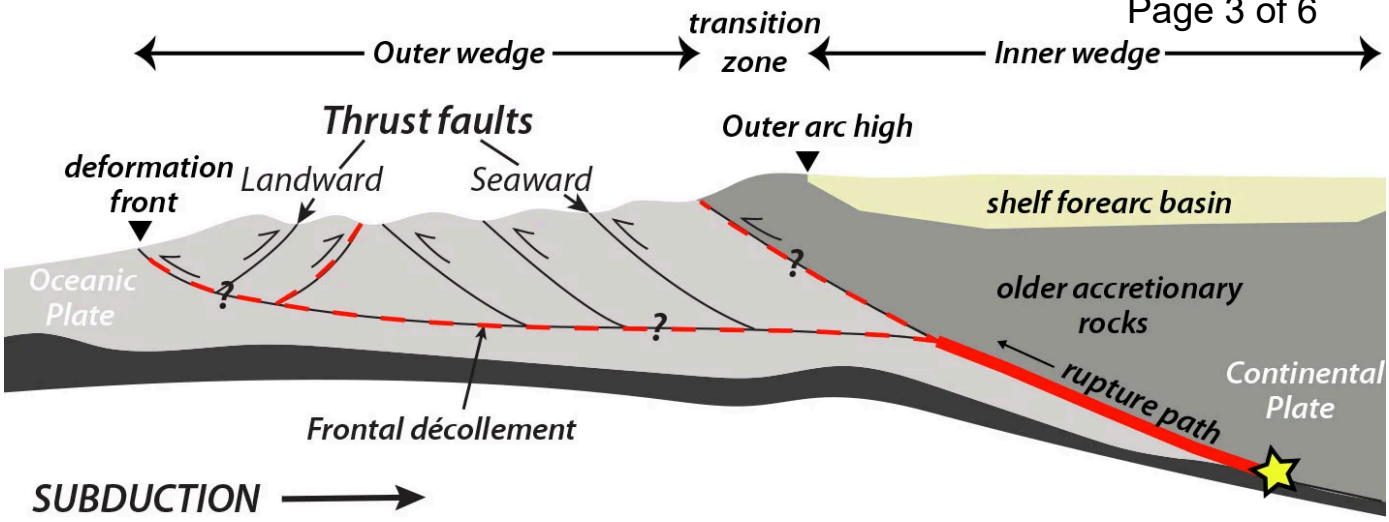
BY COLUMBIA CLIMATE SCHOOL — AUGUST 28, 2024 65 COMMENTS 7 MINS READ

Facebook Twitter Pinterest Telegram

New research on the Cascadia Subduction Zone shows it has a segmented fault structure, impacting earthquake predictions and preparedness strategies, potentially affecting building codes in vulnerable areas like Washington's Olympic Peninsula. Credit: SciTechDaily.com

Large-scale earthquakes and tsunamis have historically affected the western regions of the U.S. and Canada and are likely to do so in the future.

Off the southern coasts of British Columbia, Washington, Oregon, and northern California, a 600-mile-long strip exists where the Pacific Ocean floor gradually subducts eastward beneath North America.



This area, called the Cascadia Subduction Zone, hosts a megathrust fault, a place where tectonic plates move against each other in a highly dangerous way. The plates can periodically lock up and build stress over wide areas—eventually to be released when they finally lurch against each other.

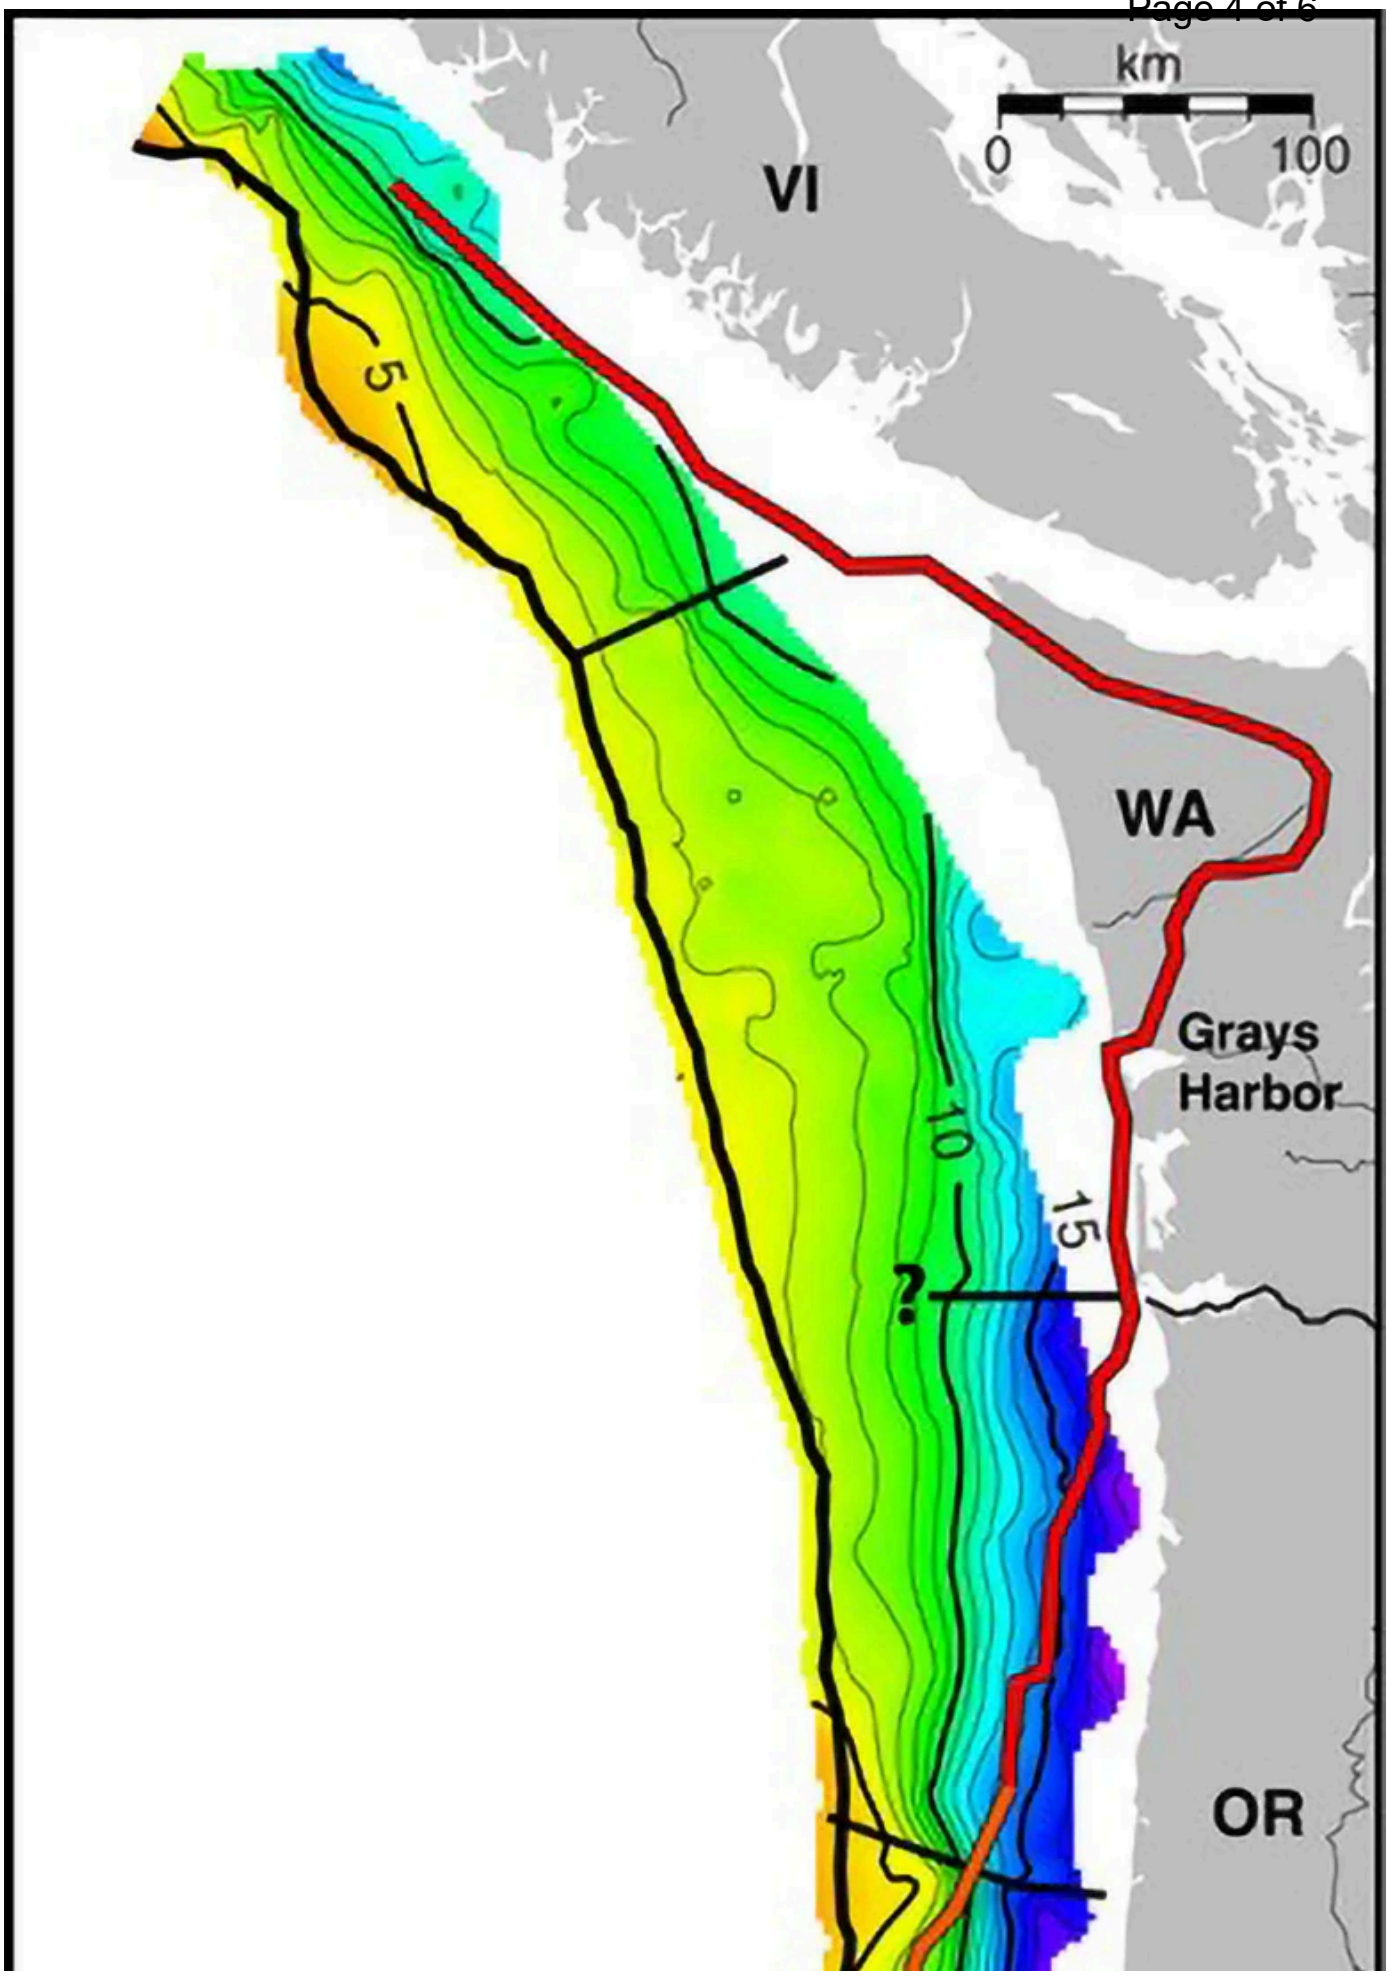
The result: the world's greatest earthquakes, shaking both seabed and land, and generating tsunamis 100 feet high or more. Such a fault off Japan caused the 2011 Fukushima nuclear disaster. Similar zones exist off Alaska, Chile, and New Zealand, among other places. At Cascadia, big quakes are believed to come roughly every 500 years, give or take a couple hundred. The last occurred in 1700.

Research Advancements in Understanding Seismic Activity

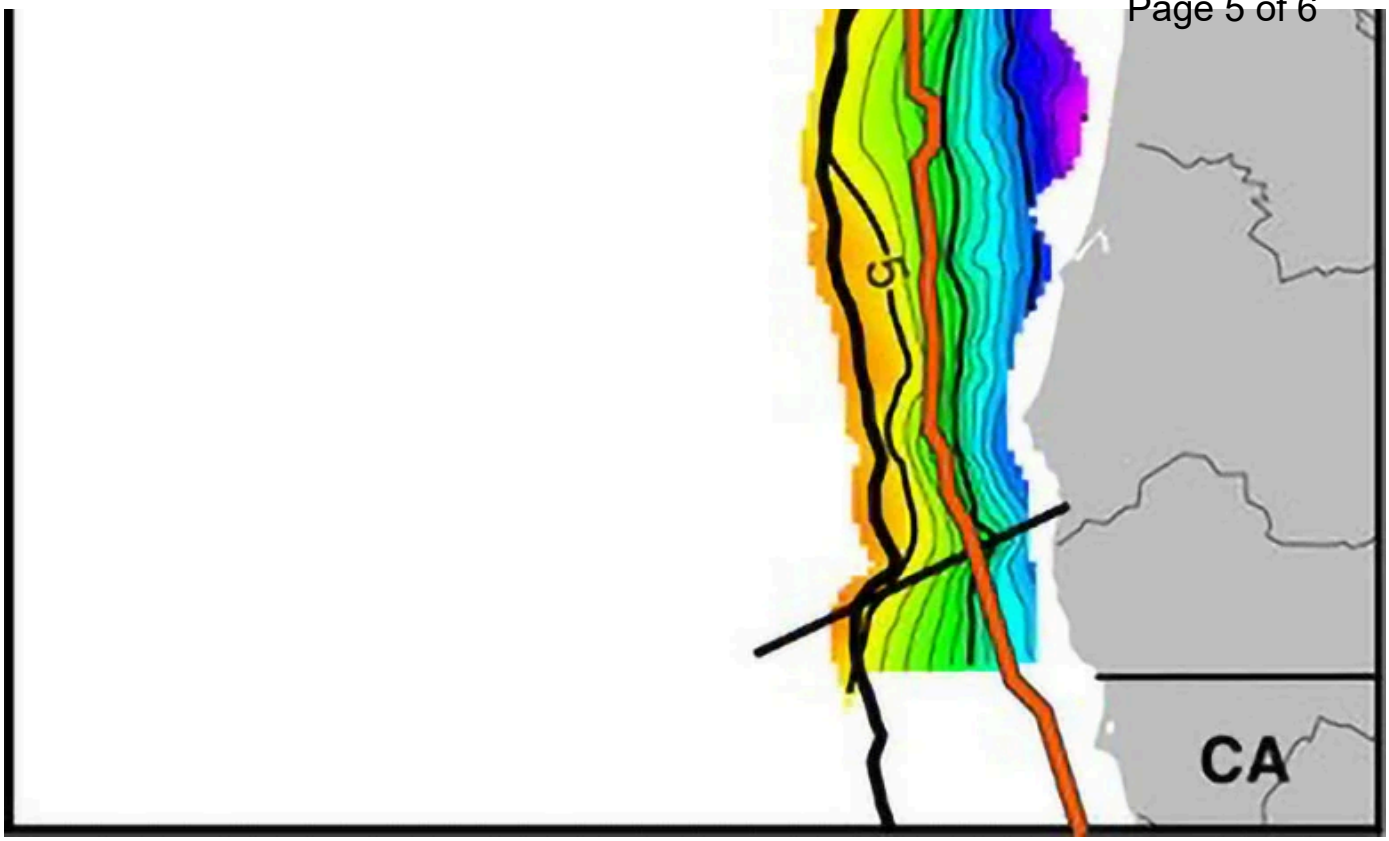
Scientists have long been working to understand the Cascadia Subduction Zone's subterranean structures and mechanics, in order to delineate places most susceptible to quakes, how big they might be, and what warning signs they might produce. There is no such thing as predicting an earthquake; rather, scientists try to forecast probabilities of multiple scenarios, hoping to help authorities design building codes and warning systems to minimize the damage when something happens.

A newly published study promises to greatly advance this effort. A research vessel towing an array of the latest geophysical instruments along almost the entire zone has produced the first comprehensive survey of the many complex structures beneath the seafloor. These include the geometry of the down-going ocean plate and overlying sediments, and the makeup of the overriding North American plate. The study was recently published in the journal *Science Advances*.

A schematic cross-section of the Cascadia Subduction Zone shows the ocean floor plate (light grey) moving under the North American continental plate, along with other features. Credit: U.S. Geological Survey



"The models currently in use by public agencies were based on a limited set of old, low-quality 1980s-era data," said Suzanne Carbotte, a marine geophysicist at Columbia University's Lamont-Doherty Earth Observatory, who led the research. "The megathrust has a much more complex geometry than previously assumed. The study provides a new framework for earthquake and tsunami hazard assessment."



With funding from the U.S. National Science Foundation, the data was gathered during a 41-day cruise in 2021 by Lamont's research vessel, the Marcus G. Langseth. Researchers aboard the ship penetrated the seafloor with powerful sound pulses and read the echoes, which were then converted into images, somewhat similar to how physicians create interior scans of the human body.

New Insights into Fault Segmentation and Tsunami Risks

One key finding: the megathrust fault zone is not just one continuous structure, but is divided into at least four segments, each potentially somewhat insulated against the movements of the others. Scientists have long debated whether past events, including the 1700 quake, ruptured the entire zone or just part of it — a key question, because the longer the rupture, the bigger the quake.

The data show that the segments are divided by buried features including big faults, where opposing sides slide against each other perpendicular to the shore. This might help buffer against movement on one segment translating to the next. "We can't say that this definitely means only single segments will rupture, or that definitely the whole thing will go at once," said Harold Tobin, a geophysicist at the University of Washington and co-author of the study. "But this does upgrade evidence that there are segmented ruptures."

Yellow/orange indicates shallow depths; green, deeper; blues/purples deepest. Diagonal black lines approximate divisions between different segments of the zone. The wavy red line to the right indicates the seaward edge of rigid continental rocks that apparently cause the zone to break into these segments. Credit: Modified from Carbotte et al., Science Advances, 2024

The imagery also suggests the causes of the segmentation: the rigid edge of the overriding North American continental plate is composed of many different kinds of rocks, formed at different times over many tens of millions of years, with some being denser than others. This variety in the continental rocks causes the incoming, more pliable oceanic plate to bend and twist to accommodate differences in overlying pressure. In some places, segments go down at relatively steep angles, in others at shallow ones.

The researchers zeroed in on one segment in particular, which runs from southern Vancouver Island alongside Washington state, more or less ending at the Oregon border. The subterranean topography of other segments is relatively rough, with oceanic features like faults and subducted seamounts rubbing up against the upper plate — features that might erode the upper plate and limit how far any quake may propagate within the segment, thus limiting the quake's size. In contrast, the Vancouver-Washington segment is quite smooth. This means that it may be more likely to rupture along its entire length at once, making it potentially the most dangerous section.

Ongoing Research and Implications for Regional Safety

Also in this segment, the seafloor is subducting under the continental crust at a shallow angle relative to the other segments. In the other segments, most of the earthquake-prone interface between the plates lies offshore, but here the study found the shallow subduction angle means it probably extends directly under Washington's Olympic Peninsula. This might magnify any shaking on land. "It requires a lot more study, but for places like Tacoma and Seattle, it could mean the difference between alarming and catastrophic," said Tobin.

With funding from the U.S. Geological Survey, a consortium of state and federal agencies and academic institutions has already been poring over the data since it became available to sort through the implications.

As for tsunami hazard, that is "still a work in progress," said Kelin Wang, a research scientist at the Geological Survey of Canada who was not involved in the study. Wang's group is using the data to model features of the seafloor off Vancouver Island that might generate tsunamis. (In general, a tsunami occurs when the deep seafloor moves up or down during a quake, sending a wave to the surface that concentrates its energy and gathers height as it reaches shallower coastal waters.) Wang said his results will go to another group that models tsunamis themselves, and after that to another group that analyzes the hazards on land.

Practical assessments that could affect building codes or other aspects of preparedness may be published as early as next year, say the researchers. "There's a whole lot more complexity here than was previously inferred," said Carbotte.

1 Advanced Air Mobility

Transportation is constantly evolving, and each step forward yields new opportunities that fundamentally change how people and goods are being transported. A new era of aviation once only portrayed in movies or science fiction is taking off. Advanced Air Mobility (AAM) is an emerging aviation ecosystem that leverages new aircraft and an array of innovative technologies to provide the opportunity for more efficient, more sustainable, and more equitable options for transportation.

1.1 AAM Definition

As defined in the AAM Coordination and Leadership Act (P.L. 117-203, 136 Stat. 2227), October 17, 2022, "AAM is a transportation system that moves people and property by air between two points in the United States (U.S.) using aircraft with advanced technologies, including electric aircraft, or electric vertical takeoff and landing (eVTOL) aircraft, in both controlled and uncontrolled airspace." For purposes of this Implementation Plan, however, the scope of AAM is limited to those engaging in passenger-carrying or cargo operations with a pilot on board.

1.2 AAM Integration into the National Airspace System

The Federal Aviation Administration (FAA) has a long, successful history of bringing new technologies safely into aviation. The agency's role in integrating AAM into the National Airspace System (NAS) is to ensure this new generation of aircraft maintains the highest level of operational safety that defines commercial aviation today. The FAA's top priority and statutory responsibility are to ensure the safety of the traveling public. The agency is

looking at every necessary aspect to support AAM flights: the aircraft itself, the framework for operations, access to the airspace, operator training, infrastructure development, environmental impacts, and community engagement.

As these aircraft are being developed, the FAA will amend, as appropriate, operational rules and pilot training requirements. Longer term, the agency will develop permanent regulations to safely enable powered lift operations and pilot training and certification.

The FAA is implementing a crawl-walk-run methodology that recognizes early opportunities to support Entry into Service (EIS) operations through existing services and infrastructure with minimal changes. The agency is doing this while developing a path to implementation of more advanced concepts and capabilities to support increasing scale and automation of AAM operations, as well as integration with other types of aircraft operating in the NAS.

To address the development of a near-term ecosystem, the FAA created Innovate28 (I28), a joint government and industry initiative that will culminate in integrated AAM operations at one or more key site locations by the 2028 timeframe. The FAA also recognizes and has begun executing the collaborative actions needed to mature AAM concepts, operations, and regulatory frameworks beyond initial operations and into the mid-term and mature state phases (see Section 7). This Implementation Plan shows how the agency expects all these pieces to come together to allow the industry to scale safely.

1.3 Stakeholder Collaboration

Operationalizing AAM in the NAS and establishing timelines from EIS to operations at scale requires collaboration with, and commitments by, many stakeholders to ensure safe, efficient, and equitable operations, including:

Federal Aviation Administration

From a federal level, the FAA has sole and exclusive authority over all aviation safety aspects of AAM integration, including operating rules, aircraft certification, and pilot certification. The agency provides a leadership role in identifying and integrating the responsibilities of all the key actors and stakeholders. The FAA develops and processes all certification, policy and procedures, rulemaking, and regulatory activities to ensure safety of flight, and strives to ensure that industry (including original equipment manufacturers (OEMs), aircraft operators, and vertiport operators) and local, state, and tribal governments can accommodate AAM operations and plan accordingly.

In support of I28, the FAA established internal workstreams, called iTeams. These teams are dedicated to addressing major focus areas for AAM integration, including Certification, Airspace and Air Traffic Management, Infrastructure, Environment, Hazardous Materials Safety, and Community Engagement, to ensure a coordinated approach for I28 operations.

Other Government Agencies

The FAA is leveraging existing programs and research conducted by other government agencies to integrate AAM more rapidly into the NAS, including the National Aeronautics and Space Administration (NASA), U.S. Department of Transportation (DOT), Department of Defense, and others. For example, through the FAA's extensive AAM-focused partnership with NASA's AAM Program and the National Campaign and collaboration with the U.S. Air Force AFWERX Prime programs, the FAA is able to leverage the research, data, and testing experience in the shared mission to safely integrate AAM aircraft.

In addition to collaboration at the federal level, the FAA is engaging with local, state, tribal, and territorial governments that have vested interests in making decisions to ensure safe and successful AAM operations from local and regional planning, power infrastructure, intermodal transportation, and community perspectives. These entities will likely be responsible for the coordination, logistics, zoning, licensing of infrastructure, and the community engagement necessary to support AAM operations.

Inter-Agency Working Groups

The FAA participates in several inter-agency AAM groups, including the DOT AAM Interagency Working Group, which was established by the AAM Coordination and Leadership Act. Much like the FAA iTeams' structure, the DOT AAM Interagency Working Group is coordinating efforts related to safety, operations, infrastructure, physical security and cybersecurity, and federal investment necessary for maturation of the AAM ecosystem in the U.S. They are focused on ensuring cohesive and consistent Executive Branch-wide policy through a collaborative and proactive approach that supports the FAA's integration of AAM into the NAS.

The FAA also participates in the newly-formed International Civil Aviation Organization (ICAO) AAM Study Group. The 41st ICAO Assembly recognized that the rapidly evolving AAM ecosystem requires a globally harmonized operational and regulatory framework and guidance. ICAO provides the forum for 26 international stakeholders to develop a holistic vision and framework to achieve global harmonization and interoperability of AAM implementation, allowing all countries to benefit from the AAM operations. The FAA and other government agencies participate in all relevant ICAO technical panels that will ultimately work on international standards and recommended practices for AAM as the specific work is forwarded for their action from the AAM Study Group.

AAM Operators and Manufacturers

Companies developing or operating AAM aircraft are key stakeholders in the integration process. These companies will need to work with government agencies to bring forward the use cases and locations of interest, obtain necessary certifications and approvals, and ensure that their aircraft and operations meet safety and regulatory requirements. They will also need to consider the environmental impacts of their aircraft and operations, engage with relevant communities, and minimize environmental and other impacts on communities.

Infrastructure Providers

Any time new transportation is introduced, communities must plan for the integration of those operations either within existing infrastructure or through the development of new facilities. Companies that provide charging stations, vertiports, and other infrastructure necessary for AAM operations will also play a role in integration. Providers of private infrastructure that do not require FAA approval will, in particular, need to engage with relevant communities, minimize environmental and other impacts on communities, and foster community support.

Communities and the Public

As AAM aircraft begin to operate in urban areas, communities and the general public will be affected by these new technologies, capabilities, and services. Community involvement is the process of engaging in dialogue and collaboration with communities affected by FAA actions. This process supplements the public involvement activities required under other laws or requirements. Public engagement and education through involvement of all stakeholders will be necessary to ensure that communities understand the benefits and impacts of AAM operations, and to address any concerns they may have. The AAM industry offers the prospects of convenient alternatives to traditional transportation, as well as increased access to air transportation. However, for this emerging industry to reach its fullest potential, it must gain the support of the general public. The FAA encourages communities to get involved now in these early phases, and to stay engaged.

2 Introduction to Innovate28

On May 3, 2023, the FAA released Version 2.0 of the Urban Air Mobility (UAM) Concept of Operations (ConOps) that describes the technical roadmap for enabling UAM, which is an urban-focused subset of AAM, from the near-term to far-term. The focus of this Implementation Plan, Version 1.0, is to document the work required to enable initial AAM operations in a variety of operational settings or "key sites" in the near-term.

Initial Integration of AAM Operations at One or More Key Sites

Innovate28 (I28) is an FAA initiative that will culminate in integrated AAM operations with OEMs and/or operators flying between multiple origins and destinations at one or more locations in the U.S. by 2028. I28 marks one milestone on the AAM evolutionary continuum and the path to full integration and operations at scale across the NAS. I28 will leverage public-private partnerships to identify key locations and use cases of interest to AAM industry stakeholders while promoting an all-hands-on deck approach to ensure the necessary steps are taken to enable these operations. Leveraging lessons learned from OEMs and/or operators conducting individual EIS building block operations, I28 operations are expected to be larger in scale than initial EIS operations. I28 is intended to result in "leave behind" processes, infrastructure, procedures, and local knowledge at the key site(s). Additionally, the collective experience gained through the I28 initiative is expected to support expanded operations in other areas of the country.

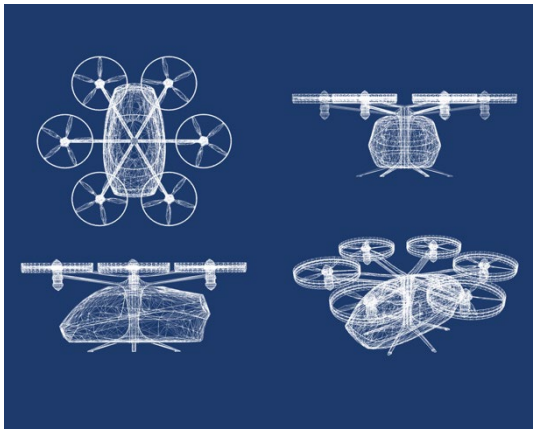
Repeatable Implementation Methodology

The I28 implementation approach includes documenting steps and protocols and collecting data over the course of the effort to develop a repeatable methodology, including processes, procedures, and mechanisms, for expanding AAM operations to other locations across the NAS. This methodology will be used as a guide for future sites to collaborate with the FAA and other stakeholders to streamline implementation of AAM solutions. The FAA will also leverage the I28 efforts, as well as the EIS building blocks, in its ongoing work to evolve and advance AAM into the future.

3 Implementation Plan Overview

This AAM Implementation Plan is a living document that will guide implementation efforts and mature as the FAA works with stakeholders to refine and execute AAM implementation strategies. It will be updated periodically to reflect the continued plans and progress with AAM integration, roadmaps, and schedules for I28 and beyond as work continues to advance towards the mature state vision of AAM operations across the NAS.

Version 1.0 provides details for the near-term I28 initiative, which will enable a repeatable AAM ecosystem at key locations based on information known to date. The evolution of AAM beyond I28 is also previewed. Version 1.0 specifically addresses the following:



- **I28 Key Site Operations**
  - Description of the operating environment in 2028 based on assumptions and expectations of AAM aircraft and operations, including a scenario thread for a generic key site location
  - Overarching framework that FAA stakeholders can use to identify and work through key challenge areas, executing to a common vision
- **I28 Workstreams**
  - Holistic approach to the required efforts, both internal and external to the FAA, needed to meet I28 goals (presented in Section 2)
  - Descriptions of work completed to date and gaps to be addressed in Certification, Airspace and Air Traffic Management, Infrastructure, Environment, Hazardous Materials Safety, and Community Engagement
- **I28 Integrated Master Schedule**
  - Detailed schedule across workstream focus areas that supports I28 operations and leave behind processes
  - Tool for tracking the milestones of internal and external stakeholders (e.g., tribal/state/local government, and industry) who manage their own activities relevant to implementation at specific site(s)
- **AAM Evolution Framework**
  - High-level view of the evolution of AAM operations and an associated framework for the continued development and commitments that are needed to advance AAM integration in the NAS

4 Innovate28 Key Site Operations

The I28 initiative envisions a near-term AAM operational ecosystem that has advanced from EIS at various locations to substantive presence at locations of interest. Since AAM aircraft are currently undergoing or are being planned to undergo the certification process, and specific operational needs are still being defined, it is necessary to make assumptions as to how the AAM industry will operate and what the supporting capabilities will be in 2028. The I28 key site operations presented here are based on industry and FAA projections on the state of technology development, air and ground supporting infrastructure and services, and other capabilities. These assumptions will continue to be updated in future versions of this document as the industry advances and regulations are developed.

The following addresses the assumptions and expectations about AAM aircraft with respect to certification and operating characteristics. I28 AAM operations are then described in the context of the operating environment, including flight operations, airspace usage and route structure, air traffic control (ATC) services, and infrastructure. A scenario thread is also presented for an I28 AAM operation.

4.1 AAM Aircraft

For I28, AAM aircraft will be authorized for piloted operations and will transport passengers and/or cargo within the limits of the aircraft and certification regulations. The aircraft are expected to range in size from single passenger to larger occupancy shuttles, and employ new means of propulsion (e.g., electric motors, hydrogen fuel, hybrid designs). Many are capable of vertical takeoff and landing (VTOL) or short takeoff and landing (STOL) operations and quickly transition to fixed-wing operation after takeoff. It is assumed wake characteristics will be known, including the impacts of wake from other aircraft on AAM aircraft and an AAM aircraft's own wake generation.

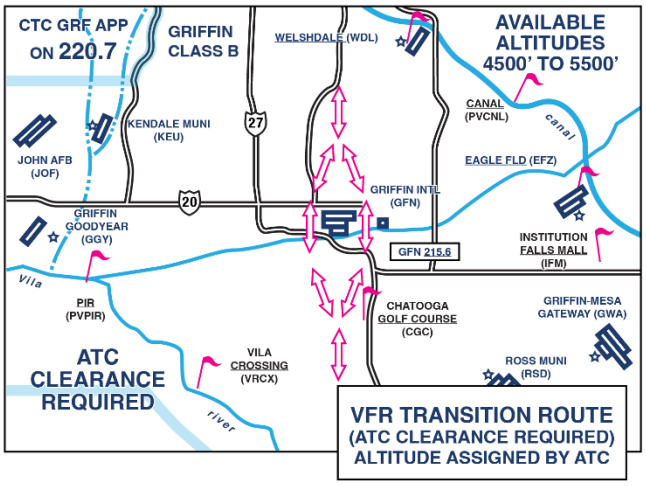
AAM aircraft are expected to be type certificated as special class under 14 Code of Federal Regulations (CFR) § 21.17(b). Because these aircraft have novel airframes and powerplants, the FAA is using many of the performance-based regulations in 14 CFR part 23, *Airworthiness Standards: Normal Category Airplanes*, for the certification basis. AAM commercial operators are expected to be certified to operate under 14 CFR part 135, *Operating Requirements: Commuter and on Demand Operations and Rules Governing Persons on Board Such Aircraft*. Pilots of powered lift aircraft are expected to be rated (type rated as required) for each powered lift aircraft they fly, and they will be required to meet updated qualification requirements for operating under part 135.

AAM aircraft are expected to operate under part 135, including seeking FAA approval for the carriage of dangerous goods and hazardous materials, consistent with the aircraft's type certificated operating weight to include passenger carriage or cargo capability and their frequency of operations. These operations must be part of the operator's FAA approved Dangerous Goods program and further authorized within the operator's Operations Specifications.

4.2 AAM Operations

The descriptions of I28 AAM operations in this section are agnostic to location. As key sites are identified, site-specific airspace and air traffic management (ATM) solutions will be developed for operations within defined geographical areas based on AAM operator use cases.

Airspace Usage and Route Structure



AAM operators are expected to comply with existing communication, navigation, and surveillance (CNS) requirements for the airspace in which they will operate. For I28, the expectation is that the aircraft will operate from the surface to 4000' above ground level in urban and metropolitan areas, and in relatively close proximity to or directly on airports. This means that AAM aircraft will operate predominately in or around Class B and C airspace.

To operate within Class B airspace, pilots must receive ATC clearance, and aircraft are required to be equipped with an operating two-way radio, Automatic Dependent Surveillance – Broadcast (ADS-B) Out, suitable navigation capability, and an operable transponder with altitude reporting capability. Initial AAM aircraft operations are generally expected to operate in compliance with Visual Flight Rules (VFR) weather minima in visual meteorological conditions (VMC).

VFR aircraft operating within Class B airspace receive separation services from ATC. VFR aircraft may obtain an ATC clearance to transit Class B airspace, if needed, however, the FAA encourages VFR pilots to operate above or below, or transit Class B airspace using established VFR corridors. To operate within Class C airspace, pilots must initiate two-way radio communications prior to entry and maintain communications while in the airspace. They must also be equipped with a two-way radio and an operable transponder with altitude reporting capability.

The addition of AAM operations will add to the already busy traffic levels of Class B and C airspace. In cases where existing VFR procedures do not meet the needs of air traffic facilities or AAM operators, special agreements or coordination may need to occur to

accommodate the increase in traffic levels. Ideally, agreements made at the local level will reduce ATC workload.

Charted routes will be the primary routing structure used by AAM aircraft. This approach enables the FAA to develop routes that accommodate AAM operator needs while leveraging the existing design and charting processes. The development of airspace route structures for I28 operations will consider design standards based on 14 CFR parts 135 and 91, *General Operating and Flight Rules*, local procedures, terrain, and traffic flows. Pilot adherence to charted I28 routes and the recommended altitudes or flight ceilings associated with them are voluntary. However, ATC may assign charted routes and altitudes where pilot compliance is required, provided such procedures are called for in specific FAA-operator Letters of Agreement (LOAs), or are necessitated by traffic density and/or safety considerations. ATC may also restrict operations within designated operating zones when certain criteria are met, and as requested by the appropriate authorities. Noise and other environmental considerations are accounted for in the airspace design. Changes to airspace design and/or new routes will likely require the FAA to conduct environmental review and community outreach.

I28 AAM routes will be designed for use in VFR conditions only, and where possible, use existing or modified low altitude VFR routes and constructs. While these routing constructs do not inherently provide separation or segregation of participating AAM traffic, they are developed to assist pilots in avoiding major controlled traffic flows. The routes[1] may include:

- **VFR flyways** - General flight paths not defined as a specific course, for use by pilots in planning flights into, out of, through or near complex terminal airspace to avoid Class B airspace. An ATC clearance is not required to fly these routes.
- **VFR corridors** - Airspace through Class B airspace, with defined vertical and lateral boundaries, in which aircraft may operate without an ATC clearance or communication with ATC.

[1] *https://www.faa.gov/air_traffic/publications/atpubs/aim_html/chap3_section_5.html*

- **VFR transition routes -** Specific flight courses depicted on a terminal area chart for transiting a specific Class B airspace. These routes include specific ATC-assigned altitudes, and pilots must obtain an ATC clearance prior to entering Class B airspace on the route.

- **Special flight rule areas** - Airspace of defined dimensions, above land areas or territorial waters, within which the flight of aircraft is subject to the rules set forth in 14 CFR Part 93, unless otherwise authorized by ATC.

I28 AAM routes may include non-published routes. They may also require development of new routes. More information is needed to make this determination; it may be a combination of existing and new route structures until a specific AAM route process can be developed. It is important to note, however, that no unique AAM airspace structures (e.g., dedicated AAM airspace corridors) or procedures are expected to be implemented by this 2028 timeframe.

Efforts will be made when developing and designating AAM routes to ensure, to the extent possible, that the flow of AAM traffic does not negatively impact or interfere with other air traffic flows or other airspace available to ATC today. In some cases, this may be unavoidable, and operational efficiency will need to be considered. As previously noted, these routing constructs do not inherently provide separation or segregation of AAM traffic, therefore see-and-avoid will continue to be the primary means of aircraft separation.

Air Traffic Control Services

For I28, ATC services will be provided to AAM operators as needed or required and are defined in FAA regulations, directives, and agreements (e.g., FAA Order Joint Order (JO) 7110.65, *Air Traffic Control*, LOAs, Memorandums of Understanding (MOU), Notices to Air Missions (NOTAM), and Advisory Circulars (AC)). AAM operations may require an LOA covering local procedures or routes, establishment of reserved discrete beacon codes, and use of abbreviated call signs.

The following lists the expectations of ATC and OEMs/operators with respect to operations at designated key site locations.

- AAM operators comply with the appropriate CFR pertaining to ATC or apply for a waiver/exemption.

- AAM operations are expected to be conducted with flight schedules that are predetermined. Schedules are provided in advance of operations and coordinated with local ATC and all other identified stakeholders.

- The pilot has two-way radio communication with ATC when required.

- VFR aircraft operating within Class B airspace receive mandatory traffic advisories and safety alerts, as well as separation services where required.

- VFR aircraft operating in Class C airspace receive sequencing services and ATC separates IFR aircraft from the VFR aircraft. VFR aircraft receive traffic advisories and safety alerts. VFR pilots retain responsibility for their separation.

- In other airspace, ATC provides oversight with traffic advisories and safety alerts, but the pilot is responsible for separation.

- AAM aircraft operators are not guaranteed ATC flight following services outside of Class B, C, or D airspace where mandatory air traffic services are not required.

- Air traffic automation is as it currently exists.
    - There are no expected major changes to ATC automation systems within the 2025 to 2028 timeframe to support I28 operations.

- Third-party service providers may support non-safety critical aspects of operations (e.g., operator scheduling of flights), but not substitute for ATC services where required by rule.

- Existing communication methods are used for pilot-controller communications for AAM VFR operations.

Infrastructure

Initial AAM operations in the 2025-2028 timeframe are expected to primarily use existing airports and heliports (with modification where required to meet FAA's interim guidance for vertiport design). Greenfield or infill (repurposed) development for new vertiports is also expected to connect operations to destinations near a city center or other preferred locations. It is unlikely, but possible, that specially built vertiports will be available in this timeframe. Modifications may be required for existing ground and air infrastructure due to the nature of these new aircraft. For example, if heliports are used as vertiports, they require the following infrastructure to successfully operate in the 2025-2028 time:

- *Adequate AAM aircraft parking zones for loading/unloading.* An efficient vertiport has parking zones that are separate from the "pad" that is used for takeoff and landing. Separate parking zones allow for safe entrance and egress of passengers. They also allow for parking of vehicles waiting for demand to materialize.

- *Infrastructure sizing, dimensional geometry and load bearing requirements modified to comply with FAA* Engineering Brief (EB) #105, Vertiport Design (September 21, 2022). The dimensional and sizing requirements for vertiport landing and safety areas may warrant differences from heliports based on the design and performance characteristics of AAM aircraft.

- *Charging stations.* Safe rapid charging stations for electric batteries are present at vertiports as well as adequate cooling stations and hazardous materials (HazMat) lockers/storage for batteries and fire suppression for battery fires. Sufficient amperage is available to reduce recharging time to the minimum.

- *Weather station.* The vertiport has a weather station, possibly an Automated Surface Observing System (ASOS) or Automated Weather Observing System (AWOS), if it is remote from an airport. AAM pilots need to know wind speed and direction, as well as visibility, when planning an arrival or departure. Vertiports co-located with an airport can use the airport's weather system.

- *Fire management services.* The vertiport has access to fire management services with personnel trained in handling electric/hydrogen fueled fires.

New vertiport facilities follow the guidance in FAA EB #105, Vertiport Design. FAA vertiport guidance is updated over time to address the variety of aircraft and operations seeking EIS.

- Airport sponsors or proponents submit a Form 7460-1, *Notice of Proposed Construction or Alteration*, in accordance with 14 CFR § 77.9 for any proposed on-airport (or on-heliport) vertiport support infrastructure (e.g., charging stations, fueling stations, AAM terminal). Airport sponsors with federally obligated facilities, which are airport sponsors who have accepted federal financial assistance, must also conduct proper planning activities including an update to their FAA-approved Airport Layout Plan.

- Sponsors of non-federally obligated facilities or proponents of a new vertiport facility not on or co-located with an existing federally obligated airport or heliport submit a Form 7480-1, *Notice of Landing Area Proposal*, at least 90 days in advance of the day that construction work is to begin on the landing area. This notification to the FAA is required in accordance with 14 CFR part 157, *Notice of Construction, Alteration, Activation, and Deactivation of Airports*.

New vertiport facilities that require approval and/or funding from FAA will undergo FAA environmental review. Facilities that do not require FAA approval or funding may be expected to engage in community engagement consistent with any applicable local rules.

All non-FAA stakeholders will have agreed to established criteria for ground infrastructure, including: vertiport location, charging, cooling, maintenance, security, ground safety, and parking in accordance with federal regulations where applicable. Take-off and landing from the Touchdown and Liftoff Area (TLOF) is recommended for approach and departure operations from a standalone vertiport or vertistop (vertiport with limited services). It is unlikely that AAM operators will use "hover taxi" to taxi or re-position on the airfield due to anticipated battery limitations.

Security

Security is a key component to the safe and secure integration of AAM. However, AAM presents unique challenges for aviation security. Therefore, a Working Group under the broader DOT-lead Interagency Working Group previously discussed was established to focus strictly on security issues to inform the whole of government strategy for addressing the integration and evolution of AAM as required in the AAM Coordination and Leadership Act.

4.3 I28 Scenario

The following provides a glimpse of what I28 might look like once an AAM aircraft has successfully completed the certification processes (including wake turbulence classification)[2] and is ready to fly. This scenario sequence reflects the use of designated operating areas, to include landing and departure areas, other existing infrastructure, services, and existing policies and procedures to the degree possible. LOA negotiations between air traffic, OEMs and operators, airport operators, port authorities, emergency management services, and federal, tribal, state, and local law enforcement organizations establish the processes and procedures for safe and efficient operations.

This simplified thread steps through an I28 AAM operation departing a vertiport in uncontrolled airspace and landing at a tower-controlled airport in controlled airspace:

1. The pilot follows established procedures for checking weather and NOTAMs for departure, en route, and destination, and files a flight plan if required. While passengers prepare to board the AAM aircraft, the pilot conducts aircraft walkarounds, preparations, safety protocols, and departure checklists.

2. Departing in uncontrolled airspace, the pilot is responsible for adhering to appropriate rules governing flight in uncontrolled airspace. The pilot announces their departure intentions over a common radio frequency and maneuvers the aircraft to the takeoff location. After visually ensuring their departure area and path is clear, the pilot departs.

3. The pilot is aware of the requirements for flight in controlled airspace. The aircraft enters controlled airspace by means of two-way radio communication and the appropriate clearance from ATC. Published procedures or agreements (national, local, or signatory) reduce the need for ATC communications.

4. ATC issues instructions or clearances to provide separation and/or sequence the aircraft with other traffic. The pilot on board complies with instructions given by ATC or follows previously coordinated and approved instructions from the approving ATC facility (via published procedures or agreements).

5. ATC transfers control and communication from controller to controller as the aircraft transits different ATC sectors. After the pilot obtains information on destination runway(s) in use, weather, and other pertinent airport information, they start their approach to the landing site or follow a previously approved approach path. The ATC tower issues a clearance to land. The pilot may ask and be permitted to land at airport areas other than runways and taxiways.

[2] *Without wake turbulence classification, ATC is required, per FAA JO 7110.65, to provide the existing maximum wake turbulence separation in Class B airspace (10 nautical miles in front and behind the aircraft), including VFR aircraft.*

6. The pilot on board completes landing checklists, their approach, and safe landing at a new, existing, or predetermined approved landing site. The aircraft is maneuvered to the approved parking area for deplaning.

7. Passengers and crew follow established procedures for deplaning the aircraft. Following prescribed security procedures, the passengers exit the area or are directed to any further security screening required to enter the secure terminal area for connecting flights.

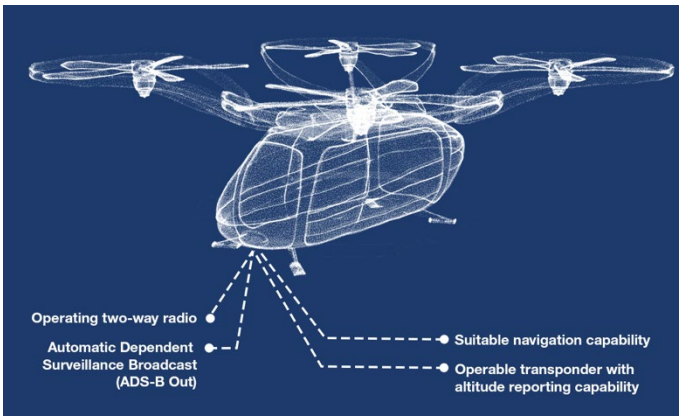
This is a high-level view of I28 operations and the near-term integration phase. The assumptions, expectations, and nature of operations will evolve over time to reflect the technology and infrastructure advancements that will provide increased scalability and types of operations.

5 Innovate28 Workstreams

The FAA is taking a holistic approach to the efforts required for AAM implementation. The I28 leadership team in the NextGen organization (ANG) established iTeams comprised of representatives across FAA lines of business (LOBs) to bring together expertise in different areas associated with AAM implementation and foster collaboration in the planning and execution of required activities. The iTeams represent the major workstreams associated with AAM implementation, including Certification, Airspace and Air Traffic Management, Infrastructure, Environment, Hazardous Materials Safety, and Community Engagement.

This section addresses each workstream and describes the activities completed or underway, as well as gaps to be addressed, to support near-term I28 implementation goals. Integrating this information supports the development of a coordinated roadmap to I28 AAM operations. While the initial focus is on enabling near-term AAM operations, the work efforts and milestones within these workstreams will continue beyond I28 to support the continuous evolution of AAM.

5.1 Certification



UNITED STATES OF AMERICA
DEPARTMENT OF TRANSPORTATION-FEDERAL AVIATION ADMINISTRATION
STANDARD AIRWORTHINESS CERTIFICATE

The FAA has a proven track record of safely certificating and integrating new and novel design features, aircraft, and safety-enhancing technologies into the NAS. New AAM aircraft are expected to offer capabilities ranging from single-pilot, recreational eVTOL aircraft, to piloted, powered lift, multi passenger short range aircraft. The type certification of AAM aircraft is possible because the FAA can leverage the current regulatory framework, which allows development of project-specific requirements tailored to fit the unique aspects of novel designs. The flexibility to tailor requirements can come in the form of special conditions or unique airworthiness criteria under a special class, depending on the AAM design (airplane, rotorcraft, or powered lift).

5.2 Operational Suitability

As AAM aircraft near issuance of their Type Certificate, the OEM will engage with multiple boards within the FAA's Flight Standards Service (AFX) to conduct operational suitability reviews. It is during this process that the Flight Standardization Board will determine the aircraft type rating, the Maintenance Review Board will determine the scheduled maintenance taskings for development of an operator maintenance program, and the Flight Operations Evaluation Board will determine the requirements of the aircraft's master minimum equipment listing. The applicant may also apply for any needed regulatory exemptions during this process.

5.2.1 Operations Certification

To satisfy regulatory responsibilities and promote convergence, AAM industry engagement concerning operations certification will resemble a mix of traditional aviation with one-on-one engagement combined with utilization of existing and/or new forums that invite FAA-industry (e.g., standards development organizations) collaboration. In other words, the FAA will use normal processes with a mix of one-on-one outreach with individual applicants, and larger groups via forums to achieve a successful collaboration. This is a key procedural step in setting common expectations across the industry.

The FAA is engaged in rulemaking to enable AAM operations. The efforts are currently oriented around piloted operations, and in the interim the agency expects to use waivers, deviations, and exemptions as appropriate for initial operations. For AAM operations to be successful in 2028, it is important to connect, as seamlessly as possible, the interim methods with proposed rulemaking (and an overall framework, including external and internal guidance) as operational experience accrues.

Rulemaking Activities

Integration of Powered Lift: Pilot Certification and Operations: Publication of a Notice of Proposed Rulemaking (NPRM) is expected in June 2023. This action proposes an SFAR for alternate eligibility requirements to safely certificate initial groups of powered lift pilots, as well as determine which operating rules to apply to powered lift aircraft on a temporary basis to enable the FAA to gather additional information and determine the most appropriate permanent rulemaking path for these aircraft.

Recognition of Pilot in Command Experience in the Military and Air Carrier Operations: The final rule was published on September 21, 2022. This action extended the 500-hour credit military pilots of fixed-wing airplanes can use towards the 1,000 hours of air carrier experience to pilots of powered lift aircraft operations. This allows credit for select military time in a powered lift aircraft flown in horizontal flight towards the 250 hours of airplane time as pilot in command (PIC), or second in command performing the duties of PIC, required for an airline transport pilot certificate.

Update to Air Carrier Definitions: This NPRM was published on December 7, 2022, with comments submitted by February 6, 2023. This action proposes to amend the regulatory definitions of certain air carrier and commercial operations. The proposed rule adds powered lift to these definitions to ensure the appropriate sets of rules apply to air carriers' and certain commercial operators' operations of aircraft that FAA regulations define as powered lift. The FAA also proposes to update certain basic requirements that apply to air carrier oversight, such as the contents of operations specifications and the qualifications applicable to certain management personnel. In addition, this action proposes to apply the rules for commercial air tours to powered lift. This proposed rule is an important step in the FAA's integration of this new entrant aircraft in the NAS.

Airman Certification Standards and Practical Test Standards for Airmen; Incorporation by Reference: This NPRM was published on December 12, 2022, with comments submitted by February 10, 2023. This action proposes to revise certain regulations governing airman certification. Specifically, the FAA Airman Certification Standards and Practical Test Standards are currently utilized as the testing standard for practical tests and proficiency checks for persons seeking or holding an airman certificate or rating. The FAA proposes to incorporate these Airman Certification Standards and Practical Test Standards by reference into the certification requirements for pilots, flight instructors, flight engineers, aircraft dispatchers, and parachute riggers.

The following list includes examples of guidance that may need to be developed or updated in support of AAM integration rulemaking activities to describe standards and means of compliance, as well as promote good safety practices. This list is not all-inclusive.

- Advisory Circulars
- Development of standards and practices for Flight Standardization Boards and Maintenance Review Boards
- Processes and Procedures for issuance of 14 CFR part 135 Air Operator Certificates
- Amendment of internal FAA Orders and related change management
- FAA Order 8900.1 Flight Standards Information Management System
- FAA Order 8260-series
- Development of training for workforce to support AAM oversight and certification
- Development of and guidance related to the issuance of Operations Specifications (OpSpecs), Management Specifications (MSpecs), Training Specifications (TSpecs), and Letters of Authorization as appropriate, for AAM Operations
- Guidance and procedures for the issuance of licensing and certification of industry personnel
- Aeronautical Information Manual (AIM) and Aeronautical Information Publication (AIP)
- Pilots Handbook of Aeronautical Knowledge
- Flight Standards infrastructure guidance

Flight Standards is working to further adapt its organizational structure for both conventional and emerging operations. Aircraft capabilities and procedures (defined by manufacturers) are inextricably linked with operational approvals and personnel training, along with procedures for flight operations and continued airworthiness. As such, Flight Standards will continue to work closely with the FAA's Aircraft Certification Service (AIR) as part of an integrated oversight strategy by dovetailing its efforts with the certification of AAM aircraft and the issuance of Type Certificates (and continuous operational safety after entry into service).

Flight Standards is evolving its tools used for coordination of manufacturer/operator applications to increase efficiencies and enhance communications. For simple certifications, some steps can be condensed or eliminated. Some applicants may lack a basic understanding of what is required for certification. Other applicants may propose a complex operation but are well prepared and knowledgeable. Because of the variety in proposed operations and differences in applicant knowledge, processes will be thorough and flexible enough to apply to all possibilities. Industry applicants have the responsibility for compliance. Flight Standards will ensure applicants are aware of applicable regulations, standards, and requirements.

Flight Standards is making improvements to the prioritization and processing of certification of new operators and repair stations. This includes exploring various ways to reduce wait times, while ensuring resources available to support valid business ventures. Similarly, as with conventional aviation and drone operations, surveillance and oversight will be scaled taking a risk-based approach, ensuring application of the right level of FAA (and industry) resources. For cases where direct oversight is not applied as frequently, the FAA will work with industry on broad safety promotion and compliance activities.

5.2.2 Aircraft Certification

Aircraft certification is a process through which the FAA approves the design, production, and airworthiness of aircraft in the U.S. The certification process ensures that an aircraft meets minimum safety and environmental standards set by the FAA before it can be operated commercially or privately in the U.S. airspace.

The certification process involves several stages, including design approval, production approval, and airworthiness approval. Design approval involves reviewing and approving an aircraft's proposed design, including its systems, structures, and performance capabilities. Production approval ensures that an aircraft is built according to the approved design and meets the FAA's quality standards. Finally, airworthiness certification ensures that the aircraft is in a condition for safe operation and conforms to its approved design.

Currently, AIR is engaged with over two dozen manufacturers targeting the development of novel aircraft and propulsion technologies that underlie the design and operation of AAM aircraft. While some of these companies are relatively early in their technology development, vehicle design, and operations concepts, and in their readiness to engage in a new type certification program, nearly half of the companies have reached a level of

maturity and development to have manufactured flying testbed prototypes. Their progress reflects positively on readiness to advance in the type certification process.

AIR is also currently working to define clear certification requirements and pathways to showing compliance for several novel aircraft technologies that are anticipated to be key to the future of AAM design and operations. These technologies include electric propulsion, large lithium-ion battery arrays, hydrogen fuel cell systems for electrical energy supply, distributed propulsion systems with highly integrated flight and propulsion controls, increased automation, and VTOL capabilities for winged aircraft.

The FAA determined that its existing aircraft certification processes are sufficient to type certificate powered lift as a special class under 14 CFR § 21.17(b). The special class process allows the FAA to address the novel features of unique and nonconventional aircraft without the need for additional processes such as special conditions or exemptions that would be required if the FAA used existing airworthiness standards. Under the special class process, the FAA designates or creates applicable airworthiness requirements as the certification basis for each aircraft design, including its engines and propellers. This designation and creation of applicable airworthiness requirements includes appropriate requirements from the existing airworthiness standards applicable to normal category and transport category airplanes, normal category and transport category rotorcraft, aircraft engines and propellers (parts 23, 25, 27, 29, 33, and 35), and it may also include unique airworthiness criteria developed specifically for the individual product.

In order to move forward to a more streamlined certification process, the FAA has proposed an update and expansion of the requirements for Safety Management Systems (SMS) and requires 14 CFR parts 5, *Safety Management Systems*, 21, *Certification Procedures for Products and Articles*, 119, *Certification: Air Carriers and Commercial Operators*, 91, and 135 certificate holders to develop and implement an SMS. The FAA also proposed this rule in part to address a Congressional mandate as well as recommendations from the National Transportation Safety Board (NTSB) and two Aviation Rulemaking Committees (ARCs). The Notice of Proposed Rulemaking on Safety Management Systems was published in the Federal Register on January 11, 2023, and the comment period closed on April 11, 2023.

Acceptable Means of Compliance

A key tenet of the FAA's approach to AAM certification is that an applicant's means of demonstrating compliance with the airworthiness requirements for its proposed design (i.e., the applicant's Means of Compliance (MOC)) must be accepted by the FAA. Although the FAA is leveraging the performance-based requirements from 14 CFR part 23 as modified by amendment 23-64, the consensus standards that the FAA has accepted as MOCs for normal category airplanes may not be appropriate for a particular proposed AAM due to its configuration, complexity, or novel technology. Work is still in progress to provide applicants with standardized MOCs that consider configuration differences, complexity, and novel design.

Noise Considerations

Aviation noise remains one of the primary environmental challenges to the continued growth of aviation. Pursuant to 49 U.S. Code (U.S.C.) 44715, the FAA has the responsibility to "protect the public health and welfare from aircraft noise." This responsibility includes broad authority to adopt regulations and noise standards as necessary. The FAA regulates the maximum noise level that an individual civil aircraft can emit through requiring aircraft to comply with certain noise limits. These limits and associated testing standards are found in *14 CFR part 36, Noise Standards: Aircraft Type and Airworthiness Certification.* Any applicant seeking a type certificate for their aircraft in the U.S. must comply with noise standard requirements as a part of the type certification process.[3] In addition, the FAA must complete a Noise Control Act finding, which ensures that the latest safe and airworthy noise reduction technology is incorporated into aircraft design and enables the reductions in noise experienced by communities.

When establishing the noise certification basis for AAM, the FAA will examine each application and determine whether existing part 36 requirements are appropriate as a noise certification basis, as is done for all applicants whose aircraft are subject to noise certification. If the current standards cannot be appropriately applied, the FAA may promulgate a rule of particular applicability for that applicant's aircraft model to establish a noise certification basis. Such a rule will require environmental review pursuant to the National Environmental Policy Act (NEPA). To date, for the one aircraft presented for noise certification, the FAA has determined that the existing testing procedures and requirements in part 36 are applicable. The FAA is currently evaluating other applications and will determine the noise certification basis for them.

5.3 Airspace and Air Traffic Management

AAM infrastructure, automation, and traffic management approaches will evolve over time as the AAM operational tempo increases in airspace across the NAS. AAM aircraft will be integrated at greater scale with commercial and general aviation (GA) traffic, as well as other low-altitude airspace users, such as recreational and commercial small unmanned aircraft systems or drones. In the near-term for I28, however, these interactions are minimized and thus can be managed with existing ATC tools, procedures, and protocols. AAM aircraft are expected to be operating with a pilot on board and under VFR in VMC conditions; it is likely these aircraft will be treated as any other fixed wing/rotorcraft operating under VFR conditions, to the extent they are able to comply with existing rules, regulations, and procedures.

[3] *If the AAM aircraft is non-electric and has a thrust of >6000lbs, engine emissions regulations could also possibly be applicable.*

The FAA's Air Traffic Organization (ATO) leads the planning, development, and implementation of airspace and ATM solutions, including development of airspace and route structures, policies, procedures, and ATC training. For I28, the ATO developed a general approach for airspace route design and usage, and traffic management that supports AAM VFR operations in the near-term (see Section 4), including the use of existing VFR route constructs.

I28 ATM processes will support a future national strategy, and supplemental directives will ensure consistency in how AAM route networks are designed. Existing mechanisms used by air traffic beyond traditional airspace classifications include the establishment of a special air traffic rule which applies within a Special Flight Rules Area (SFRA). Evaluation of these and alternative methods early in the planning process will allow the required collaboration to ensure timely resolution and publication of AAM route and network design.

Depending on the volume and specific operational needs of I28 operations, local air traffic facilities may need to update their procedures, utilize existing non-rulemaking airspace strategies, and complete an analysis to determine the need for airspace changes. The air traffic planning and analysis policy uses an interdisciplinary approach to effectively manage NAS changes. This would include the development of necessary training in a training delivery plan.

Sufficient time will be allotted throughout I28 development activities to ensure the necessary rulemaking or non-rulemaking activities, route publications and distribution, and training materials can be developed; and controller training can be completed to support the safe management of NAS operations.

In parallel, the ATO will continue to address AAM through its ATO AAM Near-Term Operational Integration Workgroup (NTIWG), which was established in November 2021 to identify air traffic considerations and impacts for near-term operations. After concluding their review in June 2022, the NTIWG had identified 55 recommendations to help address the integration of AAM operations in the near-term. Many of the recommendations require changes to FAA policy and guidance directives including, but not be limited to:

- JO 7110.65 Air Traffic Control
- JO 7210.3 Facility Operation and Administration
- JO 7400.2 Procedures for Handling Airspace Matters

The ATO also recommends a detailed policy review be conducted to determine if other associated orders and ACs need to be updated or developed. Topics that should be considered include:

- Wake Turbulence Categorization and impacts to operations
- Aircraft Certification and how that translates to ATC Service Provisions and Separation
- Minimum Safe Altitude as it applies to AAM
- Workforce and facility staffing considerations

5.4 Infrastructure

AAM operations require specialized infrastructure to support the safe and efficient operation of eVTOL aircraft. This section addresses how existing infrastructure can be leveraged to support near-term operations. It also documents what has been completed to-date to enable the planning, design, and construction of new vertiports or modification of existing facilities. The FAA remains committed to fostering collaboration with industry and local stakeholders to enable vertiport construction. Additional aspects of infrastructure will need to be addressed as I28 efforts progress, including electrification to support charging of AAM aircraft and power for AAM operations. The DOT Interagency Working Group will address these and other topics not directly in the FAA's purview.

5.4.1 Existing Infrastructure

To enable near-term operations, operators and manufacturers desire to use existing infrastructure, including commercial service airports, underutilized GA airports, and heliports. It is likely though that existing heliports and airports will require modification or enhancements to accommodate early entry aircraft and their unique operations.

Facility owners and operators should plan for dedicated takeoff and landing areas and support facilities that address the needs of eVTOL operators, including limited taxi capabilities and charging. Airport and heliport owners should engage existing and future tenants who intend to operate eVTOL aircraft to ensure planning and siting of infrastructure and equipment adequately accommodates their intended operations.

Construction of on-airport vertiport facilities may require FAA notification under 14 CFR part 77, *Safety, Efficient Use, and Preservation of Navigable Airspace* and updates to an airport's FAA approved Airport Layout Plan (for federally obligated airports). Modifications to existing federally obligated infrastructure will also undergo FAA environmental review

and community engagement. Facilities that do not require FAA approval or funding may be responsible for community engagement consistent with local rules.

5.4.2 New Infrastructure

Communities, developers, and operators may also choose to establish new vertiports, not co-located with an existing airport or heliport. State licensing and local zoning ordinances may require updates to accommodate these new types of landing facilities. Where no federal funding is used, FAA oversight and engagement with these new vertiports and their surrounding communities may be limited. Communities are encouraged to plan for vertiports capable of accommodating multiple operators that will benefit passengers. They should also plan for equitable, multimodal placement of vertiports to connect transportation systems without creating new sources of traffic congestion and parking concerns whenever possible. Construction of new infrastructure would trigger FAA notification under 14 CFR part 157.

5.4.3 Vertiport-Related Research

In 2019, the Office of Airports (ARP) and the Airport Technology Research and Development Branch (ATR) began a multi-year research project to support the development of vertiport standards. ATR is investigating and evaluating VTOL and STOL aircraft design and performance to develop design standards and guidance.

For Phase 1, ATR completed a literature review (2021) that identified gaps in available performance data; a result of AAM company concerns about the release of proprietary information. With the help of FAA's Emerging Technology Coordination Branch (formerly known as Center for Emerging Concepts and Innovation) and other AIR offices, using existing mechanisms for communication with applicants and data protection, ATR obtained preliminary AAM aircraft data. The literature review findings, analysis of the aircraft data, and further interchange with manufacturers and operators, supported the development of interim guidance. On September 26, 2022, ARP released EB #105, Vertiport Design. The EB serves as interim guidance to airport sponsors, vertiport operators, and infrastructure developers for the design of vertiports for VTOL operations, until a performance-based AC is released in 2025. The EB is prescriptive and purposely limited to address eVTOL operations using design and performance data available from VTOL aircraft manufacturers currently working toward certification.

Phase 2 of the research was completed in summer 2022 and involved six hypothetical vertiport locations covering a range of diverse scenarios, including on-airport, off-airport (in close proximity to complex airport environment), urban, and rural vertiport environments. Modeling analyzed TLOF occupancy times for arrival and departure operations. The scenarios used site-specific information, allowing development of conceptual layouts for each scenario in an airport layout plan-style drawing.

Phase 3 of the research (started in January 2023) included simulation exercises and operation testing with various AAM companies. The simulation exercises will support

preparations for on-site operational testing which will further evaluate landing precision, approach/departure profiles, rotorwash/downwash impacts, and aircraft taxiing.

The FAA also has an interagency agreement with the Department of Energy's National Renewable Energy Lab (NREL) to determine how aircraft electrification affects a vertiport, heliport, or airport's electrical grid. The research will look at vertiport charging requirements, hazards associated with charging stations, and cybersecurity.

Collaboration among FAA organizations and research branches has been key to ensuring FAA research is relevant and addresses the variety of operations anticipated for I28 and beyond. ARP receives notification of new and innovative aircraft and technology through the AIR Intake Board and other collaborative processes, and then facilitates introductions, as needed, between AIR, the manufacturer, and ATR. The FAA iTeams will continue to coordinate and collaborate on research areas of overlap.

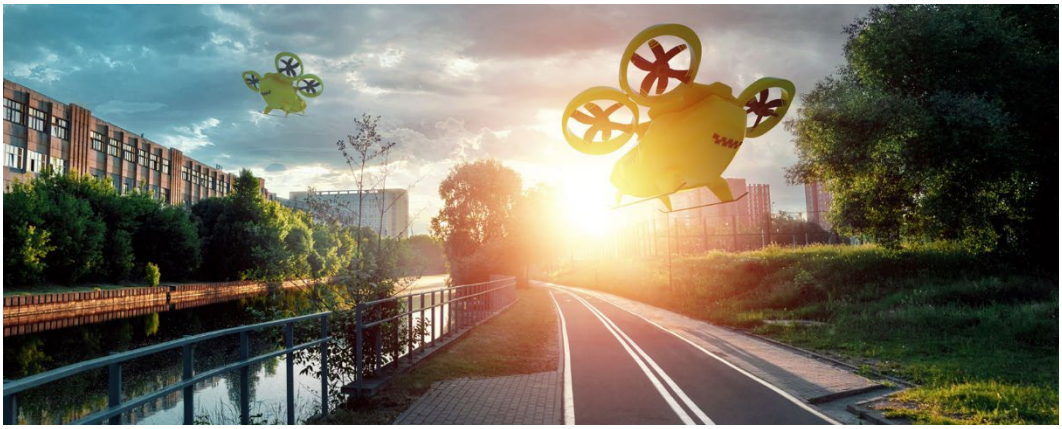
To enable near-term operations, the following areas require further research:

- Vertiport fire extinguishment equipment and electric aircraft firefighting tactics
- VTOL aircraft parking needs
- Vertiport signage, markings, and lighting

5.4.4 Vertiport Standards and Oversight

The FAA is using existing policy, regulations, and infrastructure as a baseline for vertiport guidance and regulations development; however, it will be the responsibility of the operators, manufacturers, state and local governments, and other stakeholders to plan, develop, and enable vertiport infrastructure for I28 operations.

The FAA cancelled its AC on Vertiport Design in 2010 due to a lack of commercially available aircraft. Standards are needed to address the wide variety of aircraft and operations intended under AAM. While the FAA published prescriptive interim guidance for the design of vertiports in EB #105 in September 2022, ARP plans to release a performance-based AC in 2025. Data obtained through operational testing of prototype and production VTOL and STOL aircraft will greatly influence design standards and guidance in the AC. Since AAM is constantly evolving, ARP anticipates updating the vertiport AC more frequently than other airport-related ACs.



The FAA also established a cross-LOB/staff office 'Vertiport Process Improvement Team' to identify a path forward with developing criteria and standards for processing and analyzing proposed vertiports. This team identified actions necessary to address gaps in existing policies, procedures, and standards, including but not limited to the following:

- Initiate a rulemaking project for 14 CFR parts 77, *Safe, Efficient Use, and Preservation of the Navigable Airspace*, and 157 to clarify applicability to vertiports and supporting infrastructure and define vertiport imaginary surfaces
- Review and update JO 7400.2 Airport Airspace Chapter to address vertiport infrastructure and imaginary surfaces
- Review and update FAA Forms 7460-1 and 7480-1 to identify and address vertiport/supporting infrastructure information and data needed for FAA processing/review
- Define FAA's role in vertiport inspections

Existing statutory authority may limit the agency's ability to regulate (i.e., 14 CFR part 139, *Certification of Airports*) and fund vertiports, particularly for private-use facilities. Without certification or federal funding, facilities may not comply with FAA design standards (a current condition that exists in many heliports) or have similar safety equipment and firefighting equipment onsite like today's commercial service airports.

5.5 Environment

The FAA is responsible for evaluating the significance of environmental impacts for aviation operations in the U.S. and disclosing those impacts to the public. As such, to enable near-term AAM operations, the FAA will consider the impact of AAM aircraft on a variety of aspects of the human environment, including (but not limited to) noise, air quality, visual disturbances, and disruption to wildlife. The FAA has policies and practices in place to conduct environmental review for legacy aviation. However, the FAA is still evaluating how best to streamline the environmental review process for new entrants, such as AAM.

The majority of questions related to compliance with environmental requirements in support of I28 remain open due to the need for additional information on what FAA approvals will be required for different aspects of the operation and any infrastructure, and what FAA offices will be responsible for such approvals. In addition, further information from manufacturers and operational data for aircraft is needed for the analysis of noise and

emissions impacts. In particular, in order to determine whether compliance with NEPA is required, the FAA will need to identify whether there is/are a major federal action(s) triggering NEPA. Certification of aircraft, such as AAM, is a major federal action that will trigger compliance with NEPA, however there may be other FAA actions (e.g., approving or establishing where the AAM aircraft fly) that could trigger NEPA. For example, developing routes for AAM aircraft or introducing AAM into the NAS that will impact other flight operations may trigger NEPA. If NEPA applies, the LOB responsible for the approval will need to determine and conduct the appropriate level of environmental review (including potentially public involvement), as well as consider the need for supplementary community engagement.[4]

The FAA's Office of Environment and Energy (AEE) and the Office of the Chief Counsel (AGC) will provide support and advice to FAA LOBs in identifying applicable actions and determining the appropriate level of environmental review and associated public involvement and community engagement. If environmental reviews are required, the applicable LOB(s) will be responsible for planning, coordinating, and (where applicable) funding the environmental review and provide any associated public involvement and community engagement needed.

5.6 Hazardous Materials Safety

As AAM operations are initially expected to be conducted under 14 CFR part 135, AAM operators will be required to have hazardous materials training programs approved by the FAA; hazardous materials manuals accepted by the FAA; and Operations Specifications permitting or prohibiting accepting, handling, and transporting HazMat. These requirements apply whether or not a part 135 certificate holder chooses to transport hazardous materials. Part 135 HazMat training and manual requirements are function-based and scale to the scope and complexity of a certificate holder's operation.

DOT Hazardous Materials Regulations (HMR; 49 CFR parts 171-185) apply to any operator transporting hazardous materials in commerce. The HMR are promulgated by the Pipeline and Hazardous Materials Safety Administration (PHMSA). Regulations applicable to aviation are promulgated in coordination with the FAA.

As part of an operator's SMS, safety risk assessments accounting for hazardous materials being transported, relative to a specific certificate holder's system, can help to inform supplemental risk management strategies in AAM operations.

[4] The term "public involvement" exclusively refers to activities required under NEPA and other environmental laws and requirements (e.g., scoping meetings, circulation of environmental documents for public review and comment). "Community engagement" refers to agency-specific guidance that FAA employees are encouraged to use.

5.7 Community Engagement

Changes in airport operations, airspace procedures, aviation infrastructure, and technology can have effects on communities. When developing a new project or procedure that may impact the public, the FAA proactively engages with airports, communities, and elected officials to better understand community concerns about aviation noise and in some cases adjust or mitigate these concerns. With AAM, the FAA will proactively engage with airports and elected officials to ensure they understand AAM and expected operations. Currently the scope of what may need to change to accommodate the safe integration and operation of AAM operators into the airspace is evolving. The FAA's level of engagement will follow the level of change; however, given the expected scope of AAM changes, the FAA does not expect the same type of engagement that the agency conducts for major airspace changes.

Engagement at the regional level is the most effective path as AAM stakeholders and the FAA consider key site locations for I28. The FAA's Community Involvement Manual provides flexible guidance and best practices applicable to all FAA actions and will be leveraged for AAM operations and I28. Additional guidance also exists specifically related to airspace procedures. While the FAA does not expect to develop new or unique agency policy, it will be important to ensure all aspects of the I28 project utilize these best practices.

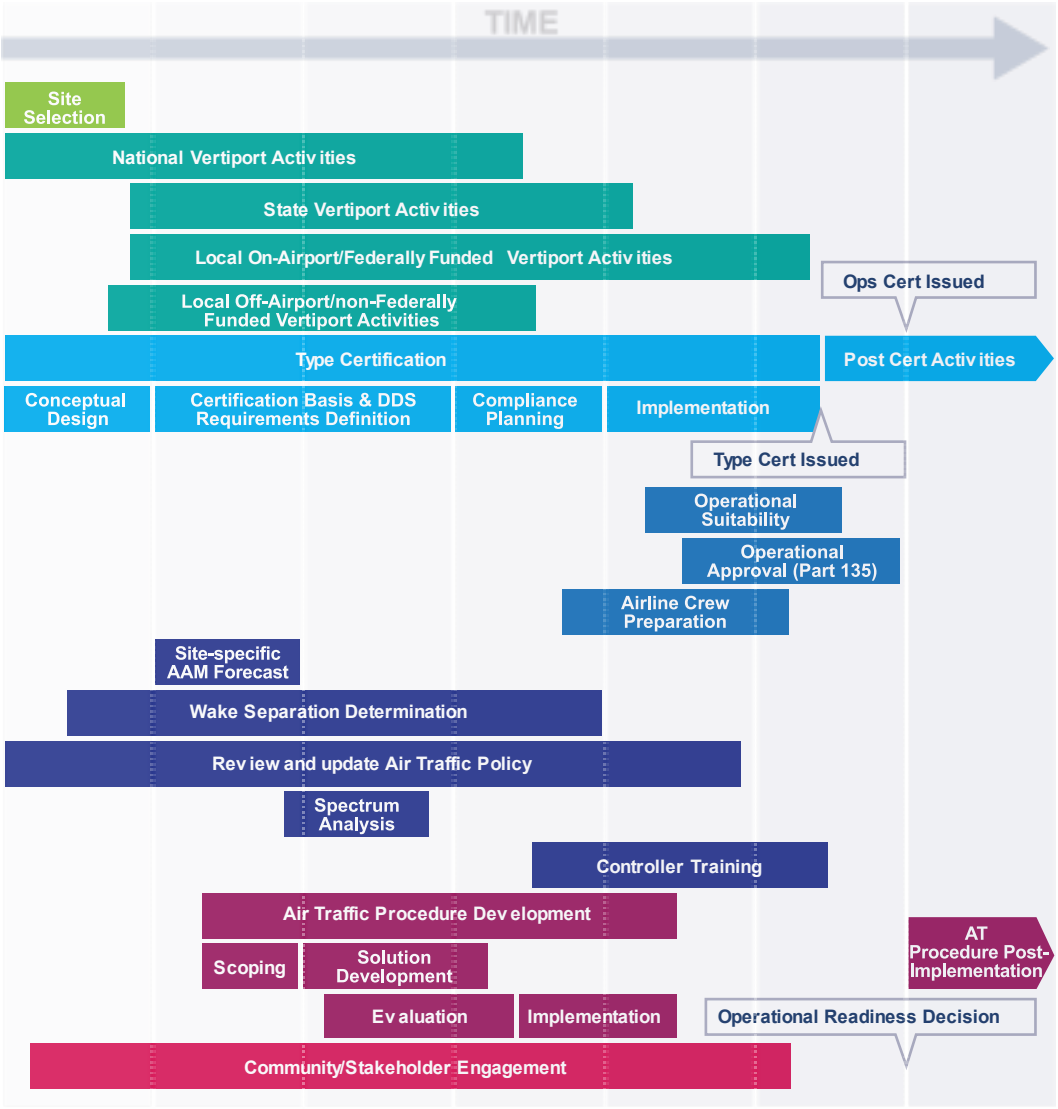
Elements of community engagement are already part of normal business practices for some FAA LOBs or Staff Offices. For example, compliance with NEPA and other environmental requirements often includes required public involvement elements, such as the distribution of an environmental document for public review and comment, that might be one element of a robust community engagement strategy. It is important to note that community engagement supplements but cannot substitute for these required public involvement activities. While public involvement is led by the FAA under some environmental laws or other requirements, community engagement may also be led by the proponent of the project (which may be FAA in the case of many airspace changes but can also be airport sponsors or operators). When the project proponent takes the lead on community engagement, the FAA plays an oversight role, providing advice and guidance on good community engagement practices.

For I28, community engagement needs to focus on more than just airspace and it will involve DOT/FAA and other agency offices. It is important that the public understand how these new aircraft operations will impact their communities. Many other stakeholders, such as AAM operators, vertiport sponsors, and airport operators, will be part of bringing AAM to an operational reality and will have a role in community engagement.

6 Innovate28 Integrated Schedule

The Integrated Master Schedule (IMS) contains a comprehensive list of activities that must be achieved by FAA LOBs and staff offices, industry, and local governments and stakeholders to enable AAM operations at a key site. The IMS is generic for a key site and will be tailored for each individual implementation, including the I28 building blocks, as more information is available. Not all activities included in the comprehensive generic IMS will be required for every implementation, and individual implementations will require additional site-specific activities. As a result, the IMS will be iterative as the team learns from each implementation. The IMS utilizes dependencies between activities which are included in Table 1. The IMS requires further refinement both within the agency and through collaboration with external stakeholders, including industry.

The following lists some considerations for the IMS as displayed in Figure 1:



- The Type Certification and Operational Certification paths shown in the IMS are examples for a typical OEM/operator. The certification timelines can vary significantly depending on the maturity and responsiveness of the OEM/operator. Some OEMs have already completed part(s) of the certification processes shown here.

- The Environmental Review timeline is based off a typical Environmental Assessment. This timeline can range significantly based on site-specific factors that can either reduce the Environmental Review to a Categorical Exclusion when the proposed federal action does not individually or cumulatively have a significant effect on the human environment and the proposed action falls within the scope of the approved agency categorical exclusions; or increase it to an Environmental Impact Statement which is required under NEPA when a proposed federal action significantly affects the human environment.

- The timelines of some activities could potentially be significantly reduced or eliminated if it is determined that existing infrastructure can be leveraged with little to no modification.

The final state of the IMS will list a duration and point of contact for each activity so its status can be tracked at routine check-in meetings.

Figure 1. Integrated Master Schedule Version 1.0

Note : The IMS is a depiction of the activities that may be required to allow an operator to enter into service at a location. Depending on the scope and concept of use for their planned operation, not all activities may be required for every implementation; the duration of a step may vary by project as well. Some companies have already completed some of these activities.

Table 1. Detailed List of Activities in the Integrated Master Schedule Version 1.0

High-level Activity	Sub-activities
Select Site	Local discussions and buy-in
National Vertiport Activities	Vertiport Operational Testing data collection and analysis
Vertiport AC	Vertiport AC
	Rulemaking project for Part 77 and 157
State Vertiport Activities	Update zoning ordinances
	Update licensing requirements to address vertiports
	State environmental policy review
Local On-Airport/Federally Funded Vertiport Activities	Airport planning activities
	Airport Layout Plan (ALP) development, submission, and approval process
	Section 163 review
	NEPA Environmental Review
	Site Engineering
	7460 process
	Receive state licensing
	Construction
	Publication and charting
Local Off-Airport/non-Federally Funded Vertiport Activities	7480 process
	Receive state licensing
	Design and Construction
Type Certification	
Conceptual Design	Process Orientation
	Pre-Project Guidance
	Familiarization Briefing
Application Requirements Definition	Application for TC and PC
	Establishment of TC Project
	Certification Project Notification
	Form the Certification Team
Certification Basis and DDS Requirements Definition	The Preliminary TCB Meeting
	Issue Paper Identification
	G-1 Certification Basis
	Notice of proposed airworthiness criteria
	G-2 Detailed Design Standards
	G-3 Noise Standards
	Mean/Method of Compliance
Compliance Planning	Review and Acceptance of Certification Plans
Implementation	Conformity Inspections

7 AAM Evolution Framework

The FAA's approach to supporting the operationalization of AAM encompasses a series of incremental changes and advancements to the regulatory, technological, and operational frameworks that govern the NAS. This approach aims to ensure safety, while also facilitating efficiency and innovation in the AAM industry and will result in a continuum of AAM capabilities that evolves over time as the tempo of operations increases, driving the need for more advanced supporting infrastructure, regulations, and processes. This will allow the collection of early benefits and lessons learned while maintaining progress toward the fully mature state of AAM.

The agency is working on a regulatory framework that will allow AAM aircraft to be fully integrated into the airspace and operate alongside traditional aircraft in the near-term and beyond. The FAA and industry are developing the necessary technologies to support AAM operations, including aircraft and traffic management systems, communication networks, and autonomous capabilities. Finally, the FAA is working to establish operational frameworks that ensure the safe integration of AAM aircraft into the NAS, including training pilots, air traffic controllers, and other stakeholders on new procedures and regulations.

This evolutionary approach to AAM provides advantages. By initially supporting lower complexity operations in the near-term, as with I28, implementation can be achieved by maximizing the use of current capabilities that meet performance requirements and do not require full-scale regulatory and operational infrastructure changes.

With increased tempo, AAM operations will evolve through changes to governing regulations augmented by AAM infrastructure, automation, and cooperative traffic management practices supported by third party services. The evolution to a collaborative, information-rich, data-sharing environment will require new technologies and capabilities. AAM operators and other stakeholders will share information with the FAA having on-demand access to information as needed.

The FAA's ANG organization developed an initial AAM framework that categorizes the evolving phases of AAM and provides context on the AAM roadmap to operationalization. The framework describes the anticipated operational capabilities for both FAA and industry stakeholders as the AAM ecosystem develops and matures over time. The framework also serves to identify key areas that require prioritization and coordination among the various stakeholders across the AAM ecosystem. The framework will inform FAA efforts, but also can be used by industry and other government agencies.

AAM Coordination Areas

The AAM framework consists of five high-level coordination areas, shown in Table 2, within which key AAM capabilities pertaining to both FAA and industry stakeholders are highlighted. AAM capabilities are expected to progress independently toward a mature state. The pace of development may vary within and between coordination areas. Maturity is capability dependent, and not bound by a specific timeline. Regional maturity rates may vary as well, with some communities embracing AAM operations more rapidly than others.

It should be noted that community engagement, although not shown here, will be an integral and required step for each coordination area.

Table 2. AAM Coordination Areas

Area	Considerations for FAA and Industry Stakeholders
Aircraft System	Aircraft, equipment, automation, certification
Infrastructure	Facilities, data systems related standards, federated networks, CNS
Operations	Operational density and modes, procedures, pilot knowledge and training
Airspace	Routes, waivers, cooperative areas, charting and publication
ATC Procedures	Standard operating procedures, LOAs, public-private responsibilities

AAM Maturity Levels

The evolution of capabilities addresses initial, intermediate, and mature states of AAM, and is described across six maturity levels (0-5). Each maturity level is characterized by a set of expected outcomes, as shown in Table 3. One or more triggering events indicate progression from one maturity level to the next.

Table 3. AAM Maturity Levels

Level	Description	Trigger Events (for reaching level)
0	Late-stage certification testing in limited environments, aircraft certification testing and operational evaluations with conforming prototypes and existing rules/procedures, and early industry development and prototyping.	
1	Exploratory operations of minimal density and complexity, type certified aircraft, early FAA procedures development, and initial Provider of Services for UAM (PSU) services.	Completion of relevant NPRMs and rulemaking to allow for vehicle type certification, initial public standards to support data exchanges between industry participants and the FAA.
2	Low-density scheduled commercial operations in urban areas and around airports, as well as an established federated service network* with several PSUs and Supplementary Data Service Providers (SDSPs). Designated cooperative airspace is limited (see UAM ConOps, Version 2.0). **A federated service network is one that is provided and supported by the operators and third-party service providers to exchange the information and agreements needed for FAA-approved cooperative operating practices.*	Increased operational density, new operational modes (e.g., remotely piloted), and the evaluation of cooperative airspace and a federated service network with multiple operating PSUs.
3	Medium-density scheduled and unscheduled commercial operations using an increased number of vertiports and routes in specific geographical areas that make continued use of limited, designated cooperative airspace. Established PSUs and federated service networks support increased levels of automation and instances of remotely piloted aircraft with a safety pilot on board.	Continued evolution of the modes of operations, implementation of designated cooperative airspace in more geographical areas, and the establishment of certification standards for automated and remotely operated large aircraft.
4	Medium-density scheduled and unscheduled commercial operations in an AAM network that make widespread use of cooperative airspace. Fully remotely-piloted operations are supported.	Certification of fully remote piloted aircraft and the availability of enhanced CNS capabilities that can support long distance and fully remote operations, complete implementation of new regulatory frameworks, widespread implementation of cooperative airspace and vertiports, and the ability to support operations in instrument meteorological conditions (IMC).
5	Mature AAM ecosystem, characterized by high density scheduled, unscheduled, and on-demand operations that are geographically dispersed and served by aircraft able to operate autonomously.	Certification of fully autonomous aircraft and the satisfactory performance of highly integrated automation within the federated service network.

FAA and Industry Coordination

The AAM evolution framework embraces independent advancement within coordination areas, but also acknowledges the need for coordination across the areas for the AAM ecosystem to come to fruition. It considers both FAA and industry activities and capabilities to support AAM maturation.

Rulemaking

The FAA uses the same rulemaking process for AAM operations as it does for other aviation-related regulations. To carry out its responsibilities, the FAA must issue regulations that are clear and provide direction to the aviation industry and the public. Through the rulemaking process, the FAA engages with stakeholders, including industry groups, pilots, and the public, to develop regulations that are informed by their inputs. The process provides an opportunity for all interested parties to provide comments and feedback on proposed regulations, which helps to ensure that the final regulations are effective, practical, and above all, ensure safety.

Standards Development

Industry stakeholders, including aircraft manufacturers, operators, and infrastructure providers, play a critical role in developing standards for AAM operations. Industry-driven standards are essential to ensure that AAM vehicles and infrastructure are safe, reliable, and interoperable. Long lead times and the level of stakeholder participation required to develop standards is a high priority area that requires establishing relationships among all the stakeholders, identifying standards development needs, and generating multi-year plans to address those needs and associated actions.

Technology Development and Deployment

Industry's development of technology often moves faster than the regulations addressing the use of the technologies. The FAA needs to establish and maintain close ties with industry to ensure that emerging technologies are designed with safety and NAS integration in mind and that regulations do not unduly constrain technology and market development. This includes the need for industry to consider the complexity of aviation operations and human factors, especially when proposing highly automated solutions. Additionally, the FAA needs to work closely with foreign regulatory counterparts and Air Navigation Service Providers to align and harmonize AAM-related regulations, policies and procedures, as applicable, given this sector's global, entrepreneurial, and innovative ecosystem.

The long lead time for development and deployment of FAA capabilities also makes identifying FAA technology/capability requirements and establishing roadmaps for acquisition and development a high priority activity.

Network Development

The mature state vision for AAM involves industry-built networks for data exchange to support many functions that the FAA has traditionally performed, including aspects of airspace management. These networks and the processes implemented for using them must be compatible with FAA data exchange mechanisms and airspace design and procedures.

Airspace Design and Management

Initial AAM operations that are low density and low complexity will be conducted using existing airspace design and charting processes, and airspace constructs available today (e.g., VFR corridors/flyways, T-routes). As the operations continue to increase in volume and complexity, novel airspace design may be needed to accommodate operations. The concept of designating cooperative areas for AAM operations envisions safe and efficient operations that may not require traditional ATC services in certain situations. They will be available to any aircraft appropriately equipped to meet the performance requirements and are created and implemented when operationally advantageous.

Moving Forward

The FAA will continue to work with AAM stakeholders to refine and further mature this framework and move towards an AAM ecosystem that supports innovation and scalability. The FAA is committed to ensuring the appropriate resources are allocated, workgroups are established to address areas that require research and development, and policy and regulatory decisions keep AAM moving forward into the future.

Hi Wendie,

Following up on this discussion, please see the attached documents pertaining to Modification of Standards. The Word document is dated 2012 in our system, the PDF Mod form is from 2018. I don't have any email records for these forms specifically, but the 2023 LOI closeout letter confirms the FAA has not granted a MOD for the ROFA at UAO.

Thank you,

Tony Beach

Subject: Meeting last week

Wendie!

Thanks for reaching out to ODAV to talk about the comments that you provided on behalf Ted Millar, TLM and AABC concerning the refined alternatives presented to the PAC on July 30, 2024. I also appreciated the opportunity to speak directly with the communities that are and will be affected by ODAV's planning efforts for UAO. It's always important to listen to stakeholders about their concerns and their wishes. I hope our conversation was helpful in understanding ODAV's role in this planning phase and in particular our hope to select an alternative that FAA will support and ultimately agree to extend federal funds to help implement. Like I mentioned in my response to your request for a meeting, I'll be ensuring that all ODAV's communications with its stakeholders are made part of the record. This this email is intended to provide a high-level summary of our discussion today in which you, Anthony Beach, Alex Thomas , Stacy Posegate of DOJ and I attended by teams.

As I explained in our meeting, Chuck Garrison, Director of the Northwest Mountain Region for FAA, has made clear to ODAV that FAA will not fund future projects if the Aurora Airport master plan does not include an ALP that will bring components of the airport up to FAA's standards of compliance. The primary areas of concern, as we have discussed, are the ROFA which extends over and above the Hubbard Highway, OR 551, and the drainfield within the Runway Safety Area supporting your clients' businesses.

I understand that you are asking ODAV to consider another alternative airport layout plan, which you describe in more detail in your letter. You have explained that this alternative should be preferable because it would not require additional real property or moving OR 551. You have also stated that the current alternatives are unrealistic or unnecessary because they seek to obtain "perfect compliance" with FAA standards. But that, in your opinion, perfect compliance is not required. Rather, FAA has an obligation to consider any modifications requested by the ODAV. You also explained that your clients are extremely concerned with the investment that they have put into this airport and their relationship with ODAV. We take all input and comments seriously.

Heather,

On page 3-6 it calls out two items that need additional coordination with FAA:

RPZ - Extension of the runway will place non-compatible land uses in the RPZ. – To run this to ground and make sure that this is something the FAA can support, a RPZ memo needs to go to FAA HQ. Please see the attached document for additional direction.

ROFA - Wilsonville Hubbard Highway runs parallel to the RWY and the north-bound lane falls within the runway OFA. – A similar analysis to the RPZ needs to be done that includes looking at alternatives to resolve the non-standard conditions, costs, etc. Could the road move west? Could the runway/taxiway move east? The FAA does not provide any permanent modifications to standards; therefore, it is not appropriate to assume further development of a non-standard condition without first exploring options to eliminate the condition.

The document also calls out runway connectors which depending on if a solution to the ROFA can be identified may become part of a RWY extension scope and may also need to be considered (If we are touching the runway/taxiway then we would need to identify solutions for the direct access)

As stated during the call, these questions need to be answered prior to an EA because if physical solutions are identified to resolve any or all of the above mentioned issues, they would have a connected action to the RWY extension and need to be considered in the EA. Proceeding without a full understanding of the scope of a project risks segmentation under NEPA.

Please let me know if you have additional questions.

Regards,

Robert Tykoski

U.S. DEPARTMENT OF TRANSPORTATION
FEDERAL AVIATION ADMINISTRATION
NORTHWEST MOUNTAIN REGION
AIRPORT IMPROVEMENT PROGRAM

MODIFICATION OF AIRPORT DESIGN STANDARDS

BACKGROUND

1. AIRPORT:	2. LOCATION(CITY,STATE):	3. LOC ID:
Aurora State Airport	**Aurora, Oregon**	**KUAO**

4. EFFECTED RUNWAY/TAXIWAY:	5. APPROACH (EACH RUNWAY):	6. AIRPORT REF. CODE (ARC):
Runway 17/35	☐ PIR ☒ NPI ☐ VISUAL	**C-II**

7. DESIGN AIRCRAFT (EACH RUNWAY/TAXIWAY):

MODIFICATION OF STANDARDS

8. TITLE OF STANDARD BEING MODIFIED (CITE REFERENCE DOCUMENT):
Advisory Circular (AC) 150/5300-13, para 307

9. STANDARD/REQUIREMENT:
The runway object free area (OFA) requires that no above ground objects protrude above the runway safety area edge elevation. For Aurora State (ARC C-II) the standard OFA width is 800 feet.

10. PROPOSED:
Highway 551 runs north/south parallel to Runway 17/35. Current operations at the Airport justify increasing the Airport's ARC to C-II. The distance from the Runway 17/35 centerline to the Highway 551 centerline is approximately 400 feet. Considering the highway's width, the Airport is approximately 20 feet short of meeting the OFA design standard.

As the airport geometry is not changing from the current condition, the Oregon Department of Aviation requests a modification of the OFA design standard as defined in AC 150/5300-13, para 307.

11. EXPLAIN WHY STANDARD CANNOT BE MET (FAA ORDER 5300.1E):
Highway 551 and the vehicles travelling along the highway penetrate the Airport's runway OFA by approximately 20 feet.

12. DISCUSS VIABLE ALTERNATIVES (FAA ORDER 5300.1E):
Runway 17/35 could be located 20 feet eastward to meet the OFA design standard. Alternatively, Highway 551 could be located 20 feet westward to achieve the 400-foot separation standard. However, neither alternative is financially feasible due to the existance of airport buildings to the east and residential properties to the west.

13. STATE WHY MODIFICATION WOULD PROVIDE ACCEPTABLE LEVEL OF SAFETY, ECONOMY, DURABILITY, AND WORKMANSHIP (FAA ORDER 5300.1E):

No changes to the existing airport geometry are proposed. Additionally, the Department of Aviation has recently removed obstructions (shrubs) along the edge of Highway 551 to increase safety margins. The safety of people on the ground or in aircraft will not be reduced as a result of the proposed design standard modification.

NORTHWEST MOUNTAIN REGION
AIRPORT IMPROVEMENT PROGRAM

MODIFICATION OF AIRPORT DESIGN STANDARDS FORM

ITEMS 1-17 ARE TO BE COMPLETED BY THE AIRPORT SPONSOR(ORIGINATOR). ALL OTHER ITEMS WILL BE COMPLETED BY THE FAA.

THE COMPLETED FORM WILL BE TRANSMITTED BY THE ORIGINATOR TO THE APPLICABLE ADO/AFO. THE ADO/AFO WILL TRANSMIT THE FINAL FAA DETERMINATION TO THE ORIGINATOR.

MODIFICATION TO AIRPORT DESIGN STANDARDS REQUESTS SHOULD INCLUDE SKETCHES OR DRAWINGS WHICH CLEARLY ILLUSTRATE THE NONSTANDARD CONDITION.

ITEMS

1. LEGAL NAME OF AIRPORT.

2. ASSOCIATED CITY.

3. AIRPORT LOCATION IDENTIFIER (SEE APPROACH PLATES/AIRPORT FACILITY DIRECTORY).

4. IDENTIFY THE RUNWAY(S), TAXIWAY(S) OR OTHER FACILITIES EFFECTED BY THE PROPOSED MODIFICATION TO STANDARDS REQUEST.

5. IDENTIFY THE MOST CRITICAL APPROACH FOR EACH RUNWAY IDENTIFIED IN #4.

6. AIRPORT REFERENCE CODE - SEE PARAGRAPH 2, PAGE 1 AC 150/5300-13(CHANGE 4) - I.E. C-II, B-II, A-I (SMALL).

7. NOTE THE DESIGN AIRCRAFT (ARC OR SPECIFIC AIRCRAFT) FOR EACH FACILITY IDENTIFIED IN #4. A DESIGN AIRCRAFT MUST MAKE REGULAR USE OF THE FACILITY. NORMALLY, FAA CONSIDERS REGULAR USE TO BE 500 OR MORE ANNUAL INTINERANT OPERATIONS.

IF THE AIRPORT SERVES A WHOLE FAMILY OF AIRCRAFT IN A PARTICULAR GROUP, THE ARC (I.E. B-II) SHOULD BE SPECIFIED. IF,HOWEVER, THE AIRPORT IS USED BY ONLY 1 OR 2 OF A FAMILY OF AIRCRAFT (IX- BEECH KING AIR C90), THE MOST DEMANDING (APPROACH SPEED, WINGSPAN) AIRCRAFT SHOULD BE SPECIFIED.

8. IDENTIFY THE SPECIFIC NAME OF THE STANDARD THAT IS PROPOSED TO BE MODIFIED FOR THE SUBJECT LOCAL CONDITION.

9. DESCRIBE (WORDS AND NUMBERS) THE DIMENSIONS AND REQUIREMENTS OF THE STANDARD AS PROVIDED IN AC 150/5300-13.

10. STATE THE PROPOSED MODIFICATION TO THE STANDARD.

11. DISCUSS THE LOCAL CONDITIONS THAT MAKE IT IMPRACTICAL OR IMPOSSIBLE TO MEET THE STANDARD.

12. IDENTIFY ALTERNATIVES TO THE SUBJECT PROPOSED MODIFICATION, AND SHOW WHY THESE ALTERNATIVES ARE NOT VIABLE.

13. DISCUSS HOW THE PROPOSED MODIFICATION WOULD IMPACT AIRPORT SAFETY AND EXPLAIN WHY AN ACCEPTABLE LEVEL OF SAFETY, ECONOMY, DURABILITY, AND WORKMANSHIP WOULD STILL EXIST.

14. TYPED NAME AND SIGINATURE OF AIRPORT AUTHORITY REPRESELNTATIVE.

15. SELF-EXPLANATORY.

16. SELF-EXPLANATORY.

17. SELF-EXPLANATORY.

18. TO BE COMPLETED BY FAA.

Subject: Potential for MOS related to runway extensions at UAO

This message was sent from outside the organization. Treat attachments, links and requests with caution. Be conscious of the information you share if you respond.

Facility requirements chapter comments were provided earlier today. A question was asked of me when the Facility Requirements chapter was provided for review and I wanted to make sure it was answered concurrently with my review comments of the chapter.

The question was related to the likelihood of the FAA issuing a MOS for existing non standard conditions or allowing future projects to be constructed with MOS.

The question was asked to both Regional level management and ADO level management. The answer provided was consistent. The Region and ADO would not be in support of issuing MOS related to the extension of the runway. Standards would have to be met for ROFA and RSA requirements.

Please let me know if you need any additional information on this topic. We are aware this will have a significant impact on your next chapter, alternatives.

February 13, 2023

Mr. Tony Beach
Aurora State Airport
Airport Manager
3040 25th Street SE
Salem, OR 97302

RE: Investigation Closeout of Vehicle/Pedestrian Deviation

Dear Mr. Beach:

On December 30, 2022, we advised you that the Federal Aviation Administration was investigating an incident that reportedly involved:

A DARK BLUE CHEVY PICKUP TRUCK ENTERED TAXIWAY A FROM THE NORTHERN MOST EAST RAMP AREA AND PROCEEDED SOUTHBOUND 50FT BEFORE RE-EXITING TO THE EASTERN NON-MOVEMENT AREA. THERE WERE NO COMMUNICATIONS WITH THE VEHICLE. NO AC WERE INVOLVED.

This letter is to inform you that the investigation of this incident has resulted in the following recommendations.

1. Develop and implement training for access and procedures for the following:
   - Non-movement driving access
   - Movement area driving
   - Escort procedures

2. Develop and implement rules and regulations for Aurora State Airport. Consequences of non-compliance should be a component of the rules and include penalties for violations. Advisory Circular (AC) *150/5210-20A Ground Vehicle Operations to include Taxing or Towing an Aircraft on Airports* contains guidance for establishing programs that will improve access to movement areas, safety areas and the airport operations area.

3. Develop a plan to implement and educate tenants about rules and regulations and training requirements to include outreach, education and training opportunities.

4. Ensure enforcement for violations are adhered to when violations do occur.

5. Keep all gates closed to prevent inadvertent entry to the movement area by unauthorized persons and vehicles.

6. Evaluate installation of a vehicle service road (VSR) in the non-movement area.

7. Markings

- Install the markings in accordance with AC *150/5340-1M, Standards for Airport markings.*
- Non-movement area boundary marking - Upgrade the non-movement boundary marking from 6 inch width to 12 inch width (Paragraph 5.4.5.2).
- Upgrade standard taxiway centerline markings to enhanced centerline markings (Paragraph 4.3).
- Install Surface Painted Hold Position Signs (SPHPS) (Paragraph 4.5) and Enhanced Taxiway Centerlines.
- Develop and implement an airfield marking maintenance program including cleaning, replacing, and repairing faded, missing, or a nonfunctional markings; keeping each item unobscured and clearly visible; and ensuring that each item provides an accurate reference to the user.

8. Lighting

- Install standard taxiway edge reflectors to differentiate specific areas of airfield. South ramp area has a sea of pavement with markings not maintained and DOT reflectors installed. This makes it very difficult to differentiate between usable and unusable pavement.
- Long term solution would be to install taxiway edge lighting to all appropriate taxiways on movement side of airfield.

9. Signs

- Add taxiway direction and location signs to the airfield. Only runway exit signs and hold signs exist (with the exception of one destination sign). The airfield is controlled and when Air Traffic is conversing with pilots the pilots don't have an easy way to identify where they are at on the airfield.
- Install VSR stop sign at access points where through the fence operations areas exist that conform with AC *150/534-18G Standards for Airport Sign Systems.* Example of a location would be the movement area at Taxiway A1.
- Review current signs on airfield and ensure they meet current standards and remove incorrect and outdated signs.
- Provide signs at gates to reference gates are to be closed and to reinforce the rules and regulations. Such as an operator be responsible for an unauthorized entry if say there was someone to follow through the gate.
- Work with local Air Traffic Control to provide outreach and education.

<u>Identified non-standard Airport Design Standards</u>

1. Aurora State Airport Sponsor does not control the property for all runway object free areas (ROFA) for C-II standards. The C-II standard ROFA from runway centerline is 400 feet. This exceeds the current location of the non-movement boundary marking (365.5 feet from runway centerline). Due to this it was found Life Flight and other aircraft were seen parked within the ROFA which is contrary to airport design standards (reference AC *150/5300-13B Airport Design* paragraph 3.12.1)

2. The Airport Layout Plan (ALP) has listed the planned modification to standard for Highway 551 but the Office of Airports does not have an approved final modification to standard approved on file.

3. It was found that the Willamette sign on the north end of the airfield around Taxiway A1 was located in the ROFA.

At non-certificated airports that have received Federal grants, the owner is obligated to comply with Federal Grant Assurance #19, Operations and Maintenance, which includes implementing corrective actions to eliminate V/PD's. FAA Order 5200.10, Procedures for conducting investigations of Vehicle/Pedestrian Deviations, states that if V/PDs continue to occur on the airport, and the airport certificate holder/operator has not taken any actions to alleviate or reduce the runway incursion problem, it will be necessary for the FAA to initiate enforcement proceedings. An airport owner's failure to comply with its grant obligations may result in the FAA withholding discretionary funds during the course of its investigation, or as a result of the FAA's investigation (i.e., a finding that the airport is ineligible to receive Federal grants) until the matter is resolved. The FAA is not considering funding disruptions at this time, with the understanding that the airport is taking action to address V/PD's. By implementing these measures, and taking appropriate action to alleviate future taxiway incursions, will ensure the airport remains in compliance with Federal Grant Assurances.

Sincerely,

Andrew Edstrom
Airport Certification Safety Inspector

AIRPORT IMPROVEMENT PROGRAM

MODIFICATION OF AIRPORT DESIGN STANDARDS

BACKGROUND

1. AIRPORT:	2. LOCATION(CITY,STATE):	3. LOC ID:
Aurora State Airport	**Aurora, Oregon**	**KUAO**

4. EFFECTED RUNWAY/TAXIWAY:	5. APPROACH (EACH RUNWAY):	6. AIRPORT REF. CODE (ARC):
Runway 17/35	☐ PIR ☒ NPI ☐ VISUAL	**C-II**

7. DESIGN AIRCRAFT (EACH RUNWAY/TAXIWAY):

MODIFICATION OF STANDARDS

8. TITLE OF STANDARD BEING MODIFIED (CITE REFERENCE DOCUMENT):
Advisory Circular (AC) 150/5300-13, para 307

9. STANDARD/REQUIREMENT:
The runway object free area (OFA) requires that no above ground objects protrude above the runway safety area edge elevation. For Aurora State (ARC C-II) the standard OFA width is 800 feet.

10. PROPOSED:
Highway 551 runs north/south parallel to Runway 17/35. Current operations at the Airport justify increasing the Airport's ARC to C-II. The distance from the Runway 17/35 centerline to the Highway 551 centerline is approximately 400 feet. Considering the highway's width, the Airport is approximately 20 feet short of meeting the OFA design standard.

As the airport geometry is not changing from the current condition, the Oregon Department of Aviation requests a modification of the OFA design standard as defined in AC 150/5300-13, para 307.

11. EXPLAIN WHY STANDARD CANNOT BE MET (FAA ORDER 5300.1E):
Highway 551 and the vehicles travelling along the highway penetrate the Airport's runway OFA by approximately 20 feet.

12. DISCUSS VIABLE ALTERNATIVES (FAA ORDER 5300.1E):
Runway 17/35 could be located 20 feet eastward to meet the OFA design standard. Alternatively, Highway 551 could be located 20 feet westward to achieve the 400-foot separation standard. However, neither alternative is financially feasible due to the existance of airport buildings to the east and residential properties to the west.

13. STATE WHY MODIFICATION WOULD PROVIDE ACCEPTABLE LEVEL OF SAFETY, ECONOMY, DURABILITY, AND WORKMANSHIP (FAA ORDER 5300.1E):

No changes to the existing airport geometry are proposed. Additionally, the Department of Aviation has recently removed obstructions (shrubs) along the edge of Highway 551 to increase safety margins. The safety of people on the ground or in aircraft will not be reduced as a result of the proposed design standard modification.

MODIFICATION OF AIRPORT DESIGN STANDARDS FORM

ITEMS 1-17 ARE TO BE COMPLETED BY THE AIRPORT SPONSOR(ORIGINATOR). ALL OTHER ITEMS WILL BE COMPLETED BY THE FAA.

THE COMPLETED FORM WILL BE TRANSMITTED BY THE ORIGINATOR TO THE APPLICABLE ADO/AFO. THE ADO/AFO WILL TRANSMIT THE FINAL FAA DETERMINATION TO THE ORIGINATOR.

MODIFICATION TO AIRPORT DESIGN STANDARDS REQUESTS SHOULD INCLUDE SKETCHES OR DRAWINGS WHICH CLEARLY ILLUSTRATE THE NONSTANDARD CONDITION.

ITEMS

1. LEGAL NAME OF AIRPORT.

2. ASSOCIATED CITY.

3. AIRPORT LOCATION IDENTIFIER (SEE APPROACH PLATES/AIRPORT FACILITY DIRECTORY).

4. IDENTIFY THE RUNWAY(S), TAXIWAY(S) OR OTHER FACILITIES EFFECTED BY THE PROPOSED MODIFICATION TO STANDARDS REQUEST.

5. IDENTIFY THE MOST CRITICAL APPROACH FOR EACH RUNWAY IDENTIFIED IN #4.

6. AIRPORT REFERENCE CODE - SEE PARAGRAPH 2, PAGE 1 AC 150/5300-13(CHANGE 4) - I.E. C-II, B-II, A-I (SMALL).

7. NOTE THE DESIGN AIRCRAFT (ARC OR SPECIFIC AIRCRAFT) FOR EACH FACILITY IDENTIFIED IN #4. A DESIGN AIRCRAFT MUST MAKE REGULAR USE OF THE FACILITY. NORMALLY, FAA CONSIDERS REGULAR USE TO BE 500 OR MORE ANNUAL INTINERANT OPERATIONS.

IF THE AIRPORT SERVES A WHOLE FAMILY OF AIRCRAFT IN A PARTICULAR GROUP, THE ARC (I.E. B-II) SHOULD BE SPECIFIED. IF,HOWEVER, THE AIRPORT IS USED BY ONLY 1 OR 2 OF A FAMILY OF AIRCRAFT (IX- BEECH KING AIR C90), THE MOST DEMANDING (APPROACH SPEED, WINGSPAN) AIRCRAFT SHOULD BE SPECIFIED.

8. IDENTIFY THE SPECIFIC NAME OF THE STANDARD THAT IS PROPOSED TO BE MODIFIED FOR THE SUBJECT LOCAL CONDITION.

9. DESCRIBE (WORDS AND NUMBERS) THE DIMENSIONS AND REQUIREMENTS OF THE STANDARD AS PROVIDED IN AC 150/5300-13.

10. STATE THE PROPOSED MODIFICATION TO THE STANDARD.

11. DISCUSS THE LOCAL CONDITIONS THAT MAKE IT IMPRACTICAL OR IMPOSSIBLE TO MEET THE STANDARD.

12. IDENTIFY ALTERNATIVES TO THE SUBJECT PROPOSED MODIFICATION, AND SHOW WHY THESE ALTERNATIVES ARE NOT VIABLE.

13. DISCUSS HOW THE PROPOSED MODIFICATION WOULD IMPACT AIRPORT SAFETY AND EXPLAIN WHY AN ACCEPTABLE LEVEL OF SAFETY, ECONOMY, DURABILITY, AND WORKMANSHIP WOULD STILL EXIST.

14. TYPED NAME AND SIGINATURE OF AIRPORT AUTHORITY REPRESELNTATIVE.

15. SELF-EXPLANATORY.

16. SELF-EXPLANATORY.

17. SELF-EXPLANATORY.

18. TO BE COMPLETED BY FAA.

Subject: RE: Meeting last week

Hi Kenji,

Thank you for the note and meeting last week. The effort is appreciated. A few things.

The airport stakeholders sincerely hope that ODAV will take a serious look at the alternative they proposed. Nothing about it is inconsistent with ODAVs objectives and it is consistent with the note below **as well as** FAA requirements. Furthermore, the stakeholders' proposal came with a fully supported MOS! On the latter, the papers that Tony sent confirm that despite FAA's requests otherwise, ODAV has **never submitted** a proper MOS to the FAA. A mere glance at the single MOS ODAV apparently submitted in comparison to the one Mr. Faegre submitted (Faegre's meets the requirements of the FAA/NTSB manual, ODAV's does not) demonstrates why it is unsurprising that FAA did not approve the 'back of napkin' MOS previously submitted by ODAV's prior administration. It is simply impossible to credibly claim that FAA would reject a properly supported MOS – especially one presented for a phased in airport development program. The claim otherwise is fundamentally misguided.

As explained in the alternative that the stakeholders presented, the stakeholders' proposed alternative is far less intrusive, less expensive, less onerous, and more functional than **any alternative** presented in the ODAV process to date. We explained in the stakeholders' submittal that it would be easy to add moving the perimeter fence as a phase 1 item and it would be easy to add to the stakeholder's alternative a phase 2 of moving Highway 551 at the end of the 20-year term if FAA funds that move. We also explained that the idea of ODAV condemning the $300 mm in private investment to move the runway east including destroying business jet hangars and Atlantic is a nonstarter – that alternative effectively destroys the airport for C-II aircraft and is completely contrary to ODAV's legislative mandate in ORS 836.640-642 to support TTF operations, as ODAV must understand. The private aeronautics interests have invested in the airport's

development as the legislature intended creating significant economic development for the area. Destroying their work under any alternative is untenable, inconsistent with all known airport development premises and respectfully, unlawful.

Please understand that it was **impossible for anyone to provide meaningful comments** on the alternatives that ODAV presented. The facts from which all ODAV proposed alternatives flowed were, with respect, faulty and their outcome was untenable - no certain runway extension. ODAV staff mistakenly claimed that FAA required perfect compliance with design standards, and that FAA had refused any MOS in exchange for any runway extension and staff asserted that moving Highway 551 to the west would result in condemnation of many homes and businesses. **Neither are true**. Staff were unable to back up the claim about FAA demands when asked - it was clear something was being missed because the position attributed to FAA is contrary to the CFRs that govern FAA's authority as well as the govern master planning. It turned out that ODAV **never even attempted to submit a properly documented MOS**, making it unsurprising that in the absence of a proper MOS, that FAA expected compliance. And it turns out that the Highway 551 ROW is wide enough for the 20 feet necessary for perfect ROFA compliance **without any apparent need for condemnation of any homes or businesses.** Or at least with a lot less land being needed than the alternatives presented claimed. How much land is needed in truth has never been disclosed.

Further, from our meeting we learned that a 4th ODAV alternative is actually being considered by ODAV– which is an alternative never presented to the PAC. That being one in which airport development is phased in and for which the desperately needed runway extension is not held hostage to infeasible conditions. Given this revelation and the mistaken or at least incomplete factual premises that supported the ODAV alternatives presented on July 30, the stakeholders suggest (and respectfully the rules governing master planning require), that another round of alternatives be presented to the PAC for their input with the following revised elements:

1. Full disclosure about ODAV's phasing proposal – that the runway extension need not be and is not intended to be held hostage to either condemning the private airport development in the east or moving Highway 551 and condemning homes and businesses.
2. Full disclosure that ODAV has never presented a properly documented MOS to FAA and that under a phased approach that FAA will in fact approve a proper MOS so that the runway can be extended in the near term as is desperately needed.
    a. Here the fully documented Faegre MOS is "temporary" in that it supports phase 1 runway extension and phase 2 results in perfect design standard compliance toward the end of the master planning term.
3. Full disclosure about the amount of space within the existing ROW to move Highway 551 west and concerning the extent to which condemning homes or businesses is actually required because it appears such condemnation is not required. What is required in truth?
4. The stakeholders' proposed alternative is presented as an alternative, with
    a. the Faegre properly documented MOS to support phase 1 which would include the runway extension
    b. moving highway 551 to the west within the existing right of way (without condemnation of homes and businesses if that is possible as it appears) as a phase 2 plan
    c. the drainfield in the south remains but is improved per the geotechnical report submitted demonstrating it can be improved to meet FAA standards.
    d. adding the TLM TTF property to the airport boundary as apparently now properly proposed – because it is the last undeveloped property that all KUAO master plans have envisioned be developed with aeronautical uses and TLM has done the work to enable it to support eVTOLs – something that does not exist anywhere else.

We look forward to your thoughts. Thank you. Best, Wendie Kellington

Subject: Meeting last week

Wendie!

Thanks for reaching out to ODAV to talk about the comments that you provided on behalf Ted Millar, TLM and AABC concerning the refined alternatives presented to the PAC on July 30, 2024. I also appreciated the opportunity to speak directly with the communities that are and will be affected by ODAV's planning efforts for UAO. It's always important to listen to stakeholders about their concerns and their wishes. I hope our conversation was helpful in understanding ODAV's role in this planning phase and in particular our hope to select an alternative that FAA will support and ultimately agree to extend federal funds to help implement. Like I mentioned in my response to your request for a meeting, I'll be ensuring that all ODAV's communications with its stakeholders are made part of the record. This this email is intended to provide a high-level summary of our discussion today in which you, Anthony Beach, Alex Thomas , Stacy Posegate of DOJ and I attended by teams.

As I explained in our meeting, Chuck Garrison, Director of the Northwest Mountain Region for FAA, has made clear to ODAV that FAA will not fund future projects if the Aurora Airport master plan does not include an ALP that will bring components of the airport up to FAA's standards of compliance. The primary areas of concern, as we have discussed, are the ROFA which extends over and above the Hubbard Highway, OR 551, and the drainfield within the Runway Safety Area supporting your clients' businesses.

I understand that you are asking ODAV to consider another alternative airport layout plan, which you describe in more detail in your letter. You have explained that this alternative should be preferable

because it would not require additional real property or moving OR 551. You have also stated that the current alternatives are unrealistic or unnecessary because they seek to obtain “perfect compliance” with FAA standards. But that, in your opinion, perfect compliance is not required. Rather, FAA has an obligation to consider any modifications requested by the ODAV. You also explained that your clients are extremely concerned with the investment that they have put into this airport and their relationship with ODAV. We take all input and comments seriously.

Please know that the agency’s consultant does intend to prepare a response to your letter which will be added to the record for the next PAC meeting. But, also, as we discussed, we hope that some of your concerns are alleviated as we explained that any project would be phased, meaning that some of the proposed improvements in the selected alternatives could be built as funding is secured for that phase. We also attempted to clarify that ODAV has no present intention of acquiring by condemnation the areas that are marked “reserve” in any of the alternatives. Rather, these are designated as reserve so that ODAV may apply to FAA for federal funds to acquire these properties, should they become available to be used for a future aviation use. Finally, we attempted to explain that FAA has worked with ODAV to identify the standards that ODAV must comply with and it is apparent that FAA will not approve a modification. As Tony explained, FAA has denied ODAV’s attempts to seek modifications in the past. Furthermore, any modification would be temporary and would not present a permanent solution to the need for new development at the airport. As promised, we will locate the documents pertaining to ODAV’s application to FAA and its response and provide you with copies!

Thank you again for meeting with us today. I look forward to seeing you in a few weeks and to working together on this and other important projects.

Thanks again Wendie!

Kenji

Aurora State Airport Master Plan Website Comments

Name	Wendie Kellington
Organization	Kellington Law Group
Comments or questions?	We represent TLM holdings. (1) ODAV's alternatives first presented 7/31/24 stated they were all premised on the claim that FAA said no runway extension could occur unless the Highway 551 ROFA design standard was first met. That is incorrect and that incorrect premise drove all of ODAV's binary 7/31 alternatives. Further, the highway is just 32 feet off of perfect ROFA compliance and ODAV appears to have been unaware that there is plenty of room in the ROW to move the highway to meet the ROFA without taking homes or businesses, because the binary choice ODAV presented was either taking a bunch of homes/businesses to move Hwy 551 west or wiping out significant aeronautical uses at the airport by moving the RW east. Both of those draconian alternatives ODAV presented are wholly unnecessary. (2) FAA never said that no r/w extension can occur without the ROFA first being met. They will absolutely allow the RW to be extended without perfect ROFA concurrent compliance. They just want the master plan to show the ROFA being met by the end of the planning period if funding becomes available. (3) The airport's aeronautical stakeholders presented an airport MP alternative that extended the RW north in the short term to serve the decade-plus long need for safe existing aircraft operations, provided a fully documented MOS demonstrating unequivocally that MOS standards were met, contemplated HWY 551 be moved the 32 ft west after the RW extension happens, and later in the MP planning period and within the existing ROW (taking no homes/businesses), if funding is available. (4) FAA will in fact allow the r/w to be extended without perfect prerequisite ROFA compliance, and ODAV mistakenly presented alternatives premised on the opposite conclusion it attributed to

	FAA. ODAV must present alternatives to the PAC that are in fact consistent with FAA directives. Otherwise, ODAV fails to comply with its citizen involvement/stakeholder involvement obligations. The aeronautical stakeholders alternative with fully justified MOS must be included as an option in a suite of real properly premised alternatives returned to the PAC for comment. (4) Respectfully, there is no justification for any alternative that wipes out any aeronautical uses. Hwy 551 can be moved west within the existing ROW at the end of the MP planning period with minimal private property impacts. Wiping out any aeronautical uses is simply unacceptable and is contrary to ORS 836.640-642 governing ODAV and the entire point of this master planning effort to serve aeronautical uses. Relatedly, there is no justification for each alternative demanding that the septic drainfield to the south be moved to some unknown location that may not even feasibly exist. As the geotechnical report in the record demonstrates, modest improvements to that drainfield make it comply with FAA standards. Nothing justifies moving it. Thank you. I would like to receive email updates.

Hi Brandy,

Attached please find the first of several emails for the record of the above matter which are the exhibits to the letter objection to ODAV's preferred alternative that I submit on behalf of TLM Holdings LLC an ODAV KUAO MP Pac Member. Please confirm receipt. Earlier I asked you if I could send you a link to a dropbox with exhibits and I did not hear from you. Therefore, I am submitting these several exhibits

individually – some split into small enough segments to emails for the record. Attached are Exhibits 1-3. Regards, Wendie Kellington.

PROJECT: MP – MASTERPLAN ALTERNATIVE TLM

AURORA STATE AIRPORT (UAO)

AURORA STATE AIRPORT – MASTER PLAN ALTERNATIVE TLM

DRAWING

MP-TLM

Working Session: Ensuring Aurora State Airport for the next decade of ORS 836.642 operations.

In 2006, the Oregon legislature directed the Department of Aviation through ORS 836.642 to establish through the fence operations at Aurora State Airport in order to promote economic development. This program has flourished ever since with over 1,000 jobs now tied to the airport. With a new master plan set to set to conclude in 2023 which will set the stage for airport infrastructure for the following decade, it's time for the Oregon Aviation Board to review associated funding and airport management going into the next decade to ensure Aurora State Airport remains the economic engine first envisioned over 15 years ago.

FUNDING

In terms of airport management, Aurora State Airport does generate funds back to the Oregon Department of Aviation of roughly $90 to $100K annually. However, expected expenditures for the next decade significantly exceeds this. As such, additional funding sources need to be identified.

Aurora Profit and Loss Statement By Biennium Not Including FAA & Connect OR Projects

Biennium	Time Frame	Revenues	Expenditures	Profit
2009-2011	July 09-June 11	350,054.00	207,946.00	142,108.00
2011-2013	July 11-June 13	358,373.00	101,576.00	256,797.00
2013-2015	July 13-June 15	400,467.00	121,078.00	279,389.00
2015-2017	July 15-June 17	431,154.00	206,620.00	224,534.00
2017-2019	July 17-June 19	461,857.00	243,618.00	218,239.00
2019-2021	July 19-June 21	457,856.91	277,428.00	180,428.91
Total	**July 09-June 21**	**$ 2,459,761.91**	**$ 1,158,266.00**	**$ 1,301,495.91**

Note: Expenditures include operations and maintenance staff time, utilities and tower expenses. ODA does not fully allocate all related costs (such as accounting or management including the state airport manager)

Anticipated Project List (expected ODA 10% match) - Costs are rough estimates for discussion only

FY 2022:	Easement acquisition supporting obstacle removal	$825,000
FY 2023:	Tree removal	$509,000

FY 2024:	Environmental Assessment for runway extension	$580,000
FY 2024:	Phase 1 Runway Rehab (design)	$373,000
FY 2025:	Phase 2 Runway Rehab (construction)	$2,360,000
FY 2026:	Runway extension Property Purchase	$4,000,000
FY 2026:	Runway extension Design Engineering	$2,275,000
FY 2027:	Runway extension Construction	$26M - $30M
Total:		$37M - $41M
TOTAL ODA Costs		$3.7M - $4.1M

Funding Sources being explored:

- FAA AIP grants – The federal Aviation Administration's Airport Improvement Program provides funding for AIP-eligible projects identified on the airports master plan. The federal share is generally 90%, with a local 10% match.
- Federal Earmark – in addition to AIP grants, Congress members have the opportunity to request directed spending (or earmarks) for specific projects. Although this practice was banned about ten years ago, Congress has recently agreed to begin sponsoring these requests again.
- State Bonding / State Funds
- Federal Transportation Funds from expected Federal infrastructure package
- Connect OR – The OR Department of Transportation has a grant program for marine, rail and aviation. This competitive grant process is generally offered once every two years and requires a 30% local match.
- SOAR – The OR Department of Aviation has a small grant program for repair and capital improvements at the 28 state-owned airports. It is currently paused due to declining revenues related to the pandemic.

STAFFING

Besides being designated for through the fence operations, Aurora is ODA's only Urban General Aviation Airport with a daily total operations of 94,935 versus the next busiest ODA airport at Independence with 33,600 total operations. Aurora is also unique in the amount of revenue produced as well as economic impact with 1,500 on airport jobs versus Independence at 21. Finally, the fast-growing community in which the airport resides is especially sensitive of the issues brought about by grow and requires a level of public engagement unlike any other ODA owned airport. This fact was specifically called out in an earlier Oregon Solutions report, recommending that "ODA, as the owner of the asset, owns the burden of proper communication related to the airport. While it has worked to provided public engagement for planning purposes, the question of how meaningful that engagement was still exists" and in terms of stakeholder communication, "ODA should take a leadership role" in providing forums for communication.

Looking at the data, it's clear Aurora is considerably different than any other airport in ODA's portfolio. So, in addition to reviewing governing structures for Aurora, the question needs to be asked if Aurora has grown beyond what the staffing levels within ODA can give it and if it's time for a level of fulltime staffing.

In contrast to the growing vitality of Aurora State Airport, ODA has seen continuous cuts both in overall staffing and in operations manpower.

2003-05 budget, ODA had 16 FTE, with 5 in Ops.
2007-09, ODA had 17 FTE, with 7 in Ops
2011-13, ODA had 16 FTE, with 7 in Ops
2013-15, ODA had 12.5 FTE, with 5 in Ops.
2015-17, ODA had 12 .25FTE, with 5 in Ops
2017-19 , ODA had 14.25 FTE, with 5 in Ops
2019-21, ODA had 15.5 FTE, with 6.5 in Ops
2021-23, ODA will have 12.5 FTE, with 4.5 in Ops

This is a disturbing trend but doesn't necessarily point towards more dedicated manpower for Aurora State. Rather the Board needs to review expectations for airport management at Aurora and balance them against what ODA can provide. Generally, airport management includes such administrative roles as managing FAA grants, scheduling and documenting meetings, assembling traffic counts, basic accounting, contract management for snow removal, grass cutting, wildlife hazard management, lights and signs maintenance, pavement maintenance and any potential items that may arise. It also includes operational duties including community involvement, i.e., maintain public relations, ensuring the facility is operated in an efficient and safe manner, Contract Tower management/coordination, lease negotiations, manage the through-the-fence operations, airport security, issue NOTAMs, construction management, obstruction removal, conduct regular inspections, etc.

Optimally, two individuals would fulfill these roles: an Airport Manager and an assistant. Should the board want to investigate manning specific to Aurora, initial estimates would be an airport manager salary of $75,000 - $95,000 depending upon experience with an assistant ranging from $60,000 to $75,000.

Unfortunately, there's no specific formula directing when an airport needs full time management as it's heavily influenced by the airport sponsors' desire and the funds available. As a reference, below is a review of other Urban General Aviation Airports similarly classed to Aurora State. These airports support all general aviation aircraft and accommodate corporate aviation activity, including piston and turbine engine aircraft, business jets, helicopters, gliders, and other general aviation activity. The most demanding user requirements are business-related. These airports service a

large/multi-state geographic region or experience high levels of general aviation activity. The minimum runway length objective for Category II airports is 5,000 feet (Oregon Aviation Plan).

Included Airports:

Aurora State Airport
- Airport: 144 acres; Total operations: 66,000
- No dedicated airport manager, State of Oregon acts as airport manager

Portland – Hillsboro Airport
- Airport: 928 acres; Total operations: 199,155
- No dedicated airport manager; Port of Portland acts as airport manager

Bend Municipal Airport
- Airport: 420 acres; Total operations: 141,175.
- Full time airport manager, salary: $81,785.60 - $106,225.60

Portland -Troutdale Airport
- 284 acres; Total operations: 121,977
- No dedicated airport manager; Port of Portland acts as airport manager

McMinnville Municipal Airport
- Airport: 650 acres; Total operations: 63,500
- No dedicated airport manager; FBO serves as airport manager

Scappoose Industrial Airpark
- Airport: 196 acres; Total operations: 60,000
- Full time airport manager

Corvallis Municipal Airport
- Airport: 1,520 acres; Total operations: 52,300
- No dedicated airport manager; Public Works serves as airport manager

Warrenton-Astoria Regional Airport
- Airport: 870 acres; Total operations: 38,721 operations.
- No dedicated airport manager; Port of Astoria serves as airport manager

Salem McNary Field
- Airport: 751 acres; Total operations: 35,657
- Full time airport manager, salary $84,000 - $113,000

Newport Municipal Airport

- Airport: 700 acres; Total operations: 16,000
- Full time airport manager, salary $73,500 - $96,340

LaGrande/Union County Airport

- Airport: 640 acres; Total operations: 16,000
- No dedicated airport manager; Public Works serves as airport manger

GOVERNING STRUCTURES

The Oregon Aviation Board is committed to ensuring airports across the state provide an aviation system that effectively serves our communities, airport users, and the region as a whole. A large part of this responsibility entails direct oversight of the Oregon Department of Aviation and the 28 airports it owns. Of these 28, Aurora State Airport is the largest and most dynamic, supporting 1,500 jobs and contributing over $1.8M to county's general fund in taxes. Ensuring the governing structures remain in sync with the growing airport is a key part of the board's oversight responsibilities for this site.

The major driver of growth at the Aurora State Airport is its unique position within Oregon as the state's largest "through the fence" pilot program. As a state recognized program governed by ORS 836, ODA is tasked to utilize public-private relationships to ensure *"Shared responsibility for: (A) Establishing and meeting the fiscal needs of the pilot site* (ie. test site)*; (B) Maintaining safety of operations; and C) Maintaining positive community relations and compatibility with existing uses. Examples of past public-private ventures at the airport are included as an attached appendix for reference.*

While public-private partnerships have been effective in the past, no guidance exists on when it should be used or what their limits are. As such, there's confusion on expected roles within the decision-making process. Explicitly this revolves around what level of engagement ODA should exercise with the business entities and to what extent those entities should able to influence ODA's actions in its role as the airport sponsor. Because of this, the board should look at whether there are any required changes in policy to eliminate confusion in the future.

In addition to tweaking existing relationships within the existing construct with ODA as the airport sponsor, the board may want to review other ownership possibilities in the name of thoroughness. The reason for this is while the costs of airport operations and maintenance often makes local ownership unfeasible, Aurora State Airport has grown into a healthy, thriving enterprise and is at a point where alternate ownership may be viable. In particular, ORS 836.642 stipulates

(6)To the extent practicable, the airport sponsors shall utilize innovative airport infrastructure and operations funding to support the pilot sites including, but not limited to:

(a)Airport districts as provided in ORS chapter 838;
(b)Economic development programs administered by the Oregon Business Development Department;
(c)Tax increment financing to provide funding for airport-related infrastructure;
(d)United States Department of Agriculture Rural Development grants or low-interest loans; and
(e)Programs, including funding for short line railroads under ORS 367.067 (Short Line Credit Premium Account), designed to facilitate development of intermodal transportation projects. [2005 c.820 §3; 2009 c.398 §2]

So what is an "Airport District"? It is a type of "Special District" authorized via ORS 838 to manage airports and enhance local economies. In general, Special Districts … "are a form of local government created by a local community to meet a specific need. Inadequate revenue bases and competing demands for existing taxes make it difficult for cities and counties to provide all of the services that their constituents want. When residents or landowners want new services or higher levels of existing services, they can form a district to pay for them. Each special district focuses on a specific set of services, like fire protection, water, healthcare, parks and recreation." (Special Districts Association of Oregon). They are funded through property tax revenues or fees charged to customers for services, and also has the authority to issue bonds.

Coos County Airport District is Oregon's only current airport district and oversees the Southwest Regional Airport in North Bend. It was formed, as a Special District, by general election on
December 4, 2002. The District is responsible for the operation of the Southwest Oregon Regional Airport and strives to provide a stable economic base for aviation services for all of Coos County. The District is governed by a Board of five Commissioners elected county wide. The primary duty of the Board is to establish policies for the governance of the District and provide oversight of its daily activities. The Executive Director and staff, operate under the oversight of the District, and are responsible for the operation and maintenance of the airport. The Board established three primary goals for the District in 2003

- Make the District financially independent so that no tax dollars will be required for operations
- Maintain and enhance general and commercial aviation
- Operate and maintain the airport Business Park in support of general and commercial aviation.

Process for Special District Formation. There are three procedures that may be used to form a special district:

- The filing of a petition for formation
- The consent of all property owners within the area of the proposed district
- Initiation and order of the county board (for districts located entirely within its borders).

Once the petition has been approved by the required county agencies, the county must hold a hearing within 30 to 50 days. Upon conclusion of the hearing, the county board will further evaluate the petition according to ORS 199.462. Upon county approval, a final hearing will be held, after which the county enacts formation resolution and an election date is scheduled.

Appendix 1: KUAO Public Private Partnership (Aurora Airport Improvement Association)

KUAO Public Private Partnership:

A list of Historic, On-going, and Planned Examples

Aurora Airport Improvement Association14497 Keil Road
Aurora, Oregon 97002

September 3, 2021

Summary Report

Aurora Airport is an FAA approved "through the fence" type of public airport that is a mix of public and private lands. Most public airports are not this, and have all of their lands owned by the government agency. When all of the land is publicly owned, all of the users are "tenants." Tenants on public land have time-limited leases during which to create their development, and when the lease is over, the development reverts to public ownership. Airport tenants at these airports often point out that at the mid-point of their lease periods, they lose motivation to maintain and improve their development, because they often are forced to move out at the end of the lease.

At Aurora Airport the private properties create additional "owner" relationships with the airport that are different from being a "tenant." Ownership promotes the making of permanent long term investments that retain their value, and that often result in more durableaviation businesses from a community investment and employment standpoint. The uses of the buildings can be more quickly changed to meet market changes, and industry innovations, because ownership also allows rapid redevelopment and re-investment using conventional financing methods of the banking industry.

The essence of a public-private partnerships (often referred to as PPP's) are that they can join the best of the public sector knowledge and abilities, with the best of the private sector knowledge and abilities, to create a better result. As joint owners, they share responsibility for the success of the airport. The private sector owners become partners with the public airport. This makes for a strong combination. The private owners have "skin in the game." For their business to be successful, they need the airport to be successful. There is a built in "win-win" relationship with the airport. For the public side, this means that the private owners put in time, resources, and funds that specifically benefit the public airport as a whole.

Examples of the public-private improvement projects accomplished through the years at Aurora Airport, that provided large public benefits, are listed in the bullets below. For those who want to know more about each bullet item, the following pages provide more details of their history and current status:

1. **2021 – The private side of Aurora Airport annually puts $1.9 million dollars into the local schools, police, fire, and other Marion County services. The businesses at the airport employ 1,500 workers with family wage pay. So the public-private partnership at Aurora Airport uniquely better supports local citizens than a traditional publicly owned airport.**

2. **In 2015, the private sector properties at Aurora Airport joined with ORAVI and OPA to strongly lobby support for HB 2075 to raise the fuel tax rate in Oregon and have those additional funds support airport infrastructure, airport economic development, and the Oregon Department of Aviation. ODA staff were prohibited from advocating for the bill, so private sector support was essential.**
3. **In 2012, the FAA approved the Control Tower project in the 2012 Airport Master Plan, but there were no funds available for it. ODA made clear that they could not advocate for those funds and had to remain neutral. The private sector worked extensively with the Oregon Congressional Delegation during 2013 and 2014 to explain the importance of the Control Tower for airport safety, which resulted in funds becoming available and construction completed in 2015.**
4. **In 2007, to improve the instrument approach capabilities of the airport, the parallel taxiway needed to be relocated to meet FAA's design standard for a greater runway-taxiway centerline separation. Most of the property needed for this relocation was on private properties. There was a friendly and quick agreement created. In 2009, the taxiway relocation was completed.**
5. **In 2005, with Aurora Airport showing the power of using a public-private model for an airport, the legislature approved Senate Bill 680 which instructed all state agencies to use the Aurora Airport as a model airport for how an airport can maximize its Economic Development impact to Oregon and its surrounding communities.**
6. **In 2003, there was agreement that the runway should be reconstructed to add 1000 feet of length and to resurface and groove it for safety. However, there were no FAA funds available for the work at the time. ODA made clear that they could not advocate for those funds and had to remain neutral. The private sector worked extensively with our Congressional Delegation, the FAA, and ODA to get the funding committed for the work. The runway extension was completed in 2004.**
7. **2003 - Creation of the Aurora Airport Water Control District, to solve major fire and life safety needs for all at the airport, led by the needs of private sector, assisted by Marion County, and providing a fire protection water system for the entire ODA airport.**
8. **1999 Agreement to install comprehensive Fencing and Security gates around the entire perimeter of the Airport, paid by Private funds on Private Land, and paid by FAA Public funds on Public Land.**
9. **1999 The Airport Gate colors & Airport Signs were installed on Canby-Hubbard Highway, Keil Road, Arndt Road, and Airport Road, thus creating the Red, Yellow, Purple, Blue, Orange, Green, and Yellow, Gates and Signs around the airport. All of the design, construction, and installation was paid by the private sector. The State agreed to maintain them and pay for the electricity in them.**
10. **1999 – Joint use parking lot developed for state owned public tie-down area with private funds and public on-going maintenance.**
11. **1999 – Joint use septic system developed on leased land from the state, is now shared to provide the needs for the Control Tower toilet facilities.**

12. **1997 - Stenbock Road, the major entry to the public airport lands that have FBO, tie-downs, hangars, and the Control Tower, was created by a public-private partnership.**
13. **1996 Creation of Positive Aurora Airport Management (PAAM) by the private sector, at the request of the public sector, to be the Liaison between the airport users, pilots, the surrounding communities, and anyone interested in be involved in the airport, with the ODA.**
14. **1986 – The private sector willingly sold private land to the state, for the creation of what became the public tie-down, hangar development, and Control Tower Area.**
15. **1968+ - Private sector airport management donated much of the time needed for providing weather reporting, Unicom service and monitoring of the airport runway.**
16. **1943 - As a military airport, the runway was constructed with public funds, and the aircraft aprons were all on private property. This shows that even at the beginning of the airport's existence it was a public-private partnership.**
17. **Miscellaneous examples of the public-private partnership efforts through private efforts that provided: radar coverage to the Aurora Airport area, getting the airport sign on I-5, presentation of WWII aircraft to honor veterans, bringing local retirement home residents for visit, weather reporting that is useful for the public, and many open houses at the airport for the public.**

Consistent with this long history of public-private partnerships at Aurora Airport there are two projects that are just now under way:

- **Private property owners are now negotiating with ODA for a partnership to install an internal circulation road that has been in the FAA and state approved Airport Layout Plan (ALP) since 2012.**

- **Private Property owners are requesting a partnership with ODA to help get the tree removal accomplished as the trees are now potentially going to raise the landing IFR flight altitude minimums needed for safety during periods of low visibility at the airport.**

Detailed Report

There has been a long history of public-private projects accomplished at the Aurora Airport, because a large amount of the developed lands around the airport are on private properties. These properties have been allowed access to the use of the runway and taxiways via a permit system with the state that requires payment of a fee and annual renewal of the access permit. In addition, all fuel sold at the airport pays a tax to the state, which supports the Oregon Department of Aviation and their airport improvement programs.

More important than paying their share of the costs of the airport, through access fees to the runway, is the synergy created by public-partner partnerships. These have allowed for very efficient, low cost, innovative major improvements at Aurora Airport at much reduced cost to the airport, due to the donations of funds, time, and effort by the private sector.

Examples of these public-private improvement projects accomplished through the years, that provided large public benefits, are listed in the bullets below:

1. **2021 – The private side of Aurora Airport annually puts $1.9 million dollars into the local schools, police, fire, and other Marion County services. The businesses at the airport employ 1,500 workers with family wage pay. So the public-private partnership at Aurora Airport uniquely better supports local citizens than a traditional publicly owned airport.**

Most publicly owned development does not pay taxes. However, the private sector pays full taxes on their property development. Thus, at Aurora Airport the private development provides enormous support for governmental services, that most public airports do not provideto their local community. Most recently Marion County records show approximately $250 million value of development at the airport, and this creates $1.9 million in annual taxes paid toMarion County. The taxes next year are expected to be well over $2 million. This supports schools, police, fire, parks, roads, and governmental services for the local area and the county at large. In addition, the approximately 1,500 employees of companies at the airport, pay income taxes as do the employers also pay additional taxes for each employee, which provides great support at the state level for social services, roads, bridges, and administrative services.

2. **In 2015, the private sector properties at Aurora Airport joined with ORAVI and OPA to strongly lobby support for HB 2075 to raise the fuel tax rate in Oregon and have those additional funds support airport infrastructure, airport economic development, and the Oregon Department of Aviation. ODA staff were prohibited from advocating for the bill, so private sector support was essential.**

In 2015 Oregon Aviation Industries Inc. (ORAVI) wrote HB 2075 and called for an increase in the aviation and jet fuel tax rate. The bill was specifically written to support airport infrastructure, economic development, and the ODA administration. The Aurora Airport private sector properties joined with ORAVI and the Oregon Pilots Association (OPA) to strongly support this bill by testifying in the Legislature and contacting their State Representatives and Senators. Thebill was opposed by the Port of Portland and the Airlines because much of the tax revenues

would come from the airlines. The ODA director and staff were told by the Governor that they could not advocate for the tax or have involvement with the bill. The private sector properties recognized the importance of the increase in fuel taxes to maintaining the health of all of Oregon airports. The private sector support ruled the day, and HB 2075 passed and was signed by the Governor.

3. **In 2012, the FAA approved the Control Tower project in the 2012 Airport Master Plan, but there were no funds available for it. The private sector worked extensively with the Oregon Congressional Delegation during 2013 and 2014 to explain the importance of the Control Tower for airport safety, which resulted in funds becoming available and construction completed in 2015.**

The 2012 Airport Master Plan Update confirmed the need for construction of a control tower, as had previous Master Plans. The FAA approved the Control Tower, but there were no funds available for it. ODA made clear that they could not advocate for those funds and had to remain neutral. The private airport sector worked extensively with the Oregon Congressional Delegation during 2013 and 2014 to explain the importance of the Control Tower for safety at the airport. The Congressional delegation working with the FAA was able to find some FAA projects in other Districts that could not meet their deadlines, and the funds could be transferred to Aurora. So in 2015 a control tower was constructed and became operational, in large part because of the private sector efforts.

4. **In 2007, to improve the instrument approach capabilities of the airport, the parallel taxiway needed to be relocated to meet FAA's design standard for a greater runway-taxiway centerline separation. Most of the property needed for this relocation was on private properties. There was a friendly and quick agreement created. In 2009, the taxiway relocation was completed.**

To improve the instrument approach capabilities of the airport, the parallel taxiway needed to be relocated to meet FAA's design standard for a greater runway-taxiway centerline separation. Most of the property needed for this relocation was on private properties. Since it was a win-win for both parties, there was a friendly and quick agreement created so that the state could acquire the needed property. The relocation of the taxiway allowed the minimum descent altitude for the instrument approaches to be lowered, so that the airport was useful when the cloud ceilings were lower. In 2009, the taxiway relocation was completed.

5. **In 2005, with Aurora Airport showing the power of using a public-private model for an airport, the legislature approved Senate Bill 680 which instructed all state agencies to use the Aurora Airport as a model airport for how an airport can maximize its Economic Development impact to Oregon and its surrounding communities.**

Senate Bill 680 called for the Oregon Department of Aviation to use Aurora Airport as the model for how a public-private partnership at an airport could work to create jobs and improved economy for the community. It referenced "through the fence" operations, which is

the aviation lingo for an airport public-private partnership. Its goals to show how rural airportscan encourage development of through the fence operations designed to promote economic development by creating family wage jobs, by increasing local tax bases and by increasing financial support for rural airports.

To the extent practicable, the airport sponsor of a pilot site shall use public-private partnerships that incorporate: (a) Innovative and creative technologies for increasing airport usability and safety; (b) Innovative and creative performance of aviation services to make the services more competitive and useful for the public; (c) Development of the pilot site as a setting for customary and usual aviation-related activities to develop and thrive, in concert with the goals of the Economic and Community Development Department; and (d) Shared responsibility for: (A) Establishing and meeting the fiscal needs of the pilot site; (B) Maintaining safety of operations; and (C) Maintaining positive community relations and compatibility with existing uses. It used Aurora Airport as the model for other airports to follow.

6. **In 2003, there was agreement that the runway should be reconstructed to add 1000 feet of length and to resurface and groove it for safety. However, there were no FAA funds available for the work at the time. ODA made clear that they could not advocate for those funds and had to remain neutral. The private sector worked extensively with our Congressional Delegation, the FAA, and ODA to get the funding committed for the work. The runway extension was completed in 2004.**

In 2003, there was agreement that the time had come when the runway should be reconstructed to add 1000 feet of length and to resurface and groove it for safety. This was part of a runway extension that had been planned since 1976 as part of the airport's master plans. However, there were no FAA funds available for the work at the time. ODA made clear that they could not advocate for those funds and had to remain neutral. The private sector worked extensively with our Congressional Delegation, the FAA, and ODA to get the funding committed for the work. The runway extension was completed in 2004.

7. **2003 - Creation of the Aurora Airport Water Control District, to solve major fire and life safety needs for all at the airport, led by the needs of private sector, assisted by Marion County, and providing a fire protection water system for the entire ODA airport.**

In 1999 Dick VanGrunsven bought a portion of the land in the south end of the airport, with the goal of re-locating his company Van's Aircraft to Aurora Airport. An initial Van's building was designed and submitted to Marion County for building permits. Prior to this time there had been construction of hangars at some of the private lands at the airport. However, this was a moment in time when the building code was changing. In 2000 the International Building Codecame into being to replace the Uniform Building Code. Oregon would be formally adopting thenew IBC in 2004, but the State Fire Marshal wanted to promote safety so advised that, whereasprior large buildings at the airport hadn't needed to have water fire sprinkling, soon that wouldbe a requirement. So Van's first building was allowed to be constructed without fire sprinklering, however the State Fire Marshal said: "no more until you have a fire protection water system at the airport." In reality, each property could have created its own water

system, but that would have meant that there would be the cost of building 10 or more different large reservoirs or tanks for water, with pipes, fire hydrants, and a large pump, each costing upwards of $750,000 each ($1.25m in 2021 dollars). Instead, the land owners all got together and looked at options for creating a common system that would serve all of their properties.

Marion County played a big role in this, helping the joint group of airport private properties and public properties create a "Water District." In 2002 the Aurora Airport Water Control District was created by the Marion County Commissioners, following filing of a petition and testimony of how it was a new requirement for many airport buildings. The AAWCD, now formed, could then go to the USDA Rural Development branch of the federal government and request, and in 2003 received a loan of $703,000 to build a 247,800 gallon underground tank system, a pump house, underground water pipes, fire hydrants, and "T" connections for private sprinkler systems. The State ODA offered up their land for the underground tanks, a well-water for water replenishment of the tanks. In 2004 the system was up and running just as the new IBC code came into effect.

Initial planning and management of the project was done by the private sector as donated time. Where costs were incurred for initial engineering the private sector donated those costs up front. Marion County assisted in the creation of the water district. On opening, the Aurora Fire District performed a water truck caravan training session using multiple fire districts in the area to do the initial filling of the tanks from water in the Willamette River. The Aurora Fire District has continued to use the system for their training exercises, year by year. They have also used the water on occasion for off airport firefighting activities in the community.

The management of the water system is largely done by volunteer effort of the Board of Directors, four of whom are from private properties, and one from State ODA. Thankfully, in the following 17 years there has so far, not been a need for the water system – there have beenno building fires. None-the-less, most of the current buildings have fire sprinklers. Fire marshals often explain the importance of fire sprinklers: if a fire occurs in a building that has a fire sprinkler system, on average one and a half heads go off. This means, the one or two headsthat went off, put the fire out, and that was the end of the problem. Aurora Airport now has this status, thanks to the very strong public-private partnership that accomplished the creation of the Aurora Airport Water Control District.

The AAWCD infrastructure has allowed other important uses at the airport. In 2014 a Control Tower was installed at the airport. This could not have occurred without the availability of Oregon building code required fire protection water. In 2020 the water system was made available to the Oregon Department of Forestry to fight the wild fires burning east and south of Estacada. And today, the presence of Van's Aircraft, Life Flight Network Regional Headquarters, and many other nationally known businesses the 1,500 workers at the airport, was only possible because of that public-private effort.

8. **1999 Agreement to install comprehensive Fencing and Security gates around the entire perimeter of the Airport, paid by Private funds on Private Land, and paid by FAA Public funds on Public Land.**

As the airport grew, in 1999, the need for a major new security fence at the airport was needed. There were major problems with deer and coyotes on the runway, as well as visitors to the airport driving right out onto active operations areas. To best allow for the safe operation of the airport as a whole airport community, private owners and the state came together to design, jointly fund (emphasis added) and construct a comprehensive and completeperimeter fence system. This included the state establishing a common standard for all of the automatically operated sliding security gates. This system improved safety and security by reducing wildlife contacts with aircraft as well as helped reduce the illegal operations of motor vehicles on state airport owned facilities.

9. **1999 The Airport Gate colors & Airport Signs were installed on Canby-Hubbard Highway, Keil Road, Arndt Road, and Airport Road, thus creating the Red, Yellow, Purple, Blue, Orange, Green, and Yellow, Gates and Signs around the airport. All of the design, construction, and installation was paid by the private sector. The State agreed to maintain them and pay for the electricity in them.**

To modernize and improve the image of the airport, in 1999, a public private partnership was formed to create defined Gate colors & Airport Signs. They were installed on Canby-Hubbard Highway, Keil Road, Arndt Road, and Airport Road, thus creating the Red, Yellow, Purple, Blue, Orange, Green, and Yellow, Gates and Signs around the airport. All of the design, construction, and installation was paid by the private sector. The State agreed to maintain them and pay for the electricity in them. designed and emplaced modern signage around the airport. The signage improved surface traffic flow around the airport as well as served to bring the airport an organized image in line with the growing investment in aviation related industry and jobs brought to the airport. This public private partnership project added greatly to making the airport a recognized economic engine of North Marion County.

10. **1999 – Joint use parking lot developed for state owned public tie-down area with private funds and public on-going maintenance.**

The state had developed the public aircraft tie-down area it had acquired, and the Columbia Aviation Association had built a new meeting facility on land it owned. A joint use parking lot was developed in adjacent state owned land, to be used by both groups. The parking lot grading, paving, striping, and light poles were paid for and put in by the CAA, while the ODA agreed maintain the parking lot and pay for the electrical cost for the parking lot lights.

11. **1999 – Joint use septic system developed on leased land from the state, is now shared to provide the needs for the Control Tower toilet facilities.**

The Columbia Aviation Association had built a new meeting facility on land it owned, but needed a septic system. The state leased land for CAA to put in a septic system. And then when the Control Tower was put up, it needed a septic system to connect to for the toilet in theControl Tower, so it was joined to the CAA's septic system, for joint use, since it was on the same state owned land.

12. 1997 - Stenbock Road, the major entry to the public airport lands that have FBO, tie-downs, hangars, and the Control Tower, was created by a public-private partnership.

The entry to the state's public 10 acres of land used to be an odd curving gravel road which still shows up as lines on the county tax map. There was a need for a direct road into the 10 acres that the state had bought. So a public-private deal was created whereby: a) the land area was donated by the private sector as an easement, b) a logger paid by the property owner agreed to cut down the trees, c) a third private sector person (pilot and contractor Brian Cloptan) took out all the stumps, and with that done, d) the state agreed to construct a new asphalt road and maintain it.

13. 1996 Creation of Positive Aurora Airport Management (PAAM) by the private sector, at the request of the public sector, to be the Liaison between the airport users, pilots, the surrounding communities, and anyone interested in be involved in the airport, with the ODA.

In 1996, Aurora State Airport was looked at as a rural, uncontrolled airport, far on the outskirts of the Portland Metropolitan area. Thinking there was nothing important happening at the airport, there arose a significant effort by a minority in the surrounding area to actually close down the airport. In fact the Mayor of the City of Aurora at that time organized a group named "Stop" that had the goal of closing Aurora Airport. Their plan was to create in its place "Williamsburg of the West."

State officials, local owners of airport neighboring properties and private enterprise came together at the request of the Director of ODA (Betsy Johnson at that time) to form the Positive Aurora Airport Management (PAAM). There was a signed agreement that this volunteer group's purpose was to be ODA's laison to the community. PAAM created a forum for all of thevoices of interested parties within and around the airport to talk together and learn from each other. By having all the parties at the table together, hearing each other in real time, it createda place for neighbors to be able to find out what was going on at the airport, and for people at the airport to know what at the airport was affecting neighborhoods around the airport. The PAAM group began in 1996 and has continuously operated ever since.

PAAM focuses on safety, respectful flight operations, noise abatement, surface traffic, discussion of planning efforts for needed improvements, interaction with schools, aviation related training of first responders, coordination of flights during periods of construction, making the airport available for community events, assisting coordination for firefighting, and more. It is a forum for complaints to be heard, solutions proposed, and an effort made to have good relations between the airport and the community. Common involved people attending are:

a. Airport Private Property Owners
b. Airport business heads and managers
c. ODA Director & Staff
d. ODA board members
e. Aircraft users, pilots & mechanics

f. Control tower operators
g. Aurora Fire Department Chief & Staff
h. Marion County Sherriff's Department
i. Clackamas County Sherriff's department
j. Charbonneau Representatives
k. City of Aurora Representatives
l. Contractors doing work on the airport
m. Many others, including interested citizens

Meetings are held weekly on Thursday mornings, with typical attendance by 20 to 40 people. Membership is voluntary and there are no paid staff. So it is funded by the airport private businesses who volunteer their staff to do the work needed of running the meetings, issuing agendas, issuing meeting minutes, and sending out coordination emails. It has been so successful that it has been copied by airports around the nation as a model way to be involved with the interests of the surrounding community.

14. 1986 – The private sector willingly sold private land to the state, for the creation of what became the public tie-down, hangar development, and Control Tower Area.

The 1976 Airport Master Plan pointed out that the State should own more than just the airfield property. A most important aspect of this was that ODA and the FAA wanted there to be a State controlled location for an FBO facility that could guarantee that airport services would always be available to users of the public airport. At one point the ODA reported to the privateowners that the FAA would not continue funding airfield developments at the airport unless some public land was acquired that could guarantee public access. So Bruce's family willingly agreed to sell ten acres to the state in 1986, to solve that problem. This is the land that becamethe ODA's developed public tie-down, FBO, hangar development, and Control Tower Area.

15. 1968+ - Private sector airport management donated much of the time needed for providing weather reporting, Unicom service, and monitoring of the airport runway.

Bruce's company, Aurora Aviation in the days beginning in 1968 assisted in much of the management of the airport. This included having the staff take classes and become certified in weather reporting, including the release of weather balloons. This information was gathered so that when an airplane called in on the radio unicom, his staff would respond on the radio with an airport advisory including weather conditions. This weather information also went hourly into regional weather data used by NOAA. The FBO staff were also the ones who would go out and take care of getting the runway cleared up if a plane was stuck on the runway, such as from landing with wheel gear up. This volunteer effort of the private sector continues to this day, evidenced by Lynx FBO recently clearing a disabled Aircraft off the runway in July of this year.

16. 1943 - As a military airport, the runway was constructed with public funds, and the aircraft aprons were all on private property. This shows that even at the beginning of the airport's existence it was a public-private partnership.

Aurora Airport was constructed in 1943, during World War II by the United States Army Air Forces. At that point in the war the outcome was still in serious question. Just a year prior, a Japanese submarine along the south Oregon coast had launched a floatplane that had dropped incendiary bombs inland, trying to start major forest fires. Another Japanese submarine had fired shells at Fort Stevens near Astoria. It was recognized by the Federal government that there was an essential need to be able to patrol and defend the West Coast with military aircraft from numerous locations in western Oregon. Aurora Airport was constructed and during its initial period was used for patrolling the coast, looking for enemy ships and aircraft, and for pilot training.

Aurora Airport from its beginning, represents a major investment of public tax dollars, to create essential public infrastructure. As a military airport, Aurora Airport was designed, and construction specified, using the standard military criteria of that era. It was established as a 150 foot wide by 4,104 foot long runway. The asphalt pavement was built upon a very thick, heavy gravel base, designed to accommodate the loads of military aircraft. This included the ability to handle medium and heavy bombers such as B-25, B-26, B-17, B-24 and cargo aircraft such as C-45, C46, and C-54. It is particularly interesting that all of the ramp areas used for tiedowns, fueling, and repair of aircraft was on the adjacent private lands. Thus, many of seen the early picture of the PBY's at Aurora Airport. Those are in the area where South End Corporate Airpark is now. In fact, from its beginning in 1943 until the early 1980's ALL development (other than airfield) at the Airport was on private property.

17. **Miscellaneous examples of the public-private partnership efforts through private efforts that provided: radar coverage to the Aurora Airport area, getting the airport sign on I-5, presentation of WWII aircraft to honor veterans, bringing local retirement home residents for visit, weather reporting that is useful for the public, and many open houses at the airport for the public.**

Miscellaneous examples of the public-private partnerships are: 1980's letters from Governor Tom McCall and Aurora Aviation working with the FAA and State government to bring radar coverage to the Aurora Area; Aurora Aviation working with Representative Denny Smith to install an Airport sign on I-5; 12 years that Aurora Aviation sponsored the Collings foundation's "living history" tour of their WWII Aircraft, inviting neighbors to the airport to honor Veterans; 2021 summer visit by "dream flights" bringing hundreds of local retirement home residents to the Airport; the current "AWOS" airport weather system (like the former volunteer manual weather reporting) feeds into the national weather system which in turn provides data for television weather reports for the public; Many open-houses and large airport events since the 1970s through the present inviting the public to view Aurora Airport operations.

The Future

Consistent with this long history of public-private partnerships at Aurora Airport there are two projects that are just now under way:

- **Private property owners are now negotiating with ODA for a partnership to install an internal circulation road that has been in the ALP since 2012.**

- **Private Property owners are requesting a partnership with ODA to help get the tree removal accomplished as the trees are now potentially going to raise the landing IFR flight altitude minimums needed for safety during periods of low visibility at the airport.**

BEFORE THE BOARD OF COMMISSIONERS
FOR MARION COUNTY, OREGON

In the Matter of the	)	Case No. CP 03-4
	)	
Application of:	)	Clerk's File No. 4968
	)	
RICHARD VAN GRUNSVEN	)	COMPREHENSIVE
OF HD AVIATION, TED MILLAR	)	PLAN AMENDMENT
OF SOUTH END AVIATION,	)	
AND JACK HOGAN	)	AN ADMINISTRATIVE ORDINANCE

ORDINANCE NO. 1205

THE MARION COUNTY BOARD OF COMMISSIONERS HEREBY ORDAINS AS FOLLOWS:

SECTION I. **Purpose**

This Ordinance is enacted pursuant to the authority granted to general law counties in the State of Oregon by ORS Chapters 197, 203, and 215 to implement the Marion County Comprehensive Land Use Plan. This ordinance amends the Marion County Comprehensive Plan by taking exceptions to Statewide Land Use Planning Goals 11—Public Facilities and Services and 14—Urbanization for certain properties to share a septic system at the Aurora State Airport. (T4S; R1W; Section 11A; Tax lots 200, 201, 203, and 400) and (T4S; R1W; Section 02D; Tax lots 1100 and 1600).

SECTION II. **Procedural History**

The Marion County Board of Commissioners held a public hearing on September 22, 2004, for which proper public notice and advertisement was given. The purpose of the hearing was to consider proposed amendments to the Marion County Comprehensive Plan to take exceptions to Statewide Land Use Planning Goals 11—Public Facilities and Services and 14—Urbanization for certain properties to share a septic system at the Aurora State Airport. All persons present during the public hearing were given the opportunity to speak or present written statements.

SECTION III. **Adoption of Findings and Conclusion**

The Board has reviewed the evidence and testimony in the record. The amendments to the Marion County Comprehensive Plan made hereunder are based on consideration and analysis of existing Marion County Comprehensive plan goals and policies and zoning regulations and the provision of ORS Chapters 197 and 215, Oregon Administrative Rules 660 Divisions 4, 11, 14, 8, and 33, and the State Land Use Planning Goals.

After careful consideration of all facts and evidence in the record, the Board adopts as its own the Facts and Findings contained in Exhibit A, attached hereto, and by this reference incorporated herein. The properties which are granted goal exceptions are shown on the map attached as Exhibit B, attached hereto, and by this reference incorporated herein.

SECTION IV. Action

The exceptions to Goals 11 and 14 to permit six parcels at the Aurora Airport to share an existing septic disposal system are **GRANTED**.

SECTION VI. Severability

Should any section, subsection, paragraph, sentence, clause, or phrase of this Ordinance or any policy, provision, findings, statement, conclusion, or designation to a particular land use or area of land, or any other portion, segment or element of this Ordinance or of any amendments thereto and adopted hereunder, be declared invalid for any reason, such declaration shall not affect the validity and continued application of any other portion or element of this Ordinance or amendments to the Comprehensive Plan; and if this Ordinance or any portion thereof should be held to be invalid on one ground, but valid on another, it shall be construed that the valid ground is the one upon which this Ordinance of any portion thereof was enacted.

SECTION VII. Effective Date

Pursuant to Ordinance 669, this is an administrative Ordinance and shall take effect 21 days after the adoption and signatures of the Marion County Board of Commissioners.

SIGNED and FINALIZED this 13 day of October, 2004 at Salem, Oregon.

MARION COUNTY BOARD OF COMMISSIONERS

Janet Carlson
Chair

Jan Eastwood
Recording Secretary

JUDICIAL NOTICE

Oregon Revised Statutes (ORS) Chapter 197.830 provides that land use decisions may be reviewed by the Land Use Board of Appeals (LUBA) by filing a notice of intent to appeal within 21 days from the date this ordinance becomes final.

Exhibit A

Facts and Findings:
Exceptions to Goals 11 and 14

BACKGROUND:

In 1999, the applicants received approval from the Oregon Department of Environmental Quality (DEQ) to construct a recirculating gravel filter septic disposal system which was intended to serve six parcels at the southern end of the Aurora. After constructing the system, the applicants were informed by DEQ that Goal 11 forbids the extension of septic lines across property lines and an exception to Goal 11 would have to be taken in order to connect and operate the system.

In June 2003, the applicants applied for a comprehensive plan change to take an exception to Goal 11 to permit shared septic facilities. Staff from the Department of Land Conservation and Development commented that the Goal 11 exception would have to be accompanied with either an exception to Goal 14, because the Public zone at that time did not comply with Goal 14 requirements, or amendments to the Public zone that would bring it into compliance with Goal 14 requirements for rural uses outside of rural communities.

The county was involved in a periodic review task to amend the rural zoning ordinance to comply with Goal 14 and the applicants agreed to place their application on hold until the Goal 14 issues were resolved regarding the Public zone. On July 28, 2004, the Marion County Board of Commissioners adopted amendments to the Marion County Rural Zoning Ordinance which brought the code into compliance with Goal 14 requirements. Subsequently, this application was taken off hold and the applicants requested that the Board call-up the request and hold the first evidentiary hearing. Notice of public hearing was mailed on September 1, 2004 to property owners within 500 feet of the subject parcels. Notice was also published in the Statesman-Journal.

On September 22, 2004, the Board held a public hearing to consider amendments to the Marion County Comprehensive Plan taking exceptions to Goals 11 and 14 for an existing shared septic system for six parcels at the southern end of the Aurora Airport. The Board closed the hearing and directed staff to prepare an ordinance taking those exceptions.

FACTS:

1. The subject properties are designated Public in the Marion County Comprehensive Plan and are correspondingly zoned P (PUBLIC) under the Marion County Rural Zoning Ordinance (MCRZO). The purpose of the Public designation and zone is to provide regulations governing the development of land appropriate for specific public and semi-public uses.

2. The properties are located on the north side of Keil Road NE, approximately 1,700 feet west of the intersection of Airport Road NE and Keil Road. The parcels contain aircraft related facilities and are proposed for additional development in the future.

3. Adjacent properties to the southwest, west, east, and north are zoned P and contain the Aurora Airport and airport related uses and businesses. Properties to the south are zoned EFU (EXCLUSIVE FARM USE) and are devoted to farm use.

4. The airport facility was constructed at this site in 1943 to provide an emergency alternate field for carrier aircraft. It has been in operation as an airport, and zoned public, since that time. Since before 1968, additional land east of the runway and north of Keil Road has also been zoned public and closely associated with the airport. Between 1968 and 1981, properties to the south of Arndt Road and east of the runway were rezoned to public and developed with airport uses. In 1981, the airport facility, and surrounding airport related uses in the public zone, were acknowledged as exceptions in the Marion County Comprehensive Plan.

5. The 1976 Airport Master Plan was adopted by Marion County as part of its comprehensive plan. The adoption included a committed exception area to Statewide Planning Goal 3 of approximately 250 acres at the Aurora State Airport. In 1994, an exception for an additional 1.86 acres was taken and acknowledged to add land to the southwest of the airport. The County's Airport Overlay Zone, Marion County Rural Zoning Ordinance (MCRZO) Chapter 177 has been applied to both the 1981 exception area and the area added in 1994.

6. In Legislative Amendment 03-3, which amended the Marion County Rural Zoning Ordinance to comply with Goal 14 requirements for rural exception areas, an exception to Goal 14 for size of use was approved for airport related uses at the Aurora State Airport due to its being developed with a use that is urban in nature and requiring urban styled development to support the existing uses.

COMMENTS:

7. Marion County Building Inspection commented that based on the information submitted in the attached site plan, Building Inspection cannot make a determination on the permit requirements.

8. The FAA commented, "on-airport development requires submittal to FAA of FAA Form 7460-1, off-airport development requires submittal of separate form 7860-1, concurrence of Oregon Dept. of Aviation required for on-airport development, recommended for off-airport development."

9. All other contacted agencies stated that they had no objections or had not commented at the time the staff report was prepared. All comprehensive plan changes are subject to review by the State Department of Land Conservation and Development (DLCD).

DLCD's comments are contained in the file and explained in the background section of this report.

ANALYSIS:

10. Goal 11—Public Facilities and Services states: "Local Governments shall not allow the establishment or extension of sewer systems outside urban growth boundaries or unincorporated community boundaries...." The Goal defines "extension of a sewer or water system" as "the extension of a pipe, conduit, pipeline, main, or other physical component from or to an existing sewer or water system in order to provide service to a use that was not served by the system on the applicable date of this rule...."

    Goal 14—Urbanization prohibits the establishment of urban services on rural lands and the shared septic facility constitutes a urban level of service as defined by Goal 11. Because of this, an exception to Goal 14 will have to be taken along with an exception to Goal 11.

11. The exception requirements for land physically developed to uses other than those allowed by the applicable goal is set forth in OAR 660-004-0025:

    (1) A local government may adopt an exception to a goal when the land subject to the exception is physically developed to the extent that it is no longer available for uses allowed by the applicable goal.

    (2) Whether land has been physically developed with uses not allowed by an applicable Goal will depend on the situation at the site of the exception. The exact nature and extent of the areas found to be physically developed shall be clearly set forth in the justification for the exception. The specific area(s) must be shown on a map or otherwise described and keyed to the appropriate findings of fact. The findings of fact shall identify the extent and location of the existing physical development on the land and can include information on structures, roads, sewer and water facilities, and utility facilities. Uses allowed by the applicable goal(s) to which an exception is being taken shall not be used to justify a physically developed exception.

12. It was determined previously in Legislative Amendment Case No. 03-3 that the existing airport-related development at the airport exceeds the size limitations for commercial and industrial uses allowed by Goal 14 and the Unincorporated Communities Rule and an exception was talen to permit continued development to occur at a level consistent with existing development at the airport. The Land Use Board of Appeals (LUBA) recognized that the level of development at the airport would likely require exceptions to Goals 11 and 14, referring to the Aurora State Airport as an "urban public facility" and commenting that the text of an exception "probably could be very similar to that required for the proposed exception to Goal 3," an exception which was subsequently acknowledged by LCDC. Murray et al. v. Marion County, 23 Or LUBA 268 (1992).

13. OAR 660-014-0040 sets forth the criteria for taking an exception to Goal 11—Public Facilities and Goal 14—Urbanization:

(1) As used in this rule, "undeveloped rural land" includes all land outside of acknowledged urban growth boundaries except for rural areas committed to urban development. This definition includes all resource and nonresource lands outside of urban growth boundaries. It also includes those lands subject to built and committed exceptions to Goals 3 or 4, but *not* developed at urban density or committed to urban level development.

(2) A county can justify an exception to Goal 14 to allow incorporation of a new city or establishment of new urban development on undeveloped rural land. Reasons which can justify why the policies in Goals 3, 4, 11, and 14 should not apply can include but are not limited to findings that an urban population and urban levels of facilities and services are necessary to support an economic activity which is dependent upon an adjacent or nearby natural resource.

(3) To approve an exception under this rule, a county must also show:

(a) That Goal 2, Part II(c)(1) and (c)(2) are met by showing the proposed urban development cannot be reasonably accommodated in or through expansion of existing urban growth boundaries or by intensification of development at existing rural centers;

(b) That Goal 2, Part II(c)(3) is met by showing the long-term environmental, economic, social and energy consequences resulting from urban development at the proposed site with measures designed to reduce adverse impacts are not significantly more adverse than would typically result from the same proposal being located on other undeveloped rural lands, considering:

(A) Whether the amount of land included within the boundaries of the proposed urban development is appropriate, and

(B) Whether urban development is limited by the air, water, energy and land resources at or available to the proposed site, and whether urban development at the proposed site will adversely affect the air, water, energy and land resources of the surrounding area.

(c) That Goal 2, Part II(c)(4) is met by showing the proposed urban uses are compatible with adjacent uses or will be so rendered through measures designed to reduce adverse impacts considering:

(A) Whether urban development at the proposed site detracts from the ability of existing cities and service districts to provide services; and

(B) Whether the potential for continued resource management of land at present levels surrounding and nearby the site proposed for urban development is assured.

(d) That an appropriate level of public facilities and services are likely to be provided in a timely and efficient manner;

(e) That incorporation of a new city or establishment or new urban development of undeveloped rural land is coordinated with comprehensive plans of affected jurisdictions and consistent with plans that control the area proposed for incorporation.

14. The Aurora Airport has been in place since 1943 and airport related uses have been associated with the airport since before 1968. The airport consists of properties in multiple ownerships providing a wide range of aviation-related and support services such as aircraft instruction, rental, maintenance, charter, sales, avionics sale and repair, aircraft construction, storage, fueling, helicopter maintenance and fueling, aerial photography, and others. This airport provides necessary air transportation services to businesses and individuals in Marion, Clackamas, Washington and Multnomah counties, enhancing the economy of the region and the state. The airport facility depends on its location, and the commercial, industrial and population centers and growth in the area, for its viability and necessity. This state airport facility is uniquely able to provide services to the surrounding rural area and nearby communities, as well as a connection to other urban airports because of it's proximity to the Interstate 5 corridor and Highway 99E, the county roadway system, Clackamas County and the south Metro area. In addition, the need for airport transportation facilities is recognized in the Marion County Comprehensive Plan (MCCP).

The Aurora State Airport is needed to serve the economic and air transportation needs of the surrounding community which is dependent upon the existing location of the airport. The criteria in 13(1) and 13(2) are met.

15. The nearest UGB is that of the City of Aurora, approximately 1500 feet to the southeast of the airport. The land between the existing UGB and the airport boundary is resource land. The City of Aurora originally proposed that the airport be included in the UGB when it was going through acknowledgement; however, this was not approved by LCDC and the UGB was reduced to the present area. It continues to be unreasonable to extend the UGB this distance due to the amount of intervening resource land at this time. There are also no rural centers which could encompass the proposed exception area. The closest rural center, Fargo Interchange, is over 9,000 feet west of the airport. The criterion in 13(3)(a) is met.

16. The criteria in 13(3)(b) require that the long-term environmental, economic, social and energy consequences resulting from urban development at the proposed site not be significantly more adverse than would result from the same proposal being located on

other undeveloped rural lands. Because the Aurora Airport is already developed with airport and airport-related uses, and because of its demonstrated need to be located where it currently is, as explained in #14, there are no alternative locations being considered requiring the use of undeveloped land.

Additionally, information provided by the applicant demonstrates that developing the properties with septic or holding tanks would be much more expensive than using a shared septic system.

Also there are environmental concerns developing with septic systems on the subject properties. The soils on the subject properties are not optimum soils for septic systems and can be difficult to locate a system on an individual property. A shared septic also provides the opportunity to process the effluent in a more complete manner that can be certified to meet Leadership in Energy and Environmental Design (LEED) standards.

Considering the lack of alternatives locations for the airport, as well as the benefits economically and environmentally and the potential for positive affects on the air, water, energy and land resources of properties and surrounding area, the criteria in 13(3)(a) and (b) are met.

17. Public facilities are not provided by any of the surrounding cities or service districts. The airport has existed surrounded by resource land and uses since 1943. During that time there has been no evidence that the airport has reduced the potential for continued resource management of land surrounding the airport. Aside from a runway extension, no expansion of airport facilities has occurred historically and no expansion of facilities is proposed in the airport master plan. There is no evidence that a shared septic system for the subject properties will adversely impact surrounding property uses. The criterion in 13(3)(c) is met.

18. The airport has established an Aurora Airport Water Control District to provide a fire suppression water system. Development on the subject properties would still be limited to the capacity of systems in place, including holding tanks, which would serve the uses. Although the City of Aurora sewer system became operational in 2001, there are no plans to extend the system to the airport, at this time, nor has any determination been made of the capacity of the city system to serve the airport. The criterion in 13(3)(d) is met.

19. No incorporation of a new city or establishment is proposed. Any new urban development of undeveloped rural land will be coordinated with the comprehensive plans of affected jurisdictions and applicable zoning. The criterion in 13(3)(e) is met.

20. OAR 660-004-0018 states that for "physically developed" and "irrevocably committed" exceptions to goals, plan, and zone designations shall authorize a single numeric minimum lot size and shall limit uses, density, and public facilities and services to those:

    (a) Which are the same as the existing land uses on the exception site; or

(b) Which meet the following requirements:

(A) The rural uses, density, and public facilities and services will maintain the land as "Rural Land" as defined by the goals and are consistent with all other applicable Goal requirements; and

(B) The rural uses, density, and public facilities and services will not commit adjacent or nearby resource land to nonresource use as defined in OAR 660-004-0028; and

(c) The rural uses, density, and public facilities and services are compatible with adjacent or nearby resource uses.

21. The proposal does not change the allowable commercial or industrial uses at the airport. The purpose of the exception is to allow a shared septic system to serve six parcels at the airport, consistent with the existing urban level of development already existing at the airport. There is no evidence that an exception to permit a shared septic will not commit adjacent or nearby resource land to nonresource use as defined in OAR 660-004-0028. The proposal satisfies the criterion in 20(a) and (b).

22. The airport has a history of being compatible with adjacent and nearby resources uses since its inception over sixty years ago. There is no evidence that allowing the subject properties to share a septic system will be incompatible with surrounding resource uses. The shared septic will be located on the properties where the septic is shared and will not commit surrounding land to nonresource uses. The surrounding resource uses have also been compatible with airport uses. The master planning process, which the Oregon Department of Aviation recently completed for the airport in 2000, requires consideration of National Environmental Protection Act (NEPA) requirements as well as compatibility with surrounding uses. The proposal satisfies the criterion in 20(c).

23. In addition to providing procedures, the MCCP provides guidelines and policies to ensure compatibility with the adopted comprehensive plan and consistency in the planning process. The first guideline is that the proposal should comply with the Statewide Planning Goals that apply in a particular situation. This proposal must be consistent with all applicable Statewide Planning Goals except Goals 3, 11 and 14 for which exceptions have been taken.

24. The proposal is consistent with Statewide Planning Goal 1—Citizen Involvement, which provides for citizen involvement in the planning process. Notice was sent of the request for goal exceptions. A public hearing will were be held before the Board of Commissioners where concerned citizens will have the opportunity to provide comment and make suggestions.

The application is consistent with Goal 2—Land Use Planning since the proposal is consistent with the County's acknowledged comprehensive plan. Moreover, appropriate analysis of the exception provisions have been provided with regard to Goals 11 and 14.

Goals 3—Agricultural Lands, 4—Forest Lands and 5—Open Spaces, Scenic and Historic Areas, and Natural Resources are not applicable to this proposal.

Because the airport and related uses already exist, and the proposal seeks to maintain development at the existing level of uses and sizes, there is no evidence that the proposal will impact air, water or land resource quality over any impacts of the existing airport. Development within the public zone is subject to standards that address and seek to minimize adverse impacts to surrounding uses and resources. The proposal is consistent with Goal 6—Air, Water and Land Resources Quality.

The airport is not in an area subject to natural disasters; the proposal is consistent with Goal 7—Areas Subject to Natural Disasters and Hazards.

Goal 8—Recreational Needs is not applicable to this proposal.

The proposal is consistent with Goal 9—Economic Development. The subject properties are needed to serve commercial, industrial, and public uses in the surrounding community. Allowing development to continue at sizes commensurate with existing development will sustain the economic viability of the airport. The airport and associated uses provide employment to the area and in the state. Employment at the airport should also increase as use of the airport continues to increase as described in the Aurora State Airport Master Plan.

Goal 10—Housing is not applicable to this proposal.

The proposal is consistent with Goal 12—Transportation because the airport is necessary to serve the aviation needs of users at the airport and the surrounding communities. The location of this airport has also been demonstrated to be necessary because neighboring cities and communities do not provide public airport facilities. In addition, the airport is either bordered by or in close proximity to major road facilities, the Interstate 5 corridor, Hubbard Cutoff Road, Highway 99E, Arndt Road, Keil Road, and Airport Road, which provide the traveling public access to and from the airport for both persons and freight.

Goals 13—Energy Conservation, 15—Willamette River Greenway, 16—Estuarine Resources, 17—Coastal Shorelands, 18—Beaches and Dunes and 19—Ocean Resources do not apply to this proposal.

Overall, the proposal is in compliance with the Statewide Planning Goals or an appropriate exception has been taken.

25. The proposal must also conform to the relevant policies in the comprehensive plan. In discussing this requirement, only relevant comprehensive plan policies will be mentioned.

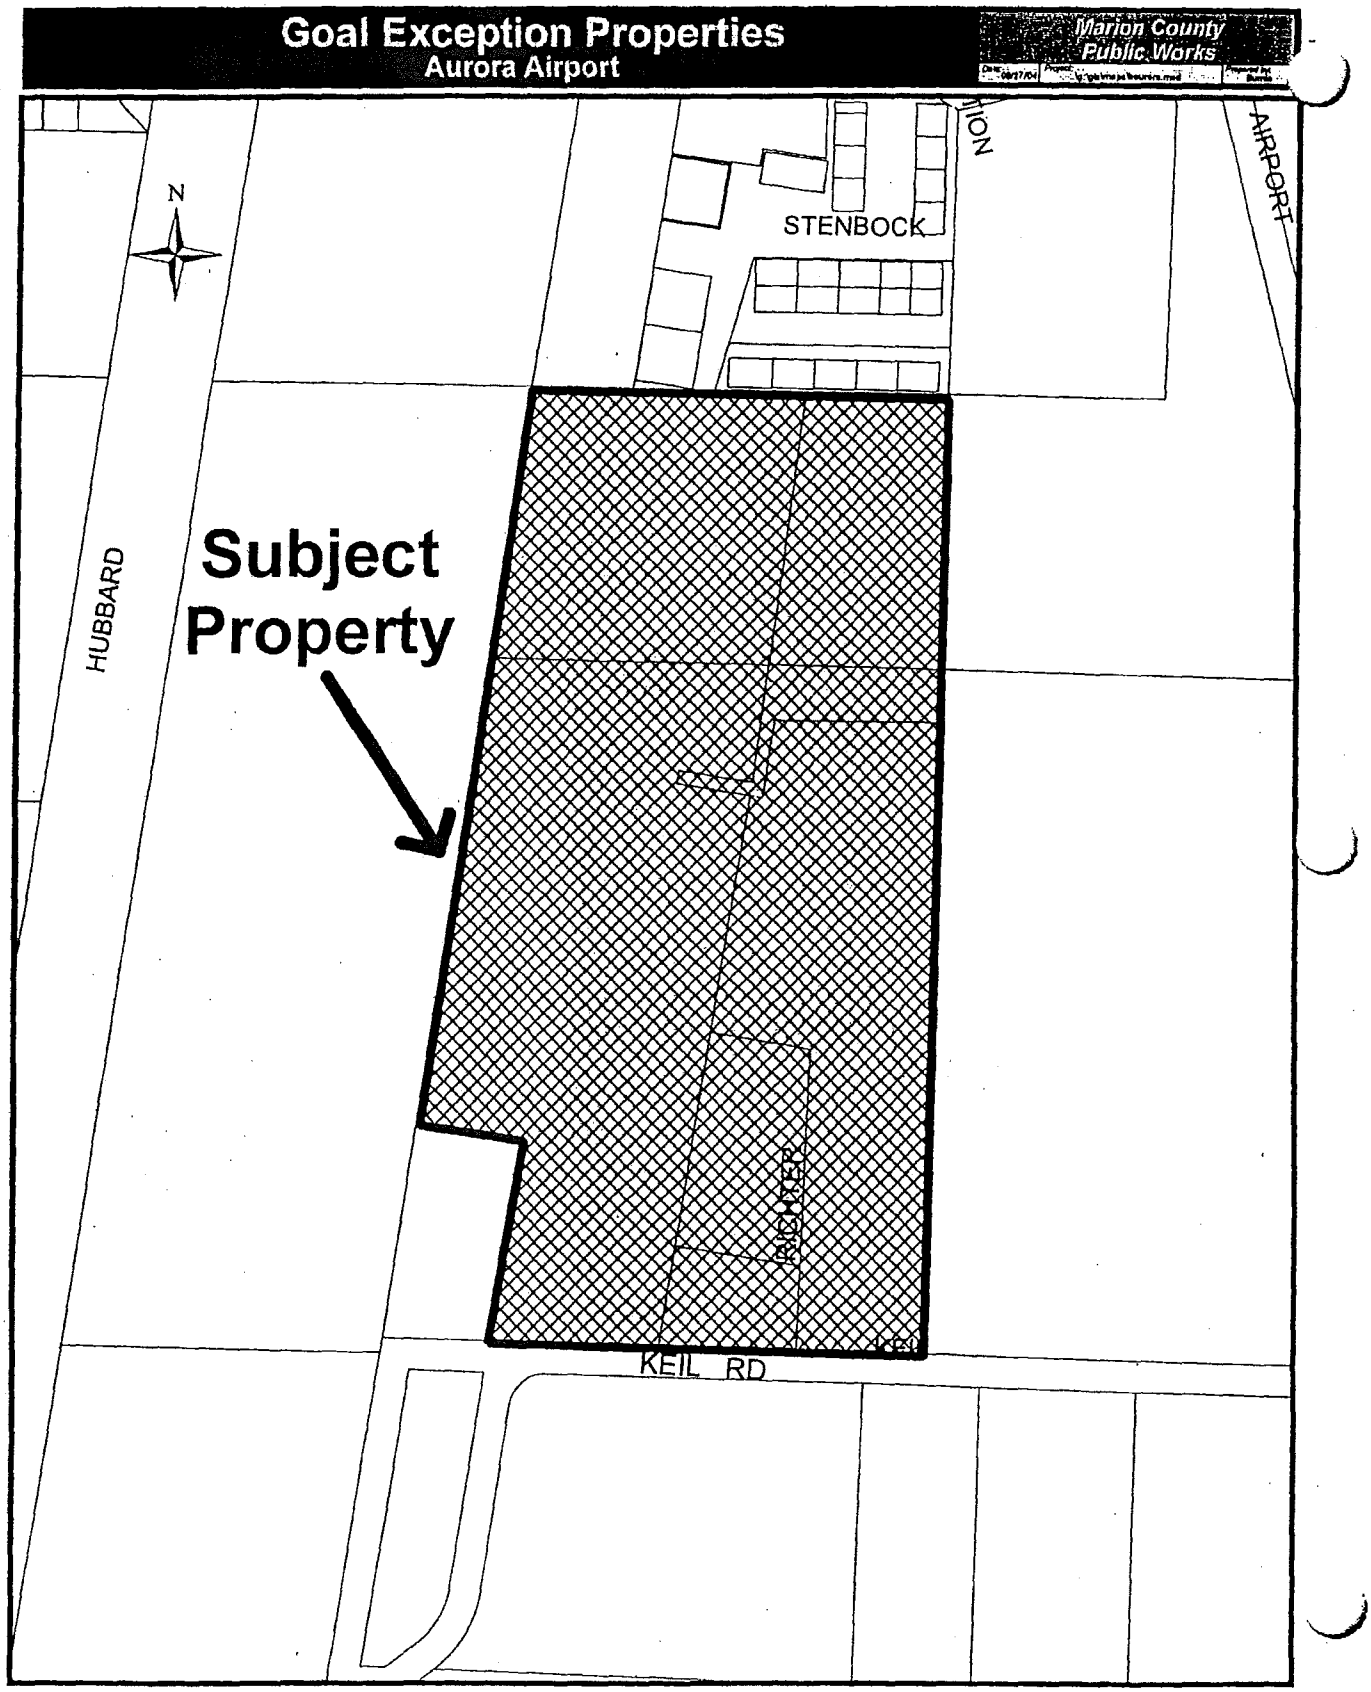
Rural Services Policy #1: The impact on existing services and the potential for additional facilities should be evaluated when rural development is proposed.

Rural Services Policy #2: It is the intent of Marion County to maintain the rural character of areas outside of urban growth boundaries by allowing those uses that do not increase the potential for urban services.

Rural Services Policy #3: Only facilities and services that are necessary to accommodate planned rural land uses should be provided unless it can be shown that the proposed service will not encourage development inconsistent with maintaining the rural density and character of the area.

Rural Services Policy #4: The sizing of public or private service facilities shall be based on maintaining the rural character of the area. Systems that cannot be cost effective without exceeding the rural densities specified in this Plan shall not be approved. The County shall coordinate with private utilities to ensure that rural development can be serviced efficiently.

Any new development on the subject properties will be airport-related and similar to, and no more intensive than, existing development. There is no evidence that the existence of the airport since 1943 has increased the need for urban services or that the development at the airport has impacted the density or character of the rural area. The shared septic facility reflects the urban nature of uses at the airport while not committing the parcels to a fully urban level of development. The parcels would still be able to be developed with urban facilities once those became available. The proposal complies with the rural development policies.



Transportation Policy #8: Airports and airstrips shall be located in areas that are safe for air operations and compatible with surrounding uses.

The existing location of the airport has demonstrated it is in a safe location for air operations. There have been concerns from neighboring residential areas regarding noise at the airport. Efforts have been made over the years to reduce the level of noise associated with airport operations. This proposal will not have an impact on airport operations and, so, will not affect the level of noise produced at the airport. The fact that many of the surrounding lands are in resource zones helps to mitigate the impact of noise from the airport on those lands and surrounding urbanized uses. The proposal complies with applicable transportation policies.

CONCLUSION:

The Board finds that the proposed exceptions meet the applicable criteria in the Oregon Administrative Rules, Oregon Revised Statutes, Statewide Planning Goals, and the Marion County Comprehensive Plan that physically developed and reasons exceptions to Goals 11 and 14 are justified for the subject properties to be able to share a septic system at the Aurora State Airport.

EXECUTIVE SUMMARY

Airport Master Plan Update

Aurora State Airport

The Aurora State Airport Master Plan Update was undertaken to assess the Airport's role, evaluate the Airport's capabilities, forecast future aeronautical activity for the next 20 years, and plan for the timely development of any new or expanded Airport facilities needed to accommodate future aviation activity.

The owner and operator of the Airport, the Oregon Department of Aviation (ODA), obtained and matched a grant from the Federal Aviation Administration (FAA) to fund this study. ODA organized a Planning Advisory Committee (PAC), representing Airport users and neighbors, to participate in the planning process. In addition to six PAC meetings, public involvement in the master plan update included a website to disseminate information and gather comments and questions, and five open houses for the general public.

GOALS & ISSUES IDENTIFIED FOR THE PLAN - CHAPTER 1

Goals and issues for the master plan update were a subject of the first PAC meeting held on July 22, 2010. The common themes of PAC members' goal statements were divided between two categories – goals for the planning process and goals for the Master Plan itself. Issues identified by the PAC, ODA and airport users (via survey) are also included below.

Planning Process Goals

The goals for the planning process guided the conduct of ODA, ODA's consultants, and the PAC throughout the development of the master plan update. Planning process goals were:

- Be open-minded and proceed in good faith.
- Keep the focus more on the long-term future than the short-term future.
- Don't mix unrelated issues and don't be sidetracked by issues that don't relate to the master plan.
- Obtain high quality information for analysis and cite sources.
- Seek consensus for solutions that are acceptable, helpful, and clear.
- By the end of the planning process, establish a clear vision statement that defines what the Airport will be like in the foreseeable future (30 to 50 years) and that is overwhelmingly embraced by all stakeholders. The vision statement should encompass safety, noise, and development scale and flavor.

Master Plan Goals

The Master Plan goals guided the future development of the Airport. When it became time to evaluate alternative layouts for airport development, the goals were used as the evaluation criteria.

- Goal 1: Enhance safety
- Goal 2: Meet the current and projected needs of airport users, as feasible
- Goal 3: Consider all the off-airport impacts of Airport development; minimize negative impacts and maximize positive impacts

Issues

- Runway Extension
- Air Traffic Control Tower
- Impact of Airport Expansion on Surrounding Areas
- Calm Wind Runway Change
- Precision Instrument Approach
- Helicopter Operations (location on public property)

These goals and issues were used throughout the planning process to ensure the Master Plan acknowledged and incorporated concerns from the PAC and general public.

Airport Role Analysis

Aurora State Airport fits well within the OAP 2007 description of an Urban General Aviation Airport, which supports all general aviation aircraft and accommodate corporate aviation activity, including business jets, helicopters, and other general aviation activity. It is one of five GA airports in the region with facilities and services appropriate for business jets. The five airports are Aurora State, Hillsboro, McMinnville, McNary Field in Salem, and Troutdale. These airports are appropriately spaced to provide good accessibility to the population and businesses in the region without substantial service area overlap that might undermine the long-term viability of any of the airports.

The Airport has grown at a faster rate than past planning efforts expected. It has become popular for both personal and business GA use. The growth in business use is likely due to the Airport's location with access to Interstate 5, along with private development adjacent to the state-owned airport property. Considering prior investment in the Airport, its large and growing number of based aircraft, its eligibility for FAA funding, and its proven record for attracting private funding for landside facilities, it appears likely that Aurora State will remain a viable GA airport long into the future.

> Business aviation is anticipated to grow more than personal and recreational aviation, but the Airport's role in the future should not change from its current role—a busy airport handling a full range of GA, including helicopters and business jets.

The Master Plan recommends that Aurora State Airport continue to fulfill its role as an Urban General Aviation Airport.

AIRPORT INVENTORY - CHAPTER 2

An initial step in the planning effort was to collect data pertaining to the Airport and the area it serves. An inventory of the Airport was accomplished through physical observation of existing facilities, interviews with Airport users and business owners, ODA staff, and a review of previous Airport studies and records. Highlights of the information gathered included the information presented in **Table ES-1**.

Table ES-1. Aurora State Airport Inventory

Description	Existing
County	Marion
Ownership	Public (Oregon Department of Aviation)
Acreage	144
Airport Reference Code (ARC)	B-II
Runway Orientation	17/35
Runway Length x Width	5,004' x 100'
Runway Pavement Strength	30,000 lbs (single wheel gear), 45,000 lbs (dual wheel gear)
Taxiway	Parallel
Approach Capabilities	Nonprecision (not lower than 1 statute mile)
Weather Reporting	ASOS (Automated Surface Observing System)
Based Aircraft (2010 data)	354
Annual Operations (2009 data)	89,495

The information gathered as part of this initial step was the foundation for various analyses completed in subsequent chapters of the Plan. An accurate inventory helped to produce an aviation demand forecast that was reasonable and aided in identifying future facility development needs.

AERONAUTICAL ACTIVITY FORECAST - CHAPTER 3

The aeronautical activity forecasts projected were unconstrained and assume ODA or others will be able to develop the various facilities necessary to accommodate based aircraft and future aircraft operations.

ODA has chosen not to constrain the forecasts because undeveloped land to accommodate growth is available.

The primary objective of forecasting was to define the magnitude of change that can be expected over time. Because of the cyclical nature of the economy, it is impossible to predict with certainty year-to-year fluctuations in activity when looking 20 years into the future. However, a trend can be established that characterizes long-term potential. Forecasts serve only as guidelines, and planning must remain flexible to respond to unforeseen changes in aviation activity and resultant facility needs.

Table ES-2. Summary of Forecasts

		2010	2015	2020	2030
Based Aircraft	Jet	23	27	33	47
	Turboprop (Multi-Engine)	16	19	20	26

FACILITY REQUIREMENTS - CHAPTER 4

The following section summarizes the development recommendations given in Chapter 4, *Facility Requirements*, needed to accommodate forecasted aeronautical activity.

Airfield Requirements

- The runway length justification process analysis followed guidance provided in FAA Advisory Circular 150/5300-13, *Airport Design*, and demonstrated it is prudent to plan[1] for a runway extension now. The runway length justification process – approved by ODA, the Oregon Aviation Board, and the FAA – was founded on actual data of aircraft currently operating with constraints, such as reduced payload or shortened stage lengths, and aircraft forecasted to operate at and/or relocate to the Airport within the next five years and exceed 500 annual constrained operations. As a result of the analysis, an extension of at least 1,000 feet was recommended and subsequently approved by the FAA on October 19, 2012 and shown on the approved Airport Layout Plan. The runway length justification process is detailed in Chapter 4[2].

- The current runway strength of 45,000 pounds (dual-wheel gear) is adequate for the existing runway length, as several of the heavier aircraft operating at the Airport are constrained (*i.e.*, reduced fuel load or payload). However, with a runway extension it was recommended the pavement strength be increased to 60,000 pounds (dual-wheel gear), which is the same pavement strength as the parallel taxiway.

- It was recommended the approach lighting system be upgraded to a precision approach path indicator (PAPI).

- ODA should continue to emphasize departure procedures for Runway 17/35, to avoid flight over noise-sensitive areas, and change the altitude limit on left turns when departing Runway 35. (Note: ODA worked with the FAA to create these procedures, which were published in the fall of 2011.)

- A run-up area should be constructed near the northern end of the parallel taxiway to enhance the traffic flow.

---

[1] *Planning for a runway extension does not give justification for federal funding. Based on the number of aircraft operations constrained by runway length projected into the future, justification for funding should occur within the 20-year planning period, although not within the next five years.*

[2] *Pages 4-10 through 4-13.*

Landside Requirements

- To meet 2030 hangar demand, approximately 23.0 acres will be needed.
- 25 aircraft parking positions, or approximately 6.5 acres, will be needed for aprons and aircraft parking by 2030. This includes fixed wing and helicopter parking.
- A cargo apron was recommended, per the Oregon Aviation Plan, which requires approximately one acre of land.
- Expansion of a current fixed base operator (FBO) or establishment of a new FBO will likely be needed to accommodate growing activity.
- Fuel tanks owned by Aurora Aviation should be relocated once they have exceeded their useful life, as the current location could better be used for aircraft-related uses. Off-airport operators may want to consider impacts of current fuel tank location and their impacts from future demand
- Approximately 2 acres of land should be reserved for the air traffic control tower (ATCT), parking and security requirements.
- A suitable location for the facility the Aurora Rural Fire Protection District wants to locate at the airport should be identified.
- ODA should work with and support Marion County and the City of Aurora as improvements to Airport Road are considered. The question of funding these improvements should be part of the discussions.

AIRPORT DEVELOPMENT ALTERNATIVES - CHAPTER 5

Four alternatives for the long-term future of the Airport were presented. Generally speaking, the alternatives can be described as such:

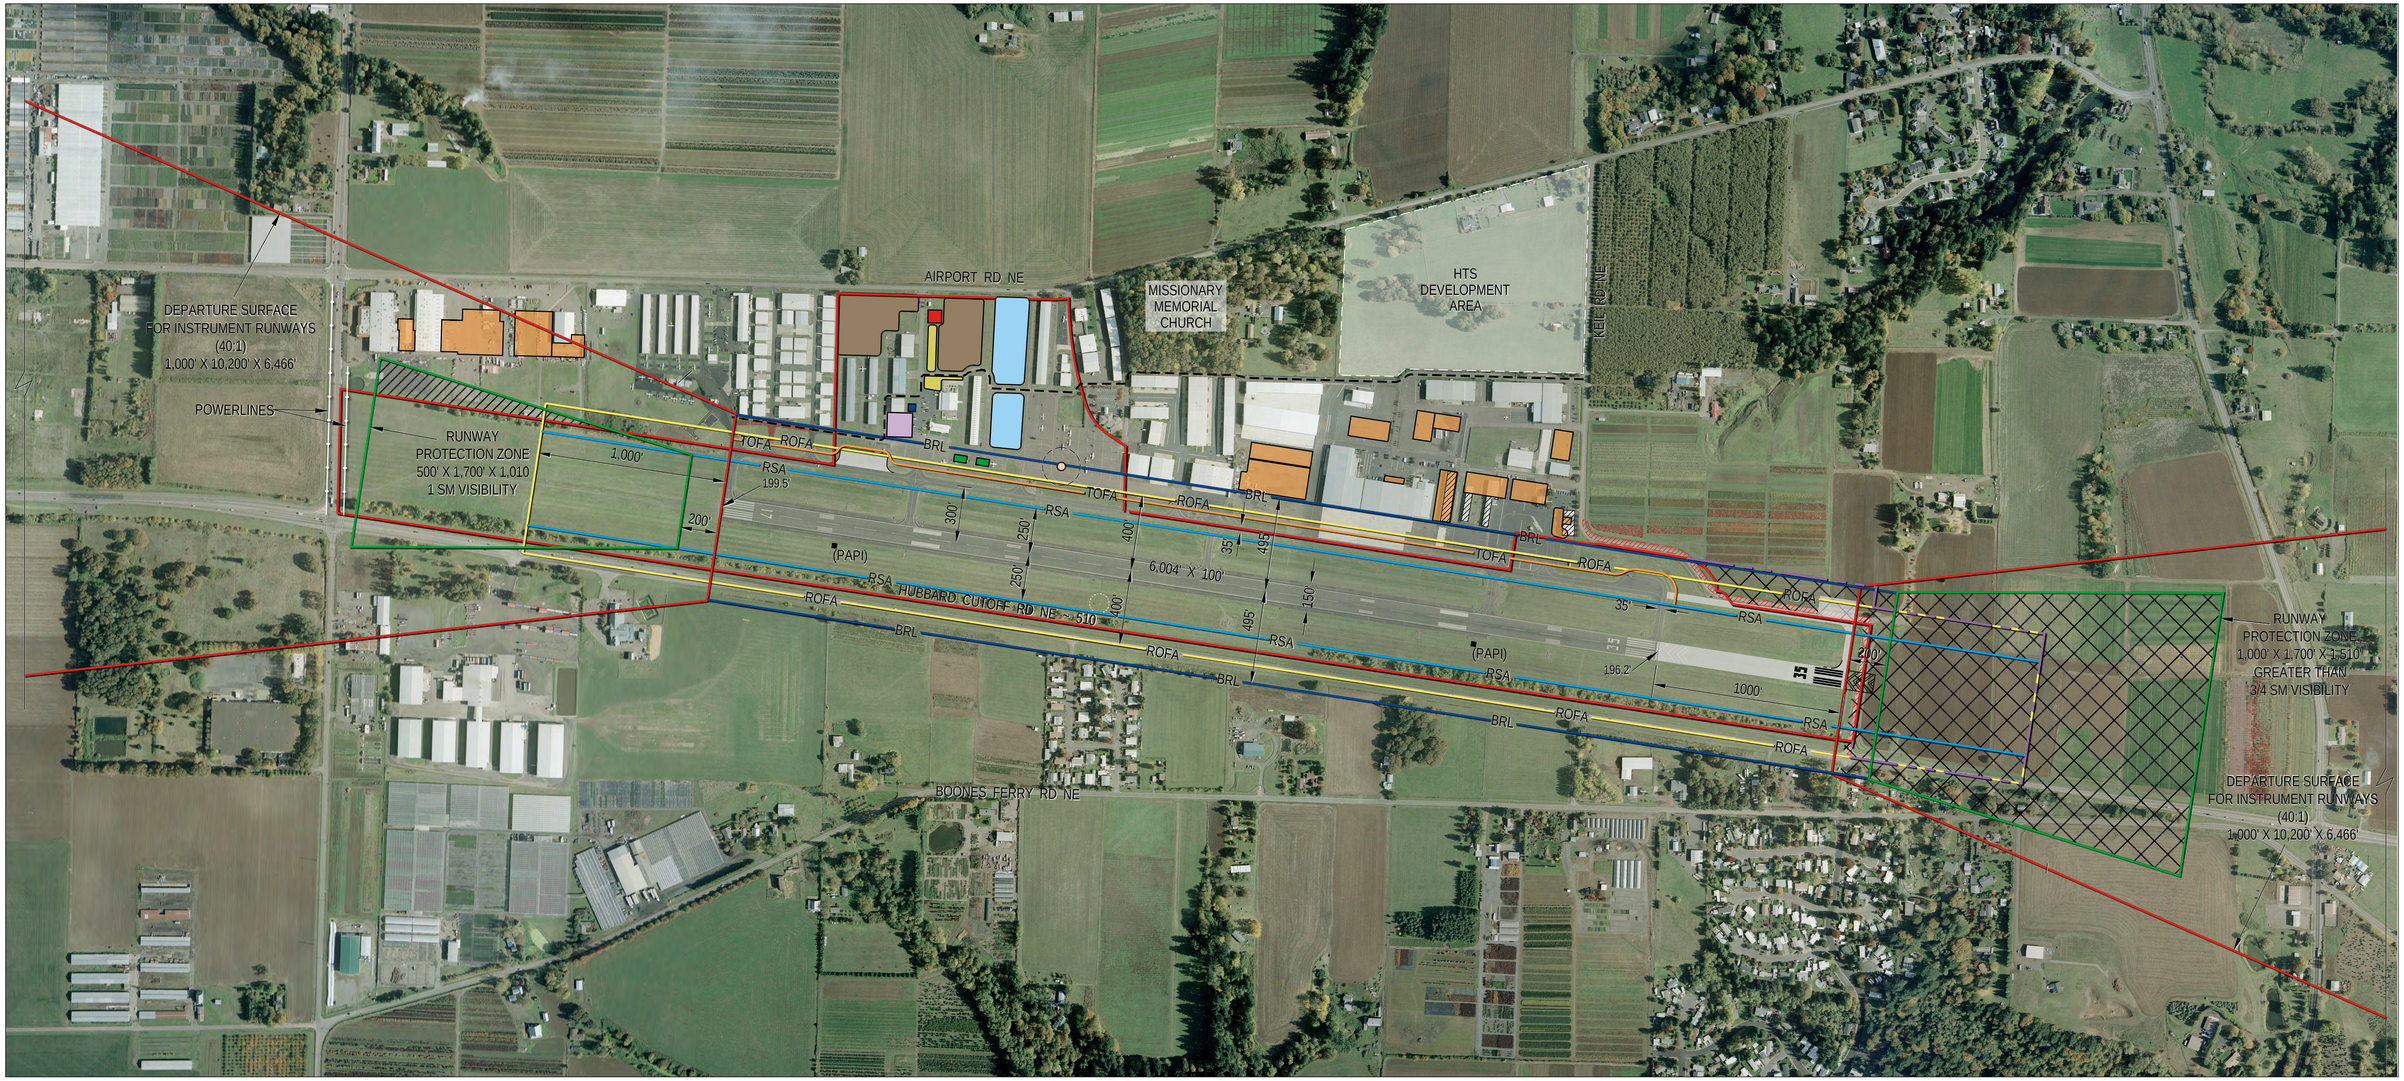
- The No Build Alternative assumed maintenance of existing facilities and no expansion of airfield or landside facilities on State-owned property. The Airport would remain designed to ARC B-II standards (approach minima to remain at visual and not lower than 1 sm). Adjacent, through-the-fence operators would still have the option to develop their property as the market demands.
- Build Alternative 1 included a 600-foot extension to the north end of the runway and an instrument approach with visibility not lower than 1 sm. The ARC would remain B-II in this alternative.

- Build Alternative 2 incorporated a 1,000-foot extension to the south end of the runway and improved instrument approach capability (visibility greater than ¾ sm). This alternative reflected improvements to meet the design standards for ARC C-II.

- Build Alternative 3 depicted ARC C-II and instrument approaches with visibility minima lower than ¾ sm (precision approaches). No runway extension was shown on this alternative. However, in order to meet ARC C-II standards, with the lower instrument approach, the parallel taxiway would be relocated 100 feet to the east and multiple buildings would need to be removed or altered.

PREFERRED ALTERNATIVE

On March 10, 2011, the above alternatives were presented to the PAC and public. The purpose of the meeting was to gather input towards developing a preferred alternative. In addition to discussion during the meeting, comment forms were available at the meeting and on the project website, and comments were gathered for two weeks after the meeting. Comments varied greatly, from supporting the No Build Alternative to Airport expansion.



Since no consensus for a Preferred Alternative was reached at the PAC meeting, ODA considered PAC and public comments (gathered through March 24), and then presented a recommended Preferred Alternative for the Oregon Aviation Board's consideration. The Preferred Alternative **Exhibit ES-1** and presented in Chapter 5 as Exhibit 5J was the basis for revising the Airport Layout Plan, which established FAA grant funding eligibility for airport improvements and was approved by the FAA. Implementing the airfield improvements in the Preferred Alternative depends on FAA and ODA funding availability and the results of environmental analyses for individual projects. The private development of landside facilities will depend on the actual growth of aviation demand, market and financing conditions, and local laws and regulations.

AIRPORT LAYOUT PLAN DRAWING SET - CHAPTER 6

The Airport Layout Plan (ALP) drawings are a pictorial culmination of the master planning process. A major purpose of the ALP drawing set is to establish funding eligibility for the FAA's Airport Improvement Program (AIP), as capital projects must appear on an FAA-approved ALP to receive AIP grant funding.

The following sheets are included within the ALP drawing set.

- Cover Sheet. The cover sheet is an index to the airport layout plan drawing set.
- Airport Layout Plan. The ALP depicts the current airport layout and proposed improvements to the Airport for the 20-year planning period. The ALP is a development guide; the timing of development depends upon when it is needed and can be funded.
- Airport Airspace. This drawing shows the Airport Imaginary Surfaces for the future layout of the Airport with a USGS topographic map as the background.

- Airport Approach Surfaces. This drawing presents a larger scale plan and profile view of the approach surfaces shown in the Airport Airspace Drawing.
- Inner Portion of the Runway 17/35 Approach Surfaces. This drawing provides plan and profile views of the portions of approach surfaces that are closest to the runway, encompassing the existing and ultimate RPZs.
- Terminal Area Plan. The Terminal Area Plan drawing provides a large-scale view of the terminal area.
- Land Use and Noise Contours. A land use map was developed for the Airport and the surrounding area. This map includes the land uses on and around the Airport according to Marion and Clackamas Counties, as applicable.
- Runway Departure Surfaces. The Runway Departure Surfaces Plan depicts the plan and profile views of the Runway 17/35 departure surfaces, which apply to runways with instrument departure procedures.
- Airport Property Map. This drawing provides a history of the ODA's airport property acquisition by showing and listing all land transactions.

CAPITAL IMPROVEMENT PLAN - CHAPTER 7

Through the evaluation of the facility requirements, identification of the Preferred Alternative, and the development of the Airport Layout Plan, the improvements needed at the Aurora State Airport over the next 20-year period were determined. The Capital Improvement Plan (CIP) provided the basis for planning the funding of these improvements. The planned phases of development are in the 5-, 10- and 20-year time frames.

[1] *Other Funding is Connect Oregon III Grant*
[2] *ODA share for PMP is 75% of total cost*
[3] *If no displaced threshold project; construct R17 run-up at same time as fuel tank relocation project.*

Financial Plan Summary

Based on anticipated CIP project costs and the projected operating income, annual income from the Airport's operation was shown to be sufficient to cover the ODA share of CIP project related costs in Phase I. The ODA share of CIP Phase I costs amounts to $582,600. When projected income was interpolated from the table above for each year FY2011 through FY2016, it was estimated that the Airport could expect about $610,000 in operating income over the 6-year period to go toward CIP projects. Additionally, ODA's projected income during CIP Phases II and III was expected to cover the agency's project share.

The primary goal is for the Airport to evolve into a facility that will best serve the air transportation needs of the region while simultaneously developing into a self-sustaining economic generator. This Master Plan Update can best be described as being the road map to helping the Airport achieve these goals. But it should be recognized that planning is a continuous process that does not end with the completion of the Master Plan in that the fundamental basic issues that have driven this Master Plan will remain valid for many years. Therefore, the ability to continuously monitor the existing and forecast status of airport activity will be a key ingredient in maintaining the applicability and relevance of this study.

CONTINUATION OF THE MASTER PLAN PROCESS

The FAA approved the ALP on October 19, 2012 (included as **Appendix B**). As stated in the Master Plan, ODA should consider working with Marion County to incorporate this document into the County's Comprehensive Plan. Additionally, the Master Plan should be a living document used to aid in decision-making, especially when prioritizing future projects based on demand.

Chapter One: INTRODUCTION

Airport Master Plan Update

Aurora State Airport

This update to the 2000 Airport Master Plan was undertaken to assess the role of the Aurora State Airport (Airport), evaluate the Airport's capabilities, forecast future aeronautical activity for the next 20 years, and plan for the timely development of any new or expanded Airport facilities needed to accommodate future aviation activity.

The owner and operator of the Airport, the Oregon Department of Aviation (ODA), obtained and matched a grant from the Federal Aviation Administration (FAA) to fund this study. ODA has organized a Planning Advisory Committee (PAC), representing Airport users and neighbors, to participate in the planning process. In addition to six PAC meetings, public involvement in the master plan update includes a website to disseminate information and gather comments and questions, and five open houses for the general public.

The purpose of this first draft chapter of the Airport Master Plan Update (Plan) is threefold:

- to summarize major issues that the Plan should address
- to identify goals for the planning process and for the future development of the Airport
- to determine the Airport's current and future role within the system of airports

GOALS

Goals for the master plan update were a subject of the first PAC meeting held on July 22, 2010. The common themes of PAC members' statements have been synthesized and are presented below.

The goals are divided between two categories – goals for the planning process and goals for the master plan itself.

Planning Process Goals

The goals for the planning process should guide the conduct of the ODA, ODA's consultants, and the PAC throughout the development of the master plan update. Planning process goals are:

- Be open-minded and proceed in good faith.

- Keep the focus more on the long-term future than the short-term future.
- Don't mix unrelated issues and don't be sidetracked by issues that don't relate to the master plan.
- Obtain high quality information for analysis and cite sources.
- Seek consensus for solutions that are acceptable, helpful, and clear.
- By the end of the planning process, establish a clear vision statement that defines what the Airport will be like in the foreseeable future (30 to 50 years) and that is overwhelmingly embraced by all stakeholders. The vision statement should encompass safety, noise, and development scale and flavor.

Master Plan Goals

The master plan goals should guide the future development of the Airport. When it is time to evaluate alternative layouts for airport development, the goals should be the evaluation criteria.

Goal 1: Enhance safety.

Safety as a goal has broad support from PAC members, airport users, ODA, and the FAA. While aviation safety is the primary concern, the Plan should enhance other aspects of safety at the Airport, including vehicular and pedestrian safety. The primary way to enhance aviation safety is to comply with FAA airport design standards and other FAA guidance. The FAA and State have standards for land use compatibility that address the protection of people around airports from aviation accidents and aircraft noise, as well as the protection of aviators. Security is another component of aviation safety, so the master plan should comply with Transportation Security Administration recommendations for general aviation (GA) airports.

Goal 2: Meet the current and projected needs of airport users, as feasible.

Some PAC members who are airport users fear that community concerns will unduly constrain the growth of the Airport to meet their needs and the needs of businesses in the Airport's service area. They note that the Airport is a significant component of the national airspace system and should fulfill its role within the system. The areas of feasibility that could restrict the Airport from growing to meet users' needs include financial feasibility, environmental feasibility, and political feasibility. The financial feasibility of airfield expansion depends primarily on obtaining FAA grant funding; airfield improvements that do not meet FAA's standards for justifying need probably will not be built. The financial feasibility of landside development (hangars, etc.) depends primarily on market demand and the availability of private financing. In normal economic times, private financing is available if the demand for the facilities truly exists. Environmental feasibility depends upon the ability to mitigate negative impacts of airport development on the natural and manmade environment. Political feasibility depends upon the adoption of the Master Plan by Marion County and on support for the Master Plan by surrounding jurisdictions.

Goal 3: Consider all the off-airport impacts of Airport development; minimize negative impacts and maximize positive impacts.

The PAC expressed several objectives that relate to this goal:

- Involve all communities and jurisdictions in the Airport's influence area.

- Protect farming and farmland.
- Protect the livability of surrounding communities.
- Evaluate and minimize the impacts of airport growth on off-airport infrastructure, including ground and air transportation, fire protection, water, and sewer systems.
- Evaluate and maximize economic benefit.
- Balance the costs and benefits of airport development.

ISSUES

Issues that the master plan update should address were a subject of the first PAC meeting held on July 22, 2010. Other sources for issue identification were ODA and an Airport user survey that was conducted in the fall of 2009. (See the appendices for a summary of the Airport user survey.) The major issues are outlined below.

Runway Extension

Some Airport users report there are times that they must lessen their airplane's weight in order to depart from the Airport. Reducing weight means fewer passengers, less cargo, or, most often, less fuel—requiring them to make more refueling stops than the range of their aircraft requires. On hot days, some operators may reschedule a flight to a cooler time of day, due to the effect temperature has on the aircraft's takeoff performance. Some Airport users and businesses favor a runway extension of up to 1,500 feet, as expressed in a public meeting. The revenue of some businesses would increase if more fuel could be sold for the constrained aircraft and if more aircraft types could use the Airport. Airport neighbors are concerned that a runway extension would unduly disrupt the area and their quality of life, and encourage more and louder aircraft.

Air Traffic Control Tower

The FAA has performed a cost-benefit analysis that justified an air traffic control tower at the Airport. ODA has been seeking funding for building and operating the tower. Some PAC members and others have expressed concern that a control tower will increase traffic and noise at the Airport. They feel that the tower needs to be vetted by the current master planning process. Many Airport users feel strongly that a control tower is needed for safety. However, some Airport users do not want a control tower at the Airport because it would change the classification of airspace around the Airport and increase the requirements for pilot communication. At this time, the FAA and ODA have slowed down a control tower siting study to make better planning decisions when considering tower location and design.

Impact of Airport Expansion on Surrounding Areas

Concerns about Airport expansion include the effects on the capacity of surrounding infrastructure and environmental impacts.

Neighboring jurisdictions fear that off-Airport roads and utility systems cannot handle increased usage from Airport growth. The Aurora Fire District is concerned about having enough equipment and people to protect expanded Airport facilities. On the other hand, Airport businesses want to be able to grow, and Airport users want utility improvements, particularly sewer service, for existing and future facilities.

For example, the lack of sewer service is a major constraint for having a restaurant at the Airport. While ODA recognizes the complexities of Oregon's land use system and potential need for upgrades to City of Aurora utilities prior to annexation, ODA is generally supportive of annexation of the Airport by the City of Aurora due to the economic growth potential for the Airport if it were connected to City services.

Airport neighbors are also concerned about noise and other possible Airport impacts that could degrade the rural character, quality of life, and natural environment of the area.

Calm Wind Runway Change

When winds are calm, pilots are advised to use Runway 35 (northerly traffic flow) to reduce noise impact on surrounding areas. However, the favored instrument approach is to Runway 17 (southerly traffic flow), which results in conflicting traffic patterns and safety concerns. Several Airport users support designating Runway 17 as the calm wind runway, as it once was. Noise impact would move with the traffic, a concern for Airport neighbors. Residents from the Charbonneau area report the calm wind runway has never lessened their noise exposure, so reverting the calm wind runway is not a major concern.

Precision Instrument Approach

Business aviators especially would like to see the Airport's instrument approach capability upgraded from nonprecision to precision. A precision approach would allow them to land in lower visibility conditions. A precision approach could change the size of some FAA-required safety clearances, particularly at runway ends, which might affect Airport neighbors.

Helicopter Operations

Aurora State Airport has a large number of based and transient helicopter operations. Helicopters operating close to small fixed wing aircraft can be a concern, because of the potential damage to the fixed wing airplanes from rotorwash. Currently, most helicopters takeoff and land on tenant or private property. An area available to the public for the takeoff, landing, and parking of helicopters on ODA land may be needed. Airport users and businesses are likely not to agree on a location or need for a new public helicopter area.

Other Airport Improvements

Suggestions for Airport improvements have been made through the Airport user survey and interviews. These suggestions include internal road improvements, a run-up area for Runway 17, improved runway lighting, a restaurant, and radar/approach control coverage in the area. These improvements are not contentious, and will be analyzed later in the planning process, along with improvements resulting from the analysis of Airport capacity vs. demand, FAA design standards, TSA guidance, and industry standards. The PAC, Airport users, and others will have the opportunity to review the full range of Airport improvements that ODA considers in this Master Plan Update.

AIRPORT ROLE ANALYSIS

This section identifies the current role of the Airport and analyzes whether or not that role should change in the future. First, the current role assignment for the Airport within the national and state system of airports is described. Then, the Airport's role within the regional system of airports is examined in depth, including analysis of other airports in the region. Finally, the appropriate future role of the Airport is recommended.

Aurora State Airport's Role within the National System

The Airport is identified by the Federal Aviation Administration (FAA) as one of 2,564 General Aviation (GA) facilities nationwide and is included within the National Plan of Integrated Airport Systems (NPIAS). GA airports do not have scheduled passenger service. There are several criteria allowing an airport to be included in the NPIAS; however, the general criteria are that the airport has at least 10 based aircraft and is located at least 20 miles (30 minutes drive time) from another NPIAS airport. Aurora State Airport meets the based aircraft criteria; however, the Airport is within 13 miles (approximately 19 minutes drive time) of another NPIAS airport (Mulino State). This closer than 20-mile spacing of NPIAS airports is not unusual in urban areas where it is justified by the need for additional airport capacity.

Since it is in the NPIAS, the Airport is eligible to receive Federal grants under the Airport Improvement Program (AIP). Under the current AIP, federal grants cover up to 95% of GA airport eligible costs. Eligible costs include planning, development and noise compatibility projects. As part of receiving AIP grants, the ODA must accept all conditions and obligations under the FAA grant assurances. In general, such assurances require ODA to operate and maintain the Airport in a safe and serviceable condition, not grant exclusive rights, mitigate hazards to airspace, and use airport revenue properly.

Aurora State Airport's Role within the State of Oregon's System

The Oregon Aviation Plan 2007 (OAP 2007) classifies the Airport as a Category II, Urban General Aviation Airport. A Category II airport supports all general aviation aircraft and accommodates corporate aviation activity, including business jets and helicopters, and other general aviation activity. The primary users of these airports are personal and business related, and the airports serve a large geographic region. Key performance criteria associated with these airports are a FAA Airport Reference Code of C-II[1], minimum runway size of 5,000 feet by 100 feet, a precision instrument approach, and full service fixed base operations (FBOs).[2]

[1] Generally, this means the airport is designed to handle medium-sized business jets.
[2] A full-service FBO is a business that provides a wide range of services, such as fuel sales, aircraft repair and maintenance, hangar and tiedown rentals, aircraft charters and rentals, flight training, and amenities for pilots and passengers.

Aurora State Airport's Regional Role

The Airport is an important GA airport serving the Portland metropolitan area and the northern Willamette Valley. It has a convenient location with direct access to Interstate 5. Virtually all types of GA activity occur at the Airport, which is home to multiple businesses offering an array of aviation services. The Airport provides significant economic benefit to the region. The OAP 2007 reported 781 jobs at the Airport, and the total number of jobs attributed to the Airport is 2,469 when direct off-airport and "spin-off" (multiplier) effects are included. Annual wages for these jobs amount to $59,326,000. Annual business sales, aviation and non-aviation related, total $147,862,000.

Efforts to understand more about how the Airport is used and by whom included reviewing the Airport user survey responses, interviewing FBOs in the region, analyzing the geographic location of airport users, and evaluating airports with service areas that overlap the Airport's.

Airport Use According to User Survey and FBO Interviews

The recent Airport user survey shows the Airport is used mostly for business[3]. Over 55% of survey participants reported using the airport for business purposes. Other uses were recreational (41%), training (18%), emergency (4%), and other (14%). The other uses cited included personal transportation and inspection work for a telephone/broadband utility.

Forty-nine of 61 respondents indicated that they own or fly an aircraft and the other 12 respondents do not. About two-thirds of the aircraft used by respondents were small, single engine piston aircraft, such as the Cessna 172. The remainder included helicopters, multi-engine piston and turboprop aircraft, and business jets.

About one-fourth of survey respondents do not base their aircraft at Aurora State Airport. Their aircraft are based at airports within and outside of the region: Corvallis, Hubbard (Lenhardt Airpark), Troutdale, Medford, La Grande, Newburg (Sportsman Airpark), Sunset Airpark, Hillsboro (Stark's Twin Oak), Scappoose, San Jose (CA), Eugene, and Salem. Those who do not keep an aircraft at the Aurora State Airport indicated why they do not. Most cited inconvenient location (67%). Other reasons were the cost of a hangar (25%), lack of a suitable hangar (17%), and inadequate runway length (8%).

FBOs at surrounding airports were contacted to ask how they use the Aurora State Airport. Four FBOs responded, from Hillsboro Airport, McMinnville Municipal, Scappoose Industrial Airpark, and Troutdale Airport. Their use of the Aurora State Airport is limited to picking up or dropping off charter clients. The aircraft used for these operations range from Twin Commanders to a Gulfstream IV. They do not see the Airport as a reliever to Portland International now. The Airport might become a reliever if certain improvements were undertaken--runway lengthening and strengthening, increased hangar availability, auto parking, and improved instrumentation for poor weather operations. The possibility of reliever status will be discussed later in this chapter. When asked about the potential air traffic control tower,

[3] The Airport User Survey was not intended to be a statistical representation of airport users. Surveys were distributed through the project website, project meetings, and at local FBOs (Aurora State, Mulino State, Troutdale, McMinnville, Hillsboro and Scappose).

all reported the tower would be a good safety enhancement, but that their use of the Airport would likely remain unchanged. One FBO operator indicated their operations might decrease if there were a tower, since operations into and out of Aurora State Airport are efficient now, and having air traffic controllers sequencing aircraft would reduce this efficiency.

Analysis of Airport Service Area and Other Airports in the Service Area

To determine better who uses the Airport, the mailing addresses of aircraft owners who have used the airport for Instrument Flight Rules (IFR) arrivals and departures were analyzed. While more Visual Flight Rules (VFR) operations than IFR operations occur at the Airport, records of the aircraft performing VFR operations are not available. However, IFR data alone suffice to determine how far the Airport's service area extends. This is because IFR flight occurs more often in larger, higher performance aircraft than VFR flight.[4] Pilots who typically fly by VFR in small aircraft can choose among multiple airports with facilities and services adequate for their needs, and will often base their airplanes at the airport that is closest to home. Owners of higher performance turboprop and jet aircraft have fewer airports to choose from, since they need a longer/stronger runway, instrument approach, jet fuel, larger hangar, more security, and/or other features not every GA airport has.

For a two-year period, between October 2007 and October 2009, the Airport hosted 14,186 IFR operations, a combination of arrivals and departures (FlightAware). Aircraft based at Aurora and transient aircraft based at other airports performed these operations. The aircraft owners' addresses were unknown for 9% of the total operations. For the 12,848 operations with known aircraft owner addresses, the zip codes were analyzed.[5]

Of the owners of aircraft conducting IFR operations, 77% have addresses in Oregon, 8% in Washington, 4% in California, and 11% in 42 other states. Of the Oregon addresses, about one-third were outside the Portland-Salem region (Aurora State Airport was the trip destination). About two-thirds of the Oregon addresses were within a 30-mile radius of the Airport (Aurora State Airport was the trip origin). The addresses within 30 miles of the Airport were distributed as follows:

- 20% within 10 miles of Aurora:
  - 10% Aurora[6]
  - 5% Canby
  - 2% Tualatin
  - 3% Hubbard, Wilsonville, Woodburn, and Sherwood
- 39% between 10 and 20 miles from Aurora:
  - 17% Portland (south part)
  - 16% Lake Oswego
  - 2% West Linn

[4] Air taxi and corporate aircraft pilots usually fly IFR, due to regulatory requirements or company policy. In addition, the additional equipment and training expense for IFR flight is more often associated with more expensive, higher performance aircraft.
[5] Distances between zip codes were determined using xionetic.com.
[6] 2% of these aircraft are owned by Columbia Helicopters, which operates from facilities at Aurora State Airport, but their office in downtown Portland is listed as the aircraft owner's address.

  - 4% Beaverton, Molalla, Oregon City, Dayton, Dundee, Hillsboro (south part), Lafayette, Newberg, Milwaukie, Tigard, and Silverton
- 6% between 20 and 30 miles from Aurora:
  - 4% Portland (north part)
  - 2% Boring, Brightwood, Eagle Creek, Estacada, Fairview, Gresham, Sandy, Troutdale, Happy Valley, Hillsboro (north part), McMinnville, Salem

From this analysis, it appears that the Airport's core service area is within 20 miles (about 30 minutes driving time), but the service area extends up to 30 miles (about 45 minutes driving time). **Exhibit 1A** shows the area within 45 minutes driving time from the Airport, which represents the maximum extent of Aurora State Airport users. The airports within 45 minutes driving time from Aurora State Airport have service areas that overlap the Airport's service area. To help understand the regional role of Aurora State Airport, the characteristics of these "competing" airports were examined and compared to the Airport. The Airport's maximum service area covers portions of Clackamas, Marion, Multnomah, Washington, and Yamhill Counties, as well as Clark County in Washington and contains 46 airports.

Table 1A presents information about the 46 airports in order of vehicular drive time from the Airport. The information includes drive time and distance from the Airport, ownership and use, FAA and State status, numbers of based aircraft and aircraft operations, runway size, approach data, and the availability of fuel. Information sources were FAA Form 5010 Airport Master Records[7] and the OAP 2007.

[8] A= Asphalt, T= Turf
[9] Visual = Visual approach only, Nonprec = Nonprecision instrument approach, Prec = Precision instrument approach
[10] For airports with multiple runways, largest runway data shown.

The majority of the airports in the region are privately owned and limited to private use. The 46 studied airports host 1,903 based aircraft; 73% of the aircraft are at publicly owned, public-use airports, 15% are at privately owned, public-use airports, and the remaining 12% are at privately owned, private-use airports. Only 19 airports have at least ten based aircraft. **Figure 1A** highlights each county's share of the 1,903 aircraft based at the 46 airports.

Figure 1A. Distribution of Regional Based Aircraft by County

Runway lengths at the 46 airports vary between 1,050 feet and 11,000 feet. Only 32% of the runways are paved, and only 21% of the airports have aircraft fueling capability.

OAP 2007 assigned categories to 11 of the 46 airports. Aurora State Airport and three other airports (Troutdale, Hillsboro, and McMinnville) are Category II, Urban General Aviation. Both Salem McNary and Portland International Airports are Category I, Commercial Service, airports that offer scheduled commercial airline service. Lenhardt Airpark, Mulino State, Chehalem Airpark, and Sportsman Airpark are Category IV, Local General Aviation. Category IV airports primarily support single engine GA aircraft, but are capable of accommodating smaller multi-engine GA aircraft. Stark's Twin Oaks is the only Category V airport; its primary role is to support single engine GA aircraft and provide access to remote areas or emergency service.

Few of the airports have a designated Airport Reference Code (ARC). An ARC represents an FAA-defined class of aircraft. The FAA uses ARCs to customize airport design standards for the most demanding aircraft that can use an airport. An ARC consists of a letter and a Roman numeral. The letter is the Aircraft Approach Category, determined by aircraft approach speed. The Roman numeral is the Airplane Design Group, determined by wingspan or tail height, whichever is more demanding. Below is a table that further explains the ARC components.

Aircraft Approach Category (Approach Speed)		Airplane Design Group (Wingspan / Tail Height)	
A	< 91 knots	I	< 49' / < 20'
B	91-121 knots	II	49'-79' / 20'-30'
C	121-141 knots	III	79'-118' / 30'-45'
D	141-166 knots	IV	118'-171' / 45'-60'
E	> 166 knots	V	171'-214' / 60'-66'

According to the 2000 Master Plan, the ARC for Aurora State Airport is B-II. Other B-II airports are Mulino State and Troutdale. Pearson Field's ARC is B-I. The ARCs for Salem McNary and Hillsboro are C-II and C-III, respectively. Portland International's ARC is D-V, and McMinnville Municipal's is D-II. The ARCs for the other 38 airports are not designated, but a review of the based aircraft fleet mix and runway dimensions indicates they would likely not accommodate or meet FAA standards for aircraft larger or faster than ARC B-I. Most single and twin-engine piston Beechcraft, Cessna and Piper aircraft are in ARC A-I or ARC B-I.

Seven of the airports have instrument approaches. At the other 39 airports, aircraft can only land when the weather is clear. Global Positioning System (GPS)-aided instrument approach procedures have been available for about 15 years. Since GPS approaches do not require costly ground-based equipment, such as required by traditional instrument approaches, the number of GA airports changing from visual to GPS-aided instrument runways has been growing nationwide. GPS navigation is becoming standard in GA aircraft, although most GA pilots still fly by VFR in visual meteorological conditions. Most business and corporate operators fly under IFR regardless of weather conditions, so they typically base their operations at airports with instrument approaches.

Only ten, or 22%, of the airports are eligible for federal funding due to their inclusion in the NPIAS. The other airports must rely solely on private funding. While there are many airports within the region, few have stable funding for planning and capital development. Facilities like Aurora State Airport play an important function within the region because they have viable, renewable sources of funding.

Supplemental information was gathered for the 19 largest airports--those with at least ten based aircraft. A description of these airports follows; each description provides, where possible, the following:

- The county in which the airport is located
- Total acres
- Accessibility by automobile
- Fuel services
- Instrument approaches
- Expansion potential

- Future development plans
- Hangar availability, rates, and fees
- Any other requirements

Accessibility was rated "good" if the airport is a short distance from an interstate or major highway. This information was acquired from available data on the ODA website, FAA Form 5010, and airport owner/manager interviews.

Aurora State Airport. Aurora State is located in Marion County and encompasses 144 acres (state-owned land only). It is easily accessible from Interstate 5, which runs north-south through the Willamette Valley. Aircraft maintenance, fuel services (Avgas and Jet Fuel) and flight training are among the many services offered at the Airport's three FBOs. Weather information is available from an Automated Surface Observing System (ASOS) and the Airport has GPS, instrument landing system localizer (ILS-LOC), and very high frequency omnidirectional range (VOR) approaches. The 2000 Master Plan states the ARC is B-II, indicating the most demanding aircraft with at least 500 annual itinerant operations is a Cessna Citation II or similar aircraft. Currently, there are 432 based aircraft at Aurora State. (More information on existing facilities follows in Chapter 2, *Inventory*.)

Workman Airpark Airport. Workman is a residential airpark located in Clackamas County, with 27 based aircraft. No services are available to the public. There are no plans to expand the airport or the number of hangars/homes located there. The FAA Form 5010 did not report acreage.

Dietz Airpark Airport. Dietz is a residential airpark located in Clackamas County, with good access to the Portland metro area. There are 49 aircraft based at the airport; in 2007, it was reported to have only 32 based aircraft. The FAA Form 5010 did not report acreage. There are no services available to the public.

Lenhardt Airpark Airport. Lenhardt Airpark is situated on approximately 30 acres within Clackamas County. Avgas is available for its 109 based aircraft and transient users. There is reportedly room to build additional hangars if needed.

Mulino State Airport. Mulino State is located in Clackamas County near Highway 213, and is owned and operated by ODA. Until recently, it was owned and operated by the Port of Portland. Access to the Portland metro area and Interstate 205 is good; however, direct access to Interstate 5 is poor. The airport is approximately 275 acres, with 43 based aircraft. New hangars have been constructed recently, and land is available for more hangar development. Self-service fuel is available. Mulino does not have an instrument approach.

Sportsman Airpark Airport. Sportsman Airpark is located in Yamhill County on approximately 60 acres, with good access to the Portland metro area. There are 51 based aircraft. Both Avgas and Jet Fuel are available. Land is available for hangar development and aviation-related businesses on the eastern portion of the airport.

Fairways Airport. Situated on approximately 40 acres within Clackamas County, Fairways supports 31 based aircraft. Reports have indicated this airport may be at risk of closure; however, the airport owner was not available to ask about future plans.

Skydive Oregon Airport. Skydive Oregon is located near Molalla in Clackamas County, with good access to the Portland metro area. The airport occupies approximately 42 acres. Available records show there are no services offered for the 16 based aircraft. Future plans for the airport are unknown. Aerial photography indicates there may be room for additional hangars.

Stark's Twin Oaks Airpark Airport. Stark's Twin Oaks Airpark is situated on approximately 65 acres in Washington County and has 108 based aircraft. There is good access to the Portland metro area. Avgas and maintenance services are available at this airport.

Salem McNary Field. McNary Field offers commercial airline service and is located in Marion County on 751 acres. It has 185 based aircraft, most of which are single engine. There is some development potential on the airport's south end. Records show the majority of operations are local and itinerant GA. Military aircraft accounted for nearly 4,000 operations in 2009. Access to Interstate 5 is excellent. The airport provides fuel and a variety of services. It also has precision and nonprecision instrument approaches.

Chehalem Airpark. Located in Yamhill County, Chehalem Airpark encompasses 28 acres. There are 22 based aircraft at the airport. It offers a wide range of aviation-related services such as Avgas, maintenance, aircraft rental, and charter services. It is privately-owned, but open to the public. Aerial photography indicates land is available for development.

Hillsboro Airport. The Port of Portland owns and operates the 900-acre Hillsboro Airport. The airport provides many services, such as fuel (Avgas and Jet Fuel), aircraft maintenance, flight instruction, and aircraft rental. It currently has 213 based aircraft. The airport is a designated reliever for Portland International and is experiencing a growing volume of corporate air traffic. The Airport Master Plan (2005, June) shows the Hillsboro Airport's ARC is C-III, meaning the most demanding aircraft using the airport would be a Gulfstream jet or similar. Both precision and nonprecision approaches (ILS, LOC, VOR/distance measuring equipment (DME), and NDB) are available to pilots, as well as an air traffic control tower. Access to the Portland metro area is very good along Highway 26.

Pearson Field. Pearson is the only airport within Aurora State Airport's maximum service area located outside of Oregon. It is located in Clark County, Washington, on approximately 104 acres, 73 of which are owned by the National Park Service and within the Vancouver National Historic Reserve. The airport is rich in aviation history and offers a variety of services. It has 150 GA hangars and a waiting list for those who want to hangar their airplane there. Records indicate 175 based aircraft.

Portland International Airport. Portland International Airport (PDX) is located in Multnomah County with excellent access to Interstate 5, Interstate 84, and Interstate 205. Owned and operated by the Port of Portland, it is the largest commercial service airport in Oregon. It occupies approximately

3,200 acres and in its immediate surroundings accommodates a variety of industrial and commercial uses. It hosts some GA activity and has 84 based aircraft, but focuses on airline service. The Port of Portland owns two reliever airports (Hillsboro and Troutdale) to "relieve" PDX of GA aircraft operations and maximize PDX's capacity for airline operations.

Sunset Air Strip. Sunset Air Strip is located on 14 acres in Washington County, just off Highway 26. It has 13 based aircraft. No services are available. It is a residential airpark, mostly surrounded by agricultural lands.

Eagle Nest Ranch. Eagle Nest Ranch is located in Clackamas County. Its acreage is unknown. It is a residential airstrip that appears to have recently expanded. In 2007, FAA records indicate it had 2 based aircraft; however, more recent data shows 19. Aerial photography indicates land is available for development.

Olinger Airpark. Olinger Airpark is a residential airstrip in Washington County with 13 based aircraft. There are no services available at this privately owned, private-use airport. Area for expansion is limited, based on aerial photography.

McMinnville Municipal. Located in Yamhill County, McMinnville has 104 based aircraft on 650 acres. Full services are available at this GA airport. It has both precision and nonprecision instrument approaches. Land is available for developing additional hangars. It is the home of Evergreen Aviation, which is the likely explanation for the ARC of D-II.

Troutdale Airport. Troutdale Airport encompasses 284 acres and is located in Multnomah County. It is owned and operated by the Port of Portland and is home to 145 based aircraft. It is a reliever for Portland International and attracts business and recreational GA traffic. Various services are offered for pilots, including fuel (Avgas and Jet Fuel), maintenance, aircraft rental, and flight instruction. The airport has an air traffic control tower and GPS and non-directional radio beacon (NDB) instrument approaches. The airport's Master Plan Update (2004, October) reports the ARC is B-II. The airport is located 10 miles east of PDX and has excellent access to Interstate 84.

Airport Role Conclusions and Recommendations

Aurora State Airport fits well the OAP 2007 description of an Urban General Aviation Airport. It is one of five GA airports in the region with facilities and services appropriate for business jets. The five airports are Aurora State, Hillsboro, McMinnville, McNary Field in Salem, and Troutdale. These airports are appropriately spaced to provide good accessibility to the population and businesses in the region without substantial service area overlap that might undermine the long-term viability of any of the airports.

Alternatives to continuing Aurora State Airport's Urban General Aviation role are undesirable:

- Downsizing the Airport's capability—attempting to limit it to smaller piston-powered, airplanes and recreational use--is an impractical future for the Airport. ODA would be violating grant

assurances made to the FAA, the regional airport system would have a hole that would be costly and difficult to fill, and residents and businesses in the region would suffer economically.

- Commercial service is also not an appropriate future role for Aurora State Airport. Portland International Airport has the capacity to handle commercial passenger and cargo airline activity in the region for many years to come. If commercial service grows elsewhere in the region, it will likely be at Salem, which is more suitable for commuter airline service.

The Airport has grown at a faster rate than past planning efforts expected. It has become popular for both personal and business GA use. The growth in business use is likely due to the Airport's location with access to Interstate 5, along with aggressive private development adjacent to the state-owned airport property. Considering prior investment in the Airport, its large and growing number of based aircraft, its eligibility for FAA funding, and its proven record for attracting private funding for landside facilities, it appears likely that Aurora State will remain a viable GA airport long into the future. Business aviation will probably grow more than personal and recreational aviation, but the Airport's role in the future should not change from its current role—a busy airport handling a full range of GA, including helicopters and business jets.

As business aviation and higher performance aircraft traffic grows, some owners of smaller, personal use and recreational aircraft may want to relocate to a less busy airport where the other aircraft are smaller and slower. ODA now owns Mulino State Airport, which is a short distance from Aurora State Airport. Mulino is well suited to single engine and small multi-engine piston aircraft and VFR flying. It has hangars available and sufficient land for building many more hangars should minor infrastructure constraints be addressed. If Aurora State Airport becomes overutilized and Mulino State Airport remains underutilized, ODA may be able to structure its rates and charges to achieve maximize utilization of both airports' capacities.

Aurora State Airport is not an FAA-designated reliever airport for Portland International, although it is often referred to as one. The Airport could be officially designated a reliever in the short-term future, if ODA decides to pursue the designation and the FAA agrees. However, the advantages the reliever designation once held--more AIP entitlement funding and higher priority for discretionary AIP funding--have disappeared in recent years.

FAA Order 5090.3C, *Field Formulation of the National Plan of Integrated Airports Systems (NPIAS),* explains the requirements for reliever designation. An existing public-use airport may be included in the NPIAS as a reliever airport if it substantially relieves airport congestion at a commercial service airport and provides GA access to the surrounding area. Although reliever airports are designated by thorough case-by-case reviews, general requirements are:

- A current activity level of at least 100 based aircraft or 25,000 annual itinerant operations
- An airport must have a forecasted activity level of at least 100 based aircraft or 25,000 annual itinerant operations for the period in which it is being designated as a reliever.
- The relieved airport (in this case, Portland International (PDX)):

- is a commercial service airport that serves a metropolitan area (MA) with a population of at least 250,000 persons or at least 250,000 annual enplaned passengers, and
- operates at 60% of its capacity, or would be operated at such a level before being relieved by one or more reliever airports, or is subject to restrictions that limit activity that would otherwise reach 60% of capacity.

Aurora State Airport meets the first two criteria on current activity levels. The relieved airport (PDX) also meets the first of two criteria. The 2010 Master Plan for PDX reports the FAA has set the airport's capacity upper limit at 500,000 annual operations. By 2035, PDX is forecasted to have 377,820 operations. This means that by 2035, PDX will be operating at 76% of its capacity.

PDX would be operating at 60% of its capacity now if Aurora State Airport did not exist and the operations that now occur at Aurora State were added to PDX operations. Using averages for the years 1998 through 2008 from the FAA's Terminal Area Forecast, PDX has 284,580 annual operations and Aurora State Airport has 79,953 operations.[11] Adding Aurora's operations to PDX's operations results in a total of 364,533 operations, or 73% of PDX capacity. These figures meet the last criteria needed for a proposed reliever airport.

However, the PDX Airport Layout Plan includes the addition of a third runway that would greatly increase PDX's capacity, thereby decreasing the demand/capacity utilization to less than 60%.

It is recommended that Aurora State Airport continue to fulfill its role as an Urban General Aviation Airport. The advantages and disadvantages of becoming a reliever airport should be discussed with the ODA, Port of Portland, and FAA.

[11] Eleven-year averages are used to reduce the effect of annual fluctuations. These annual numbers do not match any one specific year because they are averages.

Chapter Two: INVENTORY

Airport Master Plan Update

Aurora State Airport

An initial step in the preparation of this Master Plan (Plan) is to collect data pertaining to the Aurora State Airport (Airport) and the area it serves. An inventory of the Airport was accomplished through physical observation of existing facilities, interviews with Airport users and business owners, Oregon Department of Aviation (ODA) staff, and a review of previous Airport studies and records.

This chapter summarizes the Airport's background, existing airfield and landside facilities, airspace, land use and zoning, environmental issues, and historical aviation activity and financial data. The information gathered as part of this initial step is the foundation for various analyses completed in the subsequent chapters of this Plan. An accurate inventory helps produce an aviation demand forecast that is reasonable and aids in identifying future facility development needs.

BACKGROUND DATA

Airport Location and Access

The Airport is situated in the heart of the Willamette Valley in Marion County, Oregon and is adjacent to Clackamas County to the north. It is located on the southern extents of the Portland metropolitan area, but resides within the Salem Metropolitan Statistical Area – as it is mid-way between Portland and Salem. The city of Aurora is located approximately one-quarter mile southeast of the Airport. **Exhibit 2A** shows a map of the region and Airport vicinity.

The majority of the County is rural and has abundant agricultural lands, making it the largest producer of agricultural products in the state of Oregon. The County's economy is also heavily dependent on government, as the state's capital is located within its boundaries.

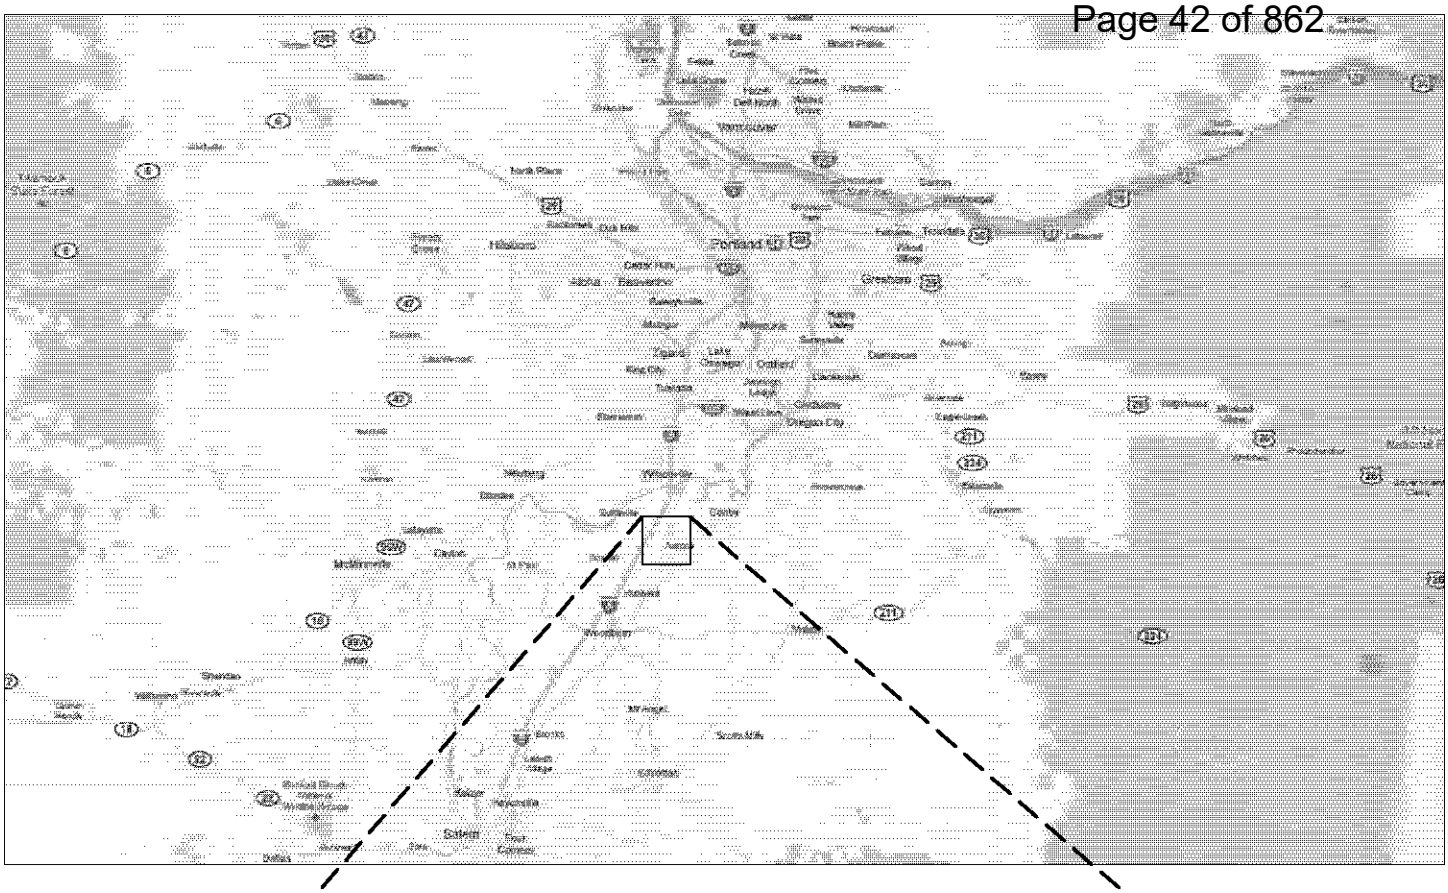
The Airport is conveniently located adjacent to Interstate 5, which is an essential commerce link for the western United States. Access to the Airport is also provided by Highway 551 (Canby-Hubbard Highway) from the north and south, Arndt Road from the east and west, and Airport Road from Aurora. Keil Road is located south of the Airport and provides additional airport business access from Highway 551 and Airport Road.

Other transportation modes are available near the Airport. Canby Area Transit offers public transportation, with a bus stop on Main Street in Aurora. Taxi service is also available in Aurora. Amtrak train and Greyhound bus services are available in Portland.

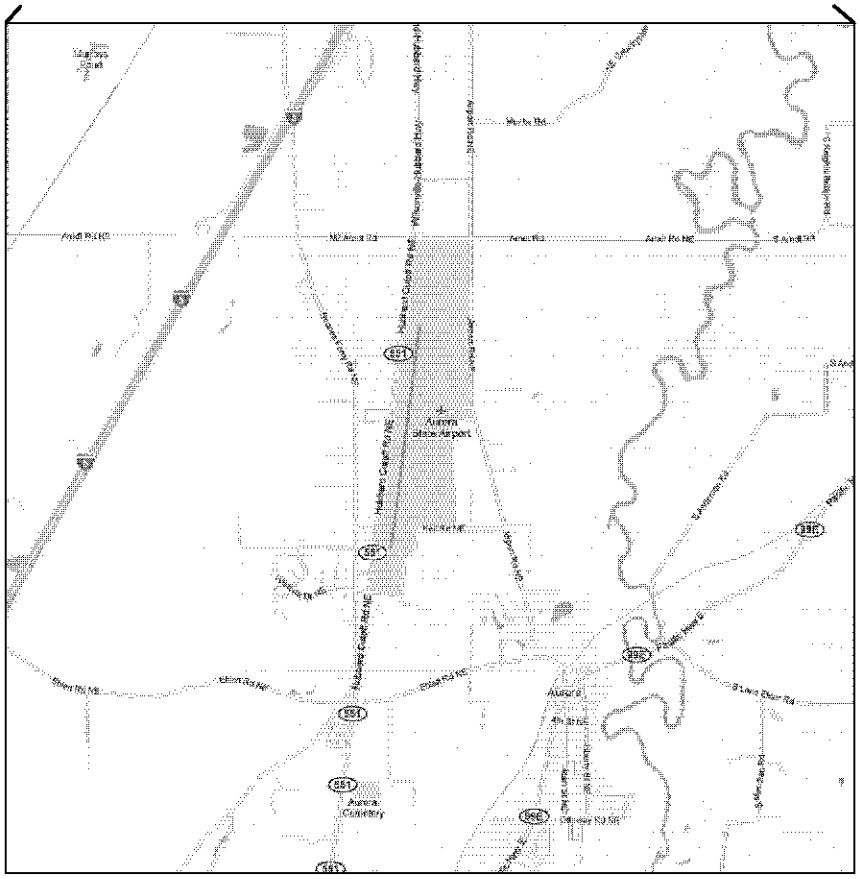
Area Topography

A mostly rural county, Marion encompasses agricultural and recreational lands (*i.e.*, Ankeny National Wildlife Refuge, Mount Hood National Forest and Willamette National Forest). Marion County is in the central area of the Willamette River Basin, which is surrounded by the Cascade Range to the east, the Coast Range to the west, the Calapooya Mountains to the south and the Columbia River to the north. Generally speaking, the area is level with rolling hills. The Airport's elevation is 200 feet above mean sea level (MSL).

Climate



The Aurora area has mild, wet winters, and warm, dry summers. Winter temperatures generally range from 45 to 55 degrees Fahrenheit, and summer temperatures generally range from 70 to 80 degrees Fahrenheit. Annual rainfall averages 40.7 inches, with the majority of it occurring from November through March. Annual snowfall averages two inches per year. The mean maximum temperature in the hottest month (August) is 84 degrees.



Community and Airport History

Dr. William Keil founded the Aurora Colony in 1856. The colony disbanded in 1883, but the community persisted due to the people's craftsmanship, and because of the stage and rail stop bringing visitors to the town's hotel. Today Aurora is recognized as a national historic district and is known for its numerous antique dealers. According to Census records, the population of Aurora in 2009 was 1,020.

The Airport was established in 1943 and was managed by the United States Bureau of Public Roads until 1953. The State of Oregon has operated the Airport since 1953, although ownership of the land was not actually transferred from the Highways Division to the Aeronautics Division (ODA's predecessor) until 1973.

The first Airport Master Plan was prepared in 1976, followed by major improvements in 1977-78, which included construction of a parallel taxiway, installation of a rotating beacon, runway reconstruction and narrowing (to 100 feet), drainage improvements, runway lighting, and tiedown apron construction. The 1976 Plan identified the need for an air traffic control tower. In 1979, a 22-acre parcel near midfield was purchased with Federal Aviation Administration (FAA) funds, which has since been leased to private parties who constructed aircraft hangars and other facilities on the property. In 1986, another 10 acres with a small tiedown apron was purchased near midfield. A second Airport Master Plan for the Airport was completed in 1988. In 1995, the runway was lengthened from 4,104 feet to 5,004 feet and a non-precision Localizer Landing System instrument approach was added to Runway 17. In 2004, the runway was reconstructed and in 2009, the parallel taxiway was relocated to meet FAA's design standard for runway-taxiway centerline separation.

A unique public-private partnership has developed over the years at the Airport. The State's property is almost exclusively dedicated to airfield facilities (runway, taxiway, tiedown aprons, etc.), while the majority of tenants are located on adjacent private lands and access the Airport via through-the-fence agreements. This Plan will reference both "Airport Property" and "Airport Environs". Airport Property refers to the State's property owned in fee. Airport Environs encompasses the property used for airport-related activities, and includes public and privately owned property. The actual Airport fence encompasses the Airport Environs for safety and security purposes. The term through-the-fence is an FAA term used to describe aircraft accessing a public airfield from private land, and does not involve actual fences.

EXISTING FACILITIES

Existing facilities at the Airport are divided into three categories: airfield, landside, and support facilities. Airfield facilities include areas such as runways, taxiways, and aprons. Landside facilities include areas such as hangars, airport buildings, and auto parking. Support facilities include emergency services, utilities, and miscellaneous facilities that do not logically fall into either airfield or landside facilities. **Exhibit 2B** shows the existing facilities at the Airport.

Airfield Facilities

Airfield facilities include pavements used for the movement of aircraft (*i.e.*, runways, taxiways, taxilanes, aprons). In April 2008, as part of a three-year rotation, the Airport's Pavement Condition Index (PCI) was updated for those pavements located on Airport Property. The condition of the airport pavements were rated on a scale of 0-100 with 0 being an unusable paved surface and 100 reflecting a just-constructed paved surface. Generally, ratings with a PCI above 70 require only preventative maintenance in the short term, while ratings between 40 and 70 require major rehabilitation and ratings less than 40 typically require reconstruction. **Exhibit 2C** depicts the pavement condition map for the Airport. The exhibit does not show the recent Taxiway A relocation since the pavement survey was done before the taxiway project. At the time the PCI was updated, pavement sections were documented. Pavement sections describe how individual sections of pavement were constructed. In general, most pavements at the Airport consist of four inches of asphalt on top of 6-13 inches of a crushed aggregate base. **Exhibit 2D** provides a detailed graphic of the existing pavement sections at the Airport.

Runway. The Airport has one paved runway, 17/35, with the dimensions of 5,004 feet by 100 feet. The runway pavement surface is asphalt and in April 2008 was given a PCI rating of excellent. The pavement strength of the runway is rated as 30,000 pounds for Single Wheel Gear (SWG)[1] aircraft and

[1] Single Wheel Gear is the term used to describe aircraft with one wheel per strut, while Dual Wheel Gear is for aircraft with more than one wheel per strut. An aircraft's landing gear configuration and gross weight are critical components in airfield pavement design and are used to characterize pavement strength.

45,000 pounds for Dual Wheel Gear (DWG). A 150-foot blast pad is located at the Runway 35 end. The runway supports general aviation, which include private and business operators but does not include commercial (airline) operators.

Taxiways and Taxilanes. Taxiways are constructed primarily to facilitate aircraft movements to and from the runway. Some taxiways are necessary simply to provide access between aprons and the runway, and other taxiways are necessary to provide safe and efficient use of the airfield.

Runway 17/35 has a full-length parallel taxiway (Taxiway A) that is 35 feet wide. Five taxiways connect Taxiway A to Runway 17-35; Taxiway A1 is located at the Runway 17 end, and A5 is located at the Runway 35 end.

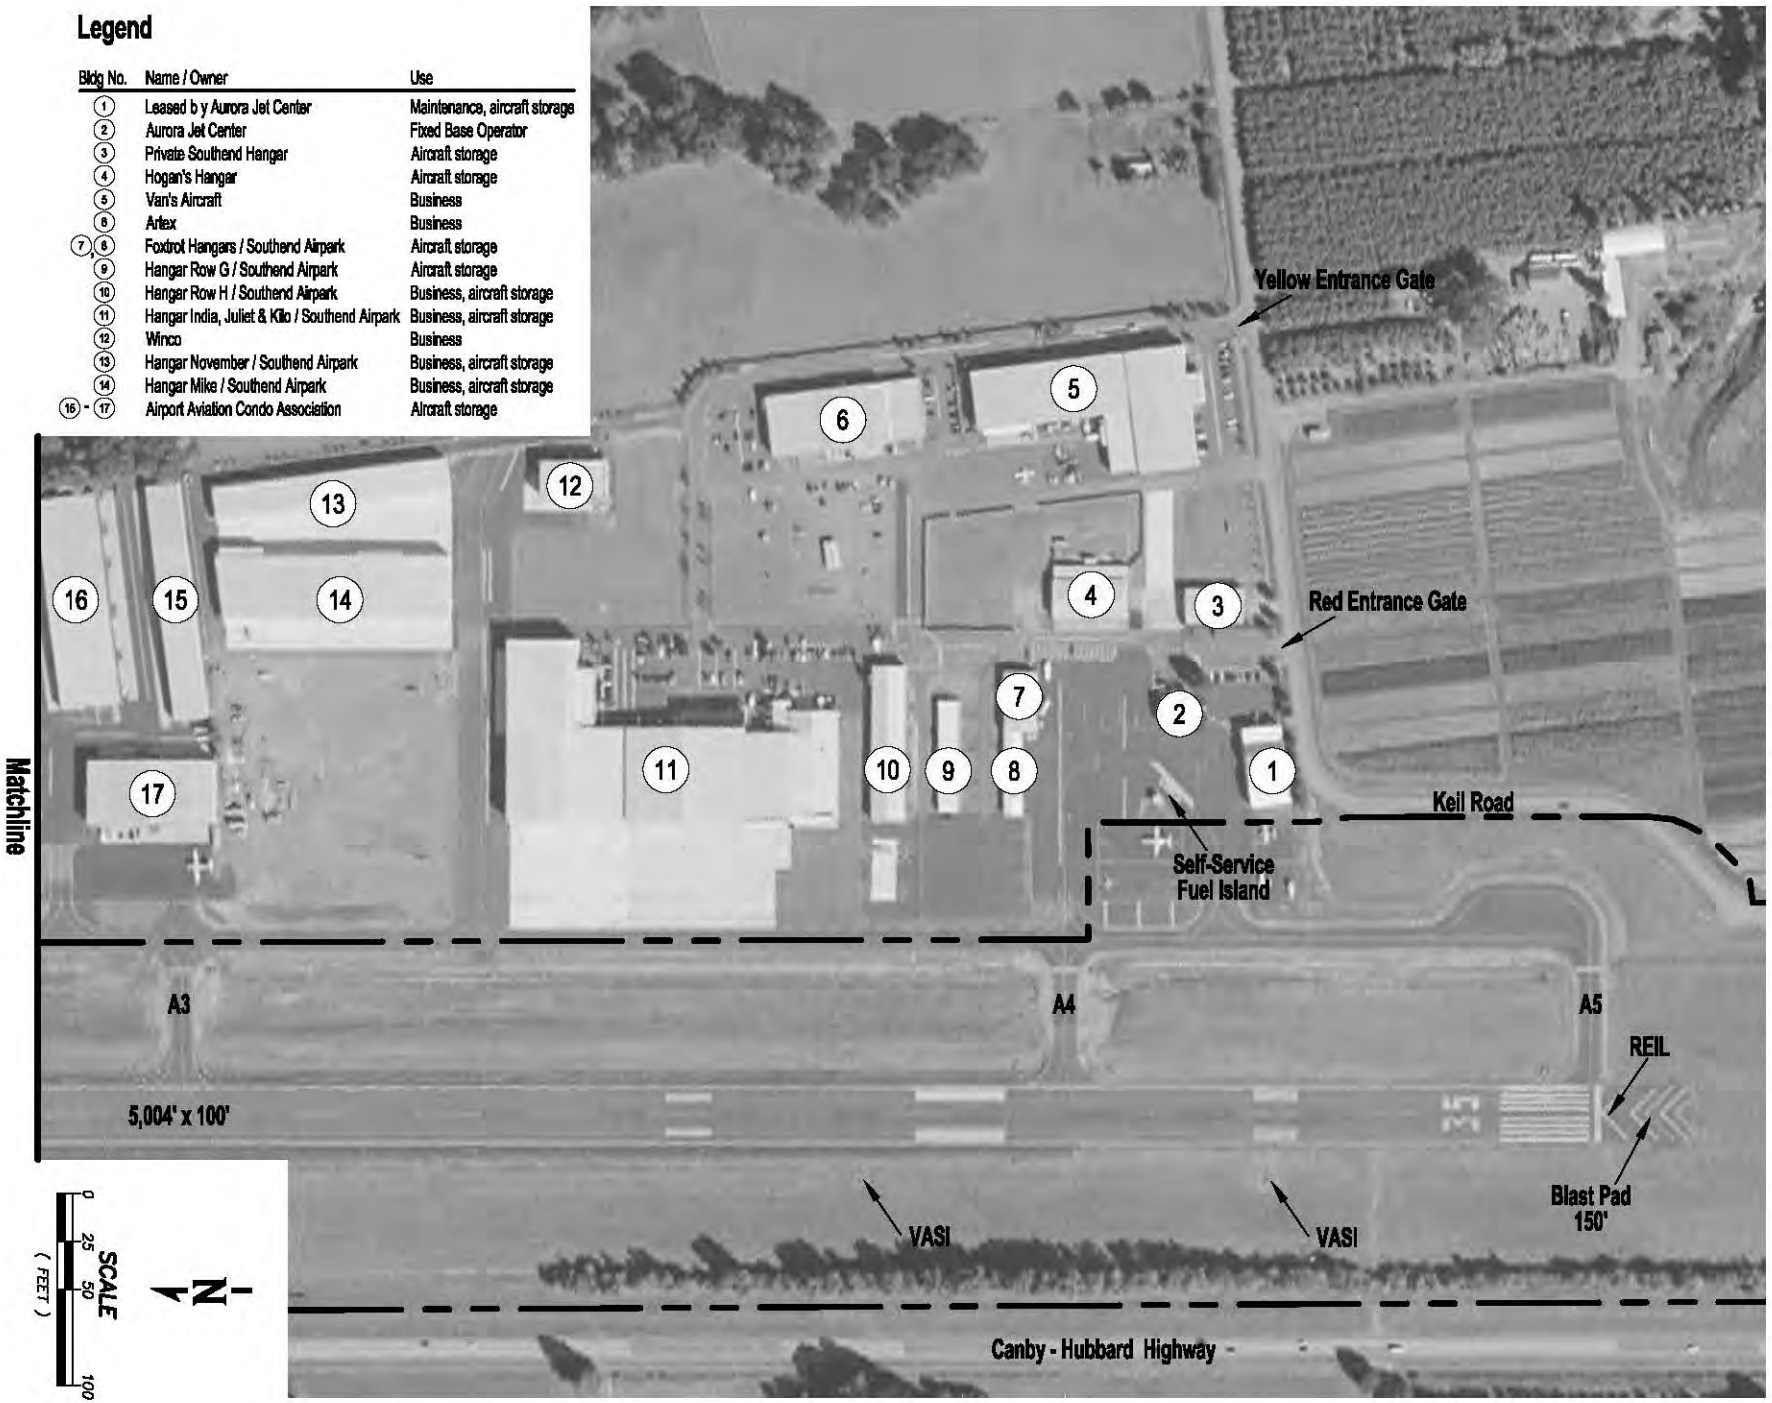
From Taxiway A, ten taxilanes lead to aircraft parking, hangars, and airport businesses. Additional taxilanes are located between hangar buildings. Taxiways and taxilanes are constructed of asphalt and have PCI ratings between 70 and 100, which is representative of pavements in very good to excellent condition. Pavement condition was not rated for taxilanes on private property)

Aprons and Aircraft Parking. On state-owned property, there are 46 designated tiedown positions. On privately owned property, there are 37 designated tiedown positions with additional aprons for large aircraft parking. The 2000 Master Plan reported 180 tiedown positions; many of these were removed because of hangar construction and the taxiway relocation project. Additionally, there are two helipads on private property and a commercial helicopter operation area for Columbia Helicopters at the northeast end of the Airport.

Airfield Lighting. Airfield edge lighting systems are categorized as low, medium, or high intensity. The color of the lights is also important as it indicates to pilots where they are in the airport environment. For example, runway edge lights are white and taxiway edge lights are blue.

At the Airport, the lighting system is a medium intensity system, which is pilot controlled by keying the microphone inside of the aircraft. Edge lighting is located on the runway and parallel taxiways, while the apron and hangar taxilanes are lined with edge reflectors.

Airport Navigational Aids. Airport Navigational Aids, or NAVAIDS, provide navigational assistance to aircraft for approaches to an airport. NAVAIDS are classified as visual approach aids or instrument approach aids; the former providing a visual navigational tool and the latter being an instrument-based navigational tool. The types of approaches available at an airport are based on the NAVAIDS provided. The following sections describe existing NAVAIDS at the Airport.



Visual Approach Aids. The Airport has three forms of visual approach aids. A two-box Visual Approach Slope Indicator (VASI) is located at each runway end. VASIs give glide slope information to pilots on final approach by displaying sequences of different colored lights to maintain a safe glide slope for landing. Runway 17 has both an Omnidirectional Approach Lighting System (ODAL) and Runway End Identification Lights (REILs). The ODAL lighting system – typically associated with runways with instrument approach procedures – consists of a series of strobe lights that extends outward from the

runway end and allows pilots to visually identify the runway environment. REILs are located at the Runway 17 threshold to provide rapid and positive identification of the runway end.

Instrument Approach Aids. Both Runway 17 and 35 have instrument approach procedures, which can be used when the visibility and cloud ceiling are below minimums for Visual Flight Rules (VFR) conditions. **Table 2A** details the approaches available at the Airport.

Additionally, the HELNS FOUR Standard Terminal Arrival (STAR) is available for pilots arriving at the Airport. A STAR is a published procedure followed by aircraft on an Instrument Flight Rules (IFR) flight plan just before reaching the Airport. Special departure procedures apply for aircraft departing the Airport during instrument conditions, as well.

Table 2A. Instrument Approaches and Approach Minima

Approach Name[2]	Runway End Serviced	Approach Minimums	
		Ceiling (feet)	Visibility (statute miles)
RNAV (GPS)	17	400	1 ¼
	35	500	1
RNAV (GPS)-B	17 and 35	500	1
LOC	17	400	1
VOR/DME-A	17 and 35	500	1

Other NAVAIDS. There is a lighted wind cone and segmented circle located west of the runway at the midfield point. A rotating beacon is located east of the runway between buildings 40 and 41, as shown on Exhibit 2B. An Automated Surface Observing System (ASOS) provides real-time weather information.

Landside Facilities

Hangars and Other Buildings. On the Airport Environs there are 89 buildings. On public property there are 14 buildings: five T-hangar buildings, seven conventional / multiple-aircraft hangars, and two other buildings (fixed base operator and fire suppression facility). On private property there are 75 buildings: six T-hangar buildings, 51 conventional / multiple-aircraft hangars, and twenty other buildings (businesses, office space, etc.). Below **Table 2B** lists those buildings, their ownership, and usage.

Aviation Services. A fixed based operator (FBO) is an individual or a business that offers aviation-related services such as flight instruction, aircraft rental, aircraft maintenance, hangar/tiedown storage,

[2] RNAV (Area Navigation) is a method of navigation that allows aircraft to choose any course within a network of navigation beacons, rather than navigating directly to and from the beacons. GPS (Global Positioning System) is a space-based global navigation satellite system. LOC (Localizer) is an approach type that provides runway centerline guidance to aircraft. VOR/DME (very high frequency omnidirectional radio range / distance measuring equipment) is a type of radio navigation system.

and aircraft fueling to Airport users. There are currently three FBOs at the Airport: Aurora Aviation, Aurora Jet Center, and Willamette Aviation Service.

Table 2B. Building Ownership and Use

Land Ownership	T-Hangar Buildings[3]	Conventional / Multiple-Aircraft	Other (business, office, etc)	Total
Public (ODA)	5	7	2	14
Private	6	51	18	75
Total	11	58	20	89

Airport Access and Vehicle Parking. There are multiple access points to the Airport. Exhibit 2B depicts these locations. A colored gate system has been employed by private businesses at the Airport to assist in emergency response and advertisement. These gates are also depicted on the exhibit. Businesses must offer adequate parking for employees and customers. Individual tenants park adjacent to or in their hangars while flying; some parking lots are available for their use, as well.

Airport Support Facilities

Emergency Services. The Aurora Rural Fire Protection District provides fire protection. A 500,000-gallon fire suppression system was recently installed to assist the District in protecting the Airport. The Marion County Sherriff Department and Oregon State Police provide emergency services.

Airport Maintenance. Airport maintenance is provided by ODA. Mowers, trucks, and other maintenance equipment are stored at their office/maintenance building in Salem. ODA has recently begun to utilize the services of the Oregon Department of Transportation (ODOT) for a majority of the mowing that occurs at the Airport. ODA provides snow removal services.

Airport Fencing. Fencing surrounds the perimeter of the Airport Environs. All access points are gated, although not all are automated. The non-automated gates sometimes remain open during normal business hours.

Utilities. Utilities and public services provided at the Airport include:

- Water – Individual well system
- Sanitary Sewer – Individual drain field / septic tank systems
- Telephone – Local franchise companies
- Electricity – Portland General Electric

[3] Multiple aircraft are stored in each T-Hangar building.

Surrounding communities have expressed concerns that additional growth at the Airport and the potential for Airport expansion will have negative impacts upon their water supplies and/or water quality. Advanced planning and feasibility assessments regarding the Airport's ability to meet water, sewer, and fire protection needs for development and expansion are of concern. While not required as part of the Airport Master Plan Update and not included in this document, the ODA recognized the importance of completion of this work in the future. ODA is supportive of pursuing funding options for such studies and supports surrounding communities in their support of funding such studies.

Airport Signage. Guidance signs to the Airport are located on Interstate 5, Highway 551, Arndt Road, Airport Road, and Keil Road and are maintained by ODOT. The colored gate system also provides signage to individual businesses.

Other Support Facilities. There are no restaurants on Airport; however, food service trucks are regularly located at the Airport. Additionally, Langdon Farms and the Cities of Aurora and Wilsonville offer restaurant options. Aurora offers public transportation, lodging, and tourism activities within walking distance of the Airport.

AIRSPACE

The FAA is responsible for the control and use of navigable airspace within the United States. Aircraft in flight, whether approaching or departing an airport, are subject to varying degrees of FAA control depending on location and meteorological conditions. These levels of control are called airspace classes. The alphabet characters A through G distinguish classes. Each class has its own unique shape and rules that govern such things as visibility minimums and cloud clearances.

The Airport is located in Class G airspace. Class G airspace is considered uncontrolled airspace in that pilots are not required to communicate with air traffic controllers; however regulations regarding visibility minimums and cloud clearances still apply. The Airport's airspace is depicted on the Seattle sectional chart (see **Exhibit 2E)**. The Airport is located south of Portland International Airport (PDX) and northeast of Salem McNary Field. Several private airports are also in the surrounding area. The Airport's location is such that it lies underneath two Victor Airways (V165 and V500), which are "highways in the sky." A Victor Airway is a corridor of protected airspace defined by radio navigational aids. In the case of the Airport, the Victor Airways (depicted with semi-transparent blue lines on Exhibit 2E) lead to PDX, making over flying traffic a common occurrence.

Traffic flows at the Airport are standard, left-hand patterns. Pilots are to fly the patterns at 1,000 feet above ground level (1,200 feet mean sea level). In 2002, ODA commissioned an airport noise mitigation study that recommended Runway 35 be designated the calm wind runway, to avoid frequent operations over noise-sensitive residential properties. ODA reports that complaints from neighboring Aurora have dropped since this designation was enacted, although complaint levels from the north have remained at a consistent level. There have been complaints by users that this scenario creates unnecessary conflicts

between VFR traffic (landing northbound) and IFR traffic flying approaches to Runway 17 (landing southbound) during visual meteorological conditions.

LAND USE PLANNING AND ZONING

The following land use and zoning discussion focuses on four areas:

- Airport Environs zoning and land use.
- Surrounding area zoning and land uses.
- Protection of airport airspace to prevent hazards and land uses that may interfere with the safety of aircraft operations.
- Ownership/control of Airport runway protection zones to enhance the safety of people and property on the ground.

Federal, State, Regional, County, and City land use regulations need consideration when reviewing existing land uses for airport compatibility and when planning for future development at and around an airport.

Federal regulations are also concerned with airspace protection (14 CFR Part 77) and noise levels, particularly for areas that fall within the 65-decibel (dBA) noise contour line. 14 CFR Part 77, *Objects Affecting Navigable Airspace,* establishes obstruction standards used to identify potential adverse effects to air navigation and notice standards for proposed construction. Imaginary surfaces are the basis for protecting the airspace around runways. There are five imaginary surfaces: primary, approach, transitional, horizontal, and conical. Definitions of each imaginary surface will be discussed in a later chapter. These surfaces should be kept clear of all obstructions.

FAA guidelines state that before FAA grants can be received the Airport Sponsor must provide assurances that appropriate actions have been (or will be) taken, to the extent reasonable, to restrict the use of land adjacent to or in the immediate vicinity of the Airport to those that are compatible with normal airport operations.

Existing Airport Environs Zoning and Land Use

The entire Airport Environs is zoned as "Public" in the Marion County Zoning Code (see **Exhibit 2F**). Marion County is the planning and building permit authority for the Airport. The Airport's existing zoning classification partially complies with Oregon Revised Statutes (ORS) 836.600 through 836.630, Local Government Airport Regulation. The county has adopted airport overlay imaginary surface protection which mirrors Part 77 imaginary surfaces. However, Marion County has not adopted the standards of ORS 836.616 which authorizes certain airport uses and activities to occur at the Airport.

Clackamas County and Aurora have both enacted Airport Overlay Zones as required by ORS 836.600 through 836.630.

Surrounding Area Zoning and Land Use

The Airport is surrounded primarily by agricultural and rural residential land uses. Land to the east, south and west is within Marion County, while land to the north resides in Clackamas County. The zoning is predominantly Exclusive Farm Use, with two residential areas zoned Acreage Residential west of the Airport and a golf course and rural residential (5-acre) north of the Airport.

A section of the Airport and the surrounding lands are reference in the Urban Growth Boundary Coordination Agreement with Marion County, as an Area of Mutual Concern for the City of Aurora. Additionally, the ODA, Marion County, and City of Aurora have an Intergovernmental Agreement supporting communication between the involved parties relating to the Aurora State Airport. Within the City of Aurora Comprehensive Plan, the Airport is referenced in Goals 9, 11, and 14.

The Airport Master Plan is incorporated by reference in the 2005 Transportation System Plan (TSP) for Marion County, which is currently being updated. The TSP identified an Access Management Plan for the Wilsonville-Hubbard Highway (Highway 551) and Arndt Road intersection and indicated that the intersection would be operating at a level of service (LOS) 'F' (maximum volume/capacity) by 2015. The TSP identified improvements at this intersection as a 0-5 year priority to resolve congestion and safety problems. The TSP also indicated the intersection of Arndt Road and Airport Road would be operating at LOS 'F' in 2015. The TSP identifies this improvement as a 5-10 year priority to resolve congestion issues. Clackamas County TSP (2002) also identified improvements in the Arndt Road corridor from Airport Road to Ore 99E in its 20-year Capital Needs list (although this project was shelved in the County's 2006-08 Capital Improvement Plan). The Clackamas County TSP states the goals of minimizing conflicts between airports and other uses, and coordination with Marion County to implement regulations on development near the Airport.

Protection of Airport Airspace

The FAA requires that airport sponsors – to the extent of their ability – restrict zoning on adjacent lands and lands within an airport's immediate vicinity to compatible land uses. Marion County has established an Airport Overlay Zone to protect the Airport and its airspace from hazards to air navigation, such as tall structures and other non-compatible land uses. An overlay zone may restrict the height of buildings and other structures or trees. Airport overlay zones also may restrict any land use that would create such hazards as electrical interference with airport radio communications, cause glare or impair visibility near the airport or would attract wildlife.

Ownership/Control of Runway Protection Zones

Runway Protection Zones (RPZs) are designated areas off runway approaches that enhance the protection of people and property on the ground. RPZs are trapezoidal in shape and have dimensions determined by the aircraft type and runway approach visibility minimums. The FAA strongly encourages Airport Sponsors to either own or exercise land use control within the RPZs. If an airport does not own the RPZs in fee, control of obstructions to airspace can be achieved through avigation easements. ODA owns all property within the Airport's two RPZs, except for a small portion that overruns onto Columbia Helicopters' property.

ENVIRONMENTAL INVENTORY

The purpose of this section is to summarize the environmental setting of the Airport, and identify any potential environmental constraints.

Environmental constraints for airports typically fall into two general categories: human environment and natural environment. Human factors that can constrain airports include existing settlements and incompatible land use, noise, social or socioeconomic conditions, light and glare, and the general controversial nature of airports. Natural environmental elements include various aspects of air quality, water resources, fish and wildlife, hazardous materials, energy and other resource issues.

Human Factors

Noise. The Airport currently supports about 87,345 annual operations (2008 FAA Terminal Area Forecast), mostly single engine aircraft. The typical threshold of concern is when the 65 DNL contour extends over noise sensitive land uses. Because the majority of the adjacent land is in agricultural use, the number of noise sensitive uses is minimal. Another threshold of significance is 90,000 annual adjusted propeller operations. The current usage of the Airport is approaching this level. Noise modeling will be prepared as part of this Master Plan, and the 65 DNL contour will be identified for the future anticipated airport use. Per Oregon Department of Environmental Quality guidelines, the 55 DNL will also be shown, even though Oregon has suspended its noise program.

Noise associated with the Airport is an existing issue for the communities of Aurora and neighboring Charbonneau and Deer Creek. In 2002, ODA commissioned a noise mitigation study. Recommendations of that study were to adopt a noise abatement procedure and implementation program, and change the calm wind Runway designation to Runway 35. Both of these recommendations have since been implemented. Additionally, a noise committee has been formed in association with Positive Aurora Airport Management (PAAM) to monitor noise issues.

Land Use. The Marion County zoning map designation for the Airport Environs is Public. Airports and airport-related commercial and industrial uses are conditional uses in the Public zone. The airport is surrounded primarily by land zoned for Exclusive Farm Use. Further to the north of the Airport are rural residential-farm forest (5-acre) zoned lands and a golf course, along Airport Road. To the west, along the Wilsonville-Hubbard Highway and Boones Ferry Road, there are two residential areas zoned Acreage Residential. Marion County also has an Airport Overlay Zone for Aurora State Airport.

The Airport Master Plan is incorporated by reference in the 2005 Transportation System Plan for Marion County. This plan is currently being updated.

Social Impact and Induced Socioeconomic Issues. Social impacts are typically related to relocation of businesses, residences or the alteration of established patterns of life (e.g. roadway changes, new facilities that divide a community, et cetera.) per the National Environmental Policy Act. In the event the State acquires additional land for airport expansion, existing homes or businesses may be required to relocate.

Socioeconomic issues include the potential for the Airport to provide an economic attraction to the community, including on-airport jobs, off-airport jobs that are supported by the Airport, or some attraction that provides incentive to use the Airport. The Airport provides some positive economic benefit to the community—flight lessons, aircraft repair, and other services. The Airport also has land and buildings that provide rental income to the State. According to Airport Management, there have been two or three businesses considering locations in Clackamas or Marion counties, and the location of the Airport and the ability to base a corporate aircraft there have factored into these considerations.

Environmental Justice is a specific aspect of socioeconomic impact that addresses whether a facility places a disproportionate burden on a population that is otherwise subject to perceived discrimination or other burden, for example a low-income or ethnic minority community. There do not appear to be populations meeting the definition within the immediate airport vicinity.

Historic Properties, Cultural Resources (Section 106 Resources). The site has been an airport since 1943. The subject site has been disturbed during the construction of the initial airport, construction of private hangars and other structures, the extension of the runway and taxiway extension in 1990, and for more recent runway reconstruction and taxiway relocation projects at the Airport. During excavation for these activities, no artifacts were found.

Historically, the land fell into the range of the Ahantchuyuk tribe of the Kalapuya Indians, now one of the Confederated tribes of the Grand Ronde. Cultural resource studies and tribal consultation were performed for the 2005 taxiway relocation project. No resources were identified and the tribe concurred that the property is not of interest.

Recreational Lands (Section 4(f)) Resources. There do not appear to be any public recreation areas in the immediate vicinity of the Airport.

Wild and Scenic Rivers. There do not appear to be any designated or candidate Wild and Scenic Rivers in the immediate vicinity of the Airport.

Farmland Preservation. Certain types of soils are considered prime farmland because of their drainage, mineral, and other characteristics. These soils, when in urbanized or developed areas, are not considered prime due to the compaction and other activities that degrade the potential for farm use. The Natural Resources Conservation Service on-line soil database map (OR643 Soil Survey of Marion County, Oregon) found nine soil types in the Airport area. All but one of these soil types has the potential to be either prime farmland or farmland of statewide significance, under the NRCS classifications. Soils can meet these classifications with either irrigation or drainage, depending on the soil type. In addition, much of the area around the Airport is designated Exclusive Farm Use (EFU), a state-defined zoning category for land considered prime farmland. Furthermore, some of the farmland near the Airport has been classified by the Oregon Department of Agriculture as Foundation Farmland.

FAA Guidelines state that the Farmland Protection Policy Act (FPPA) is not applicable and no formal coordination with the Natural Resource Conservation Service (NRCS) is required if any of the following conditions apply:

- The land was purchased prior to August 6, 1984, for purposes of being converted.
- Acquisition does not directly or indirectly convert farmland (e.g., land acquired for clear zones or noise compatibility). Indirect conversion includes any use of land or operation of the facility, which would prohibit the land from being farmed.
- The land is not prime farmland as defined in the FPPA.
- The land is not unique farmland.
- The soils are not considered prime farmland.
- The land has not been determined by a state or local government agency, with concurrence of the Secretary of Agriculture, to be of statewide or local importance.

Development of any land acquired outside of the existing Airport would be subject to NRCS coordination. The NRCS coordination is conducted by FAA per NEPA requirements, once a project is identified and if the project includes a taking of farmland. Through consultation, the NRCS would need to be shown there is no feasible and prudent alternative to taking farmland for the use.

Light and Glare. On-airport lighting is focused for visibility to aviators, without creating a disturbance or distraction. Any additional facilities will need to consider the impact of light or glare, including the use of windows or roofing material, on aviation. Similarly, residences and other sensitive receptors are located some distance from the Airport. Any additional lighting or structures will need to be focused such that light or glare is not projected into the community.

Natural Factors

Air Quality. The Airport is just outside of the Portland Air Quality Maintenance Area, in a "non-classified" area. Any construction impacts will need to consider the impact of particulate material on the local environment, including water quality and other resources. There are no "air quality hot spots" for surface transportation facilities in the airport vicinity. General aviation airports typically do not generate significant amounts of surface traffic. However, to provide information for the Master Plan, the ODA is investigating the possibility of sampling traffic at Airport access drives, to quantify the Airport's contribution to traffic on surrounding roads.

Water Quality. The Airport site lies on the boundary between the Pudding River basin and Middle Willamette River subbasin. Creeks include Deer (Pudding basin), Senecal and Mill Creeks (both Middle Willamette). The Pudding River has been listed by the DEQ for exceeding standards for temperature, fecal coliform and DDT. Mill Creek has been listed for temperature.

Projects on the Airport to modify the taxiway included improvements to the stormwater collection system and a modification to the Airport's NPDES permit. Any additions to impervious surfaces or changes in drainage plans for the Airport must be evaluated in the context of the permit conditions.

Plants and Animals, Including Endangered and Threatened Species and Essential Fish Habitat (MSA resources). The Airport is located within the Willamette Valley Ecoregion, located between the Coast Range and the Western Cascades in northwestern Oregon. The abundant rainfall and fertile soils make the valley Oregon's most important agricultural region. As a result, the Willamette Valley comprises Oregon's most altered ecoregion.

The Willamette Valley's location on the Pacific Flyway makes it an important area for migrating and wintering waterfowl. Geese and shorebirds benefit from flooded agricultural lands, and the Willamette River and its many tributaries support salmon and steelhead runs, mostly of hatchery origin due to the large number of dams in the system. The valley's few remaining fragments of native prairie support many special plant species and endemic invertebrates, while the remaining wetlands provide habitat to the Oregon chub, the western pond turtle and many other sensitive animal species.

The Airport does not currently have any issues with wildlife or bird strikes.

The Airport Environs includes site conditions typical of an airport facility in regards to the maintenance of the grounds and vegetation. Existing vegetation includes a mixture of invasive and native species, predominantly made up of grasses and forbs. An extensive mowing schedule maintains all vegetation for airport safety and visibility as required by FAA regulations. A row of trees along the west side of the Airport will be removed in fall 2010, because many of the trees are obstructions that penetrate the imaginary transitional surface.

The nearest waterways are the Pudding River and Deer Creek. Each system is approximately the same distance from the Airport, with the nearest tributary drainage located approximately 3,300 feet from the Airport. The Pudding River has a documented population of both Upper Willamette River Steelhead and Chinook salmon, both listed as Threatened under the Federal Endangered Species Act (ESA).

Previous environmental reviews for projects at the Airport have identified the potential for the following listed species, as well as their critical habitat (where defined) in the airport vicinity: Upper Willamette River Steelhead (*Oncorhynchus mykiss*), Upper Willamette River Chinook Salmon (Oncorhynchus tshawytscha), Fender's blue butterfly (*Icaricia icarioides fenderi*), Golden Indian Paintbrush (*Castilleja levisecta*), Willamette Daisy (*Erigeron decumbens var. decumbens*), Howellia (*Howellia aquatilis*), Bradshaw's lomatium (*Lomatium bradshawii*), Kincaid's lupine (*Lupinus sulphureus var. kincaidii*), and Nelson's checker-mallow (*Sidalcea nelsoniana*). Several candidate species potentially may occur in the Airport area: Yellow-billed cuckoo (*Coccyzus americanus*), Streaked horned lark (*Eremophila alpestris strigata*), Oregon spotted frog (*Rana pretiosa*), and Taylor's checkerspot (*Euphydryas editha taylori*). The agencies found no proposed species within and/or adjacent to the area.

Any activity on the Airport would need to consider impacts to these species under the Endangered Species Act as well as habitat impacts under the Magnuson-Stevens Act.

Wetlands and Floodplains. Because of previous projects on the Airport, on-airport wetlands have been significantly reduced. A brief review of the Airport shows that some of the on-airport drainage ways are developing wetland-like characteristics, as has the septic drain field area. Because these are

man-made wetlands in upland areas, they will likely not be considered jurisdictional. At the time of any development action affecting the infield area or drainage ways, a formal delineation will be prepared.

The Airport is outside of any known floodplain.

Energy Supply and Natural Resources. This category focuses on the impact of airport actions on energy and natural resources used in construction materials. In general, construction materials are not in short supply. Fuel for construction equipment is available nearby. The site has adequate electrical supply to provide power to navigation aids and security lighting on the Airport.

Solid Waste. Typically, general aviation airports do not generate significant amounts of solid waste. Often materials include food and beverage containers or packaging for aircraft maintenance products. Food containers may create a bird and rodent attractant.

During construction, pavement materials are often recycled into the new pavement, reducing the need for disposal.

Plans for future activity at the Airport should consider the manner in which waste is collected and removed.

Hazardous Materials. The Airport has four commercial fueling sites (Columbia Aviation, Aurora Jet Center, Aurora Aviation, and Willamette Aviation Service), and two private fuel sites.

There is potential for additional contamination anywhere maintenance or fueling takes place because of accidental spills. No exploration of this has occurred on the Airport. Any such areas where construction is proposed would need to undergo some level of due diligence such as a "Phase One Environmental Site Assessment" to identify any history of possible contamination.

Construction Impacts. Construction impacts typically include temporary noise, dust or traffic impacts, as well as the potential for erosion and water quality impacts associated with construction material spills. Once construction activities are identified, construction timing, phasing and mitigation measures need to be considered.

Controversy. Controversy is typically associated with off-airport impacts. In the case of Aurora, controversy appears to revolve around use of the Airport by jets and the associated noise. According to ODA, there are some members of the community who are against airport growth and desire closure of the Airport and release of the land to other uses. However, there are opinions that the Airport should exist but growth should have some constraints to insure livability in the community.

Other Issues. There do not appear to be any other environmental-related issues on or around the Airport.

Conclusion

The FAA considers public controversy to be an environmental issue. Beyond controversy over noise and airport expansion, there do not appear to be any significant environmental issues on the Airport or in

the airport vicinity – with the exception of concerns over vehicular traffic/safety. Additional study regarding noise, threatened and endangered species, cultural resources, and possibly hazardous materials should be conducted once a project is defined.

AVIATION ACTIVITY DATA

There are two primary measures of aviation activity at a general aviation airport: based aircraft and aircraft operations. Each activity type is discussed below.

Based Aircraft

Based aircraft are the number of aircraft that are stored at an airport in a hangar or tied down on either a paved apron surface or a grassy area designated for such a use. ODA's records indicate that there are currently 432 aircraft based at the Airport. Of the aircraft based at the Airport, they can be further broken down into the following categories:

Table 2C. Based Aircraft

Aircraft Category	Number Based at Aurora State Airport
Single Engine	312
Jet	21
Multi-engine	59
Helicopter	35
Glider	1
Unknown Category	4
Total	432

Aircraft Operations

Annual operations are the total number of aircraft takeoffs and landings occurring at the Airport in a year. A touch-and-go, which occurs during pilot training, counts as two operations. Touch-and-go operations are categorized as local, along with other operations that remain within 20 miles of the Airport. Operations not categorized as local are categorized as itinerant. The latest estimated data from the FAA's December 2009 Terminal Area Forecast is for 2008, and is shown in **Table 2D**.

Table 2D. Operations Records

	FAA Terminal Area Forecast (2008)
Air Taxi	9,656
General Aviation Local	36,030
General Aviation Itinerant	41,409
Military	250
Total	87,345

AIRPORT FINANCIAL DATA

The following subsections provide a brief summary of historical financial information for the Airport.

Airport Operating Revenues and Expenses

Table 2E shows the Airport's revenues and expenses for the past five years.

Federal grants from the Airport Improvement Program (AIP) are the major source of funding for airport capital expenditures. **Table 2F** depicts the AIP funding the Airport has received for airport improvement projects between the years 2004 and 2009.

RATES AND CHARGES

ODA leases hangar space to users at a rate of $0.25 per square foot. The lease rate is determined by market rent surveys; the last survey was completed in 2008. By administrative rule[4], ODA must review lease rates at a minimum of every five years and can adjust lease rates at intervals not to exceed every two years.

[4] Oregon Administrative Rule (OAR) 738-010-0035, *Fair Market Value Cost of Construction – Adjustments of Unimproved Land, Improved Land and Facility Rents*.

Table 2E. Revenues and Expenses

	2006 Actual	2007 Actual	2008 Actual	2009 Actual	2010 Actual
Operating Revenues					
Land Lease / Tie Downs	43,749.44	42,305.83	53,110.54	45,855.59	46,823.02

Chapter Three: AERONAUTICAL ACTIVITY FORECAST

Airport Master Plan Update

Aurora State Airport

Forecasting aviation demand helps determine the size and timing of needed airport improvements. This chapter indicates the types and levels of aviation activity expected at the Aurora State Airport (Airport) during a 20-year forecast period. Projections of aviation activity for the Airport were prepared for the near-term (2015), mid-term (2020), and long-term (2030) future.

These projections are unconstrained and assume the Oregon Department of Aviation (ODA) or others will be able to develop the various facilities necessary to accommodate based aircraft and future aircraft operations. When development alternatives are evaluated later in the planning process, ODA may choose not to meet the unconstrained demand. ODA has chosen not to constrain the forecasts because undeveloped land to accommodate growth is available. In addition, the preparation of unconstrained forecasts follows the typical Federal Aviation Administration (FAA) practice. In individual airport forecasts it prepares annually, the FAA "…assumes an unconstrained demand for aviation services based upon local and national economic conditions as well as conditions within the aviation industry. In other words, an airport's forecast is developed independent of the ability of the airport and the air traffic control system to furnish the capacity required to meet demand."[1]

The primary objective of forecasting is to define the magnitude of change that can be expected over time. Because of the cyclical nature of the economy, it is impossible to predict with certainty year-to-year fluctuations in activity when looking 20 years into the future. However, a trend can be established that characterizes long-term potential. While a single line expresses the anticipated growth, actual growth may fluctuate above and below this line. **Forecasts serve only as guidelines, and planning must remain flexible to respond to unforeseen changes in aviation activity and resultant facility needs.**

[1] Federal Aviation Administration. (December 2009). *Terminal Area Forecast Summary, Fiscal Years 2009-2030*. p. 3.

This chapter presents the following forecasts:

- **Based Aircraft, Including Fleet Mix.** The number and type of aircraft based at the Airport help determine the future aircraft hangar, apron, and auto parking facility requirements. Fleet Mix refers to the distribution of aircraft by type.

- **Aircraft Operations, Including Annual, Peak, Local vs. Itinerant, and Fleet Mix.** An operation is counted as an aircraft either landing or taking off (*i.e.*, an aircraft landing then taking off counts as two operations). Local operations are touch-and-go and other training operations that stay near the airport. The operations forecast helps in analyzing runway capacity and determining runway, taxiway, and navigational aid requirements. The aircraft operations forecast provides some of the input for the computer modeling that estimates future aircraft noise exposure.

- **Critical Aircraft and Airport Reference Code.** The critical aircraft is derived from the operational fleet mix. The critical aircraft and its airport reference code determine many airfield design requirements, such as runway and taxiway size and strength, and safety clearances around aircraft movement areas.

National, state, and regional trends and forecasts for the aviation industry are reviewed in this chapter, along with socioeconomic trends and forecasts, to assess their effect on past and future aviation activity at the Airport.

Historical activity at the Airport is analyzed for growth trends that help forecast aviation demand. Sources of historical data include the FAA's Terminal Area Forecast (TAF) and based aircraft inventory, ODA's record of current based aircraft and recent fuel flowage, records of flight plans filed under Instrument Flight Rules (IFR), the airport user survey conducted as part of this planning study, and anecdotal information provided by some businesses at the Airport.

The TAF is the FAA's annual forecasting for terminal control centers and for the approximately 3,300 individual airports that are in the National Plan of Integrated Airport Systems (NPIAS). "The TAF is prepared to assist the FAA in meeting its planning, budgeting, and staffing requirements. In addition, state aviation authorities and other aviation planners use the TAF as a basis for planning airport improvements."[2] The TAF provides a benchmark for individual master plan forecasts. The FAA may modify or update the TAF based on an approved master plan forecast. If an airport master plan forecast for operations exceeds the TAF by more than 10% in the first five years, FAA Headquarters must review the forecast. According to Par. 428.a, FAA Order 5100.38C, the lack of FAA acceptance of forecasts may delay any further planning or capital improvements depending on them.

Prior forecasts specific to Aurora State Airport are presented for comparison to the historical records of activity that have occurred and for comparison to the forecasts developed for this study. These other

[2] Federal Aviation Administration. (December 2009). *Terminal Area Forecast Summary, Fiscal Years 2009-2030.* p. 3.

forecasts include the FAA's Terminal Area Forecast (December 2009), the Oregon Aviation Plan (2007), and the prior Aurora State Airport Master Plan (2000).

The forecasts presented in this chapter are consistent with the Airport's role as an urban general aviation airport; they do not anticipate a major role change, such as the initiation of commercial passenger or cargo service.

NATIONAL AVIATION TRENDS AND FORECASTS

Aurora State Airport is part of an air transportation system and, as such, is subject to national and regional aviation trends.

General aviation (GA) in the United States peaked in the 1970s, and then experienced years of decline until growth returned in the 1990s. The growth in the 1990s was due not only to an expanding economy, but also to the General Aviation Revitalization Act (GARA) of 1994. GARA set an 18-year limit on the liability of GA aircraft and component manufacturers, spurring production of single engine piston aircraft. Single engine piston is the aircraft type that accounts for the majority of the nation's GA activity.

The business aviation portion of GA grew rapidly in the 1990s and into the first part of the 21st century. Airplanes used for business tend to be larger and faster than those limited to personal use, although business use of GA aircraft ranges from small, single-engine aircraft rentals to multiple aircraft corporate fleets supported by dedicated flight crews and mechanics. Since 9/11, business aviation has benefited from airline service problems—the additional airline passenger and baggage security imposed and reductions in air service, particularly to smaller communities. Until 2008, business aviation grew rapidly as various chartering, leasing, time-sharing, fractional ownership,[3] interchange agreements, partnerships and management contracts emerged.

GA growth began to decline in 2008 and 2009, due primarily to the economic recession that began the end of 2007. Soaring fuel prices in mid-2008 kept some airplanes parked. From a high of $129.03 per barrel in July of 2008, the price of oil dropped to $37.45 in January 2009, when demand for oil plummeted with the economy. The recession dampened every aspect of GA—from flight training and aircraft production, to the number of pilots and the hours aircraft are flown. The harm to the development of new aviation technology and businesses is exemplified by the Eclipse and DayJet stories. Eclipse Aviation was the leading developer and manufacturer of a new aircraft type, the Very Light Jet (VLJ). The VLJ is a small, low-cost jet capable of using short runways and offering the speed and comfort of high-altitude jet flight. Eclipse was the first to deliver a VLJ in late 2006. DayJet, operating a fleet of Eclipse aircraft in the Southeastern U.S., employed a unique air taxi business model, "per seat, on-demand", which was a radical change from the tradition of a single customer chartering a whole aircraft.

[3] Fractional aircraft ownership is similar to real estate time-sharing.

After producing 260 VLJs, Eclipse Aviation declared bankruptcy in November 2008. DayJet ceased operating in September 2008, blaming the tight credit market for its demise.

According to the *FAA Aerospace Forecasts Fiscal Years 2010-2030* (March 2010), "Each passing month of 2009 saw the light on consumer confidence dim as housing foreclosures climbed, credit tightened, and unemployment surged." The bad news the FAA reported about 2009 included the following:

- The world economy declined 2.4%, while the U.S. economy declined 2.5%.
- The market for GA products and services declined sharply.
- Compared to 2008, which had declined from the previous year, U.S. manufacturer aircraft shipments declined 48.5% and billings fell 32.1%.
- Student pilots decreased 10.8%, the fifth straight year of decline.
- GA flight hours decreased 10.3%.
- GA aircraft operations recorded by air traffic control towers fell 11.7% in 2009, one of the largest declines in that measure ever reported.

The General Aviation Manufacturers Association (GAMA) reported that the 2009 business jet sector declined following five straight years of growth.[4] The number of worldwide fractional share owners fell for the first time, from 5,179 to 4,881, and the number of airplanes in the fractional fleet decreased 5.2%. Aircraft shipments in the first quarter of 2010 were down 15% compared to the same period in 2009, although billings were up 7.1%.[5]

In spite of all the bad news, the FAA's March 2010 forecast stated, "Even though the highly cyclical U.S. aviation industry went into a downward spiral during 2009, history has shown the demand for air travel is resilient and growth will return." The U.S. economy grew in the fourth quarter of 2009 for the first time in five quarters, and the economies of most regions of the world appear to be recovering.

GAMA also reported that at the end of 2009, there were hopeful signs—the availability of used aircraft was declining, aircraft utilization was stabilizing, availability of financing was improving, and inquiries for new orders were starting to grow. Corporate profits were beginning to recover; profits are historically related to new airplane demand.[6] In May 2010, the GAMA President and CEO reported that flight activity is on an upward trend and the used aircraft inventory is decreasing, but the industry is far from recovery. He noted that the U.S. Congress' continuation of bonus depreciation is crucial to the industry's recovery.[7]

FAA Aerospace Forecasts Fiscal Years 2010-2030 projects recovery for GA, using economic forecasts developed by Global Insight Inc. to project domestic aviation demand. **Table 3A** shows the FAA's forecast for active GA and air taxi aircraft. An active aircraft is one that has a current registration and was flown at least one hour during the calendar year. The source of historical numbers is the FAA General Aviation and Air Taxi Activity (and Avionics) Surveys.

Source: FAA Aerospace Forecasts Fiscal Years 2010-2030 (March 2010)

The FAA forecasts growth in business aviation demand over the long term, driven by a growing U.S. and world economy. The more expensive and sophisticated turbine-powered fleet, including helicopters, is projected to grow at an average of 3.0% per year. The worldwide delivery of VLJs has been refreshed with the introduction of Embraer's Phenom 100 to the market. The FAA expects 440 VLJs to enter the U.S. fleet in the next three years, with an average of 216 per year for the remainder of the forecast period. Piston-powered aircraft are expected to decline through 2017 and then grow at a low rate. The FAA expects VLJs and sport aircraft to erode the replacement market for traditional piston aircraft at the high and low ends of the market respectively. Rotorcraft (helicopters) have experienced high growth since 2000, and growth is projected to continue.

Table 3B presents the FAA's forecast for aircraft hours flown. The number of GA hours flown is projected to increase by 2.5% annually. A larger portion of the growth is expected to occur in the short-term, post-recession period, where low utilization rates experienced in 2009 will return to normal, particularly for jets. Rotorcraft hours were relatively immune to the recession compared to other categories.

Source: FAA Aerospace Forecasts Fiscal Years 2010-2030 (March 2010).

GA aircraft operations at FAA and contract towers are expected to continue declining in 2010, 3.1% from 2009, then rise 1.2% in 2011 and 2012 as unemployment decreases. For the whole forecast period, the expected GA aircraft operations growth at towered airports is 1.1% per year on average. The FAA expects military aircraft activity to remain constant through the forecast period.

The FAA identified the following risks to their forecasts:

- **Oil Prices.** Although oil prices were much lower in 2009 than in 2008, there is risk of rising oil prices when economic growth resumes. FAA's forecast, based on Global Insight's October 2009 forecast, calls for steady increases in oil prices after 2009, but does not expect the price to exceed $100 per barrel until 2025.
- **Business Aviation Risks.** Business and corporate aviation grew strongly after 9/11 but fell sharply with the economic recession. Public perception of business and corporate aviation, potential environmental regulations and taxes, and increased security measures could place downward

[9] Gliders and lighter than air vehicles

pressure on the forecast. On the other hand, new and more efficient product offerings and increased competition from new manufacturers could broaden the appeal. The growth of the on-demand air taxi industry that was expected with the VLJ entry into the market could materialize.

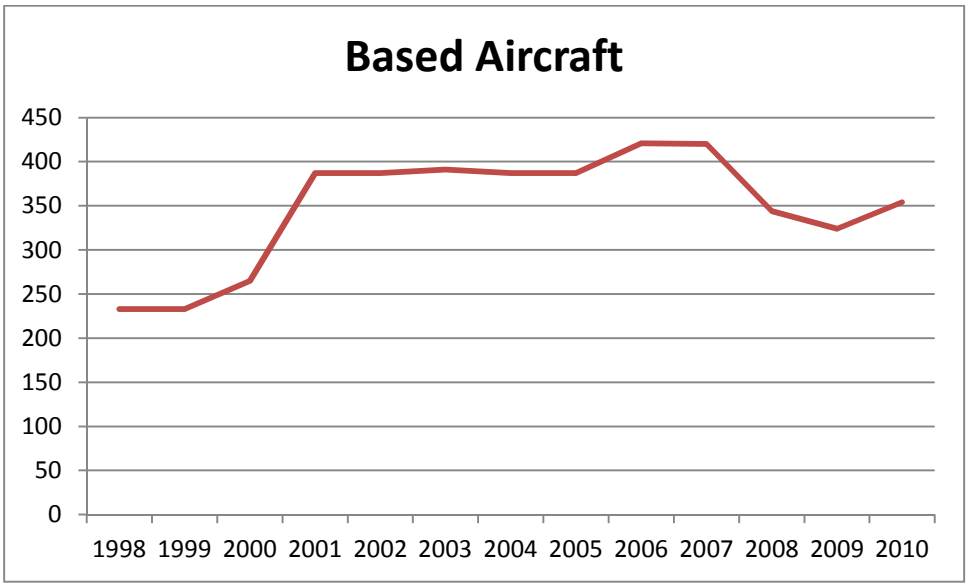
- **Environmental Concerns.** Air transportation could be constrained from growth by environmental concerns that might limit airport expansion or new construction or by the cost of meeting new air emissions standards. On the other hand, research and technological breakthroughs may overcome these constraints. Breakthroughs in cleaner, quieter, more efficient aircraft are possible, and Nextgen—the FAA's air traffic modernization program—promises to increase capacity at some airports without physical expansion and to reduce air and noise pollution.

STATE AVIATION TRENDS AND FORECASTS

Since 2000, aviation in Oregon has seemed to trend with the nation. In 2008, Oregon's share of the nation's active GA and air taxi fleet was 2.0%, the same share it was in 2000. The number of these aircraft was virtually the same in both years—4,687 in 2000 and 4,614 in 2008. The number peaked at 6,029 in 2007, which was also the national peak. Hours flown in GA and air taxi aircraft hit a low point in 2008 in Oregon (431,000) and in the US (26,009,000). Oregon's share of U.S. hours flown, 1.7%, was lower in 2008 than in the 2000 to 2007 period.[10]

The *Oregon Aviation Plan 2007 (OAP 2007)* used 2005 as the base year for forecasting. For statewide based aircraft, the forecast was an increase from 4,875 to 6,225 by 2025—a 1.23% average annual increase. The annual rate of growth was slightly lower than the FAA's national forecasts for active GA and air taxi aircraft, 1.29%. The mix of based aircraft was projected to remain 81% single engine, 7% multi-engine, 3% jet, 4% helicopter, and 5% other. Aircraft operations were projected to grow at the same rate as based aircraft.

OAP 2007 was prepared before the economic recession. GA did grow in Oregon from 2005 to 2007, and then dropped in 2008. Based aircraft declined 9% and operations declined 5%, most likely due to the economic downturn. However, from 2008 through 2030, the FAA's Terminal Area Forecast shows average annual growth of 1.2% for based aircraft and 1.1% for GA operations.[11]



TRENDS AT AURORA STATE AIRPORT

The Airport began the 21st century with a surge in based aircraft (**Exhibit 3A**), in part, due to the increase in hangar capacity created by the Southend Airpark development. From 2001 to 2007, the number of based aircraft grew, and then declined in 2008 and 2009. In 2010, growth resumed.

---

[10] General Aviation Manufacturers Association: 2009 General Aviation Statistical Databook & Industry Outlook
[11] FAA's Terminal Area Forecast (December 2009), which is limited to airports in the National Plan of Integrated Airport Systems (NPIAS)

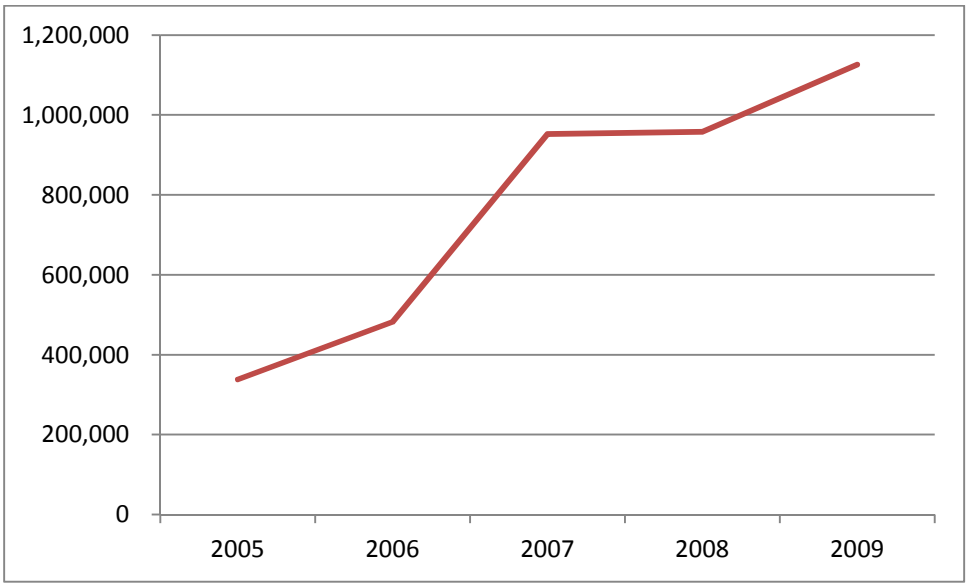


Exhibit 3A. Historical Based Aircraft at Aurora State Airport

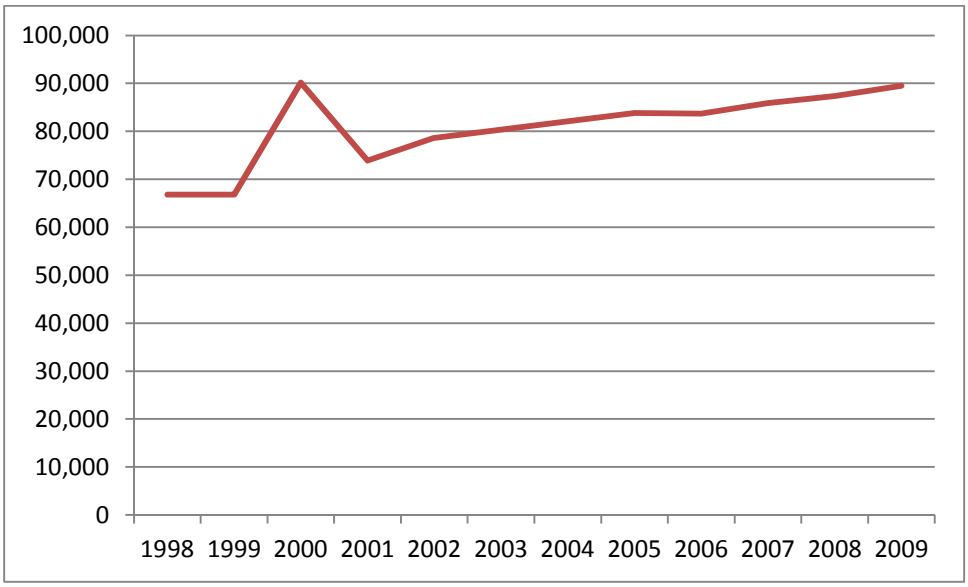
Source: FAA Terminal Area Forecast (December 2010) for 1998 – 2010 numbers. ODA registration for 2010 numbers.

The ODA exacts fuel flowage fees on six businesses at the Airport: Aurora Aviation, Columbia Helicopters, Metal Innovations, Aurora Jet Center, TEC Equipment, and Willamette Aviation. Three of these businesses sell fuel to the operators of aircraft based at the Airport and to the operators of "transient" aircraft based at other airports. **Exhibit 3B** shows the combined fuel flowage of these businesses over the last five years. Fuel flowage is a relatively good indicator of the trend in aircraft operations, although fuel prices at other airports can affect where aircraft operators refuel. Exhibit 3B shows a sharp rise of 182% between 2005 and 2007, from 338,088 gallons to 951,870 gallons. Aviation gasoline (avgas) use dropped 47% from 2007 to 2008, while jet fuel gained 11%. Fuel flowage resumed growth in 2009, reaching 1,126,272 gallons.

Exhibit 3B. Historical Fuel Flowage at Aurora State Airport (gallons)



Source: Oregon Department of Aviation Records.

While the majority of aircraft based at and using the Airport are piston-powered and use avgas, about 85% of the fuel flowage is jet fuel and 15% is avgas. On average, jets have larger fuel tanks than piston-powered airplanes, and are flown more hours. ODA records and informal information from fueling operators indicate that jet fuel use is growing faster than avgas use. This implies operations by turbine-powered aircraft are growing more than piston-powered aircraft operations.

The FAA keeps records of estimated aircraft operations (takeoffs and landings) reported by airport owners on periodically updated Airport Master Records (FAA Form 5010). ODA submits Form 5010 updates every three years to the FAA Airport District Office in Seattle. The Airport District Office then reports estimated annual numbers to FAA Headquarters for inclusion in the TAF. **Exhibit 3C** shows the reported aircraft operations at Aurora State Airport for the years 1998 through 2009. Since 2001, operations at the Airport have grown slowly but steadily.

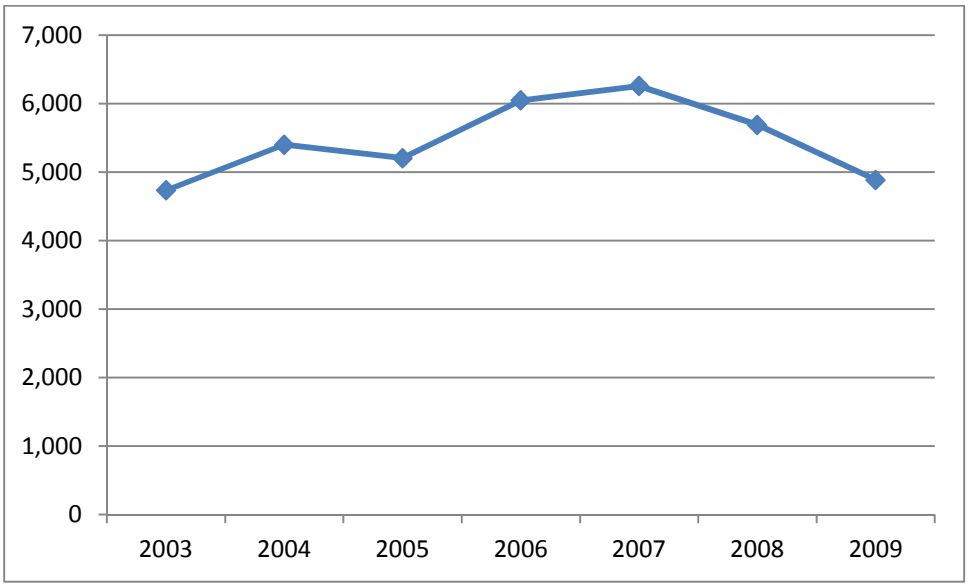


Exhibit 3C. Historical Aircraft Operations at Aurora State Airport

Source: FAA Terminal Area Forecast (December 2010).

IFR operations for the Airport appear in **Exhibit 3D**. These are actual IFR flight plans filed, although the records have been found to omit some flight plans filed after takeoff or cancelled before landing. Nevertheless, the operations in Exhibit 3D are more accurate than the total estimated operations shown in Exhibit 3C, although IFR traffic comprises only 5% to 10% of total traffic at the Airport. IFR traffic peaked at 6,257 operations in 2007, up 32% from the 4,734 operations recorded in 2003. Then traffic declined 9% to 5,688 operations in 2008. The decline continued (14% between 2008 and 2009), so that IFR ops in 2009 (4,886) were nearly the same as in 2003. The IFR activity of the last five years follows the trend of GA activity nationwide—growth to peak in 2007 and then decline in 2008 and 2009. Recovery appears to be underway. For the partial year 2010 (through August 18), IFR traffic is up 22% from the same period in 2009.

Exhibit 3D. Historical IFR Operations at Aurora State Airport

Source: Derived from IFR arrival and departure data, Airport IQ Data Center, GCR.

Businesses at the Airport have informally indicated that they have suffered during the recession. The decline in aircraft charters was the most severe, but hangar rentals, aircraft maintenance, aircraft sales and rentals, flight training, and avgas sales declined substantially. These businesses report they have fewer employees now than five years ago. However, they project business will grow between 1% and 3% per year in the future, and they will be expanding staff. Their projections for the Airport's future include continued increases in turbine-powered aircraft operations, more corporate and individual travel for business and pleasure, and declines in flight training and recreational flying.

SOCIOECONOMIC TRENDS AND FORECASTS

Aviation activity at an airport is usually tied closely to the population and economy within its service area. As the population around the airport grows, airport activity grows. Aviation activity has also traditionally been linked to employment and income factors because of the discretionary nature of personal and business travel.

This section defines the core service area for Aurora State Airport and analyzes the population and economy of the core service area and surrounding region.

Identification of Core Airport Service Area

As the strategic role analysis in Chapter 1 showed, the maximum extent of the Airport's service area is about 45 minutes. This 45-minute service area distance applies primarily to higher performance aircraft,

particularly transient aircraft. This is because jet aircraft generally need longer runways, instrument approaches, and more services (jet fuel, etc.) than the average GA airport has. The occupants of some transient aircraft using the Airport may be destined for downtown Portland, but the owners of smaller aircraft do not need to travel farther than 30 minutes to find an adequate airport for basing their airplanes. The typical GA airport's service area is within a 30-minute drive from the airport, or about 20 miles, although it depends on population density, the road network, and the location and services provided at other airports in the vicinity.

Airport Service Area Population

A 20-mile distance from the Airport extends into 59 zip codes located in five counties—Clackamas (18 zip codes), Marion (10 zip codes), Multnomah (14 zip codes), Washington (13 zip codes), and Yamhill (4 zip codes). **Table 3C** shows the population within this core service area in 2000.[12] Approximately half of the residential population of the five counties lives within 20 miles of the Airport. While the Airport is located in Marion County, Marion County accounts for less than 10% of the service area population. More than two-thirds of the service area population is in Clackamas and Washington Counties.

Table 3C. Core Service Area Population (2000)

County	Population of County	Portion of County Population in Core Service Area	Population in Core Service Area
Clackamas	338,391	91%	307,936
Marion	284,834	21%	59,815
Multnomah	660,486	25%	165,122
Washington	445,342	73%	325,100
Yamhill	84,992	41%	34,847
Total	1,814,045		892,819

Source: U.S. Census Bureau population by zip code.

Different components of aviation activity have been analyzed to estimate how Airport users are distributed among the five counties. The analysis resulted in the following rough estimates of Aurora State Airport use:

- 42% of aviation activity is associated with Clackamas County.
- 9% of aviation activity is associated with Marion County.
- 13% of aviation activity is associated with Multnomah County.
- 32% of aviation activity is associated with Washington County.
- 4% of aviation activity is associated with Yamhill County.

Based on these estimates, nearly three-quarters of the Airport's aviation activity is associated with Clackamas and Washington Counties. **Table 3D** shows the derivation of these estimates of aviation use

[12] The most recent population numbers broken down by zip code are from 2000.

by county. The "Licensed Pilots" column indicates the distribution of 2,995 licensed pilots whose mailing addresses have zip codes within the Airport's core service area. The "Population" column shows the distribution of population that is within the core service area by county, using Table 3C as the source. The "IFR Operations" column indicates the distribution of owners' mailing addresses for aircraft on IFR flight plans to or from Aurora State Airport from October 2007 through October 2009.

Table 3D. Aviation Activity Indicators Distributed by County

County	Licensed Pilots	Population	IFR Operations	Average
Clackamas	40%	34%	52%	42%
Marion	6%	7%	14%	9%
Multnomah	11%	18%	11%	13%
Washington	37%	37%	20%	32%
Yamhill	6%	4%	3%	4%
Total	100%	100%	100%	100%

Source: FAA Civil Aviation Registry, U.S. Census 2000, IFR arrival and departure data for October 2007 through October 2009 from GCR's Airport IQ Data Center.

All the five service area counties, except Marion, are in the seven-county Portland-Beaverton-Vancouver OR-WA Primary Metropolitan Statistical Area (PMSA).[13] Metro, the regional government for three Greater Portland counties, recently published aggregate population forecasts for the PMSA. Metro projects that the seven-county area will grow from 1.9 million people in 2000 to between 2.9 and 3.2 million by 2030. The growth rates these high and low forecasts represent are compared with other forecasts in **Table 3E**. The table shows that higher population growth is expected for the Portland metro region than for Oregon or the United States.

Regional population growth, particularly in-migration, varies with economic growth. However, the Portland metropolitan area no longer experiences wide swings in population due to its size and maturity. The population growth of the 1990s (2.4% per year on average) has slowed in the last decade to 1.7% per year. Future growth is expected to slow as birth rates slowly decrease and stabilize near the national average, life expectancies no longer rise as sharply as in the past, and migration trends change. Migration trends of the last century have favored movement from rural to metropolitan areas and to states on the west coast, gulf coast, and eastern seaboard; in some areas, an emerging trend is to move back to rural communities.[14]

[13] The seven counties are Clackamas, Columbia, Multnomah, Washington, and Yamhill in Oregon, and Clark and Skamania in Washington.

[14] Metro: 20 and 50 Year Regional Population and Employment Range Forecasts (April 2009 Draft)

Table 3E. Comparative Population Forecast Growth Rates, 2000 - 2030

Average Annual Growth	Geography of Forecast	Forecast Source
0.85%	United States	U.S. Census middle series (2004)
0.95%	United States	Global Insight (2008)
1.14%	Oregon	Global Insight (2008)
1.16%	Oregon	U.S. Census middle series (2004)
1.18%	Oregon	OR Office of Economic Analysis (2004)
1.28%	Portland metro region (3 counties)	OR Office of Economic Analysis (2004)
1.40%	Portland metro region (7 counties)	Global Insight Regional Service (2008)
1.37%	Portland metro region (7 counties)	Metro – low end of range (2009)
1.70%	Portland metro region (7 counties)	Metro – high end of range (2009)

Source: Metro: 20 and 50 Year Regional Population and Employment Forecasts, April 2009 Draft.

Since Metro's PMSA forecast did not distinguish individual counties, other sources were sought for county population forecasts. **Table 3F** shows historical and projected populations for the five counties in the Airport's service area. The highest growth since 1990 has been in Washington County, while the lowest growth has been in Multnomah County. Future populations forecast by the Oregon Office of Economic Analysis (OEA) and by Portland State University (for Marion County) show the highest growth rate in Washington County and the lowest in Multnomah County. In all five counties, future growth is expected to slow from the pace of the 1990s.

Applying the percentages of county populations in the Airport's core service area from Table 3C to the population projections in Table 3F results in an estimated Airport service area population of 1,407,579 in 2030. This shows considerable growth from the estimated 2000 service area population of 892,819. The average annual population growth in the core service area is 1.53% from 2000 to 2030, which is midway between the low (1.37%) and high (1.70%) rates that Metro forecast for the seven-county MSA.

Table 3F. Population History and Forecasts by County

	Clackamas County	Marion County	Multnomah County	Washington County	Yamhill County
1990	278,850	228,483	583,887	311,554	65,551
2000	338,391	284,834	660,486	445,342	84,992
2009	386,143	317,981	726,855	537,318	99,037
2030	536,123	410,431	800,565	788,162	141,505
			Average Annual Growth Rates		
1990-2009	1.73%	1.75%	1.16%	2.91%	2.20%
2000-2009	1.48%	1.23%	1.07%	2.11%	1.71%
2009-2030	1.57%	1.22%	0.46%	1.84%	1.71%

Source: For 1990, 2000, and estimated 2009 populations, U.S. Census Bureau. For 2030 forecast of Marion County, Portland State University forecast (Adopted by Marion County October 2009). For 2030 forecasts of other counties, Oregon Office of Economic Analysis, Department of Administrative Services, State of Oregon: Forecasts of Oregon's County Populations and Components of Change, 2000 - 2040 (Release: April 2004). The OEA's forecast for Marion County population in 2030 is 410,022.

Airport Service Area Economy

Air transportation use and aircraft ownership typically rises and falls with the airport service area economy. Aurora State Airport's core service area encompasses the diversity of Portland's urban economy, as well as the rural economies of northern Marion County and southern Clackamas County.

Although a recession officially began in December 2007, the Portland region's economy held steady until the fourth quarter of 2008, after the economic meltdown on Wall Street. Unemployment then rose rapidly. As of June 2010, the unemployment rate in the Portland-Vancouver-Hillsboro metropolitan area was 10.2%, down from 11.2% the previous year, but far above the 4.8% unemployment rate of 2007. Oregon's unemployment rate in June 2010 was 10.5%, down from 11.6% in June 2009. In comparison, the national unemployment rate was 9.5% in June 2010 and in June 2009.[15]

In 2009, Metro forecast employment in the PMSA. From 973,000 jobs in 2000, employment is projected to reach between 1.3 and 1.7 million in 2030. The low and high ranges for the forecast reflect average annual growth between 0.84% and 1.53%.[16] Nonfarm employment is projected to grow between 0.7% and 1.8% annually from 2008 to 2040. For manufacturing jobs, the employment forecast ranges from decline to slight growth. The highest job growth is projected for information services, business services, education and health services, and other/personal services.

Higher income often relates to higher levels of aircraft ownership, pilots per capita, and aircraft use. Higher income relates to more use of air transportation for business and more discretionary income for

[15] US Department of Labor, Bureau of Labor Statistics, http://www.bls.gov/home.htm.

[16] Metro: 20 and 50 Year Regional Population and Employment Range Forecasts (April 2009 Draft)

personal aviation use. **Table 3G** shows that the three most populous counties in the Airport service area have per capita incomes that exceed the U.S., Oregon, and Portland metropolitan area averages. Income projections for Oregon and the U.S. show declines in 2009, recovery to 2008 levels by 2010, and annual growth between 3.4% and 5.1% through 2017. Per capita income in Oregon is projected to stay below the average for the U.S. and to grow more slowly than in the U.S.as a whole.[17]

Table 3G. Per Capita Personal Income History (dollars)

Area Name	2000	2008	Average Annual Growth Rate 2000-2008
United States	30,318	40,166	3.58%
Oregon	28,718	36,365	3.00%
Clackamas County	37,212	44,803	2.35%
Marion County	25,038	32,565	3.34%
Multnomah County	33,122	41,222	2.77%
Washington County	33,942	40,188	2.13%
Yamhill County	24,420	32,700	3.72%
Portland Metropolitan Area	32,779	39,942	2.50%

BASED AIRCRAFT FORECAST

The based aircraft forecast begins by presenting historical numbers of based aircraft. Then, various forecast models prepared for the Airport are analyzed and the preferred forecast for based aircraft and fleet mix through 2030 is presented.

Records of the numbers and types of aircraft based at the Airport back to 1998 appear in **Table 3H**. The numbers through 2009 were taken from the TAF, which relies on airport owner-reported estimates on periodically updated Airport Master Records (FAA 5010 forms). Oregon's aircraft registration requires an airplane owner to designate where the airplane is based, and ODA has used these registration logs to determine the based aircraft at the Airport. ODA validated the number of based aircraft for 2010 with the FAA's Civil Aviation Registry, Airport tenants, and hangar inspections.

Table 3H shows that the number of aircraft based at the Airport grew steadily through 2007 then declined in 2008 and 2009, increasing again in 2010. In 2007, the FAA launched a nationwide program to inventory based aircraft by their unique "N" numbers. The FAA contended that many of the "N" numbers reported for Aurora State Airport were also reported at other airports. The result was a

[17] Oregon Economic and Revenue Forecast, June 2010, Volume XXX, No. 2, prepared by Office of Economic Analysis, and U.S. Department of Commerce, Bureau of Economic Analysis, www.bea.gov/regional/reis/drill.cfm

decrease of 76 aircraft reported for Aurora State Airport between 2007 and 2008. Nevertheless, from 1998 through 2010 based aircraft grew at a 3.6% average rate. Jet aircraft grew at the highest annual rate, 15.3%, while the number of helicopters declined at a 1.5% average annual rate. Single engine aircraft have always dominated the based aircraft fleet, accounting for 74% in 2010.

Table 3H. Historical Based Aircraft at Aurora State Airport

Year	Single Engine	Jet	Multi-Engine	Helicopter	Other	Total
1998	175	4	22	30	2	233
1999	175	4	22	30	2	233
2000	193	5	30	35	2	265
2001	319	7	27	34	0	387
2002	319	7	27	34	0	387
2003	323	7	27	34	0	391
2004	319	7	27	34	0	387

2007	322	33	38	27	0	420
2008	276	14	30	24	0	344
2009	258	12	30	24	0	324
2010	261	23	40	25	5	354

Source: FAA Terminal Area Forecast, December 2010 for 1998 through 2009. ODA registration records for 2010.

It appears the number of aircraft jumped up when the Southend Airpark opened. Southend Airpark's increased hangar capacity and expansion of aircraft services may have led to the Airport gaining a greater share of regional aviation activity. **Table 3I** illustrates the change in market share. It provides based aircraft history for four airports with comparable facilities and services to the Airport. These four airports are located at the edges of Aurora State Airport's maximum service area—Hillsboro Airport, Troutdale Airport, McMinnville Municipal Airport, and McNary Field in Salem. These airports have roughly comparable runway length, runway strength, instrument approach capability, and services that make them "business jet-capable."[18] Other airports in the region are used almost exclusively by single engine and multi-engine piston aircraft and generally do not have the features needed or desired for business jets.

[18] Portland International Airport is capable of handling business jets and has based general aviation aircraft, but its role as a medium-hub commercial service airport constrains its use for general aviation. Consequently, it is excluded from the analysis.

Between 1998 and 2009, Aurora State Airport's market share of based aircraft grew from 21% to 30%. Two of the other airports lost market share and two increased slightly. Aurora State Airport gained in its share of single engine, jet, and multi-engine aircraft. The Airport's share of helicopters and other aircraft declined from 1998 to 2009.

Table 3I. Change in Based Aircraft Market Shares at "Jet-Capable" Airports

Year	Aircraft Type	Aurora	Hillsboro	Troutdale	McMinnville	McNary (Salem)	Total Based Aircraft
1998	Single engine	175 (21%)	288 (34%)	149 (18%)	76 (9%)	148 (18%)	836 (100%)
	Jet	4 (11%)	24 (69%)	2 (6%)	1 (3%)	4 (11%)	35 (100%)
	Multi-Engine	22 (18%)	60 (48%)	20 (16%)	5 (4%)	17 (14%)	124 (100%)
	Helicopter	30 (46%)	18 (28%)	5 (8%)	10 (15%)	2 (3%)	65 (100%)
	Other	2 (3%)	0 (0%)	1 (2%)	18 (31%)	38 (64%)	59 (100%)
	Total	233 (21%)	390 (35%)	177 (16%)	110 (10%)	209 (18%)	1,119 (100%)
2009	Single engine	258 (33%)	145 (19%)	129 (17%)	88 (11%)	153 (20%)	773 (100%)
	Jet	12 (18%)	38 (56%)	2 (3%)	5 (7%)	11 (16%)	68 (100%)
	Multi-Engine	30 (28%)	30 (28%)	14 (13%)	11 (11%)	21 (20%)	106 (100%)
	Helicopter	24 (25%)	40 (42%)	9 (9%)	11 (12%)	11 (12%)	95 (100%)
	Other	0 (0%)	0 (0%)	0 (0%)	17 (46%)	20 (54%)	37 (100%)
	Total	324 (30%)	253 (24%)	154 (14%)	132 (12%)	216 (20%)	1,079 (100%)

Source: FAA Terminal Area Forecast, December 2010.

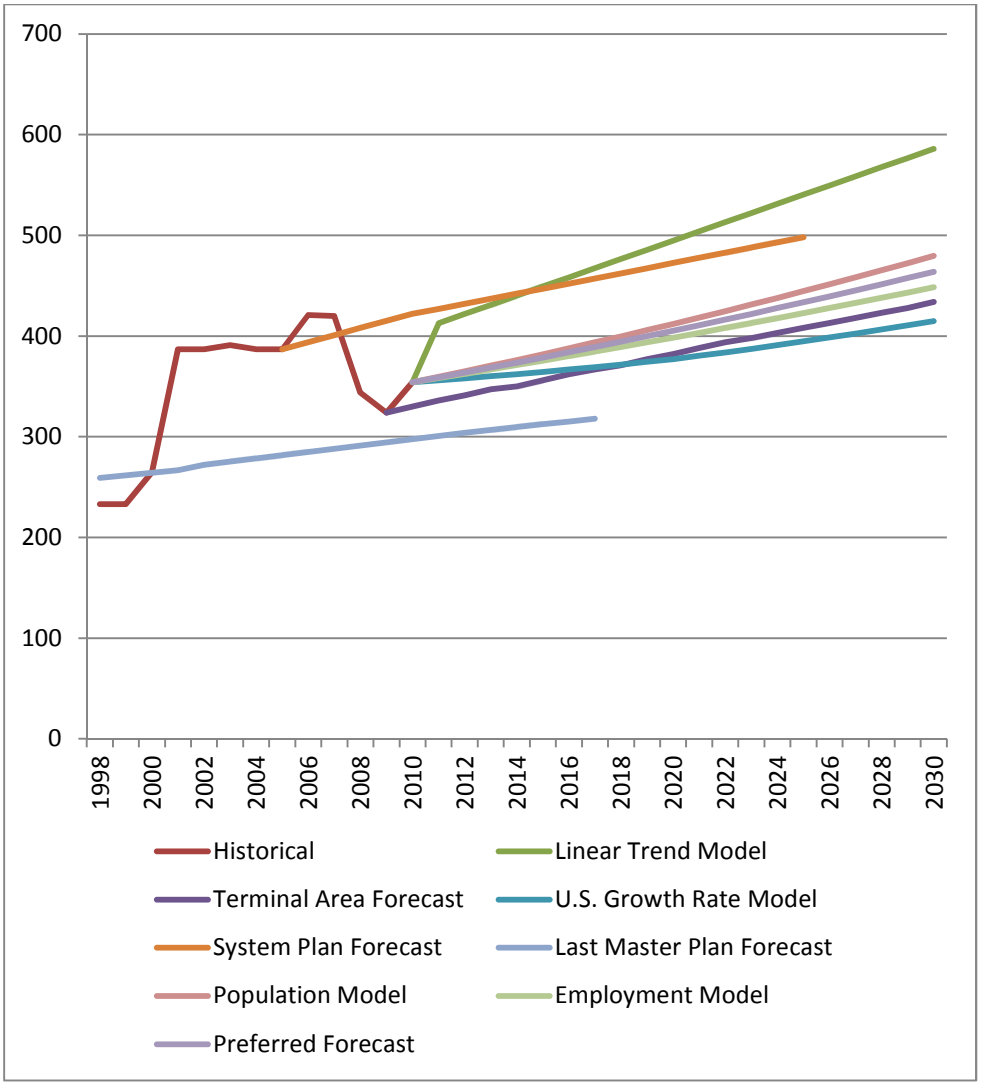
While some aircraft may have relocated from the Hillsboro and Troutdale Airports to Southend Airpark at Aurora, this was not likely the only cause of the market shift. The removal of hangars at other airports in the region may have contributed to the gain in the Airport's market share. In 2008, Portland International

Airport removed 18 hangars for a road improvement project. Since 2001, the following private airports have closed in the region: Basl Hill Farms Airstrip, Bonney Acres, Clackamas Heights, Cup Port, Hayden Mountain, McGill, Myers, and Pat's Pasture. Farther away in Vancouver, Washington, the privately owned Evergreen Field, with up to 165 aircraft, closed in 2006.

For the 1998 through 2009 period, Aurora's average annual growth rate was the highest of the five airports (3.0%), followed by McMinnville (1.7%), Salem, (0.3%), Troutdale (-1.3%), and Hillsboro (-3.9%). Combining the five airports, the number of based aircraft declined at an average annual rate of 0.3% between 1998 and 2009. The highest rate of decline was for other aircraft (-4.2%). On average, multiengine aircraft declined 1.4% annually and single engine aircraft declined 0.7% annually. In contrast, jets and helicopters increased – at 6.2% and 3.5% average annual growth rates, respectively.

The overall decline in based aircraft may be due to slow recovery from the economic recession or the relocation of single engine and multi-engine aircraft to airports that are not "jet-capable." Overestimated 1998 numbers or underreported 2009 numbers may also account for the decline. The FAA's based aircraft inventory in 2007 generally found overestimated numbers at airports across the country. However, since the FAA performed its based aircraft inventory in 2007, updating that database has depended on airport owners doing so voluntarily.

Socioeconomic changes often result in changes in the number of based aircraft at an airport. The population within the Airport service area has grown. Employment and income also grew until the recession hit the region hard in late 2008. However, very low statistical correlation[19] was found between historical based aircraft numbers at Aurora State Airport and the historical population, employment, or income statistics of the service area. The Airport's abrupt change in market share due primarily to the Southend Airpark development is probably the reason based aircraft numbers do not correlate with socioeconomic data.



Although the historical relationship between aviation activity and socioeconomic variables cannot be used for linear regression forecasting of activity at the Airport, other forecasting models can be used. Trend analysis is a linear regression model that relies on projecting past trends into the future. In trend analysis, a regression equation uses time as the independent variable. Market share modeling assumes an airport will retain its share of the national or state market in the future, relying on forecasts prepared for the nation or state to determine the forecast for an individual airport.

---

[19] Regression analysis is often used to forecast aviation activity. In regression analysis, the value being estimated (or forecast)—the dependent variable—is related to other variables—the independent or explanatory variables—that "explain" the estimated value. An example of a regression equation is to estimate based aircraft as a function of economic variables. The relationship is estimated using historic data for the independent and dependent variables. The explanatory power of the equation is measured by the R^2 statistic (called the coefficient of determination). An R^2 of 0 indicates that there is no statistical relationship between changes in the independent and dependent variables. R^2 values near 1.0 mean that there is a very strong statistical relationship. The R^2 values for Aurora State Airport based aircraft and regional population, income, and employment were less than 0.3.

Exhibit 3E shows the range of five forecast models and three other forecasts that were considered for the Aurora State Airport based aircraft forecast. They are described after the exhibit.

Exhibit 3E. Comparison of Based Aircraft Forecasts

U.S. Growth Rate Model (0.80% Annual Growth).

This is a market share model because it assumes that each type of aircraft at the Airport will retain its current share of the national market. Growth rates from the FAA's March 2010 forecasts were applied to the Airport's current fleet mix. The result is an average annual increase of 0.80% from 2010, to 415 aircraft in 2030. Growth in the first ten years is higher than in the last ten years of the forecast. The highest forecast growth rate is for jets (4.25%), followed by helicopters (3.0%), other aircraft (2.25%), multi-engine (0.65%, averaging the rates for multi-engine piston and turboprop aircraft), and single engine (0.05%). The composition of the 2030 fleet projected by this model is 264 single engine aircraft, 53 jets, 46 multi-engine aircraft, 45 helicopters, and 8 other aircraft. The drawback of this model is that

the Airport's history has been to grow at a much higher rate than the nation as a whole. Population in the service area is also projected to grow at a higher rate than the U.S. population.

Linear Trend Model (2.55% Annual Growth).

This forecast model analyzes historical growth from 1998 through 2010 and continues that growth trend into the future. The result is an average annual growth rate of 2.55%, resulting in a projection of 586 based aircraft in 2030. From 2010 to 2030, single engine aircraft grow to 457 at 2.85% per year, jets grow to 48 at 3.76% per year, multi-engine aircraft grow to 69 at 2.75% per year, helicopters decline at 4.34% per year to 100, and other aircraft decline at 6.85% per year, to 1. The problem with this model is that the Airport's growing share of the regional market is likely to slow, and it is unlikely that all aircraft types will grow according to the historical trends. The model's strong growth in single engine aircraft and decline in helicopters opposes state and national trends. The decline in helicopters is also inconsistent with the fact that a new helicopter business is planning to operate from the Airport soon.

Population Model (1.53% Annual Growth).

While the historical based aircraft data did not correlate with historical population, both based aircraft and population in the service area increased between 1998 and 2010, showing they are moving in the same direction. The annual growth rate projected for the core service area population, 1.53%, is used to forecast 480 based aircraft in 2030.

Employment Model (1.19% Annual Growth).

Historical numbers of based aircraft did not correlate any better with employment data than with population. However, employment is usually a factor in based aircraft growth and decline. A 1.19% annual growth rate, the average of the high and low ranges of Metro's 2030 employment forecast, resulted in growth to 448 aircraft in 2030.

Terminal Area Forecast (1.40% Annual Growth).

The FAA's Terminal Area Forecast projects that based aircraft will grow to 424, reflecting 1.4% average annual growth from 2009 to 2030. Jet aircraft are forecast to grow at the highest rate, 6.93%, while multi-engine aircraft are projected to remain unchanged. The composition of the 2030 fleet according to the Terminal Area Forecast is 321 single engine aircraft, 49 jets, 30 multi-engine aircraft, and 34 helicopters.

System Plan Forecast (1.27% Annual Growth).

The *Oregon Aviation Plan 2007* used 2005 as the base year, when the Airport's based aircraft totaled 387. It projected yearly growth at 1.27% to 498 aircraft in 2025.

Last Master Plan Forecast (1.09% Annual Growth).

The 2000 Aurora State Airport Master Plan projected 1.09% annual growth in the number of based aircraft, from 259 in 1998 to 318 in 2017. This forecast was constrained, based on ODA's decision not to expand the Airport to serve a more demanding critical aircraft. An unconstrained forecast projected growth to 345 aircraft in 2017. The constrained and unconstrained forecasts for 2017 were reached by 2001.

Preferred Forecast (1.36% Annual Growth).

The preferred forecast uses the average of the growth rates in the Population and Employment Models, 1.36% per year, so that based aircraft reach 464 in 2030. The Preferred Forecast falls in the mid-range of the other forecasts and models. It is higher than national forecasts, but in line with growth projected by Airport businesses, between 1% and 3% per year over the next 20 years. While the Airport may experience a spurt in based aircraft resulting from additional landside development, the other comparable airports (Hillsboro, Troutdale, and McNary Field in Salem) may also expand to meet metropolitan area demand. The preferred forecast assumes it is more likely that Aurora State Airport will maintain its share of regional based aircraft than gain market share as it did in the last decade.

Table 3J presents the based aircraft forecast and fleet mix. The fleet mix was determined by averaging the fleet mixes of the Linear Trend and US Growth Rate Models, and then adjusting primarily the single engine and helicopter shares. The single engine share was lowered slightly and the helicopter share raised, to be more in line with expectations for the Airport. Multi-engine aircraft were divided between turboprop and piston, with turboprop aircraft growing faster than multi-engine piston aircraft. The resulting annual growth rates from 2010 to 2030 differ by aircraft type: 3.7% for jets, 2.6% for turboprop, 0.6% for multi-engine piston, 1.0% for single engine, 2.8% for helicopter, and 0.0% for other.

Table 3J. Based Aircraft and Fleet Mix Forecast

Year	Jet	Turboprop (Multi-engine)	Multi-engine Piston	Single Engine	Helicopter	Other	Total
2010	23	16	24	261	25	5	354
2015	27	19	24	276	28	5	379
2020	33	20	25	288	34	5	405
2030	47	26	27	316	43	5	464
				Fleet Mix			
2010	6%	5%	7%	74%	7%	1%	100%
2015	7%	5%	6%	73%	8%	1%	100%
2020	8%	5%	6%	71%	9%	1%	100%
2030	10%	6%	6%	68%	9%	1%	100%

Source: WHPacific, Inc.

The fleet mix is projected to shift over the 20-year forecast period, consistent with trends the FAA has projected nationally. Single engine aircraft remain predominant at the Airport, but decline from 74% to 68% over the next 20 years. The proportion of jets and helicopters increases over the planning period, while the proportion of total multi-engine aircraft stays about the same, with some shifting between the multi-engine turboprop and multi-engine piston shares.

AIRCRAFT OPERATIONS FORECAST

This section begins with a review of historical trends in aircraft operations. Previous aircraft operations forecasts are reviewed and the preferred aircraft operations forecast is explained and presented. The operations forecasts include total annual operations, local vs. itinerant operations, operational fleet mix, and peak activity.

Aircraft operations are difficult to measure at a non-towered airport. Research into the problem has concluded that the most accurate and cost-effective way to estimate aircraft operations at a non-towered airport is to sample traffic with an acoustical counter for two weeks for each of the four seasons and extrapolate that sample into an annual estimate.[20] However, acoustical counters can provide false readings from other sounds, miss landings and takeoffs at mid-field by quiet aircraft, and are less reliable for helicopters than fixed wing traffic when helicopters can use multiple takeoff and landing locations and routes.

From 1979 through 2003, ODA's Aircraft Traffic Monitoring Program employed acoustical counting to estimate the levels of annual aircraft operations at Oregon airports. No acoustical samples have been taken since 2003, and combined with the inherent flaws associated with this method, it has been determined that the FAA's Terminal Area Forecast is the best source of historical aircraft operations for the Airport. The Terminal Area Forecast reports periodically updated Airport Master Record estimates provided by ODA.

Table 3K shows the history of operations from 1998 to 2009. Operations peaked at 90,180 in 2000. Their decline to 72,895 in 2001 may be attributed to 9/11. Since 2001, operations have increased slowly to 89,495 in 2009, the last year of historical estimated operations records according to the Terminal Area Forecast.

The composition of operations has not varied substantially from 1998 through 2009. Air taxi (FAR Part 135) operations stayed close to 11% of total operations. Military operations remained a very small portion of total operations, and all military operations were itinerant. The split of GA aircraft operations between itinerant and local varied a bit more. Local operations ranged between 41% and 56% of total GA operations, averaging 45%.

[20] Transportation Research Board, Airport Cooperative Research Program, ACRP Synthesis 4: Counting Aircraft Operations at Non-Towered Airports (2007).

Table 3K. Historical Aircraft Operations at Aurora State Airport

Year	Air Taxi	GA Itinerant	Military Itinerant	Total Itinerant	GA Local	Total Local	Total Operations
1998	8,791	34,650	180	43,621	23,200	23,200	66,821
1999	8,791	34,650	180	43,621	23,200	23,200	66,821
2000	9,000	36,000	180	45,180	45,000	45,000	90,180
2001	6,190	39,475	250	45,915	27,980	27,980	73,895
2002	9,227	39,713	250	49,190	29,402	29,402	78,592
2003	9,325	39,951	250	49,526	30,824	30,824	80,350
2004	9,422	40,188	250	49,860	32,208	32,208	82,068
2005	9,520	40,426	250	50,196	33,628	33,628	83,824
2006	9,431	39,965	250	49,646	34,064	34,064	83,710
2007	9,564	41,176	250	50,990	34,892	34,892	85,882
2008	9,656	41,409	250	51,315	36,030	36,030	87,345
2009	9,788	42,592	250	52,630	36,865	36,865	89,495

Source: FAA Terminal Area Forecast, December 2010.

One method for forecasting aircraft operations at GA airports is to apply a ratio of operations per based aircraft (OPBA) to the based aircraft forecast. For each year in the forecast, operations equal the forecast number of based aircraft multiplied by an OPBA ratio. Some of the operations in an OPBA ratio are by based aircraft and some are by transient, or itinerant, aircraft. The FAA has provided the following guidelines for OPBA ratios:[21]

- 250 OPBA is typical at a rural GA airport with little itinerant traffic.
- 350 OPBA is typical at a busier GA airport with more itinerant traffic.
- 450 OPBA is typical at a busy reliever airport with a large amount of itinerant traffic.

The historical OPBA ratio for Aurora State Airport averages 240 per year,[22] varying from a high of 340 in 2000, to a low of 191 in 2001. In 2009, the OPBA was 276. For comparison, an OPBA ratio was extracted from the Airport user survey that was conducted as part of this Master Plan, in the fall of 2009. The survey asked airport owners and operators to estimate their annual number of landings. Information for fixed wing aircraft varied from 30 annual landings (about once every two weeks) to 300 annual landings (nearly once a day) per aircraft. The average per fixed wing aircraft was approximately 145 landings, which equates to 290 annual operations. The survey results covered a variety of aircraft

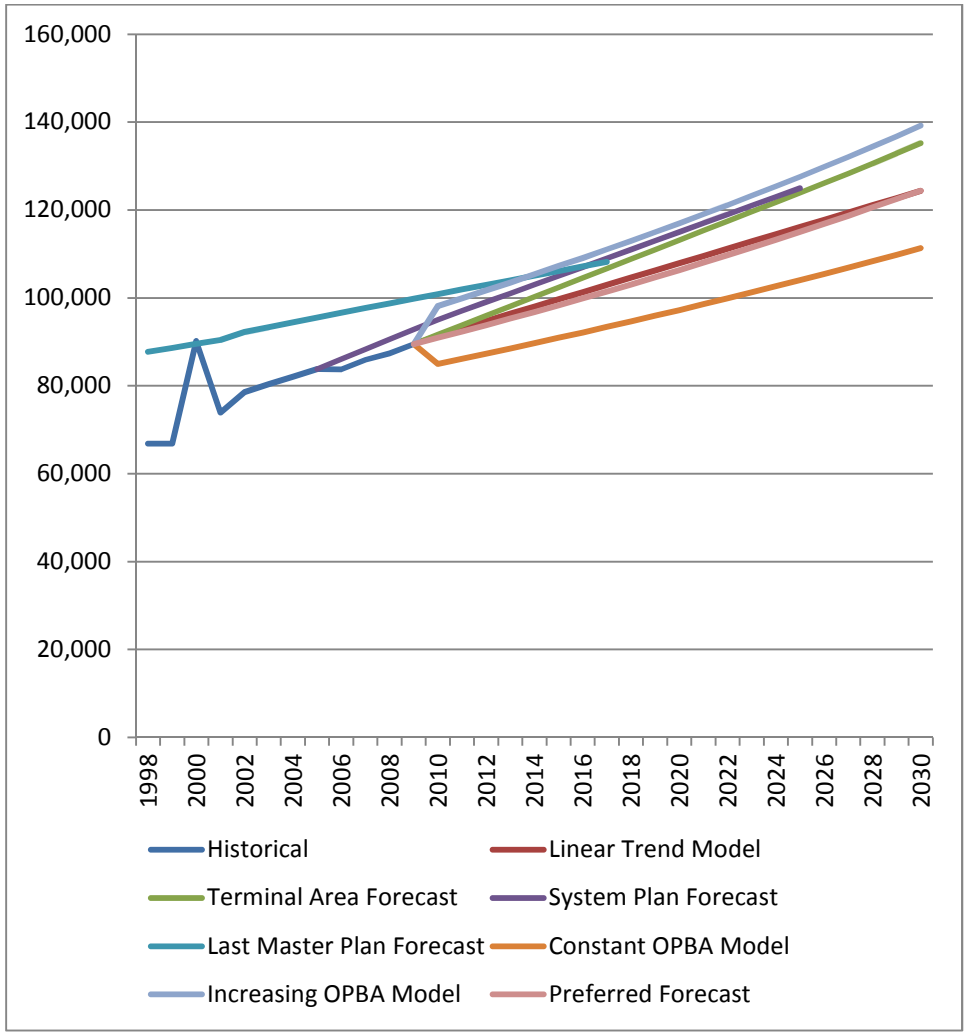
[21] FAA Order 5090.3C, Field Formulation of the National Plan of Integrated Airport Systems (NPIAS)

[22] The number changed from the earlier forecast because three years of based aircraft numbers were lowered, which increased the ratio of operations per based aircraft for those years. Also, an additional year of operations was available.

types, from small single engine piston aircraft to mid-sized business jets. For helicopters, the number of landings per aircraft was much higher, up to 1,500 per year; however, 70% to 90% of the landings are not at the Airport. This illustrates the difference in how helicopters operate, compared to fixed wing aircraft.

The Airport has a lower OPBA than Hillsboro, McMinnville, Troutdale, and McNary Field in Salem. These other airports are located in the same region and, except for McMinnville, have more reliable records of aircraft operations because they have air traffic control towers. The average OPBA ratios for these airports from 1998 to 2008 are as follows:

- Hillsboro 639 OPBA
- McMinnville 592 OPBA
- Troutdale 419 OPBA
- Salem 411 OPBA



Aurora State Airport's lower OPBA ratio is probably due to a combination of factors, including a lower proportion of local operations (less flight training that entails a high number of touch-and-go operations per aircraft) and a large number of small aircraft that are flown infrequently.[23]

When an OPBA ratio is used for forecasting, the OPBA might be held constant over the forecast period, or it might increase over the forecast period. The projection of an increase in OPBA would be supported by the national trend and FAA's national forecasts over the last several years for increasing aircraft utilization. Put another way, GA and air taxi aircraft hours flown have been increasing faster than the active aircraft fleet, and the FAA has been forecasting higher growth rates for hours flown than for aircraft. Longer trips might account for some of the increase in hours flown, but most of the higher utilization translates to more trips per aircraft. More trips mean more takeoffs and landings per aircraft.

Forecast models for aircraft operations that used the OPBA model and those that did not were considered. **Exhibit 3F** compares the various forecast models and previous forecasts of aircraft operations at the Airport, which are described after the exhibit.

[23] The Airport user survey found many smaller piston airplanes are flown less than once a week, or less than 100 operations per year.

Exhibit 3F. Comparison of Aircraft Operations Forecasts for Aurora State Airport

Linear Trend Model (1.58% Annual Growth).

This model analyzes historical growth from 1998 through 2009 and continues that growth trend into the future. The result is an average annual growth rate of 1.58%, resulting in a projection of 124,347 operations in 2030. By 2030, the OPBA is 268.

Terminal Area Forecast (1.99% Annual Growth).

The FAA's Terminal Area Forecast projects that operations will grow to 135,240 in 2030, reflecting 1.99% average annual growth from 2009 to 2030. By 2030, the OPBA is 312.

System Plan Forecast (2.02% Annual Growth).

The *Oregon Aviation Plan 2007* used 2005 as the base year, when Aurora State Airport's aircraft operations totaled 83,824. It projected yearly growth at 2.02% to 124,978 operations in 2025. The OPBA ratio grew over the forecast period, from 217 to 251.

Last Master Plan Forecast (1.11% Annual Growth).

The 2000 Aurora State Airport Master Plan projected 1.11% annual growth in aircraft operations, from 87,714 in 1998 to 108,204 in 2017. The forecast was prepared by using a constant 339 OPBA ratio.

Constant OPBA Model (1.05% Annual Growth).

This model uses the average OPBA from the 1998 to 2009 period, 240. In 2030, aircraft operations reach 111,360, representing 1.05% average annual growth rate from 2009 to 2030. Since the OPBA in 2009 was 276, higher than the 11-year average, the resulting growth rate is slightly lower than the growth rate of the based aircraft forecast. This is inconsistent with the trend for higher aircraft utilization.

Increasing OPBA Model (2.13% Annual Growth).

This model follows the FAA's national forecast for higher aircraft utilization. Over the forecast period, the OPBA ratio is increased to 300. The resulting projection of aircraft operations in 2030 is 139,200, and the average annual growth rate is 2.13%.

Preferred Forecast (1.58% Annual Growth).

The preferred forecast uses the same growth rate as the linear trend[24]. In 2030, aircraft operations reach 124,386, representing 1.58% average annual growth rate from 2009 to 2030. The Preferred Forecast falls in the mid-range of the other forecasts and models. The growth rate is slightly higher than the growth rate of the based aircraft forecast, which is consistent with the trend for higher aircraft utilization. Over time, the OPBA ratio increases to reach 268 in 2030.

Table 3L distributes the preferred forecast for aircraft operations among the categories that the FAA uses for aircraft operations. Air taxi operations remain 11% of total aircraft operations. The split between GA itinerant and local operations is 60% itinerant and 40% local through the planning period. Compared to historical proportions of itinerant and local operations, future local operations are a smaller portion, which reflects the expectation of lessening flight training at the Airport. Itinerant military operations remain constant, and, consistent with the past, there are no local military aircraft operations in the forecast.

[24] The previous operations preferred forecast used the constant OPBA model (1.9% average annual growth rate) from the 1998 to 2008 period. This update took a fresh look at the models and determined this model is no longer appropriate, as it is yields an average annual growth rate inconsistent with trends expected at the Airport and nationwide.

Table 3L. Aircraft Operations Forecast

Year	Itinerant Air Taxi	Itinerant GA	Itinerant Military	Total Itinerant	Local GA	Total Operations
2009 Historical	9,788	42,592	250	52,630	36,865	89,495
2010 Estimated	10,000	48,395	250	58,645	32,264	90,909
2015	10,815	52,354	250	63,419	34,902	98,321
2020	11,697	56,635	250	68,582	37,756	106,338
2030	13,682	66,272	250	80,205	44,181	124,386

Operations Fleet Mix Forecast

Because aircraft operations include those by transient aircraft as well as those by based aircraft, the operational fleet mix for the Airport is not the same as the based aircraft fleet mix (Table 3J). Since it is a non-towered airport, the operational fleet mix for the Airport must be estimated. IFR traffic records help with the estimate, although IFR operations account for a small portion of the total Airport traffic, and higher performance (turbine-powered) aircraft are disproportionately represented in the IFR traffic. The Airport users surveyed reported higher utilization for jets and turboprops than for piston airplanes.[25] Local operations are predominantly for training, and are reportedly dominated by piston aircraft and helicopters.

National data confirm that business jet aircraft are used more often than piston aircraft. Tables 3A and 3B show that piston aircraft are flown 83 hours per year and jet aircraft are flown 252 hours per year on average. Consequently, jets have a greater share of the operations at the Airport than their share of based aircraft. In addition, since Aurora State Airport is "jet-capable," and most of the 46 other airports in the service area are not, the Airport will be used more by transient jet aircraft than most of the other airports.

Using this information and considering national growth rates for hours flown, the operations fleet mix forecast was prepared (**Table 3M**). Piston-powered airplanes are projected to have a declining share of total operations, while jet, turboprop, and helicopter traffic have growing shares.

[25] For the 86 aircraft with use estimates in the user survey results, helicopters have the highest utilization—up to 1,500 operations per year per helicopter, although 70% to 90% of those operations are not at Aurora State Airport. The jets in the survey are used nearly 600 operations per year per aircraft. Piston aircraft have the lowest utilization, 60 to 150 operations per year.

Table 3M. Operations Fleet Mix Forecast

Year	Jet	Turboprop	Multi-engine Piston	Single Engine	Helicopter	Total Operations
2010	10,909	9,091	8,182	35,455	27,273	90,909
2015	12,782	10,815	7,866	35,396	31,463	98,321
2020	15,951	11,697	7,444	37,218	34,028	106,338
2030	22,389	14,926	8,707	37,316	41,047	124,386
			Fleet Mix			
2010	12%	10%	9%	39%	30%	100%
2015	13%	11%	8%	36%	32%	100%
2020	15%	11%	7%	35%	32%	100%
2030	18%	12%	7%	30%	33%	100%

Peak Aircraft Operations Forecast

As airport activity fluctuates from month to month, day to day, and hour to hour, airside and landside facilities should be designed to accommodate peak levels of use. The forecast of annual aircraft operations serves as the basis for generating forecasts of peak demand. Peak demand is usually expressed as "Peak Month" (the month in a calendar year when the highest level of activity occurs), "Design Day" (the average daily level of activity during the Peak Month), and "Design Hour" (the busiest hour within the Design Day).

Peak demand forecasts at the Airport are based on assumptions that consider the following:

- Peaking characteristics determined from fuel sales and IFR flight plan data
- Guidance regarding peak demand from FAA Advisory Circular 150150/5060-5, *Airport Capacity and Delay*

Historical fuel sales and IFR operations records are available by month. They indicate that May through September is typically the busiest time at the Airport, and the winter months are the slowest time. The single busiest month varies from year to year, but for both fuel and IFR activity, the busiest month accounts for 11% of the annual total, on average.

The Design Day is the average day of the Peak Month, calculated by dividing Peak Month operations by 30.5 days. Based on FAA guidance for the Airport's mix of aircraft, the Design Hour is estimated to contain 11% of the Design Day operations.[26] **Table 3N** presents the resulting peak demand forecasts for Aurora State Airport.

[26] FAA Advisory Circular 150/5060-5, Airport Capacity and Delay, Table 2-1.

CRITICAL AIRCRAFT AND AIRPORT REFERENCE CODE

According to FAA criteria, an airport's design is based on the characteristics of the critical aircraft, which is the most demanding aircraft that uses the airport "regularly" or "substantially." The FAA defines regular or substantial use as at least 500 annual itinerant operations. The Airport Reference Code (ARC) is the main criterion for determining applicable FAA airport design standards for dimensions such as runway and shoulder widths; separations of runways, taxiways, and taxilanes; and cleared areas. The Aircraft Approach Category and the Airplane Design Group of the critical aircraft define the ARC. The Aircraft Approach Category is determined by the approach speed, or 1.3 times the stall speed of the aircraft in its landing configuration at its maximum landing weight. The letters A, B, C, D, and E. represent the Aircraft Approach Category. The Airplane Design Group of the aircraft is based on the wingspan or tail height, and is defined by Roman numerals I, II, III, IV, V and VI. **Table 3O** shows the ARC component definitions and typical aircraft that meet these definitions.

According to the 2000 Airport Master Plan, the planned ARC was B-II, exemplified by the King Air turboprop and the Cessna Citation jet. At that time, ODA decided to constrain the forecast by keeping the airfield ARC at B-II. A runway designed for ARC B-II is adequate for about 45% of the business jets manufactured.[27]

[27] Central Region FAA Newsletter, October 2001.

Table 3O. Airport Reference Code (ARC) Components

Approach Category	Approach Speed	Typical Aircraft
A	Less than 91 knots	Cessna 150, 172, 206, Beech Bonanza
B	91 to 120 knots	King Air, Piper Navajo, Gulfstream I
C	121 to 140 knots	Boeing 727, 737, Learjet, Challenger
D	141 to 165 knots	Boeing 747, Gulfstream V
Airplane Design Group	**Wingspan**	**Typical Aircraft**
I	Less than 49 feet	King Air, Cessna 150, 172, 206, Gates Learjet, Beech Bonanza
II	49 to 78 feet	King Air, Super King Air, Cessna Citation, Dassault Falcon, Gulfstream I, Challenger
III	79 to 117 feet	Boeing 727, 737, DC-3, DC-6, Gulfstream V
Airplane Design Group may be determined by tail height, if more demanding than wingspan:		
Airplane Design Group		**Tail Height**
I		Less than 20 feet
II		20 to 29 feet
III		30 to 44 feet

Source: FAA AC 150/5300-13, Airport Design

Note: Aircraft Approach Category E (166 knots or more) and Airplane Design Groups IV, V, and VI (118 feet or more) are not shown.

The Airport has now passed the 500 operations threshold for Aircraft Approach Category C, so the current ARC should be C-II. To prove this, **Table 3P** presents the distribution of documented[28] jet aircraft operations by ARC for FY 2007 and FY 2009. The two years represent recent peak and valley years, neither of which is typical of activity at the Airport. The peak year (2007) was the boom time immediately preceding the recession, and the valley year (2009) was the deepest part of the recession. The average of the two years reflects activity in a more normal year. The source of this information is IFR flight plan records. Undocumented VFR jet operations are not included in the table, nor are the many turboprop and piston aircraft operations that fall in Approach Categories A or B and in Airplane Design Groups I or II.

[28] Documentation is from IFR flight plans filed. They were reviewed, and VFR operations required to make trips whole were added. For example, if an individual aircraft's IFR record showed a flight from Aurora State to another airport, and its next sequential IFR operation originated at Aurora State, a VFR operation was added to bring the aircraft back to Aurora State for the next flight. One Flight Operations Director at the Airport confirmed that IFR clearance is sometimes obtained after VFR departure or cancelled prior to arrival, to save time.

Table 3P. Documented Jet Operations by Airport Reference Code

ARC	FY 2007	FY 2009	Average
B-I	689	273	481
B-II	883	785	834
B-III	0	4	2
C-I	293	209	251
C-II	406	181	293
C-III	2	0	1
D-I	8	0	4
D-II	2	2	2
D-III	0	2	1
Unknown or Other ARC	59	64	62
Total	2,342	1,520	1,931

Source: Derived from IFR flight plan data (Detailed GA Activity and Airline reports) obtained from GCR's Airport IQ Data Center. Note: during the update, more research was done to identify ARCs for the "Unknown" aircraft, which increased the number of B-I, B-II and C-II aircraft operations.

The Cessna Citation is the most prevalent jet aircraft represented in the documented operations and in the based aircraft fleet. In the FY 2007 data, the Cessna 525 Citation (ARC B-I, 10,400 pounds maximum takeoff weight) is predominant. In the FY 2009 data, the Cessna 560 Citation (ARC B-II, 16,300 pounds maximum takeoff weight) is predominant. Other models of the Cessna Citation[29] account for large numbers of operations at the Airport, along with the Dassault Falcon 900[30] and the Israel Aircraft Industries (IAI) Westwind 1124[31] and Astra 1125.[32]

Aircraft Approach Category C accounts for 701 documented operations in FY 2007 and 390 in FY 2009, resulting in an average of 545 operations. The number of Aircraft Approach Category D airplane operations is negligible, as are operations in Airplane Design Group III.

With more than 500 operations in Aircraft Approach Category C and more than 500 operations in Airplane Design Group II, the appropriate ARC for the Airport is C-II. With based jet aircraft and jet aircraft operations projected to grow at rates over 3% per year, the ARC is not likely to grow from

[29] ARC B-I and B-II, maximum takeoff weights up to 24,000 pounds
[30] ARC B-II, 45,500 pounds maximum takeoff weight
[31] ARC C-I, 23,500 pounds maximum takeoff weight
[32] ARC C-II, 23,500 pounds maximum takeoff weight

Aircraft Approach Category C to D or from Airplane Design Group II to III. Aurora State Airport meets many of the ARC C-II design criteria now, as the next chapter will show.

The current and forecast ARC is C-II, which reflects a family of business jets. The critical aircraft is the aircraft in ARC that uses the Airport the most. The current critical aircraft is the IAI Astra 1125. A runway designed for ARC C-II would be adequate for about 90% of the business jets manufactured.[33] In Table 3P, the Astra accounted for the largest number of C-II operations. An aircraft based in Eugene accounted for most of the Astra operations, and operations by Astra aircraft based elsewhere in Oregon and in California were also recorded. An Astra was recently based at the Airport.

In the future, a newer model of ARC C-II business jet, the Cessna Citation X, is projected to overtake the Astra as the predominant C-II aircraft. The Citation X (36,100 pounds maximum takeoff weight) is in the transient fleet using the Airport now, but is not yet part of the Airport's based aircraft fleet. An aircraft operator based at the Airport is buying a Citation X for its increased range capability, to be able to fly nonstop to the East Coast. The future critical aircraft is the Cessna Citation X.

The ARC does not determine the runway length required. Among other things, runway length differs with aircraft performance and with stage length (trip distance), which determines the fuel load. Runway length is examined in the next chapter.

SUMMARY OF FORECASTS

Table 3Q summarizes all the aviation demand forecasts presented previously in this chapter. **Appendix H** includes the FAA TAF Worksheet, which is used to compare the two forecasts.

With this forecast data, the next step in the master planning process is to calculate the ability of existing facilities to meet the forecasted demand. Additionally, the next chapter will identify needed enhancements of airside and landside facilities to accommodate forecasted demand.

Chapter Four: FACILITY REQUIREMENTS

Airport Master Plan Update

Aurora State Airport

In this chapter, existing airport facilities are evaluated to identify their functionality, condition, compliance with design standards, and capacity to accommodate demand projected in Chapter Three, *Aeronautical Activity Forecasts*.

The objective of this effort is to identify what facilities are needed and the adequacy of the existing airport facilities in meeting those needs. Where differences between existing and needed facilities are noted, this chapter identifies when those additional facilities may be needed. Once the facility requirements have been established, alternatives for providing these facilities will be created with input from the Oregon Department of Aviation (ODA), the Federal Aviation Administration (FAA), and the Planning Advisory Committee (PAC). The alternatives will be discussed in Chapter Five.

FAA Advisory Circular 150/5070-6B, *Airport Master Plans*, states the following about this stage of the planning process:

> Planners should determine what, if any, additional facilities will be required to accommodate forecast activity. This task begins with an assessment of the ability of existing facilities to meet current and future demand. If they cannot, planners must determine what additional facilities will be needed to accommodate the unmet demand.
>
> In some cases, the airport sponsor may decide that it is in the community's best interest for the airport not to continue to grow to accommodate forecast activity, or to accommodate forecast activity only up to a point. In these cases, the master plan should document this decision and indicate the probable consequences of the decision (e.g., demand will be capped, the demand will go unmet, or the demand will be diverted to another airport).

At this time, ODA has not decided to constrain Aurora State Airport's ability to meet the unconstrained forecasts presented in Chapter Three. Such a decision may occur later. Facility requirements were constrained in the 2000 airport master plan update because ODA made a policy decision to do so. In the 2000 Master Plan update, forecasting determined the Airport Reference Code (ARC) as B-II, which meant that airport design should accommodate light jets and turboprop aircraft, as well as less demanding aircraft types. Unconstrained forecasting projected jet traffic at the Airport would grow so

that the future ARC would be C-II, which meant that airport design should accommodate more medium-sized jets. ODA made a policy decision to constrain the forecasts by constraining the ARC to B-II. Since then, aircraft activity growth has exceeded both the unconstrained and constrained forecasts in the 2000 master plan update. Current activity has passed the FAA's threshold for the ARC to be C-II. This has been possible because the airfield is adequate for many operators of Aircraft Approach Category C airplanes, even though the Airport does not meet all design standards for ARC C-II. In this current master plan update, ODA will examine the impacts of meeting ARC C-II design standards and of accommodating the unconstrained forecasts from Chapter Three. It is anticipated that airport development alternatives analyzed in the next chapter will compare meeting the unconstrained demand forecasts fully, with accommodating no growth, and with accommodating constrained growth. This will allow ODA, with advice from the PAC, to make an informed decision about the possibility of constraining Airport growth.

BACKGROUND

Airport Planning and Development Criteria

Airport planning and development criteria are often defined by both federal and state agencies. The FAA provides specific guidance concerning dimensional standards and many state agencies provide generalized guidance based on facilities offered and aircraft activity levels. Both sets of planning criteria are discussed below, along with some industry criteria.

State and Federal Criteria

ODA has created general guidelines in the 2007 Oregon Aviation Plan (OAP) for airport planning and development based on the roles or categories of airports within the statewide system. The OAP identified five airport categories, each with its own set of performance criteria. The categories are based on factors such as the Airport's function, the type and level of activity at the Airport, and the facilities and services available. The Aurora State Airport (Airport) is classified as Category II – Urban General Aviation Airport. The function of this category is to support all general aviation aircraft and accommodate corporate aviation activity, including business jets, helicopters, and other general aviation activity. The OAP identified a few deficiencies at the Airport for meeting Category II minimum and desired criteria. To correct these deficiencies, the OAP recommends the Airport should:

- Increase Airport Reference Code from B-II to C-II
- Correct parallel taxiway / runway centerline separation (deficiency corrected in 2008)
- Install precision instrument approach
- Install medium intensity taxiway lighting (MITL) (deficiency corrected in 2008)
- Construct designated cargo apron

The FAA specifies design standards by ARC and instrument approach visibility minimums. The ARC is a coding system used to relate airport design criteria to the operational (Aircraft Approach Category – AAC) and the physical characteristics (Airplane Design Group – ADG) of the airplanes intended to operate at an airport. In the previous chapter, it was determined that the ARC at the Airport is C-II,

which is exemplified by the IAI Astra 1125. The airport design standards applicable for the IAI Astra 1125 are also applicable for many mid-sized business jets. An AAC of C represents aircraft with an approach speed between 121 and 141 knots. An ADG of II represents aircraft with tail heights of 20 to 30 feet and wingspans from 49 to 79 feet.

The Airport currently has nonprecision instrument approaches. For determining airport design criteria, instrument approach visibility minimums are divided into three categories:

- Visual and not lower than one-mile (currently at the Airport)
- Not lower than ¾-mile
- Lower than ¾-mile

The 2007 OAP and multiple Airport users – by means of survey – have indicated that a precision instrument approach procedure at the Airport would be desirable. New technology allows instrument approaches using the Global Positioning System (GPS) at a minimal cost, in terms of navigational aids and cockpit equipment. For many general aviation airports however, the cost of upgrading facilities (*e.g.*, larger safety clearances, installing lights) to the minimum requirements for the different approach visibility categories is a significant constraint to establishing or improving an instrument approach. This chapter presents the requirements of all the different instrument approach visibility minimums to aid in assessing the feasibility of an instrument approach, considering existing constraints.

Industry Criteria

The next paragraphs outline criteria important to the users of business jets and other business-oriented components of general aviation. These criteria are useful for planning the Airport's future but do not provide sufficient justification for the FAA to fund a project.

The National Business Aviation Association (NBAA) provides optimum and acceptable airport guidelines for corporate jets and turboprops, as shown in **Table 4A**. The guidelines describe specific aspects of airports important to business aviation operators, but are not intended to replace or override airport requirements under federal funding requirements. Table 4A indicates several features that the Airport lacks, including more runway length and instrumentation.

Table 4A. National Business Aviation Association Airport Guidelines

Airport Feature	Optimum		Acceptable	
Runways	Dimensions (ft.)[1]	Weight Capacity (lbs)[2]	Dimensions (ft.)	Weight Capacity (lbs)
Heavy Jet (above 50,000 pounds)	8,603 x 150	120,000	6,314 x 100	75,000
Medium Jet (up to 50,000 pounds)	6,314 x 100	75,000	5,742 x 100	50,000
Light Jet (up to 25,000 pounds)	5,170 x 100	50,000	4,597 x 75	20,000
Very Light Jet / Turboprop (up to 12,500 pounds)	4,597 x 75	25,000	3,453 x 60	15,000
	Taxiways for all runways 200 x 300 ft. ramp area min. Stabilized overruns on longest runway		Adequate ramp for maneuvering / parking	
Air Traffic Control (ATC) Tower	24 hours		None	
Lighting	Full approach light system High intensity runway lights Visual glideslope indictor on all runways		Runway End Identifier Lights (REIL) or Omnidirectional Approach Lighting System (ODALS) Medium intensity runway lights Visual glideslope on instrument runway Pilot controlled lights	
Instrument Procedures	Area Navigation (RNAV) Standard Instrument Departures (SIDs) Standard Terminal Arrival Route (STARs)		Area Navigation (RNAV) Standard Instrument Departures (SIDs) Standard Terminal Arrival Route (STARs)	
Weather Reporting	ASOS		AWOS	
Services	Full-service Fixed Base Operator (FBO)[3] Transient hangar space FAR Part 107[4] type security De-icing		Enclosed passenger waiting area Fuel/tiedowns Elementary security Telephone	
Maintenance	FAR Part 145 Repair Station		Minimal maintenance (tire/battery service, etc.)	
Amenities	Nearby hotel/motel Nearby restaurant		Distant hotel/motel Vending machines

---

[1] *Runway lengths from NBAA (standard 59 degrees & sea level) were adjusted for Airport conditions (elevation, temperature, runway gradient) described later in this chapter. Actual runway lengths needed for specific aircraft in specific circumstances will vary.*

[2] *Aircraft weights shown are for the group's Maximum Takeoff Weight (MTOW). "Acceptable" runway weight capacities are to accommodate 100% of the fleet within each category. "Optimum" runway weight capacities accommodate 100% of the category's fleet, as well as occasional use by aircraft in larger categories.*

[3] *Staffed 24/7, fuel, passenger and crew lounge, rental cars, shuttle/crew car, vending machine*

[4] *Now TSR (Transportation Security Regulation) Part 1542.*

AIRFIELD REQUIREMENTS

As discussed in Chapter Two, airfield facilities are those related to the arrival, departure, and ground movement of aircraft. Airfield facility requirements are addressed for the following areas:

- Airfield Capacity
- Airfield Design Standards
- Runway Orientation, Length, Width, and Pavement Strength
- Taxiways
- Airport Visual Aids
- Airport Lighting
- Radio Navigational Aids and Instrument Approach Procedures
- Other Airfield Recommendations

Airfield Capacity

The capacity of the runway system to accommodate existing and future aircraft operations was determined using the FAA Advisory Circular 150/5060-5, *Airport Capacity and Delay*. This publication describes throughput methods for calculating airport capacity derived from computer models the FAA uses to analyze airport capacity and reduce aircraft delay.

Capacity determined by using the advisory circular reflects the level of aircraft operations at which average delay per aircraft is not more than four minutes. The advisory circular describes two different methods of calculating runway capacity. Both methods assume there are no airspace limitations that would adversely affect flight operations.

One method of calculating capacity is to look at runway diagrams in Figure 2.1 of the circular. The FAA recommends using the capacity numbers in Figure 2.1 only for long-range planning and acknowledges that the assumptions underlying the capacity numbers are not applicable to every airport. Figure 2.1 shows that the capacity of a single runway with a mix index[5] below 20% – conditions at Aurora State Airport – is as follows:

Annual Service Volume (ASV)	230,000 operations
Visual Flight Rules (VFR) Hourly Capacity	98 operations
Instrument Flight Rules (IFR) Hourly Capacity	59 operations

[5] *Mix index is the percentage of total aircraft operations by Class C aircraft (those with maximum takeoff weights between 12,500 and 300,000 pounds) plus three times the percentage of Class D aircraft (those over 300,000 pounds maximum takeoff weight). Mix index at Aurora State Airport was estimated assuming 80% of jet aircraft operations are in Class C, 10% of the turboprop aircraft operations are in Class C, and no operations are in Class D. Consequently, the estimated mix index for the Airport in 2010 is 11%. The mix index rises slightly over time, to 12% in 2015, 13% in 2020, and 16% in 2030.*

A more detailed analytical method from *Airport Capacity and Delay* found that specific circumstances at Aurora State Airport account for a lower estimation of the Airport's current capacity. The calculation of ASV considers three different weather conditions—92% of the time when weather is above VFR minimums, 3% of the time when weather is below VFR minimums but above the Airport's instrument approach minimums, and 5% of the time no operations occur because weather is below the instrument approach minimums.[6] Runway utilization (percentage of the time Runway 17 or 35 is used) was not a factor, since the taxiway exit locations are the same from either runway end.

Over the forecast period, the capacity of the Airport will decline as the mix index (percentage of airplanes with maximum takeoff weights over 12,500 pounds) increases. Other circumstances, such as the instrument approach visibility minimums, are assumed to remain the same. **Table 4B** shows how capacity declines and demand increases in the future. It compares annual and hourly capacity to annual and hourly demand over the forecast period.

Table 4B. Capacity Analysis (Aircraft Operations)

2010	**Annual**	**VFR Hourly**	**IFR Hourly**
Capacity	207,473	111	62
Demand	90,909	36	2
Ratio Demand to Capacity	44%	32%	3%
2015	Annual	VFR Hourly	IFR Hourly
Capacity	199,717	107	61
Demand	98,321	39	3
Ratio Demand to Capacity	50%	36%	5%
2020	Annual	VFR Hourly	IFR Hourly
Capacity	197,778	106	61
Demand	106,338	42	3
Ratio Demand to Capacity	55%	40%	5%
2030	Annual	VFR Hourly	IFR Hourly
Capacity	186,144	99	60
Demand	124,386	49	4
Ratio Demand to Capacity	67%	49%	7%

[6] *Instrument weather conditions were determined from Aurora State Airport weather data for 2000 through 2009 obtained from the National Oceanic and Atmospheric Administration (NOAA). The ten years of data included 77,646 weather observations made by the Airport's ASOS. Some data interpolation is required to estimate that IFR weather occurs 8% of the time. The lowest visibility minimums of instrument approaches to the Airport are 1 mile—a condition that is estimated to occur 5% of the time.*

The table shows that the demand forecast for the Airport stays below the capacity through 2030. FAA guidance[7] recommends planning for increased capacity (*e.g.*, additional taxiway exits, a new runway, or supplemental airport) when an airport reaches 60% to 75% of its capacity. Table 4B indicates that planning for additional capacity should not be required until near the end of the planning period.

Number and Orientation of Runways

The number of runways needed for an airport depends upon the level of aviation demand and wind coverage. The previous airfield capacity analysis concluded that an additional runway is not needed for the 2030 unconstrained forecast of aircraft operations. An analysis of wind coverage found that a crosswind runway is not needed at the Airport, as explained below.

For the operational safety and efficiency of an airport, it is desirable for the primary runway to be oriented as close as possible to the direction of the prevailing wind. This reduces the impact of crosswind components during landing or takeoff. Wind coverage is the percent of the time crosswind components are below an acceptable velocity. The desirable minimum wind coverage for an airport is 95%, based on maximum crosswind speeds that are defined for different sizes of aircraft (lower for smaller aircraft). Ten years of wind data (2000 through 2009) at Aurora State Airport were examined. The analysis found that Runway 17/35 exceeds the 95% threshold for a 10.5-knot (12 mph) crosswind, which is the maximum for the smallest airplanes.

Airfield Design Standards

FAA Advisory Circular 150/5300-13, *Airport Design,* sets forth the FAA's recommended standards for airport design. A few of the more critical design standards are those for runways and the areas surrounding runways, including:

- Runway Safety Area (RSA)
- Object Free Area (OFA)
- Obstacle Free Zone (OFZ)
- Runway Protection Zone (RPZ)

The RSA is a defined surface surrounding the runway that is prepared or suitable for reducing the risk of damage to airplanes in case of an airplane undershoot, overshoot, or an excursion from the runway.

The OFA is an area on the ground centered on the runway or taxiway centerline that is provided to enhance the safety of aircraft operations. No above ground objects are allowed except for those that need to be located in the OFA for air navigation or aircraft ground maneuvering purposes.

The OFZ is a volume of airspace that is required to be clear of objects, except for frangible items required for the navigation of aircraft. It is centered along the runway and extended runway centerline.

The RPZ is an area off each runway end whose purpose is to enhance the protection of people and property on the ground. The RPZ is trapezoidal in shape and centered about the extended runway

[7] *FAA Order 5090.3C, Field Formulation of the National Plan of Integrated Airport Systems (NPIAS), Table 3-2.*

centerline. The dimensions of an RPZ are a function of the runway ARC and approach visibility minimums. Among other things, the FAA recommends that RPZs be clear of all residences and places of public assembly (churches, schools, hospitals, etc.) and that airport owners acquire the land within the RPZs so they can control the use of land.

In addition to these design standards, the FAA provides recommended dimensions for runway width, taxiway width, taxiway safety areas, and others. **Table 4C** compares the Airport's existing B-II dimensions to the design standards for ARC C-II. The ARC C-II standards in Table 4C are based on three approach categories. One column reflects the existing approach minimums – visual and not lower than 1 statute mile. The other approach categories are not lower than ¾ statute mile and lower than ¾ statute mile.

Table 4C. Airfield Design Standards

		Existing Dimensions (ARC B-II)	ARC C-II Visual and not lower than 1 statute mile	ARC C-II Not lower than ¾ statute mile	ARC C-II Lower than ¾ statute mile
Runway Width		100'	100'	100'	100'
Runway Centerline to Parallel Taxiway Centerline Separation		300'	300'	300'	400'
RSA	Width	150'	500'	500'	500'
	Length beyond runway end	300'	1,000'	1,000'	1,000'
OFA	Width	500'	800'	800'	800'
	Length beyond runway end	300'	1,000'	1,000'	1,000'
OFZ	Width	250'	400'	400'	400'
	Length beyond runway end	200'	200'	200'	200'
Precision OFZ [8]	Width	N/A	N/A	N/A	800'
	Length	N/A	N/A	N/A	200'
RPZ	Inner Width	500'[9]	500'	1,000'	1,000'
	Outer Width	700'	1,010'	1,510'	1,750'
	Length	1,000'	1,700'	1,700'	2,500'

Taxiway Object Free Area Width		131'	131'	131'	131'

Source: FAA Advisory Circular 150/5300-13

[8] *A Precision OFZ (POFZ) is a volume of airspace beginning at the runway threshold and at the threshold elevation. It is in effect only when the following three conditions are met: Vertically guided approach, reported ceiling below 250' and/or visibility less than ¾ mile, and an aircraft on final approach within two miles of runway threshold.*

[9] *Existing RPZ dimensions meet the ARC B-II criteria for approaches with minimums not lower than 1 mile, which represents the existing instrument approach procedures into the Airport.*

The Airport meets or exceeds all B-II design standards for visual/not lower than 1 statute mile. Except for RPZ size, the Airport also meets or exceeds B-II design standards for not lower than ¾ statute mile approach minimums. For ARC B-II with approach minimums lower than ¾ statute mile, the Airport is deficient for RSA, OFA, and RPZ standards. When upgrading an airport's ARC from B-II to C-II, there are prominent increases in the dimensions of RSA, OFA, OFZ width, and RPZ, as shown in Table 4C.

Runway Length

The runway length required for an aircraft is different for landing and for takeoff, and it depends on several factors such as airport elevation, temperature, runway gradient, airplane operating weights, runway surface conditions (*i.e.*, wet or dry), and others. A single airplane using Aurora State Airport will require different runway lengths at different times, depending on temperature, runway surface condition, the airplane's weight, which varies with the stage length (length of trip or distance between refueling stops), and other factors.

FAA Advisory Circular 150/5325-4B, *Runway Length Requirements for Airport Design*, the FAA's Airport Design Computer Program, and aircraft manufacturers' specifications were consulted for guidance on recommended runway length at the Airport. In addition, aircraft operators were surveyed to quantify operations that are constrained by the current runway length at Aurora State Airport.

Both the Advisory Circular and the FAA's computer program classify aircraft based on weight. For "small" airplanes (those with maximum takeoff weights of 12,500 pounds or less), the classifications are further divided into two additional categories - small airplanes with fewer than 10 passenger seats and small airplanes with 10 or more passenger seats. Additionally, the program displays recommended runway lengths for airplanes between 12,500 and 60,000 pounds maximum takeoff weight. The computer program, using site-specific data, reflects runway length recommendations by grouping general aviation aircraft into several categories, reflecting the percentage of the fleet within each category. **Table 4D** summarizes the FAA's generalized runway length recommendations for the Airport.

The current runway length of 5,004 feet accommodates 100% of the small aircraft fleet with fewer than 10 passenger seats. However, the recommended lengths for larger aircraft exceed the current runway length.

Table 4D indicates that a longer runway may be needed at Aurora State Airport for airplanes over 12 ,500 pounds maximum takeoff weight. Table 4A also indicated a longer runway might be needed at the Airport for light and medium jets, according to NBAA recommendations. Planning for a longer runway may be justified based on these two tables, but to obtain FAA funding for a runway extension requires additional justification that is described in the next paragraphs.

Table 4D. Runway Length Requirements

Airport and Runway Data	
Airport elevation	200 feet
Mean daily maximum temperature of the hottest month	84° F
Maximum difference in runway centerline elevation	2 feet
Wet and slippery runways	
Runway Lengths Recommended for Airport Design	
Small airplanes with less than 10 passenger seats	
To accommodate 75 percent of these small airplanes	2,510 feet
To accommodate 95 percent of these small airplanes	3,060 feet
To accommodate 100 percent of these small airplanes	3,630 feet
Small airplanes with 10 or more passenger seats	4,190 feet
Large airplanes of 60,000 pounds or less	
75% of these large airplanes at 60% useful load	5,330 feet
75% of these large airplanes at 90% useful load	7,000 feet
100% of these large airplanes at 60% useful load	5,500 feet
100% of these large airplanes at 90% useful load	7,850 feet

Runway Length Justification Process

FAA guidance states that to justify funding a runway extension, at least 500 annual itinerant aircraft operations must exhibit a need for an extension now or within the next five years. Determining the particular aircraft model(s) critical for runway length is much easier at a commercial service airport than at a general aviation airport because at a commercial service airport individual airlines mostly use the same type of airplanes and they publish flight schedules that facilitate quantifying numbers of operations and stage lengths. Gathering such data for a general aviation airport is more difficult. In addition, the FAA requires rigorous justification for extending runways at general aviation airports, including documentation from the operators of airplanes needing a longer runway with the individual N numbers of their airplanes and number of constrained operations. A constrained operation is one that must reduce payload for takeoff, or stop en route for fuel, for example.

To quantify constrained operations at Aurora State Airport, questionnaires were distributed to the operators of larger aircraft that use the Airport frequently. Transient aircraft operators were identified from IFR flight plan records. The questionnaires received are in **Appendix I** and the operators who identified constrained operations are listed in **Table 4E**.

Table 4E contains a list of business jets that have operated at the Airport in recent years, as documented by IFR flight plans. The table also indicates which airplane models are based at the Airport and gives the number of constrained operations reported by based and transient users of the Airport. The table lists airplane models in the order of runway length required at maximum takeoff weight, from shortest to longest. Many models listed in the table need a longer runway at maximum takeoff weight than Aurora State Airport's 5,004 feet; these airplanes can use the Airport because they are operating at less than their maximum takeoff weights and/or the temperature is lower than 84 degrees. Usually, airplanes are

constrained for takeoff due to high summer temperatures; however, for some airplanes operating under air taxi or fractional jet regulations, the constrained operation is landing on a wet or slippery runway. In addition, the lengths in Table 4E are based solely on aircraft performance requirements. Some operators may have additional requirements based on company operations specifications or insurance.

Source: WHPacific, 2010, using business jet characteristics published by the Central Region FAA in 2001, manufacturers' specifications, based aircraft from Oregon Department of Aviation aircraft registration records, constrained operators from runway length survey conducted in 2009 and 2010. List includes only business jet models that have documented operations at the Airport according to IFR flight plan records or an operator who wants to use the Airport. Takeoff distances are based only on aircraft performance; federal aviation regulations, company policies, or insurance requirements may require more length. Takeoff distances for standard conditions were adjusted (+14.8%) to account for design conditions at Aurora state Airport.

The runway lengths listed in Table 4E use the manufacturers' takeoff distance for standard conditions (sea level and 59 degrees F). These lengths were increased 14.8% to account for the higher elevation (200 feet MSL), higher design temperature (84 degrees), and runway gradient (2 feet of difference between runway high and low points). The formula for determining the amount of increase is:

Altitude Correction
(7% per 1,000' above sea level)

L = Takeoff length @ sea level
L1 = Length corrected for altitude
L1 = (.07 * E / 1000) * L + L

Temperature Correction
(0.5% per degree above standard temperature in hottest month)

T1 = Adjusted Standard Temperature
T = Mean Max High Temperature
L2 = Length corrected for altitude & temperature

(Std Temp adjusted to Sea Level)

T1 = 59 - (3.566 * E / 1000)
L2 = (.005*(T - T1)) * L1 + L1

Effective Gradient Correction (takeoff only)
(10' for each 1' difference between High / Low Point)

G = Difference between high / low point in feet
L3 = RW length corrected for altitude, temperature & gradient
L3 = G * 10 + L2

For three aircraft models, operators report constrained operations although the takeoff distance listed in Table 4E is less than the length of Runway 17/35. Two mentioned constraints on hot summer days, which are likely days when the temperature exceeds 84 degrees.

The runway length survey (Appendix I) identified the number of aircraft operations constrained at the Airport annually total 473, using only existing aircraft with N numbers and operators' names identified and using the average number of constrained operations if the operator identified a range of operations. Operators who wished to remain anonymous identified 12 more annual constrained operations. One operator based at the Airport, RJ2/DB Aviation, plans to replace its 650 Citation III/VI with a 750 Citation X, which would be constrained by runway length more often (an estimated 40 times per year compared to 30 for the existing aircraft).

To justify funding a runway extension, the FAA will not accept information for which the operator or the aircraft is not specifically identified. The identified number of constrained operations, 473, does not meet the 500 operations threshold at present time. Applying to 473 an annual growth rate of 3.6%[10], the number of annual constrained operations would reach 500 in 2012.

The 500 annual constrained operations threshold is projected to occur within five years. Even if jet traffic does not grow as fast as projected, it is likely the number of constrained operations will exceed 500 within the 20-year planning period. Consequently, ODA may want to consider planning for a runway extension now, in order to protect the airspace needed, among other things. To justify FAA funding for a planned extension, operators may need to be surveyed again in the future to identify operations that may be constrained.

Table 4E indicates the longest runway required for ARC C-II aircraft (Bombardier CL-601 and CL-604) that use the Airport is 6,544 feet, at maximum takeoff weight. This is 1,540 feet longer than the existing Runway 17/35. The longest runway required for an Aircraft Approach Category B aircraft (Raytheon/Hawker 125-800) is 6,176 feet, at maximum takeoff weight. This is 1,172 feet longer than the existing Runway 17/35. Most takeoffs are at weights under the certified maximum, so that the runway length needed is less. On the other hand, temperatures in the summer can exceed the 84 degrees used to determine runway length in Table 4E.

In the formulation of development alternatives, one or more alternatives might consider a runway extension, in order to evaluate relevant consequences.

---

[10] *Table 3M in Chapter Three shows the jet operations forecast, from 10,909 annual operations in 2010 to 22,389 annual operations in 2030, which equates to a 3.6% average annual growth rate.*

Runway Width

The current runway width of 100 feet meets the FAA's recommended standard for C-II aircraft and the current instrument approach, as well as for a precision approach with lower than ¾ mile visibility minimums.

Runway Pavement Strength

The most important feature of airfield pavement is its ability to withstand repeated use by the most weight-demanding aircraft that operates at an airport. The pavement strength rating of Runway 17/35 is 30,000 pounds for single wheel gear and 45,000 pounds for dual-wheel gear. The maximum takeoff weight of ARC C-II aircraft in Table 4E is more than 45,000 pounds (dual-wheel gear). The Airport's parallel taxiway is now designed for 60,000 pounds (dual-wheel gear), and this is the next "break point" in pavement design from the runway's current design strength. The current strength rating is adequate for the current runway length and using aircraft, because the larger aircraft are operating in a constrained situation – whether it is runway length or high ambient temperature – and are not likely at the maximum takeoff weight for that aircraft. Any future runway lengthening would affect the pavement strength required, as it would remove some of the constraints.

Taxiways

The runway currently has a full-length parallel taxiway. A full-length parallel taxiway provides a safe, efficient traffic flow and eliminates the need for aircraft to back-taxi before takeoff or after landing. The FAA recommends a parallel taxiway for nonprecision instrument approaches with visibility minimums of one mile or more and requires a parallel taxiway for instrument approaches with visibility minimums lower than one mile. The 2007 OAP recommends placement of high-speed (acute-angled) exit taxiways as part of the desired criteria. To have room for acute-angled exit taxiways, the runway centerline to parallel taxiway centerline spacing must be at least 400 feet for ADG II.

Runway centerline to parallel taxiway centerline separation distance is another important criterion to examine. The recommended distance is based on satisfying the requirement that no part of an aircraft on a taxiway or taxilane centerline is within the runway safety area or penetrates the runway obstacle free zone (OFZ). The current distance between the runway centerline and the parallel taxiway centerline is 300 feet, which meets the standard for C-II instrument runways with visibility minimums not lower than ¾ mile. However, it is deficient for the 400 feet for C-II runways with lower than ¾ mile visibility minimums.

Similar to runway width, taxiway width is also determined by the ADG of the most demanding aircraft to use the taxiway. The existing taxiways at the Airport are 35 feet wide, which meet the design standard.

The connectors and parallel taxiway system on Airport property meets FAA recommended standards and should be maintained through preventative pavement maintenance.

Taxilanes have object free area requirements, which are slightly less than for taxiways, because aircraft are moving more slowly on taxilanes than on taxiways. For ADG II, the taxilane OFA is 115 feet. Taxilanes in areas serving only ADG I aircraft should meet the 79-foot wide OFA requirement. Most

taxilanes at the Airport are on private property. All taxilane development on private property should be designed to the same design standards as taxilanes on ODA property. However, if a situation is constrained from meeting taxiway/taxilane safety and object free areas, the FAA provides the following guidance for showing that a modification of these standards will provide an acceptable level of safety:

- Taxiway safety area width equals the airplane wingspan
- Taxiway OFA width equals 1.4 times airplane wingspan plus 20 feet
- Taxilane OFA width equals 1.2 times airplane wingspan plus 20 feet

Airport Visual Aids

Airports commonly include a variety of visual aids such as pavement markings and signage to assist pilots using the airport.

Pavement Markings.

Runway markings are designed according to the type of instrument approach available on the runway. FAA Advisory Circular 150/5340-1J, *Standards for Airport Markings*, provides the guidance for airport markings. Precision markings are currently in place on Runway 17/35, which is adequate for all types of instrumentation currently at the Airport and for any upgrades to a precision approach.

There are runway holding position markings on all taxiways adjoining the runway. The purpose of these markings is to ensure that aircraft waiting for arriving or departing aircraft to clear the runway are not in the RSA. In addition to runway holding position markings, all taxiways are clearly marked with centerlines. Existing taxiway markings at the Airport are adequate.

Airfield Signage.

The Airport currently has lighted hold signs on taxiways adjoining the runway. The existing signage is sufficient for the existing airfield layout. Any future additional taxiways and aprons will require additional signs. While not required to meet FAA design standards, it is recommended through-the-fence operators also install signage on future taxiways and taxilanes.

Airport Lighting

Beacon.

The Airport's rotating beacon is adequate for the planning period.

Visual Approach Aids.

As discussed in Chapter Two, the Airport has three forms of visual approach aids. A four-box Visual Approach Slope Indicator (VASI) is located on each runway end. Runway 17 also has an Omnidirectional Approach Lighting System (ODAL) and Runway End Identification Lights (REILs). A precision approach path indicator (PAPI) is similar to VASI, but the lights are in a single row, rather than two rows. A PAPI is a more precise form of glide slope indicator, and it is recommended that ODA upgrade to a PAPI system.

Runway and Taxiway Lighting.

Airport lighting systems provide critical guidance to pilots at night and during low visibility conditions. Runway 17/35 and the parallel taxiway are equipped with medium intensity lighting. It is recommended this system be maintained throughout the planning period.

If a precision instrument approach were implemented, an instrument approach lighting system more extensive than the ODAL system would be required.

Effective ground movement of aircraft at night is enhanced by the availability of taxiway lighting. The adjacent taxiways or taxilanes at the Airport have edge reflectors, which is adequate for the planning period.

The Airport is equipped with pilot-controlled lighting (PCL). PCL allows pilots to turn runway lighting on and control its intensity using the radio transmitter in their aircraft. The PCL system is energy-efficient and should be maintained.

Radio Navigational Aids & Instrument Approach Procedures

Radio Navigational Aids. There is a localizer navigational aid at the Airport. Additionally, the Battle Ground and Newberg VORs (Very High Frequency Omni-Directional Range) can be used to guide a pilot to the Airport.

Instrument and Noise Abatement Procedures. The Airport has several nonprecision instrument approaches, as detailed in Chapter Two. The lowest visibility minimum for the approaches is 1 statute mile for aircraft in Aircraft Approach Categories A and B. For Aircraft Approach Category C, the lowest approach visibility minimums are 1-1/4 statute mile. For most instrument approaches, 1-1/2 mile visibility minimums apply for Category C, and minimums for Category D aircraft are generally higher. When weather is below the minimums prescribed by the Airport's instrument approaches, aircraft cannot land, and the Airport is closed in effect to air transportation.

The previous airfield capacity analysis estimated that weather is below 1-mile visibility 5% of the time. The Airport would be below Approach Category C and D minimums a higher percentage of the time. Low visibility weather is not spread evenly throughout the year. In the months of May through August, visibility is below 1-mile less than 1% of the time on average, but in the months of November through January the weather is below approach minimums more than 10% of the time.[11]

Having an approach that is usable in lower visibility minimums would make the Airport a more reliable mode of air transportation, which is particularly important for emergency and business use. Meeting the typical minimums for an Instrument Landing System (200-foot ceiling and/or ½-mile visibility) would halve the amount of Airport "closure," since weather is below these minimums 2.3% of the time. However, since lower visibility minimums would increase the size of certain FAA design standards shown in Table 4C, improving the instrument approach capability of the Airport to provide visibility minimums lower than 1 mile should be considered in the development alternatives for the Airport. Implementing any new instrument approach procedures will need evaluation by the FAA Flight Procedures Office.

If a better instrument approach is obtained, it should be for Runway 35, since that runway accommodates more traffic and is the preferential runway for noise abatement purposes. The

[11] *Weather data obtained from NOAA for 2000-2009.*

preferable and safest direction for takeoff and landing is into the wind, although wind is not a consideration in runway choice when winds are calm. At Aurora State Airport, the wind is calm (below 5 knots) about 60% of the time.[12] To reduce noise impact, Runway 35 has been designated the preferential/calm-wind runway. When the wind is strongest it is usually from the south, which for safety requires pilots to use Runway 17. The noise analysis prepared in 2002[13] estimated that 80% of aircraft operations could be on Runway 35 if it were designated the calm-wind runway and certain changes were made to instrument approaches and procedures. Runway 35 has since been designated the calm wind runway, but the other changes have not yet been implemented. The additional noise abatement procedures recommended in 2002 were as follows:

- Establish an additional departure procedure for Runway 35 that would allow a 90-degree right turn at 900 feet MSL. (The FAA is working on this now, at ODA's request.) These procedures would be mandatory when operating under instrument flight rules. Air traffic controllers could direct visual flight rules traffic to use the procedure.
- Change the altitude limit on left turns when departing Runway 35, which would allow turns at 900 feet MSL rather than the existing 1200 feet MSL.
- Investigate the potential to allow a back-course approach to Runway 35, which would utilize the Runway 17 localizer for approaches to Runway 35. According to the DECIBEL Committee and ODA, an upgrade to the existing Runway 17 DME is required before this is possible.

The back-course approach to Runway 35 relates to one of the planning issues identified in Chapter One. Flight students use the Runway 17 localizer approach to aid in training during calm-wind conditions, which creates conflicting traffic patterns with the preferential use of Runway 35. The FAA is transitioning to GPS-based approaches from traditional Instrument Landing Systems that use ground-based navigational aids such as localizers. Consequently, it may be difficult to upgrade a traditional radio-type navigational aid or obtain a new instrument approach using one.

Other Airfield Recommendations

Traffic Pattern.

The current traffic pattern requires left hand traffic for Runways 17 and 35 for noise abatement. ODA has worked extensively to create noise abatement procedures to avoid flights over noise sensitive areas. **Exhibit 4A** depicts the fixed wing and helicopter traffic patterns at Aurora State. ODA will continue to work with airport users and educate them on the noise abatement procedures.

Wind Indicators/Segmented Circle.

The existing windcone and segmented circle are located on the west side of the runway at about midfield. These facilities are adequate and should be maintained throughout the planning period.

---

[12] *NOAA weather data for 2000-2009 indicates the wind is between 0 and 3 knots 45.7% of the time and between 4 and 6 knots 28.4% of the time.*

[13] *Harris Miller Miller & Hanson Inc.: Final Memorandum to Daren Griffin, State Airports Manager Oregon Department of Aviation about Aurora State Airport Noise Mitigation Program, May 31, 2002.*

Weather Reporting. Real-time weather reporting at the Airport is supplied via Automated Surface Observation System (ASOS). No changes are recommended.

LANDSIDE REQUIREMENTS

Landside facilities are those facilities necessary for handling aircraft on the ground and those facilities that provide an interface between the air and ground transportation modes. Landside requirements are addressed for the following facilities:

- Hangars
- Aprons and Aircraft Parking
- Aviation Businesses and Services
- Air Traffic Control Tower

As the following analysis shows, the amount of land currently owned by ODA and the adjacent undeveloped land that is appropriately zoned is insufficient to accommodate the landside development needed to meet the 20-year forecast. In the next stage of the planning process, in which development alternatives are evaluated, it will be decided if the land area for future based aircraft storage and other aviation purposes should be constrained or not. **Table 4F** summarizes the projections of additional land development needed to meet the forecast demand. The rest of this section describes how these land requirements were determined.

The projection of land needed to accommodate the forecast growth in aviation demand over the next 20 years is 39.6 acres. Currently, about 9 acres of ODA land are undeveloped, and about 26 acres of private property appropriately zoned for Airport development[14] are undeveloped.

Table 4F. Projected Landside Development Requirement (acres)

Facilities	2011-2015	2016-2020	2021-2030	Total
Hangars	4.9	5.4	12.7	23.0
Aprons	1.5	1.5	3.4	6.5
Cargo Apron	0.9	0.0	0.0	0.9
Aviation Businesses & Services	1.5	1.6	3.9	7.0
Air Traffic Control Tower	2.0	0.0	0.0	2.0
Fire Station	0.2	0.0	0.0	0.2
Total	11.0	8.5	20.0	39.6

Hangars

Based aircraft can be stored in hangars or at apron tiedowns. Aircraft value, climate, security concerns, the relative cost and availability of hangars vs. tiedowns, and individual preference can influence an aircraft owner's choice between a hangar and a tiedown. Nationwide and at Aurora State Airport, the trend has been to favor hangars over tiedowns. Since the 2000 Master Plan Update, the number of tiedowns at the Airport has decreased from 180 to 83, due partly to hangar construction.

For this analysis, it is assumed that hangars will be built for all the additional based aircraft forecast, and the need for additional tiedowns and apron parking will be limited to transient aircraft. With few exceptions, hangars are not eligible for the FAA's Airport Improvement Program grant funding. Consequently new hangar construction on ODA-owned land would likely be privately funded on land leased from the ODA. Where "through-the-fence" access to the Airport is possible, private land ownership is possible.

Hangar facilities at the Airport consist of a combination of T-hangars and conventional hangars. T-hangars typically store one aircraft in one unit, which is attached to other units. Conventional hangars are stand-alone buildings that can store one or more aircraft.

The area required to store an aircraft varies not only with the size of the aircraft, but also with the hangar configuration and layout. T-hangars are especially efficient because each unit has a "T" shaped floor plan that molds to the shape of an airplane, and individual T-hangar units "nest" back-to-back to form a long rectangular building with aircraft access along two sides. Conventional hangars have rectangular floor plans and usually can store multiple aircraft of different sizes efficiently. Conventional hangars provide more storage flexibility than T-hangars, but have the disadvantage that it is sometimes necessary to move airplanes to get one out from behind another one. Within the Southend Airpark are some conventional hangars with aircraft doors on two (opposite) sides. This is highly convenient but uses more land.

FAA Advisory Circular 150/5300-13, *Airport Design*, Appendix 5, shows nested T-hangar layouts that accommodate between 10 and 14 aircraft per acre, depending upon whether the taxilanes between hangars allow two-way or one-way traffic. These layouts are based on hangars with clear door widths of 40 feet and depths of 30 feet, and would accommodate many Airplane Design Group I aircraft. Willamette Aviation's T-hangars numbered 80 through 83 on Exhibit 2B demonstrate this density of aircraft storage. Fourteen aircraft per acre would be the maximum density achievable at the Airport for the smallest airplanes.

Table 4G outlines the criteria used to project hangar requirements. The table lists a representative aircraft for each of the based aircraft types forecast in Chapter Three. The "footprint" of each aircraft example is the square footage resulting from multiplying the airplane's width (wingspan or rotor diameter) times its length. The table lists a low, high, and average hangar area for each aircraft type. The low hangar area for the single engine, multi-engine, and turboprop represents T-hangar area where the building shape conforms to the airplane shape. The table also lists low, high, and average ratios of

land area to hangar area. These account for the taxilanes necessary for aircraft circulation, as well as land around buildings for fire separation and drainage.

Table 4G. Criteria for Hangar Requirements

Criteria	Single Engine	Multi-Engine Piston	Turbo-prop	Jet	Heli-copter
Example Aircraft	Cessna 172	Beech Baron	King Air	Cessna Citation III	Bell 206B
Footprint (width x length, sq. ft.)	980	1,126	2,387	2,969	1,322
Low Hangar Area per Aircraft (sq. ft.)	1,000	1,200	2,500	3,500	1,500
High Hangar Area per Aircraft (sq. ft.)	2,000	3,000	4,000	5,000	3,000
Average Hangar Area per Aircraft (sq. ft.)	1,500	2,100	3,250	4,250	2,250
Average Vehicle Parking Space per Aircraft	0.2	0.2	0.5	1.5	0.2
Low Land Area per Aircraft including taxilanes = 3.1 x hangar area					
High Land Area per Aircraft including taxilanes = 4.3 x hangar area					
Average Land Area per Aircraft including taxilanes = 3.7 x hangar area					
Average Land Area per Vehicle Parking Space = 450 sq. ft.					

Source: WHPacific, Inc. 2010.

Vehicle access is another component of hangar development addressed in Table 4G. Aircraft owners typically park their vehicles in their individual hangars when they are flying, so vehicle parking in T-hangar and small conventional hangar areas are primarily needed when passengers drive separately from the pilot. For single-engine, multi-engine piston, and helicopter hangar areas, the ratio is one vehicle parking space to five aircraft. The higher vehicle parking ratios for turboprop and jet aircraft reflect higher aircraft utilization and higher passenger capacity. The land area per vehicle parking space, 450 square feet, provides for access drives and individual parking spaces.

Using the average criteria from Table 4G, the hangar building and land requirements for the next 20 years are as shown in **Table 4H**. Table 4H shows that the hangar development demand projected through 2030 needs a total of 23.0 acres.

Table 4H. Hangar Requirements

	Single Engine	Multi-Engine Piston	Turbo-prop	Jet	Helicopter	Total
Additional Aircraft						
2011-2015	15	0	3	4	3	25

Aprons and Aircraft Parking

The FAA has developed an approach for determining the number of tiedowns needed for transient aircraft operating at an airport. The source of the methodology to determine the number of additional tiedowns needed in the future is *Airport Design*, Appendix 5:

1. Identify the increase in peak, or design, day operations
2. Divide by 2 (50% of operations are departures)
3. Multiply by 50% or 25% depending on aircraft type. Assume 50% of the fixed wing airplanes will be on the apron at the same time during the peak day. For helicopters use 25% to account for the higher ratio of operations per aircraft and other differences in helicopter usage.

The operations fleet mix and design day operations forecasts from Table 3Q were used to calculate the number of additional transient aircraft parking spaces needed. **Table 4I** shows that 25 additional transient parking spaces are needed over the 20-year planning period. The FAA recommends using a ratio of 360 square yards (3,240 sq. ft.) of transient tiedown apron per single engine piston aircraft. This apron area is 3.3 times larger than the footprint of the Cessna 172 (Table 4G) to account for spacing between aircraft and taxilanes. The 3.3 multiplier was applied to other example footprint areas from

Table 4G--turboprop (King Air), jet (Cessna Citation III), and helicopter (Bell 206B)--to determine apron area. To project the land area required for transient parking aprons, the apron area was multiplied by 1.5. Table 4I shows that from 2011 through 2030 25 additional transient parking places will be needed, requiring 187,780 square feet of apron and 6.5 acres.

Table 4I. Transient Tiedown Requirements

	Jet	Turboprop	Piston	Helicopter	Total
Additional Transient Aircraft Parking					
2011-2015	2	2	0	2	6
2016-2020	3	1	1	1	6
2021-2030	6	3	1	3	13
Total	11	6	2	6	25
Additional Apron Area (sq. ft.)					
2011-2015	19,600	15,760	0	8,740	44,100
2016-2020	29,400	7,880	3,240	4,370	44,890
2021-2030	58,800	23,640	3,240	13,110	98,790

Total	3.7	1.6	0.2	0.9	6.5

Source: WHPacific, Inc., 2011.

The amount of pavement needed for transient helicopter parking is actually less than shown in Table 4I, since helicopters can hover-taxi to parking positions. However, paving or otherwise controlling dust in the taxilanes and spaces between helicopter parking pads is recommended. While there are two helipads on private property, a public helicopter landing and takeoff area is needed on ODA property. Aurora State Airport has a considerable amount of helicopter traffic beyond that associated with tenants and through-the-fence helicopter operators. A new public helicopter takeoff and landing area with associated parking positions should be located to reduce potential conflict with fixed wing aircraft, enhance noise mitigation, and comply with the guidance in FAA Advisory Circular 150/5390-2B, *Heliport Design*.

The 2007 OAP recommends Category II airports have designated cargo aprons. A cargo apron for Aurora State Airport would need to be approximately 25,000 square feet to allow one of the larger Airplane Design Group II aircraft to taxi, turn, and maneuver on the ramp. This assumes truck loading/unloading on the ramp and no need for a cargo terminal building. The land area for this apron would be approximately 0.9 acres.

Aviation Businesses and Services

Excluded from the inventory of existing facilities in Chapter Two was the major heavy-lift helicopter charter business (Helicopter Transport Services) now building on 27.48 acres of privately owned land southeast of the Airport. Initially, about half the site will be developed, with a 126,000 square foot building, a heliport, and five helicopter parking positions. Undeveloped portions of the property will be available for Helicopter Transport Services expansion or other helicopter-related uses according to the zone change application approved by Marion County on March 10, 2010.

In addition to Helicopter Transport Services, other businesses are likely to establish or grow when and if the projected increase in based aircraft and aircraft operations occur. The projected based aircraft increase is 31% over the next 20 years. As discussed in Chapter Two, FBO services are provided by three vendors. At this time service from the existing FBOs is sufficient; however, growth in aviation activity may necessitate expansion of the existing businesses or even the establishment of a new FBO. A 31% increase in aviation activity would result in more revenue from fuel sales and other aviation services, probably more employees and vehicles, and possibly more building area devoted to repair and maintenance, pilot and passenger amenities, and flight training. More likely than the establishment of a fourth FBO would be the establishment of new specialized aviation service operators, providing specific aircraft repair or maintenance services.

Currently, AvGas and Jet A fuel is available for sale at the Airport from multiple vendors. To account for the additional fuel sales that would occur with the projected increase in aircraft operations, vendors may add storage tanks or increase the frequency of fuel deliveries. Fuel tanks owned by Aurora Aviation are located near the parallel taxiway, which is not ideal. A location convenient for truck deliveries would be better for fuel storage, and land near the parallel taxiway would be better used for aircraft. Consideration for relocating the fuel tanks once they have exceeded their useful life is recommended.

Estimating the additional building and land area that might be required to serve the additional aviation activity projected for the Airport is difficult, particularly considering that much of the growth will be on private property. Table 2B indicated 23% of the current buildings at the Airport contain businesses instead of aircraft storage. If the building area for new/expanded businesses equalled 23% of the additional based aircraft hangar area, the additional building area needed through 2030 would be approximately 60,700 square feet. The land area would be up to 7 acres to include land around buildings, aircraft and vehicular access, and adequate vehicular parking.

Air Traffic Control Tower (ACTC)

In April 2009, the FAA's Systems and Policy Analysis Division informed ODA that the Airport was eligible to apply for the Federal Contract Tower program based on its calculated 1.64 benefit/cost ratio. In the FAA's benefit/cost ratio, the denominator is the cost of air traffic controller staffing and the numerator sums the financial benefits from averted collisions, other accidents, and efficiency. The benefits increase over time with the FAA's Terminal Area Forecast for growth in based aircraft, general aviation aircraft operations, and air taxi operations. The 1.64 benefit/cost ratio is for a 15-year period; the calculated ratio exceeds 1.0 in the first year, and grows to over 2.0 in the fifteenth year. The FAA will

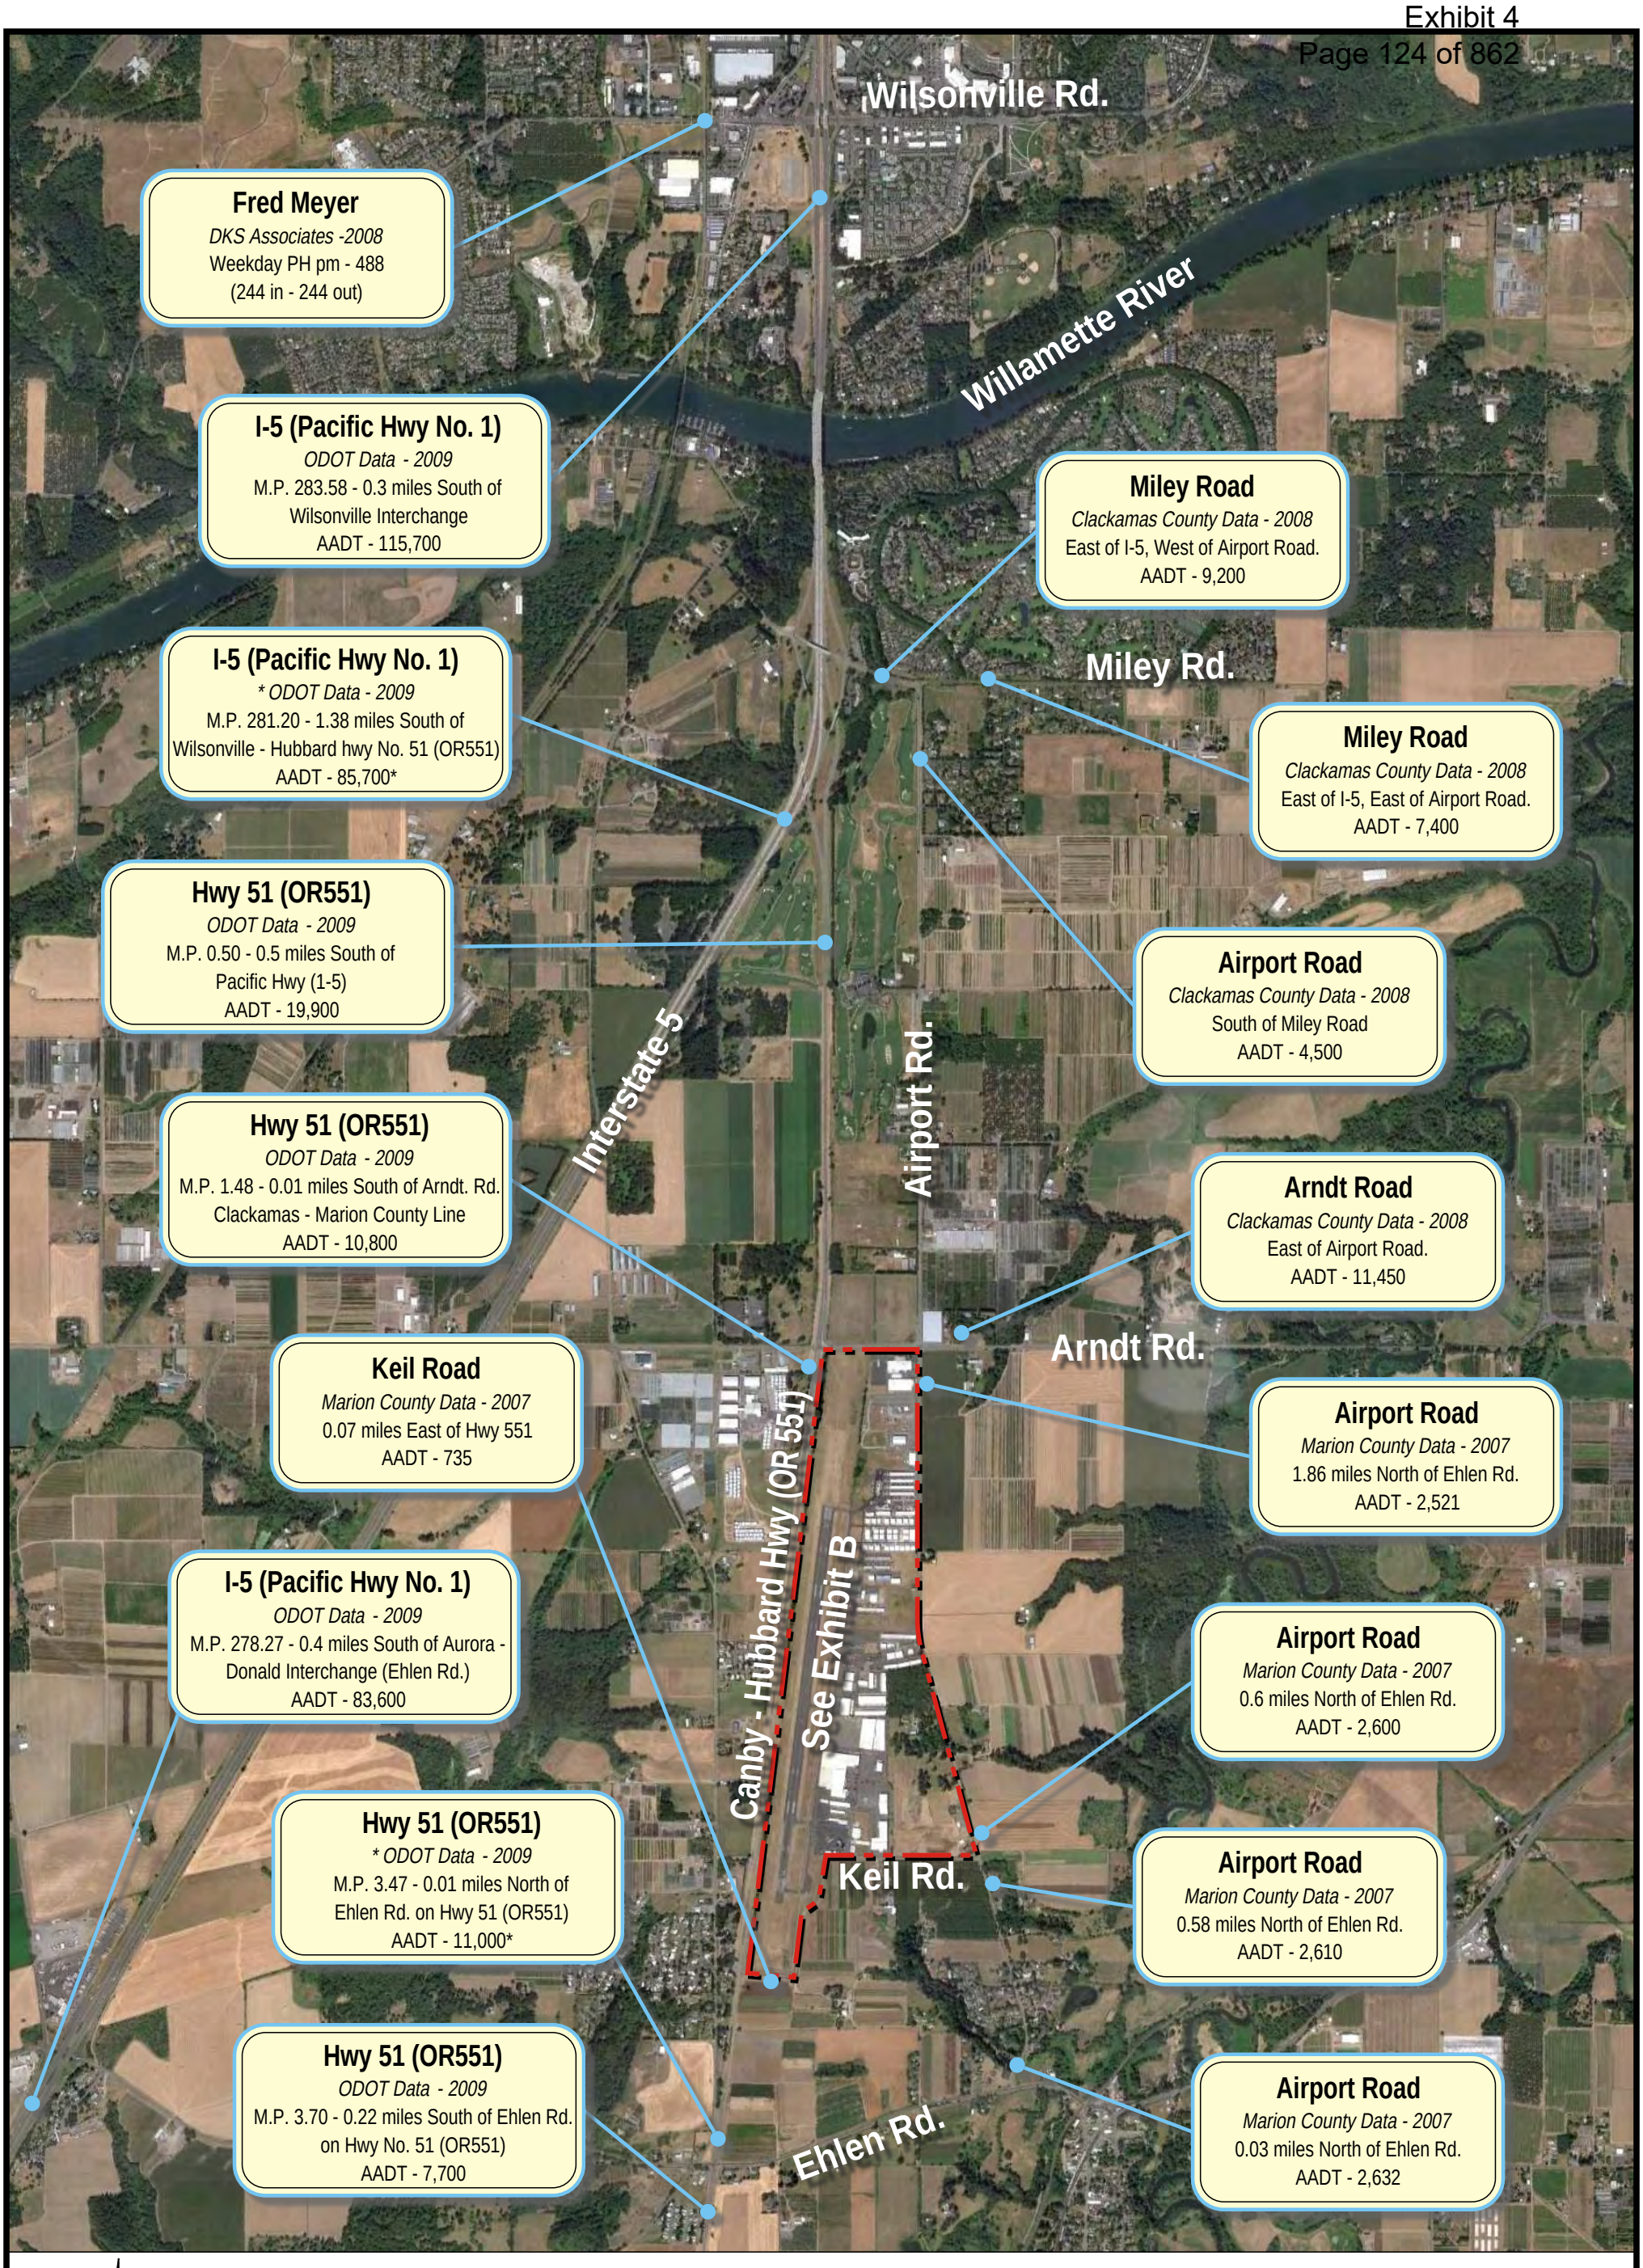
recalculate the ratio annually, and as long as the benefit/cost ratio remains over 1.0 and the program is funded, the FAA will fully fund personnel costs. The FAA will not fund the capital or operating costs of the tower. In 2010, the Oregon legislature awarded Aurora State Airport a $2.69 million grant for tower construction through the Connect Oregon III program.

Through this master planning process, and in conjunction with the FAA's Airport Facilities Terminal Integration Laboratory (AFTIL), ODA will be locating the ATCT site. Two acres are required for the building and its associated features (*i.e.*, parking lot, utility structures). For security purposes, the entire facility and parking must be enclosed with a fence. Alternative locations adequate for the ATCT will be identified in the development alternatives.

SUPPORT FACILITY REQUIREMENTS

Facilities and infrastructure that are not classified as airfield or landside are known as Support Facilities. The following support facilities were evaluated:

- Airport Access
- Emergency Services
- Airport Maintenance
- Airport Fencing
- Utilities
- Storm Drainage



Airport Access

During the initial PAC meeting, several members expressed concern that the Master Plan process would not consider the automobile traffic impact to the surrounding roadways, specifically Airport Road and Interstate 5 (I-5) near Wilsonville. As a result, the following information has been incorporated in this Master Plan Update; data sheets and supplemental reports are included in **Appendix J**:

1. Traffic Count Information for the 11 Airport gates gathered by Oregon DOT (ODOT).
2. Traffic Count data from other available sources including Marion and Clackamas Counties, ODOT, DKS Associates, and Group Mackenzie.

ODOT's Transportation Data Section placed traffic counting tubes at the 11 gates at the Airport to determine the number of vehicles passing through the gates. The counters were placed on October 18, 2010 and removed on October 25, 2010. The Annual Average Daily Traffic (AADT) and Peak Hour traffic numbers were then generated. AADT represents the total number of vehicles traveling in both directions in a 24-hour period. The findings of this sampling is shown in **Table 4J**, as well as Exhibits **4B and 4C**.

Traffic count information, including the Rural Transportation System Plan 2005 update and the 2007 traffic count data, was obtained from the Marion County website. The Clackamas County website provided traffic data from the Comprehensive Plan with updates from January 17, 2008. Information for roads near the Airport is presented in **Table 4K and 4L**.

	east of I-5	9,200	Minor Arterial

Source: Marion County Rural Transportation System Plan 2005 and website and Clackamas County Comprehensive Plan 2004 and website.

As Table 4K illustrates, the AADT of the Airport Entrances represent a large portion of Airport Road's and Keil Road's AADTs.

Marion County roads are designed to accommodate certain levels of activity, as shown in Table 4L. As reported, many of the roadways within Marion County are currently exceeding the AADT to which the road was designed. Clackamas County does not design roads based on roadway volume; the qualitative design definition for Clackamas County roads indicates Arndt Road and Miley Road generally conform with the definition given.

Table 4L. Design Standards for Functional Classification

Functional Classification	Typical AADT	Definition
Marion County		
Arterial	1,000 - 10,000	A roadway intended to carry large volumes of traffic and connect major traffic generators, cities, recreational areas, and major segments of transportation networks. High capacity is achieved through allowing higher speed, limited access, wider roadway and movement preference at intersections with lesser standard roadways.
Major Collector	500 - 1,500	A roadway intended to carry intermediate volumes of traffic and collect and distribute traffic from local streets to arterials, state highways or small population centers.
Local	0 - 500	A roadway serving short distance, intra-neighborhood and residential needs. They are characterized by minimal access limitations, lowest traffic movement preference at intersections with collectors and arterials, and minimum widths. These factors lead to minimum traffic carrying capacity, but provide maximum access to adjacent property.
Clackamas County		
Major Arterial	--	Carries local and through traffic to and from destinations outside local communities and connects cities and rural centers. Moderate to heavy volume; moderate to high speed.
Minor Arterial	--	Connects collectors to higher order roadways. Carries moderate volume at moderate speed.
Collector	--	Principle carrier within neighborhoods or single land use areas. Links neighborhoods with major activity centers, other neighborhoods, and arterials. Generally not for through traffic. Low to moderate volume; low to moderate speed. New collectors should intersect minor arterials rather than major arterials.

Source: Marion County Public Works (2005) and Clackamas County Roadway Standards (2010).

Data for roads under the jurisdiction of ODOT was also obtained. **Table 4M** presents the AADT for both Interstate 5 and Highway 551. While the Airport influences Airport and Keil Roads, the Airport's impact to the ODOT roadways is minimal.

Table 4M. ODOT Roadway AADT

Road	Description	Milepost	AADT (2009)	Functional Classification
Interstate 5 (I-5)	0.4 miles south of Aurora Donald Interchange (Ehlen Rd)	278.27	83,600	Freeway
	1.38 miles south of Hwy 551	281.20	85,700	
	0.30 miles south of Wilsonville Interchange	283.58	115,700	
Highway 551	0.22 miles south of Ehlen Rd	3.70	7,700	Highway
	0.01 miles north of Ehlen Rd	3.47	11,000	
	0.01 miles south of Arndt Rd	1.48	10,800	
	0.50 miles south of I-5	0.50	19,900	

Source: ODOT website traffic counts.

The Helicopter Transport Services (HTS) Transportation Impact Analysis prepared by Group Mackenzie in May 2009 and the Fred Meyer Transportation Impact study in Wilsonville prepared by DKS Associates in August 2008 were obtained for comparative purposes. The HTS analysis reported an AADT of 211, with a morning peak hour of 34 and evening peak hour of 36. These results are typical of other Airport entrances. The Fred Meyer traffic study did not produce an AADT; however, the weekday afternoon peak hour was 488 (244 in and 244 out).

Aurora State Airport Traffic Summary. As stated above, a total of 11 gates (driveways) at the Airport were surveyed and the AADT and peak hour traffic volumes determined. The total AADT of all 11 gates equaled 2,400, plus the projected 211 AADT from HTS when their development is completed in 2011, for a total from the Airport of 2,611 AADT. It should be noted that the three Columbia Helicopters' gates contribute 1,130 AADT or 47% of the total airport-generated vehicular traffic volume. Columbia Helicopters' main activity is helicopter maintenance and support activities that do not rely on the runway and taxiway system or generate similar numbers of operations as the majority of the other airport businesses or FBOs.

Airport Road traffic Summary. As noted in Table 4K, the 2007 Marion County data indicates that approximately 2,600 vehicles travel along Airport Road between Ehlen Road and Arndt Road, utilizing it as a cut through between the City of Aurora and Hwy 551/I-5. According to Karen Odenthal, Marion County Planner, this data will be updated in 2011 and the numbers are anticipated to increase.

Aurora State Airport Vehicular Traffic Impact to the Boone Bridge. Assuming 75% of the Airport-generated traffic travels north and south on I-5 the Airport's impact to would equate to 1,800 AADT out of the 115,700 AADT as indicated by the ODOT counter just north of the Boone Bridge – or .015% of the AADT for I-5 at that location. The current employment numbers at the Airport are estimated to be approximately 750, which equates to 3.2 trips per employee. If a 1.19% employment growth rate (based on the Employment Model in Chapter Three, *Forecasts*, pg 3-21) is applied, the total employment in 2030 will be 950, which would equate to an Airport-generated AADT 0f 3,040; still an

insignificant impact when compared to that of a development such as a Fred Meyers with a peak hour volume of 488 vehicles to the roadway system.

Future Roadway improvements. Numerous improvements to the roadway transportation systems in the airport environs have been identified by the various agencies.

- **Marion County.** Ehlen Road at Boones Ferry and Highway 551, add a left turn lane on Ehlen Road; possible realignment; and possible traffic signal at Boones Ferry to be coordinated with State Highway signal.

  Airport Road is currently designated by Marion County as a Major Collector and is a two lane road with narrow shoulders and no pedestrian or bike lanes. According to Karen Odenthal, on January 25, 2011, Marion County is planning to update its Transportation System Plan. Ms. Odenthal indicated that improvements to Airport Road would likely be identified and a general recommendation would be made to widen the travel lanes, shoulders and add pedestrian/bike lanes. She was, however, uncertain as to the priority the potential project would be given.

- **City of Aurora.** Ehlen Road and Airport Road intersection, add a signal and a left turn lane eastbound on Ehlen Road to Airport Road northbound.

- **ODOT.** Ehlen Road and Hwy 551, signal improvements, left turn lane southbound to Ehlen Road, and coordinated improvements with Marion County. Highway 551 and Keil Road, possible left turn lane southbound along Hwy 551 to Keil Road.

- **Clackamas County.** Airport Road at Miley Road intersection, realign, add turn lanes and install signal. Airport Road between Arndt road and Miley Road, reconstruct and widen to rural standards.

Recommendations. It is recommended that ODA continue to work with and support Marion County and the City of Aurora as improvements to Airport Road are considered. It will be important that appropriate considerations be given to the entrances (gates) to the Airport and business along Airport Road. The question of funding these improvements should be part of the discussions and it is appropriate that future development, both public and private, participate on a similar proportionate share as HTS recently has; see Group Mackenzie report, HTS 2009 pgs 14 and 17 in Appendix J.

Emergency Services

The Marion County Sheriff Department and Oregon State Police provide emergency services at the Airport, since it is located within Marion County and also owned by the State of Oregon. For large-scale emergencies that have a regional or statewide impact, Marion County has entered into an Inter-County Mutual Aid Agreement, wherein other counties would be available to respond.

The Aurora Rural Fire Protection District (District) provides fire protection. A 500,000-gallon fire suppression system was recently installed to assist the District in protecting the Airport. There are no Aircraft Rescue and Firefighting (ARFF) facilities available at the Airport. The District was contacted to

solicit their concerns relating to the Airport. The foremost concern is to have a place at the Airport to house the District's airport fire response apparatus. The building needs only to accommodate a crash truck and a quick response medical unit. For planning purposes, a 2,000-square foot building on a 0.2-acre site should be adequate. The District's preference for the location is near the ATCT or near the fire water pump site.

Airport Maintenance

Airport maintenance is adequately provided by ODA and the Oregon Department of Transportation (ODOT). ODA provides snow removal services. No changes are recommended

Airport Fencing

Fencing surrounds the perimeter of the Airport Environs. All access points have gates, although not all gates are automated. It is advised that the non-automated gates be upgraded.

Utilities

Utilities available at the Airport include electricity, water, septic, and telephone. Septic needs are met by individual septic tanks and drain field systems. New septic systems will be required for buildings with sanitary facilities, and may limit growth potential at the Airport until sewer service is provided. The lack of sewer service is a particular problem for establishing food service facilities. Extensions of electricity, water, and telephone to future facilities will be required as needed. The City of Aurora has express concerns that additional groundwater wells or expansion of water facilities at the Airport will have negative impacts upon the City's current water supply. Drinking water quality is also a concern for the City. Continued development and/or potential expansion of airport facilities without proper advanced planning and feasibility assessments regarding the Airport's ability to meet water, sewer, and fire protection needs concerns the City.

Storm Drainage

The need for additional hangars, other buildings, aprons, and airfield pavements has been identified. These facilities will increase the Airport's existing impervious surfaces. These additional surfaces must be evaluated to ensure that the requirements of the 1200-Z[15] stormwater discharge permit are met. Because a specific layout for future development has not been defined yet, the exact amount of increased impervious surface is to be determined. The alternatives analysis will provide additional details regarding stormwater impacts of each alternative. The analysis will also include Department of Environmental Quality (DEQ) requirements, water treatment, and detention.

---

[15] *The federal Clean Water Act mandates jurisdictional control of the quality of stormwater runoff. This mandated program is found in the Code of Federal Regulation part 122.26. The Airport may fall under the scope of these regulations and may need to apply for a National Pollution Discharge Elimination Permit (NPDES) for the discharge of rain water to the surface water system. In Oregon, this is typically referred to as a 1200-Z General Permit.*

Environmental review of individual development will be required to meet National Environmental Policy Act regulations where federal funding is used. All state and local regulations will be addressed, as required.

AIRSPACE

Currently the airspace surrounding the Airport is Class E, which has no communications requirements. The FAA has accepted the justification provided by ODA for an air traffic control tower and ODA has secured funding for its construction. When the ATCT is operational the airspace around the Airport will change to Class D. Class D has communications requirements and the ATCT will provide sequencing and traffic advisories to VFR aircraft operating into and out of the Airport, and IFR traffic separation. Most likely the ATCT will only operate part-time (closed at night), at which time the airspace will go back to Class E. ODA should coordinate with FAA regarding the airspace changes and help educate pilots of the new operating requirements.

LAND USE PLANNING & ZONING RECOMMENDATIONS

In general, the Airport meets State and County land use requirements. Even so, the ODA and Marion County should work towards several items regarding land use and zoning around the Airport. Recommendations are provided below.

Zoning Code

- ODA should consider working with Marion County to rezone the underlying designations within the Airport property as "Airport" to ensure that only compatible uses occur within the Airport property boundary. The rezoning would be based on Oregon Administrative Rules Division 13, *Airport Planning*, which provides guidelines for local government land use compatibility to encourage and support the continued operation and vitality of Oregon's airports.
- Marion County should consider adopting the standards of ORS 836.616, which authorizes certain airport uses and activities to occur at the Airport.
- A portion of the Airport Overlay, which protects FAR Part 77 Imaginary Surfaces, extends into Clackamas County. The Overlay should be maintained and updated as needed based on any airport layout changes recommended in this Master Plan.

Comprehensive Plan

- If Marion County adopts this Master Plan, it would adopt it as a component of the Marion County Comprehensive Plan and all projects identified within the Plan would receive "conditional use" approvals for development. As such, a Traffic Impact Analysis would be necessary for any projects that would have a significant impact on area ground transportation, prior to the County's adoption, in order to meet Statewide Goal 12. Alternatively, ODA could not submit the Plan to Marion County and instead apply for conditional approvals for individual projects. The advantages and disadvantages of these options will be further discussed in Chapter Five as development alternatives are identified.

- Adopt a title notice or similar requirement to inform purchasers of property within one mile of the Airport that their property is located adjacent to or in close proximity to the Airport and their property may be affected by a variety of aviation activities. Note that such activities may include but are not limited to noise, vibration, chemical odors, hours of operations, low overhead flights, and other associated activities.

Chapter Five: AIRPORT DEVELOPMENT ALTERNATIVES

Airport Master Plan Update

Aurora State Airport

The preceding chapter identified shortfalls of the Aurora State Airport (Airport) with respect to existing and anticipated aeronautical demand, which are consistent with current Federal Aviation Administration (FAA) design standards, along with industry and State of Oregon development guidelines. This chapter presents three development alternatives that focus on meeting the Airport's facility needs for the long-term future, along with the No Build Alternative.

The purpose of the build alternatives is to provide variations of how to meet forecasted demand, while the No Build Alternative serves as a baseline for comparison. The Oregon Department of Aviation (ODA) – with input from the FAA, Planning Advisory Committee (PAC), and public – will select a Preferred Alternative that will serve as the foundation for the Airport Layout Plan (Chapter 6). The Preferred Alternative will likely be a combination of elements from the alternatives.

The alternatives should be evaluated using the Master Plan Goals and Issues identified in Chapter 1, which were produced with PAC and public input.

SUMMARY OF FACILITY REQUIREMENTS

The following section summarizes the development recommendations given in Chapter 4, *Facility Requirements*, needed to accommodate forecasted aeronautical activity.

Airfield Requirements

- The Airport currently meets design standards for an Airport Reference Code (ARC) of B-II and C-II, with approach criteria minimums not lower than 1 statute mile (sm). As depicted in Table 4C, many design standards are deficient for ARC C-II, which represents the current and future critical aircraft. Table 4C also shows deficiencies if the Airport's instrument approach capability is improved (approach minimums are lowered).

- The runway length analysis demonstrated it is prudent to plan[1] for a runway extension now, based on aircraft currently operating and forecasted to operate at the Airport. Accordingly, two of the build alternatives show a runway extension, to a total length of 5,604 or 6,004 feet.

- The current runway strength of 45,000 pounds (dual-wheel gear) is adequate for the existing runway length, as several of the heavier aircraft operating at the Airport are constrained (*i.e.*, reduced fuel load or payload). However, with a runway extension it is recommended the pavement strength be increased to 60,000 pounds (dual-wheel gear), which is the same pavement strength as the parallel taxiway.

- If the instrument approach capability were improved to lower than ¾ sm visibility, then the parallel taxiway would need to be relocated another 100 feet east of the runway to satisfy design standards.

- It is recommended the approach lighting system be upgraded to a precision approach path indicator (PAPI).

- An upgraded instrument approach lighting system is recommended if an approach with minima lower than ¾ sm visibility is selected.

- ODA should establish departure procedures for Runway 17/35, to avoid flight over noise-sensitive areas, and change the altitude limit on left turns when departing Runway 35. (Note: ODA is working with FAA to create these procedures and they should be published in the fall of 2011.)

Landside Requirements

- To meet 2030 hangar demand, approximately 23.0 acres will be needed.

- 25 aircraft parking positions, or approximately 6.5 acres, will be needed for aprons and aircraft parking by 2030.

- A cargo apron is recommended, which requires approximately one acre of land.

- Expansion of a current fixed base operator (FBO) or establishment of a new FBO will likely be needed.

- Fuel tanks owned by Aurora Aviation should be relocated once they have exceeded their useful life, as the current location could better be used for aircraft-related uses. Off-airport operators may want to consider impacts of current fuel tank location and their impacts from future demand

---

[1] *Planning for a runway extension does not give justification for federal funding. Based on the number of aircraft operations constrained by runway length projected into the future, justification for funding should occur within the 20-year planning period, although not within the next five years.*

- Approximately 2 acres of land should be reserved for the air traffic control tower (ATCT), parking and security requirements.

- A suitable location for the facility the Aurora Rural Fire Protection District wants to locate at the airport should be identified.

- ODA will work with and support Marion County and the City of Aurora as improvements to Airport Road are considered. The question of funding these improvements should be part of the discussions.

AIRPORT DEVELOPMENT ALTERNATIVES

Four alternatives for the long-term future of the Airport are presented in this chapter. Generally speaking, the alternatives can be described as such:

- The No Build Alternative assumes maintenance of existing facilities and no expansion of airfield or landside facilities on State-owned property. The Airport would remain designed to ARC B-II standards (approach minima to remain at visual and greater than 1 sm). Adjacent, through-the-fence operators would still have the option to develop their property as the market demands.

- Build Alternative 1 includes a 600-foot extension to the north end of the runway and an instrument approach with visibility greater than 1 sm. The ARC would remain B-II in this alternative.

- Build Alternative 2 incorporates a 1,000 feet extension to the south end of the runway and improved instrument approach capability (visibility greater than ¾ sm). This alternative reflects improvements to meet the design standards for ARC C-II.

- Build Alternative 3 depicts ARC C-II and instrument approaches with visibility minima lower than ¾ sm (precision approaches). No runway extension is shown on this alternative. However, in order to meet ARC C-II standards, with the lower instrument approach, the parallel taxiway would be relocated 100 feet to the east and multiple buildings would need to be removed or altered.

In addition to these components, the three development alternatives depict additional hangar and apron expansions, area for helicopter operations on State-owned property, future fuel tank locations, and ATCT locations, among other items. As stated previously, there is an approximate need of 40 developable-acres to meet forecasted demand. Currently, ODA only has approximately nine acres of developable land, indicating development will be on a combination of public and private lands. The build alternatives focus on building aircraft storage and parking, ATCT, and the Fire District's facility. The land allowances for these facilities is approximately three to four times the building floor or individual vehicle/aircraft parking area, to account for circulation, fire separation and so on; however, the land allowance may not be enough for septic fields allowance.

The remaining demand will likely be met by private property owners and developers. Development of the Southend Airpark is shown on all build alternatives, based on the current site plan provided to the consulting team. However, actual development of Southend Airpark is dependent upon market demand, and is subject to change as needed. Including Southend Airpark, there are approximately 26 acres of privately-held developable land.

Combining nine acres of undeveloped State-owned property and 26 acres of undeveloped private property currently zoned for airport use, there is a shortfall of approximately 5 acres needed for airport-related development over the next 20 years. In all of the build alternatives, adjacent property is shown to be suitable for airport-related development. This area incorporates approximately 16 acres. This land, now used as a church camp, is not currently zoned Public in the Marion County Zoning Code; however, its location is immediately adjacent to existing airport development and the new Helicopter Transport Services (HTS) development.

Following is a discussion relative to each alternative.

No Build Alternative

Exhibit 5A illustrates the No Build Alternative. By showing the consequences of not developing the Airport, ODA – along with the FAA, PAC and public – can assess the advantages and disadvantages of the development alternatives.

As shown in Chapter 3, *Aeronautical Activity Forecast*, the Airport is expected to experience increased demand. If no development were to occur, the Airport would not be able to support forecasted aeronautical uses and demands. PAPIs, a cargo apron, helicopter parking, vehicle transportation scheme and additional hangars would not be built on State-owned property. The safety enhancements of an ATCT and a building for the Fire District to house emergency response vehicles would not occur. As such, the No Build Alternative would not optimize the Airport's potential.

While the No Build alternative is essentially a do-nothing option, it does not mean that there would be no financial impact to the Airport. Most prominently, there would still be a cost associated with maintaining the current pavements and facilities.

Development of private property, adjacent to the Airport and zoned Public, would be permitted – consistent with local and State regulations.

Build Alternative 1

Build Alternative 1 includes a 600-foot runway extension to the north. Instrument approach capability does not change (not lower than 1 sm visibility minima). **Exhibit 5B** illustrates this alternative. The change to the Airport's footprint would be a slightly larger area for easement acquisition to control building height west of the runway extension, in addition to identifying 16 acres of adjacent land suitable for airport-related development. The Runway 35 RPZ extends south of Keil Road and an avigation easement would be sought; however, this is no different from the existing condition.

Airfield. Airfield developments for Alternative 1 are outlined below.

Aurora State Airport
Aurora, OR

Exhibit 5B
Build Alternative 1

034317-AIRP-EX5B.DWG

- Runway 17 and parallel taxiway extension of 600 feet.
- Pavement would be strengthened to 60,000 pounds (dual-wheel gear).
- Instrument approach minimums not lower than 1 sm. This approach would be no change from the current design standards for ARC B-II, which includes the runway protection zone (RPZ).
- Designation of helicopter operations area in the northwest section of State-owned property.
- Installation of PAPIs.
- Hold area located off the parallel taxiway at the Runway 17 end.

Landside. The landside development features proposed in Alternative 1 include:

- ATCT located midfield on the east side.
- Majority of State-owned property to be developed as hangars.[2]
- Fire District's response building located near the ATCT.
- Fuel tank relocation shown south of Aurora Aviation.
- Adjacent land identified as suitable for airport-related development under private ownership, approximately 16 acres.

Build Alternative 1 has the potential to meet the forecasted demand for the Airport, with rezoning and development of the additional 16 acres of privately owned land east of the Airport.

Build Alternative 2

Build Alternative 2 includes upgrading to ARC C-II standards, extending the runway 1,000 feet to the south, and improving the instrument approach capability to visibility minimums lower than 1 sm but greater than 3/4 sm (see **Exhibit 5C**).

Airfield. Airfield development in Alternative 2 includes:

- Runway and parallel taxiway extension to the south of 1,000 feet, which would require the closure of Keil Road.
- The larger RPZs would require additional avigation easements or land acquisition.
- Pavement would be strengthened to 60,000 pounds (dual-wheel gear).
- Implementation of instrument approaches with minimums greater lower than ¾ sm and installation of approach lighting systems, as recommended by the FAA
- Designation of helicopter operations area, situated where the fuel tanks are currently located.
- Installation of PAPIs.

The runway extension would accommodate nearly all business jets with ARC C-II and below that could potentially operate at the Airport. Keil Road would be dead-ended, with no access to Highway 551. Access would be rerouted, most likely connecting with Ehlen Road. No frontage would be removed.

---

[2] *Detailed vehicular access/traffic schemes for hangar development areas are not shown on the individual alternatives. A detailed plan will be developed for the Preferred Alternative.*

Landside. Alternative 2 consists of the following landside developments:

- Designation of a cargo apron facility, north of Aurora Aviation.
- Internal service road.
- ATCT centrally located within State-owned property, but north of the location in Alternative 1.
- Fuel tanks relocated northeast of Aurora Aviation.
- Fire District's response building located adjacent to the water suppression system.
- Development of hangar area and apron area on State-owned property.
- Adjacent land identified as suitable for airport-related development under private ownership, approximately 16 acres.

Build Alternative 2 has the potential to meet the forecasted demand for the Airport, with rezoning and development of the additional 16 acres of privately owned land east of the Airport.

Build Alternative 3

Development Alternative 3 depicts precision approaches (minimums lower than ¾ sm), with ARC C-II. No runway extension is shown for Build Alternative 3. However, relocation of the parallel taxiway is necessary, along with the removal and alteration of several buildings, to meet design standards. Build Alternative 3 is illustrated by **Exhibit 5D**. With a precision approach, the building restriction line[3] moves 250 feet farther from the runway than where it is located with the other alternatives.

Airfield. Alternative 3 has the following airfield features:

- Parallel taxiway relocation 100 feet to the east.
- Implementation of an instrument approach with minimums lower than ¾ sm.
- The larger RPZs would require additional avigation easements or land acquisition.
- Closure of Keil Road, due to increased design standard requirements.
- The building restriction line would extend to include many airport buildings, as well as private residences west of Highway 551.
- Installation of approach lighting, as required by the FAA.
- Designation of helicopter operations area, north of the current apron.

Landside. Significant landside developments within Alternative 3 are:

- ATCT located closer to the north end and farther from the runway than in the other two build alternatives.
- On State-owned land, more focus on apron areas than on any of the other alternatives.
- The Fire District's response building located east of the fire suppression system.

---

[3] *The building restriction line parallel to the runway is the point where the imaginary transitional surface is 35 feet higher than the runway. The transitional surface slopes up at 7:1 from the edge of the imaginary primary surface. The primary surface is centered on the runway and is 1,000 feet wide if the runway has a precision approach. The source of information for these imaginary surfaces is Title 14 of the Code of Federal Regulations, Part 77, Safe, Efficient Use, and Protection of Navigable Airspace.*

Exhibit 5D
Build Alternative 3

03437-AIRP-EX5D.DWG

- The cargo apron centrally located on State-owned property Future fuel tanks located at the south end of State-owned property.
- Adjacent land identified as suitable for airport-related development under private ownership, approximately 16 acres.
- Power lines located along Arndt Road relocated or buried, as they would be a hazard to air navigation.

While Build Alternative 3 shows the development of an additional 16 acres, it has less potential to meet the forecasted demand for the Airport. This is due to the loss of buildable land within the new building restriction line, which prohibits and/or limits development of facilities.

COMPARISON OF ALTERNATIVES

Detailed costs estimates were not prepared for each alternative; however, the alternatives are compared in order of magnitude costs. The No Build Alternative has the least cost associated with it, as costs only represent maintenance of existing facilities. Of the build alternatives, Alternative 1 is the least costly since its runway extension is less than what is shown in Alternative 2, and there is less land acquisition/easement required than with the other build alternatives. Alternative 2 has the mid-level financial cost of the build alternatives, due to the runway extension and additional requirements for land acquisition and easements. Alternative 3 is the most costly alternative, as it requires relocation of the parallel taxiway, the most land acquisition and easements, removal and relocation of businesses and residences, and relocation of the power lines located along Arndt Road.

Runway length would remain at 5,004 feet for the No Build Alternative and Build Alternative 3. The runway length would be 5,604 feet for Alternative 1 and 6,004 feet for Alternative 2. Land acquisition to the taxiway object free area (OFA) would be required for the extension shown in Alternative 1, while Alternative 2 would require acquisition to the extended runway OFA. Since they show no runway extensions, the No Build Alternative and Build Alternative 3 would keep the pavement strength rating at 45,000 pounds (dual wheel gear). On the other hand, Build Alternatives 1 and 2 would allow use by heavier aircraft (up to 60,000 pounds dual wheel gear).

Alternative 1 would keep the same approach minima – and therefore the same design standards – as what is currently at the Airport. Approach minima of greater than ¾ sm and lower than ¾ sm are included in Alternatives 2 and 3, respectively. Generally speaking, the better the instrument approach, the lower the visibility minima, and the larger the RPZ that ODA would need to control by means of acquisition or avigation easement. Additionally, the approach minima given for Build Alternative 3 would require reconstruction of the parallel taxiway 100 feet to the east, as well as removal and alteration of facilities penetrating the Airport's primary and transitional surfaces[4].

[4] *Primary and transitional surfaces are defined in FAR Part 77, Imaginary Surfaces. Further definition will be given in Chapter 6.*

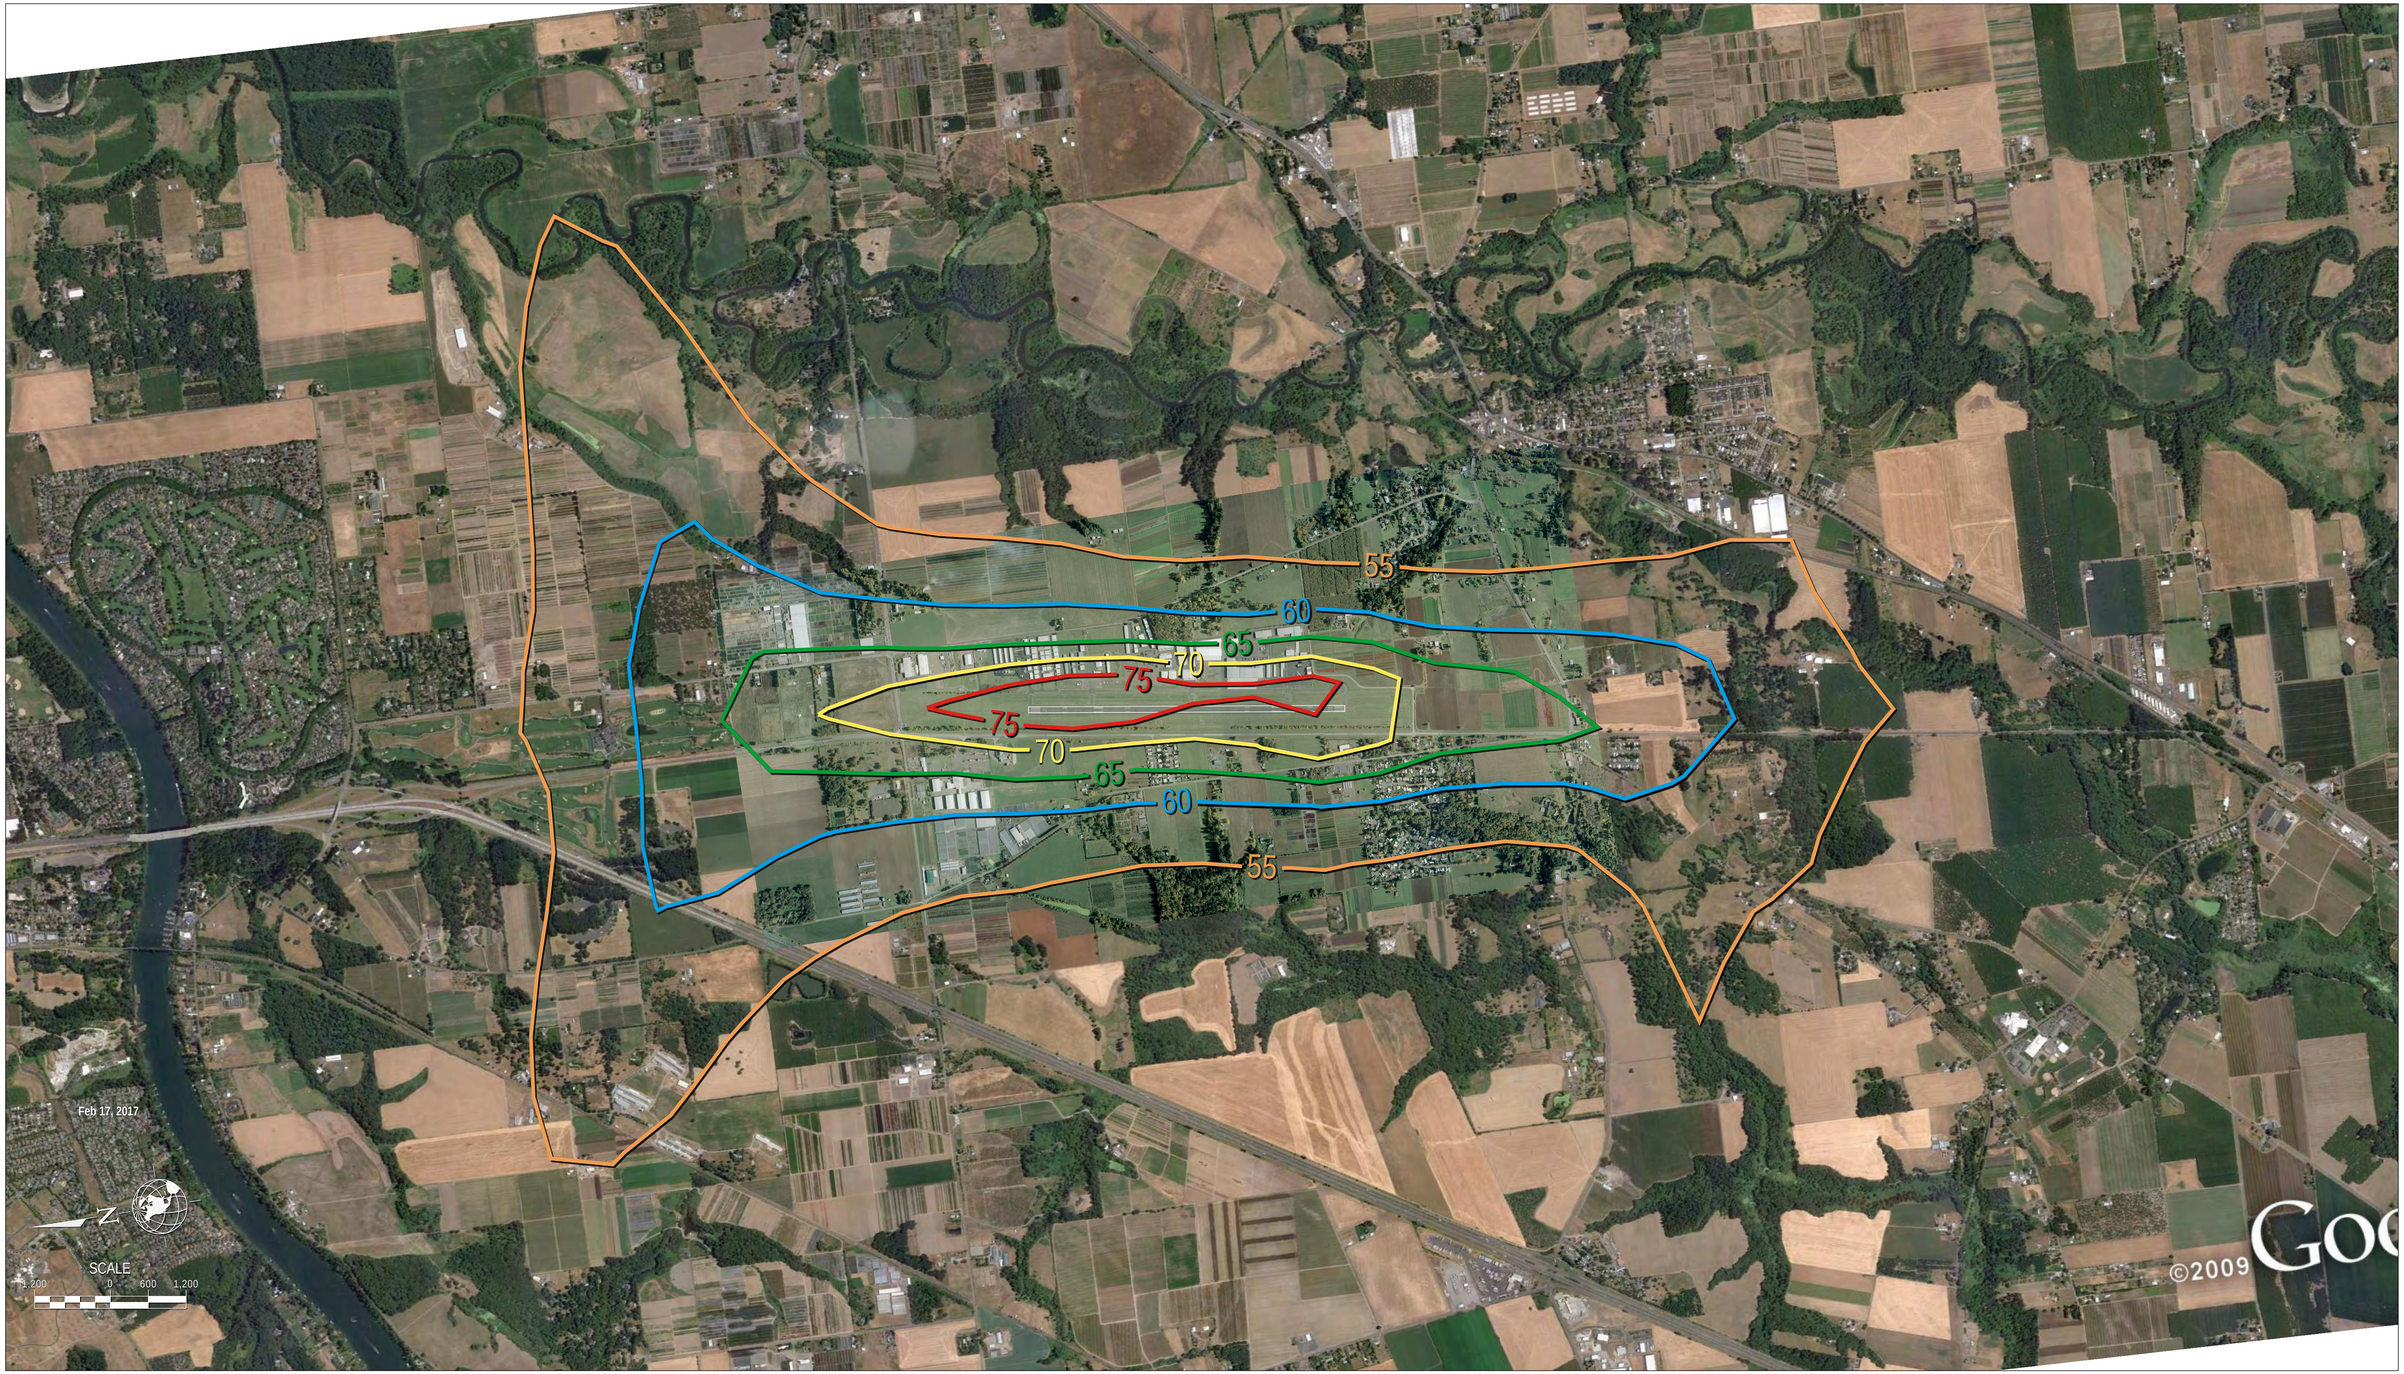
Helicopter operations, which currently do not have a designated area on State-owned property, would be accommodated in all of the build alternatives near the Airport's mid-point.

As recommended, alternative sites for Aurora Aviation's fuel tanks were identified in each of the build alternatives. Relocation of the existing fuel tanks is only recommended once the tank's useful life has been exceeded.

All alternatives identify adjacent property that would be suitable for airport-related development. Prior to any development of the property, the appropriate land use approvals must be undertaken.

As development potential for the nine acres of State-owned land is limited, much of the development needed to meet forecasted demand will have to occur on privately-held lands. Consequently, it remains imperative that ODA administer through-the-fence agreements consistent with federal guidelines and state statutes, that not only promote development but that also protect the public investment. Chapter 7, *Capital Improvement Plan*, will further discuss this issue.

NOISE ANALYSIS



A noise analysis was completed for all alternatives. The study was performed in accordance with FAA regulations using the Integrated Noise Model (INM) version 7.0. All airport noise was assessed in terms of the yearly day-night average sound level (YDNL) contours. The FAA's INM is widely used by the civilian aviation community for evaluating aircraft noise impacts in the vicinity of airports. INM is an average-value model and is designed to estimate long-term effects using average annual input conditions. Under the FAA criteria, residential land use is not considered compatible with annual day-night noise levels that meet or exceed 65 dBA.

Four separate noise contour exhibits were prepared:

- Existing Noise Contours (2010) – **Exhibit 5E**
- No Build Alternative Noise Contours (2020) – **Exhibit 5F**
- Build Alternative 1 Noise Contours (2020) – **Exhibit 5G**
- Build Alternative 2 Noise Contours (2020) – **Exhibit 5H**

The existing noise contours are meant to be a baseline for comparison of all proposed alternatives. The remaining exhibits present the expected noise contours in 2020. A separate exhibit for Build Alternative 3 (2020) was not prepared, as it reflects the same physical layout of the No Build Alternative Nose Contours (Exhibit 5F).

Tables 5A and 5B present the assumptions used for the analysis for years 2010 and 2020, respectively. The aircraft fleet was determined by using the information provided by the Harris, Miller, Miller & Hanson (2002) noise study conducted for ODA. The aircraft shown are representative of aircraft within each sub-group (*i.e.*, turboprop, small prop, jets, etc.). The data used for operations is from the

information presented in Chapter Three, *Aeronautical Activity Forecasts*. Flight paths input in the INM reflect the procedures shown in Exhibit 4A, as well as the departure procedures shown in **Exhibit 5I**[5].

2010 Existing Noise Contours

As presented in Exhibit 5E, the 65 dBA contour line extends off Airport Environs to the north, south and west. Some residential areas west of the Airport are included within this contour line, along with the 70 dBA line.

2020 No Build Alternative and Build Alternative 3 Noise Contours

The 2020 No Build Alternative and Build Alternative 3 contour exhibit represents the same physical layout as used in the 2010 existing noise contour exhibit. The only input variance is the increase in operations forecasted in Chapter Three. The increase in operations – and changes in aircraft fleet mix – cause the 65 dBA contour line to extend further off airport; however, the eastern 65 dBA noise contour line does remain nearly all within the Airport Environs. More residential homes would be impacted by noise exposures of 65 dBA, the FAA's threshold for compatibility.

2020 Build Alternative 1 Noise Contours

Exhibit 5G reflects the 600-foot runway extension to the north. Although the runway is extended to the north in this alternative, the noise profile is nearly identical to that in the 2020 No Build Alternative noise profile. The cause of this is the predominant use of Runway 35 during calm wind conditions (the Runway 17 threshold remains the same in Build Alternative 1).

2020 Build Alternative 2 Noise Contours

Build Alternative 2 proposes a 1,000-foot runway extension to the south, which is reflected in Exhibit 5H. As a result, the noise profile shifts to the south when compared to the previous profiles. Most notably, the 75 dBA contour line becomes two separate areas, because the aircraft noise exposure during the takeoff run is farther apart. Under this alternative, noise is shifted further away from Charbonneau, but closer to the City of Aurora and its surrounding communities. 65 dBA noise exposure west of the Airport is similar to the other 2020 contours. This alternative does incorporate more residential properties within the 65 dbA contour, due to its proximity to the City of Aurora.

Noise Analysis Summary

The noise profile is expected to increase by year 2020, regardless of development at the Airport. As shown in the noise contour exhibits, the 2020 noise profile for the No Build Alternative, Build Alternative 1, and Build Alternative 3 are nearly identical. In these noise profiles, some residential areas – mostly to the west – are within the 65 dBA noise contour. The noise profile associated with Build Alternative 2 displaces noise farther to the south of the Airport and reduces the noise impact to northern properties.

[5] *The FAA has not formally approved the departure procedures at this time; however, approval is expected in the fall of 2011.*

ENVIRONMENTAL SCREENING OF ALTERNATIVES

Each alternative was analyzed to assess its relative environmental impact, as well as identify any environmental constraints that may prohibit development. The results of this analysis are presented in **Table 5C**.

Each alternative presents an array of environmental opportunities and constraints. The following discussion summarizes the potential environmental concerns associated with each alternative.

Table 5C. Environmental Constraints and Impacts[10]

Impact Categories[11]	No Build Alternative	Build Alternative 1	Build Alternative 2	Build Alternative 3
Air Quality	No apparent issues. *2*	No apparent issues. *2*	No apparent issues. *2*	No apparent issues. *2*

Controversy	No apparent issues. *1*	Some issues. *2*	More issues. *3*	Many issues. *4*
Total ranking	36	42	47	53

No Build Alternative

The No Build Alternative does not propose any new use designations on the airport. It includes only maintenance for the next 20 years. The No Build Alternative does not present land use compatibility concerns, noise concerns, changes to the social environment, or direct threats to plant and animal communities in relation to FAA levels of significance. Notwithstanding, surrounding communities are concerned of the potential increased noise exposure at the Airport due to the increase in operations. In terms of overall impact, **this alternative has the least impact to the existing natural and built environments.**

Build Alternative 1

This alternative includes development plans (primarily hangars and aprons) for approximately nine acres of State-owned land along Airport Road, and an ATCT. Airside improvements include a 600-foot extension of the runway and taxiway on the north end, and RPZs consistent with an airport designated for ARC B-II with approaches not lower than 1 sm visibility.

The RPZ dimensions would be 500 feet at the runway end, 700 feet at the outer end, and 1,000 feet in length. The southern end would include Keil Road and a strip of land outside of the existing airport property. FAA typically discourages roads in RPZs, but FAA advisory circulars do not prohibit them. An easement, rather than acquisition, is proposed for the small area south of Keil Road. Additionally, an easement would be proposed for the small portion of the northern RPZ extending off State-owned property. This would, however, not be a change to the current condition at the Airport.

Development of the vacant land in State ownership, along with the runway/taxiway extension, would increase impervious surface. The airport underwent a revision to on-airport drainage as part of the runway relocation project in 2005. The current system, with minor modifications, should be able to accommodate increased stormwater from new impervious surface.

The increase in hangar development, as well as new on-airport commercial and employment uses may also be perceived as a change in character by local residents. Development of the landside areas may also increase surface transportation demand, contributing to peak period congestion, or the appearance thereof for area residents.

The extension area appears to have been previously disturbed and likely does not constitute prime habitat.

Even with the northern runway extension, the noise contour of the Airport does not extend farther to the north, because the predominant runway use is Runway 35 (the preferential calm wind runway). In this alternative, the Runway 17 threshold does not change.

Additional development proposed in the airport environs, including privately held land in the Southend Airpark and land owned by HTS, is outside of the control of ODA. The size and complexity of these development projects would likely be identical under Alternatives 1 and 2, but may be denser with the No Build Alternative, due to the lack of development on State-owned land. Since Alternative 3 changes

the building restriction line, there may also be more development on privately owned land. These developments would likely contribute to the cumulative impact of airport-area development in terms of impervious surface/stormwater, community character, noise and traffic.

This alternative has the least amount of environmental impact of the three build alternatives.

Build Alternative 2

This alternative is similar to Build Alternative 1 in the allocation of future airside uses. This alternative would include a runway and taxiway extension of 1,000 feet to the south. The RPZs would be consistent with an airport designated ARC C-II with visual approaches greater than ¾ sm visibility.

The RPZ dimensions would be 1,000 feet at the runway end, 1,510 feet at the outer end, and 1,700 feet in length. The southern end would include Keil Road and Highway 551, as well as residential and farm properties on the west, south and east areas of the RPZ. FAA typically discourages roads in RPZs, but FAA advisory circulars do not prohibit them. Avigation easements would be sought from the residential property owners, and the areas within the RPZ currently in agricultural uses would be acquired.

Development of the vacant land in State ownership would be similar to Build Alternative 1. Because this alternative has the longest runway extension, the impervious surface increase would be larger than in Alternative 1. The existing stormwater collection system, with minor modifications, should be able to accommodate increased stormwater from new impervious surface.

The increase in hangar development, as well as new on-airport commercial and employment uses may also be perceived as a change in character by local residents. Development of the landside areas may also increase surface transportation demand, contributing to peak period congestion, or the appearance thereof for area residents.

This alternative would accommodate a greater variety of aircraft, due to the increased runway length. As stated above, the noise profile would extend farther south, but improve noise conditions to the north of the Airport. This alternative has the greatest impact in relation to noise of any of the alternatives.

Additional development proposed in the airport environs, including privately held land in the Southend Airpark and land owned by HTS, is outside of the control of ODA. The size and complexity of these development projects would likely be identical under Alternatives 1 and 2, but may be denser with the No Build Alternative, due to the lack of development on State-owned land. Since Alternative 3 changes the building restriction line, there may also be more development on privately owned land. These developments would likely contribute to the cumulative impact of airport-area development in terms of impervious surface/stormwater, community character, noise and traffic.

This alternative is has the mid-level environmental impact of the build alternatives.

Build Alternative 3

Due to the increased building restriction line, there is less development potential than in Build Alternatives 1 and 2. There is no runway extension proposed in this alternative. The RPZs would be

consistent with an airport designated for aircraft design group C-II with visual approaches lower than ¾ sm visibility.

The RPZ dimensions would be 1,000 feet at the runway end, 1,750 feet at the outer end, and 2,500 feet in length. The 35-foot building restriction line would extend 745 feet perpendicular from the runway centerline. The northern RPZ would include Arndt Road and the electric transmission lines just north of the road. The southern end would include Keil Road and Highway 551, as well as residential and farm properties on the west, south and east areas of the RPZ. A variance from FAA would be sought for the roads within the RPZ. The power lines would need to be relocated. Avigation easements would be sought from the residential property owners who are outside of the building restriction line, and the areas within the RPZ currently in agricultural uses would be acquired. Structures within the building restriction line, regardless of whether they are on- or off-airport would be acquired and removed. Acquisition and relocation would follow the federal guidelines. Depending on the type of commodity produced, the FAA may allow continuation of agricultural practices within the RPZ.

Development of the vacant land in State ownership would be similar to Build Alternatives 1 and 2; however, it may be more dense due to restrictions from the building restriction line. Because this alternative has no runway extension, the impervious surface increase would be less than in Alternatives 1 and 2. The existing stormwater collection system, with minor modifications, should be able to accommodate increased stormwater from new impervious surface.

The increase in hangar development, as well as new on-airport commercial and employment uses may also be perceived as a change in character by local residents. Development of the landside areas may also increase surface transportation demand, contributing to peak period congestion, or the appearance thereof for area residents. It is likely that the loss of trips associated with properties removed to comply with the building restriction line requirements would offset any trips related to new development, for a likely net loss in area wide travel demand.

Land to the south of the airport is currently zoned Exclusive Farm Use (EFU) under Marion County's Zoning Code. The land is considered High Value Farmland, and has been described as Foundation in a categorization of viable farmland that is worth protection, but it is not a legal classification, as EFU is. Airport development on EFU land is restricted, and it is difficult to rezone EFU land to other classifications, such as Public. Changing zoning would require an exception to Oregon Planning Goal 3. If FAA funding is used, the project would also require review under the federal Farmland Protection Policy Act (FPPA). Both processes are rigorous and the justification for the proposed change may not meet the tests to allow the change.

This alternative maintains the same runway dimensions as the No Build Alternative. While the noise profile does not vary from the contours shown for the No Build Alternative, there may be a perception of a noise increase due to the use of aircraft during instrument conditions, since Build Alternative 3 improves the Airport's instrumentation capabilities.

Additional development proposed in the airport environs, including privately held land in the Southend Airpark and land proposed for development by HTS, is outside of the area governed by the Airport

Master Plan. The size and complexity of these development projects would be identical under all of the Build Alternatives, as well as the No Build Alternative. These developments would likely contribute to the cumulative impact of airport-area development in terms of impervious surface/stormwater, noise and traffic.

This alternative is has the greatest environmental impact of the Build Alternatives.

As shown in Table 5C, the No Build Alternative has the least impact, as it does not change the airport from its current configuration. Alternative 3 has the greatest impact of the build alternatives because of its on-airport actions and off-airport impacts to residences, businesses, and agriculture.

Alternative 1 is shown with the least amount of impact for the build alternatives, while Alternative 2 is shown as having the mid-level impact. While Alternative 3 lacks a runway extension, the need for a relocation of the taxiway and expansion of the building restriction line causes a large amount of off-airport property impact, including social and socioeconomic impacts. In addition, the restrictions on airport use of EFU land may make a zone change unfeasible. Additional research needs to be conducted on this issue.

EVALUTION OF ALTERNATIVES

Chapter 1 identified Goals and Issues for this Master Plan Update. The intent of identifying these early in the planning process was, in part, to help evaluate the alternatives once they were developed.

The following discussion is intended to be used as a means of comparison, and also a guideline for dialogue among interested parties, to aid in decision-making while developing the Preferred Alternative for the Airport.

Master Plan Goals

Enhance Safety.

All alternatives meet FAA design standards, which are developed to ensure the safety of people operating aircraft and of people on the ground.

The lack of an ATCT has been cited as a safety concern. All build alternatives show the construction of an ATCT and funding has been secured by ODA.

Discussions with ODOT, by ODA personnel, have identified the intersection of Keil Road and Highway 551 to be a safety hazard. Build Alternatives 2 and 3 would dead-end Keil Road, which would remove the intersection. Alternative 2 also includes a new service road that is intended to help separate vehicular traffic from taxiing aircraft. The goal of enhancing safety goes beyond airport safety to include vehicular and pedestrian safety. As such, Build Alternative 2 enhances safety in ways the other alternatives do not.

As the Airport Access analysis in Chapter Four reported, It is recommended that ODA continue to work with and support Marion County and the City of Aurora as improvements to Airport Road are considered. It will be important that appropriate considerations be given to the entrances (gates) to the Airport and business along Airport Road.

Meet the current and projected needs of airport users, as feasible (feasibility includes financial, environmental, and political).

As far as meeting the needs of airport users, Alternative 2 is best at providing the runway length supported by airport users. Alternative 1 also lengthens the runway, but less than Alternative 2. Alternative 3 provides precision instrument approach capability that would reduce the time the airport is below minima. Alternative 2 provides some improvement of instrument approach capability, but not as much as Alternative 3. Alternatives 1 and 2 are the best at accommodating the landside development needs projected for the next 20 years.

Alternative 3 has the greatest capital cost, followed by Alternative 2, Alternative 1, and the No Build Alternative. In terms of revenue generation, Alternatives 1 and 2 are the highest, with runway extensions that allow more fuel sales and more landside development for hangar rental and aviation businesses.

As stated in the environmental section, changing land zoned as EFU to Public may be unfeasible; an exception to Oregon Planning Goal 3 would be required.

On the grounds of political feasibility, it has been expressed through the planning process that there is concern over expanding the Airport's footprint. Build Alternative 1 does not appreciably expand the footprint, so it may have the least political controversy of the build alternatives, although Alternative 1 strengthens and lengthens the runway. Both Alternatives 2 and 3 expand off-Airport. Alternative 3 would require a zoning change and two rigorous farmland protection reviews; all of which are likely to be controversial. In addition, Alternative 3 has impacts to residential properties, unlike Alternative 2, so it likely has the greatest cause for political controversy.

Consider all the off-airport impacts of Airport development; minimize negative impacts and maximize positive impacts.

This goal ranges from including surrounding communities in the planning process, to protecting farmland and livability, to maximizing economic benefit. The assessment of how well the alternatives meet this goal will be addressed after the PAC has met to evaluate the impacts of the alternatives.

Master Plan Issues

Runway Extension

Through the planning process, many users have expressed the need for an extended runway while concerned citizens have voiced an extension would disrupt their community's livability. Two of the build alternatives show runway extensions. Noise modeling was prepared for each of the alternatives, to help evaluate the impact of the runway extensions, as discussed previously.

Air Traffic Control Tower

In light of safety concerns, ODA has secured funding for an ATCT at the Airport. Three potential locations for the ATCT are shown on the build alternatives. These locations will be assessed by FAA in the spring of 2011 to determine their suitability in regards to FAA's siting criteria.

Impact of Airport Expansion on Surrounding Area

Concern has been voiced over the Airport's impact on Boone Bridge. After analysis, the Airport's impact to Boone Bridge equates to 1,800 AADT out of the 115,700 AADT as indicated by the ODOT. Even with growth projections, there would still be an insignificant impact from Airport-related activity.

Other concerns listed related to the Aurora Rural Fire District's ability to respond at the Airport, availability of utilities, and aircraft noise. All of the build alternatives show locations for the Fire District's response building. Utilities are an issue the Airport is facing, regardless of future development. New technologies may bring more efficient means of septic treatments to the Airport, or a sewer extension from the City of Aurora may need to occur in the future. Aircraft noise was addressed for all of the alternatives, to assess each alternative's impact to the surrounding communities; the results of this study are shown above.

Calm Wind Runway Change

ODA is working with the FAA to get approvals for new departure procedures that will lessen the Airport's disruption to surrounding communities. The calm wind runway, as recommended in the 2002 noise study, will remain with all alternatives. As shown in the noise contour exhibits, the Airport's noise profile will increase by 2020. Utilization of the Runway 35 calm wind runway reduces impacts to areas north of the Airport. However, in Build Alternative 2 the noise exposure shifts closer to the City of Aurora, as a result of the calm wind runway.

Precision Instrument Approach

Build Alternative 3 shows what would be required to implement a precision instrument approach. The process would be difficult financially and politically. The best minima possible would likely be ½ sm, which is the lowest achievable with a GPS-aided LPV approach or with a Category I instrument landing system. Given historical weather conditions at the Airport, visibility is below ½ mile 2.3% of the time, below ¾ sm 3.7% of the time, and below 1 sm 5.0% of the time.[12]. The worst month is November, when visibility is below ½ sm 6.8% of the time, below ¾ sm 10.2% of the time, and below 1 sm 13.6% of the time. In constrast, visibility exceeds 1 sm 98.8% of the time in July. The cost associated with Alternative 3 may outweigh the benefit gained from implementing a precision instrument approach.

Helicopter Operations

All three build alternatives show suggested locations for the helicopter operations area on state-owned property.

---

[12] *National Oceanic and Atmospheric Administration (NOAA) weather data for 2000-2009.*

Other Airport Improvements

The other airport improvements listed were a run-up area for Runway 17, improved runway lighting, a restaurant, and radar/approach control coverage in the area. Build Alternative 1 shows a run-up area on the extended Runway 17 parallel taxiway. Build Alternative 2 also shows a run-up area that could be constructed if Runway 17 is not extended. Approach lighting would be upgraded, as needed, to implement new instrument approaches. A restaurant is not shown on State-owned property, but could be developed on private property. Radar is difficult to obtain, as the airway system is becoming more GPS-based. However, the ATCT will provide approach control at the Airport when the tower is open.

PREFERRED ALTERNATIVE

On March 10, 2011, the above alternatives were presented to the Planning Advisory Committee (PAC) and public. The purpose of the meeting was to gather input towards developing a preferred alternative. In addition to discussion during the meeting, comment forms were available at the meeting and on the project website, and comments were gathered for two weeks after the meeting. Comments varied greatly, from supporting the No Build Alternative to Airport expansion. **Appendix K** documents the discussions and testimony given, as well as the comments received.

Since no consensus for a Preferred Alternative was reached at the PAC meeting, ODA considered PAC and public comments (gathered through March 24), and then presented a recommended Preferred Alternative for the Oregon Aviation Board's consideration on March 31. The Preferred Alternative was then available for public comment until April 21. Based on the comments received during that period, the project team presented potential add-on Scenarios 1 and 2 to the Board on April 28. Scenarios 1 and 2 integrate the use of displaced thresholds to gain additional usable runway, as further detailed below. Subsequent discussions between ODA and FAA have reintroduced the concept of a 1,000-feet runway extension to the south, hereinafter referred to as Scenario 3. The following text outlines the Preferred Alternative and the three add-on scenarios, to be further discussed with the PAC and public on June 7.

The Preferred Alternative, shown in **Exhibit 5J,** reflects ODA's plan for developing the Airport. The Preferred Alternative will be the basis for revising the Airport Layout Plan, which establishes FAA grant funding eligibility for airport improvements and must be approved by the FAA. Implementing the airfield improvements in the Preferred Alternative will depend on FAA and ODA funding availability and the results of environmental analyses for individual projects. The private development of landside facilities will depend on the actual growth of aviation demand, market and financing conditions, and local laws and regulations.

The predominant features of the Preferred Alternative are described below. Scenarios 1, 2, and 3 vary from the Preferred Alternative only in the area of Runway Length – all other components will remain constant.

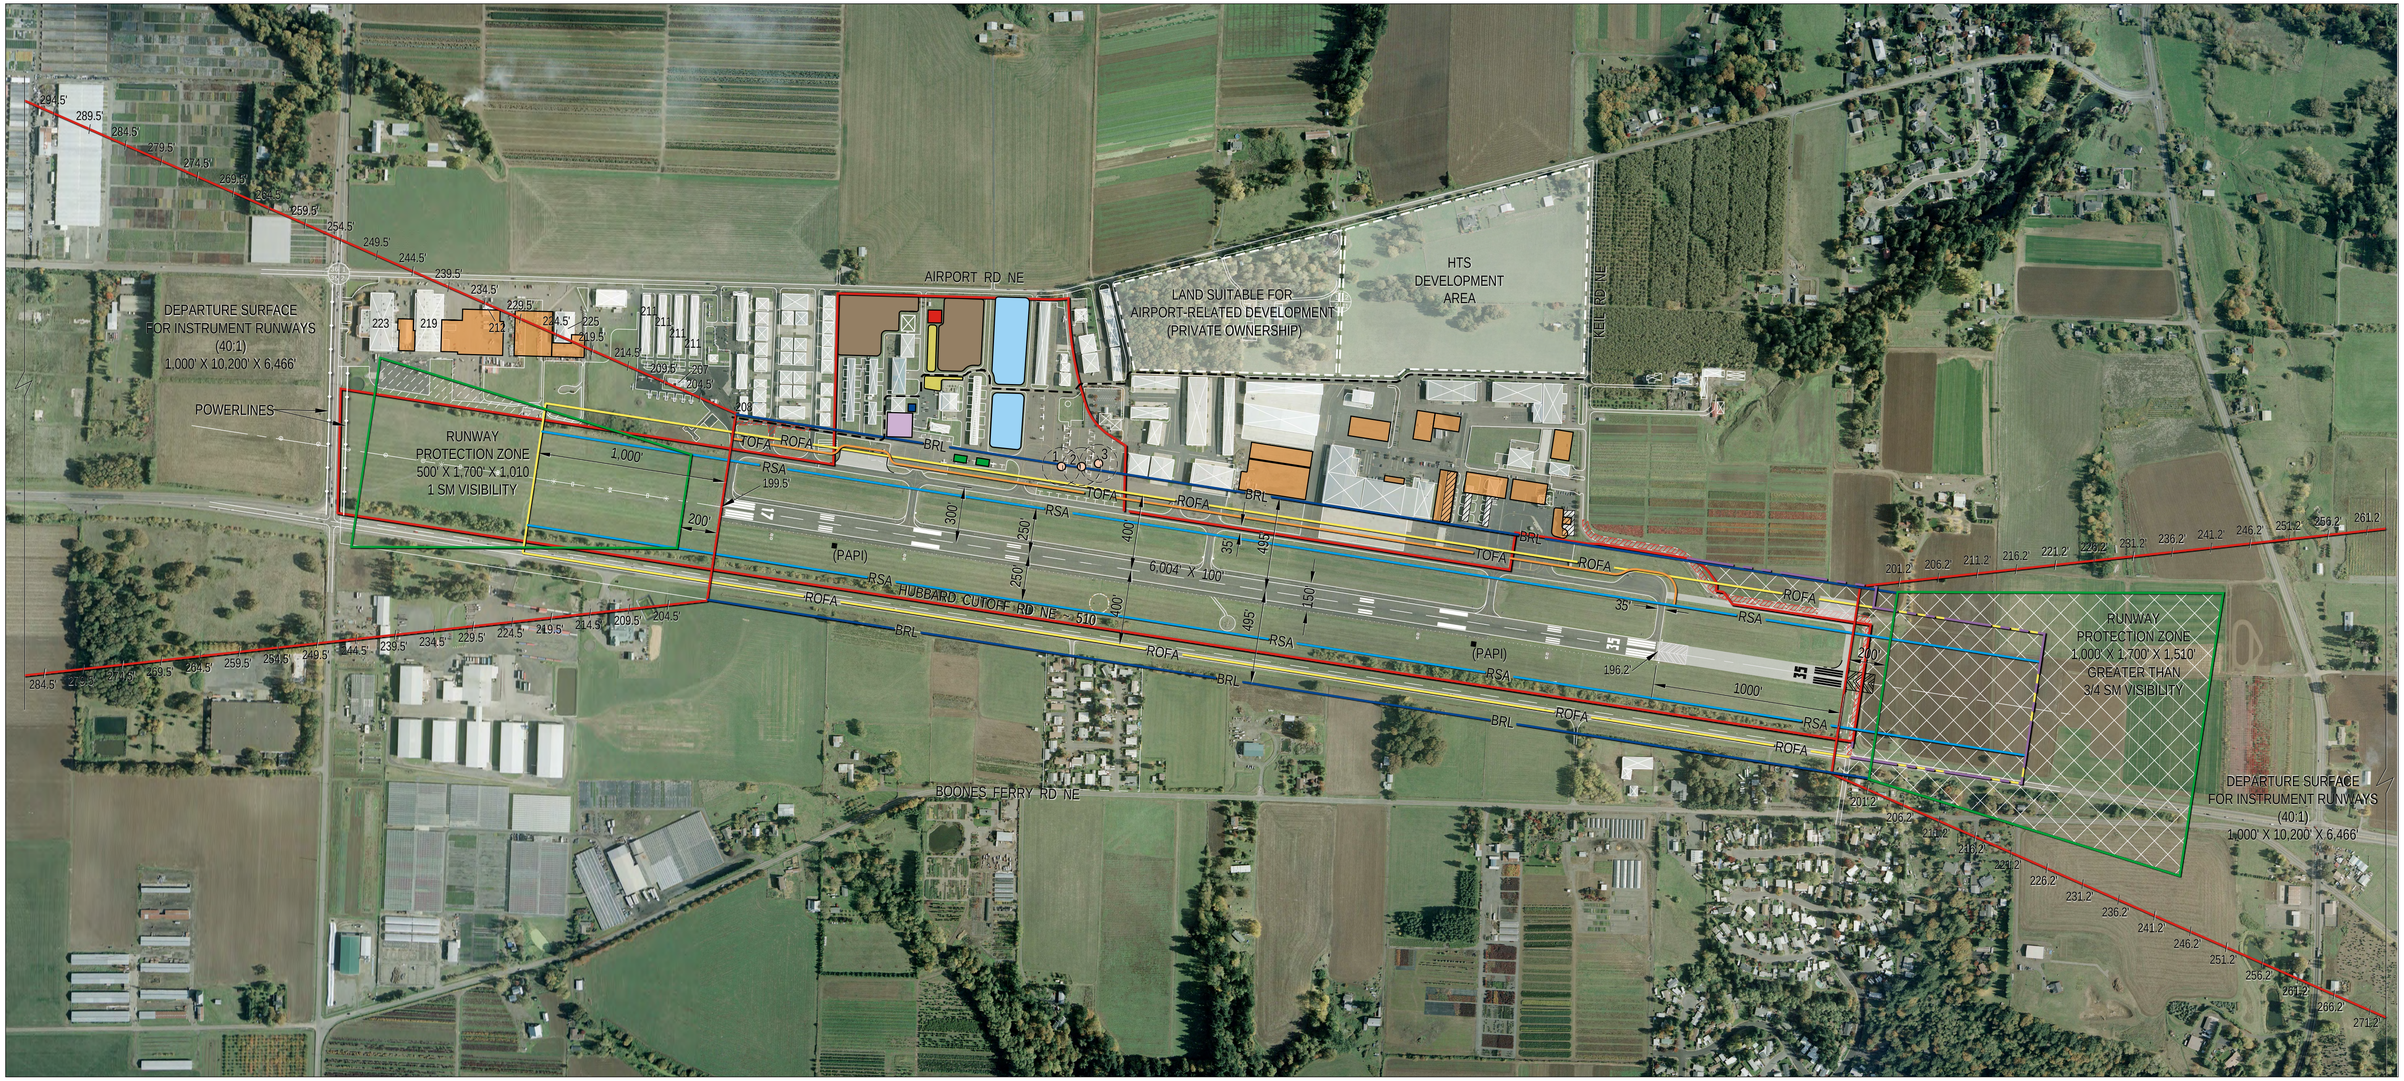
Airport Reference Code

As Chapter Three, *Aeronautical Activity Forecasts*, documented, activity at the Airport currently meets the criteria for an ARC of C-II. Meeting the FAA design standards for the appropriate ARC at an airport is important for safety. The Airport currently is designed to ARC B-II standards, although the existing runway width and the runway-to-parallel taxiway separation exceed B-II standards and meet the standards for ARC C-II. The larger RSA required for ARC C-II can be provided easily, since the ground within the larger RSA is already well-graded for rescue vehicles and aircraft recovery in case of an aircraft undershoot, overshoot, or excursion from the runway. The major design standards that would need upgrading would be the RPZ and ROFA.

For the current instrument approach visibility minimums, the required RPZ is 700 feet longer for ARC C-II. ODA should control land within the RPZs to prevent incompatible land uses. Residences and places of assembly are examples of incompatible land uses within an RPZ. If fee acquisition is not possible, land use control may be provided through avigation easement. ODA has not initiated consultation with the affected property owners relating to this item.

Vehicles on Highway 551 west of the Airport would be objects within the wider ROFA required for ARC C-II. The highway would only encroach upon this surface by a small margin, and a modification to FAA standards will be requested. Recent discussions with the FAA indicate the request will likely be approved.

Runway Length



Preferred Alternative

Although this Master Plan has shown that a runway extension is justified according to FAA guidance, ODA has decided that any extension would prove infeasible at this time. An extension to the north might constrain Columbia Helicopters' ability to expand on their private property. An extension to the south might have a negative impact on farmland – a potentially environmentally infeasible situation. A south extension might also have a negative impact on private property and Keil Road. Keil Road provides necessary access for farm equipment/machinery and emergency responders, even though it poses some safety concerns at the intersection with Highway 551.

Add-On Scenario 1

Scenarios 1 and 2 incorporate the use of displaced thresholds, which create "declared distances." The purpose of declared distances in airport design is to provide an equivalent RSA, ROFA, or RPZ in accordance with the design standards at existing constrained airports where it is otherwise impracticable to meet standards by other means. Declared distances are also employed when there are obstructions in the runway approaches and/or departure surface that are beyond the ability of the airport owner to remove and result in a displaced runway threshold or change in the departure end of the runway. In other words declared distances, when applied at Aurora State, can increase the usable runway length without fully extending the runway or encroaching upon adjacent lands

Scenario 1 adds a 600-feet displaced threshold to Runway 35 and 200-feet displaced threshold to Runway 17 to acquire the following declared distances, see **Exhibit 5J Scenario #1**.

Aurora State Airport
Aurora, OR

Exhibit 5J
Preferred Alternative
Scenario #2

Scenario 1 Declared Distances		
	Runway 35	Runway 17
Takeoff Run Available (TORA)	5,604’	5,204’
Takeoff Distance Available (TODA)	5,604’	5,204’
Accelerate-Stop Distance Available (ASDA)	5,804’	5,804’
Landing Distance Available (LDA)	5,004’	5,004’

Add-On Scenario 2

In Scenario 2, an 800-feet displaced threshold would be added to Runway 17 (**Exhibit 5J Scenario #2**). All development would be on State property for the runway. If a parallel taxiway is constructed, property acquisition from Willamette Aviation would be required. Traffic departing to the south (Runway 17) would be against the calm wind traffic on Runway 35.

Scenario 2 Declared Distances		
	R35	R17
Takeoff Run Available (TORA)	5,004’	5,804’
Takeoff Distance Available (TODA)	5,004’	5,804’
Accelerate-Stop Distance Available (ASDA)	5,004’	5,804’
Landing Distance Available (LDA)	5,004’	5,004’

Add-On Scenario 3

The FAA has been approached regarding the use of displaced thresholds at Aurora State. At this time, an official response has yet to be received. However, preliminary discussions with the FAA have indicated they are not in favor of using displaced thresholds since doing so would only be a partial utilization of the runway (*i.e.*, not all pavement would be available for takeoff and landing). Additionally, a runway extension was justified in previous sections of the Master Plan, so the FAA would favor pursuing a runway extension to meet the demand. In response, Scenario 3 was developed to incorporate a 1,000-feet extension to the south (**Exhibit 5J Preferred Alternative**). The runway extension would accommodate nearly all business jets with ARC C-II and below that could potentially operate at the Airport. Keil Road would be dead-ended, with no access to Highway 551.

Runway/Pavement Strength

The analysis relating to pavement strength in Chapter Four tied runway strength to runway length. Although the runway length will remain the same in the Preferred Alternative, strengthening of the runway's pavement is proposed. The parallel taxiway currently has 60,000 pounds dual wheel gear strength and it is recommended the runway be overlaid to provide the same pavement strength as the taxiway. Currently there are airplanes based at the Airport with maximum takeoff weights that exceed the runway's strength rating.

Instrument Approach Procedures

The need for better instrument approach capability was identified by several Airport users at the beginning of this planning process, and the business aviation industry recommends better approach capability than the Airport has. When visibility is reduced by fog, rain, or snow to a distance below the minima set for an airport's instrument approaches, airplanes cannot land, resulting in costly trip delay or re-routing.

The Preferred Alternative proposes no changes to the Runway 17 approach minima, 1 statute mile. For Runway 35 (the calm wind runway), the Preferred Alternative improves the instrument approach to visibility minima greater than ¾ statute mile. The improved approach procedure would use GPS and not require additional navigational aids on the Airport, except for an approach lighting system similar to the system at the north end of the runway. Based on ten years of historical weather data, the improved instrumentation will increase annual Airport usability by 1.3% (nearly five days). In November, the increased use of the Airport will be 3.4% of the time.

In addition to reducing the time the Airport is "closed" due to weather, the instrument approach improvement will enhance aviation safety by increasing regional capability for instrument landings, increasing the margin of safety for VFR traffic, and making it easier for Airport users to adapt to sudden weather changes.

As mentioned previously, the change in ARC to C-II lengthens the RPZ at the north end of the runway, even though there is no change to Runway 17's minima. Most of the RPZ extension will remain on Airport property and where it extends off-airport avigation easements will be sought. With the instrument approach improvement to Runway 35, the RPZ at the south end of the runway becomes much larger, extending beyond current Airport property. ODA will pursue control of the additional land in the Runway 35 RPZ through fee acquisition.

Air Traffic Control Tower

The ATCT location was further analyzed through the FAA's tower siting study on March 3-5. The final location will be west of the Columbia Aviation Association Clubhouse, in the vicinity of the State's existing aircraft parking apron, as shown on the alternative exhibits.

Cargo Apron

The Oregon Aviation Plan (2007) identified the need for a cargo apron at the Airport. This apron would be used for aircraft parking while unloading/loading freight onto ground vehicles; it would not include a

sorting facility. The Preferred Alternative places the cargo apron north of Aurora Aviation because of good accessibility to the Airport's current access road.

North Run-up Area

There is no run-up area to Runway 17, which poses a safety hazard. Current restrictions do not allow construction of a run-up area near the Runway 17 end. As a compromise, a run-up area is proposed approximately 500 feet south of the north end of the parallel taxiway. In order for the run-up area to be constructed, the Aurora Aviation fuel tanks must be relocated.

Relocation of Fuel Tanks

As stated in prior chapters, the Aurora Aviation fuel tanks are located in an undesirable area due to their close proximity to Airport taxiways. Additionally, the north run-up area is proposed where the fuel tanks are located. ODA will negotiate relocating these fuel tanks northeast of the Aurora Aviation FBO building.

Aurora Rural Fire Protection District

While an Airport Rescue and Fire Fighting (ARFF) facility is not required for the Airport, the Aurora Rural Fire Protection District has indicated interest in locating a facility on the Airport where they could house their firefighting apparatus. The most desirable location, based on the District's input, is adjacent to the existing fire suppression system centrally located on the Airport near Airport Road.

Helicopter Parking

The helicopter parking area on state-owned property is proposed in an area currently used for fixed-wing tiedowns, approximately 500 feet south of the proposed run-up area. This area separates helicopter and fixed-wing aircraft parking to minimize possible damage to small fixed-wing aircraft by rotor wash.

Internal Service Road

An internal service road is included to help separate vehicular traffic from taxiing aircraft, which will enhance safety. It is intended to be used exclusively by approved operators (ODA and others who must use it for specific purposes, like fuel trucks, etc.).

Precision Approach Path Indicators (PAPIs)

PAPIs should be installed to replace the less precise visual glide slope indicators at the Airport.

Demand-Based Improvements

The Preferred Alternative shows additional hangar and tiedown areas on state-owned property. It is expected that not all of the demand-based needs will be met by development on state-owned land, and development/reconfiguration of private property will likely occur. Accordingly, the adjacent 16-acre church camp property is identified as suitable for airport-related development. Within the 20-year planning period, the projected need for additional land that is not currently zoned Public is only 5 acres. However, demand may exceed the forecast or development density may be lower than projected. The

church camp property east of the Airport is a logical area for excess demand to be met because it is adjacent to the Airport and on the Airport side of Airport Road.

Although previous discussions identified the adjacent church camp property as a potential location to meet this forecasted need, through the public involvement process, it was determined that it would not be identified on the Airport Layout Plan as future airport-related development.

Appendix to Chapter Five: ADDITIONAL RUNWAY LENGTH SCENARIOS

Airport Master Plan Update

Aurora State Airport

January 11, 2011

The Final Draft Airport Layout Plan (ALP) Drawing Set was submitted to the FAA's Seattle Airports District Office for review and comment in November 2011. The Final Draft ALP reflected two runway length scenarios. One scenario was an 800-foot displaced threshold to Runway 17, with modification to standards request to allow the existing Runway 17 threshold to be used in calculating FAA design surfaces. The other scenario was a 1,000-foot extension to Runway 35. The Oregon Aviation Board's preference was to pursue the displaced threshold, with the full extension as a back-up plan if the FAA would not approve the modifications to standards.

In response to this submittal, the FAA directed ODA to revisit the alternative of a northern extension to Runway 17 and stated they would not support a displaced threshold (FAA letter dated November 18, 2011 is included as reference). The FAA's position is that the benefit from a limited use displaced threshold to Runway 17 is not commensurate with the cost – particularly they did not agree that minimizing impacts to private property justified the use of the displaced threshold. Rather, an actual extension to Runway 17 on property already owned by the State is more preferable to the FAA. Furthermore, the option to extend Runway 35 south would not be supported by the FAA since adequate land to the north remains to accommodate a runway extension in that direction.

This appendix to the alternatives chapter is intended to explore the scenarios suggested by the FAA, and to examine additional issues caused by extending the runway northward beyond those posed to private property. It will identify the issues associated with extending the runway north versus south to assist the ODA, Oregon Aviation Board and FAA in determining the appropriate action to reduce constrained operations at the Aurora State Airport.

Northern Extension Option

The FAA's letter cites that a 1,000-foot runway safety area (RSA) can be achieved north of Runway 17 on land owned by the state, in which case an 800-foot extension could be feasible. However, potential obstructions posed by Arndt Road, two power lines, and other facilities that would be infeasible to relocate, render a northern extension limited to 400 feet. Referencing data from Chapter Four Table 4E (also included as reference), there are no operational impacts with a 400-foot extension. To begin reducing known constrained operations at the Airport, a minimum extension of approximately 500 feet would be required. Information presented in Chapter Four shows that a runway extension of approximately 1,000 feet would have a significant impact on reducing constrained operations at the Airport. Further discussions with the FAA regarding this limitation have clarified the need to extend Runway 17/35 beyond what is possible for Runway 17. Therefore, since a 1,000-foot extension north would not be achievable due to facilities penetrating various design surfaces, this option includes a 600-foot extension to the south to gain the more ideal runway length (see **Exhibit 5K**).

Key Features

The following discussion outlines key features of the northern extension option for comparison with the other alternative.

Runway Length

The ultimate runway length would be 6,004' – to be achieved by a north extension to Runway 17 of 400 feet and a south extension to Runway 35 of 600 feet.

An extension to Runway 17 assumes that Arndt Road would not be relocated and the power lines adjacent to Arndt Road would not be relocated or buried; both would remain located in the runway protection zone (RPZ). Arndt Road is a major arterial that was recently reconstructed and widened and would be very costly relocate and any relocation would have a large impact to surface transportation. Similarly, the high voltage power lines would be very costly to relocate. **FAA Advisory Circular 150/5300-13, *Airport Design*, allows for certain facilities to exist within the RPZ; however, when practical the FAA strongly discourages roads and power lines as they pose a safety risk to people on the ground and in aircraft.**

Using the assumption that Arndt Road and the power lines will not be relocated, Runway 17 can only be extended by 400 feet to retain consistency with FAA design standards. As stated above, there are no operational gains or reductions to constrained operations with a 400-foot extension, based on data gathered in Chapter Four.

Runway 35 would be extended by 600 feet to reach to optimal runway length of 6,004 feet, which would require a relocation of Keil Road in order to clear the RSA.

Property Acquisition

Implementation of this option would require the acquisition of real property and avigation easements to secure land use control within the RPZs. Avigation easements would be sought for approximately two

acres of land from Columbia Helicopters, which would limit their planned development. To the north of Arndt Road, approximately 5.5 acres would be acquired, along with approximately 37 acres to the south of Runway 35 that would include six residential properties. Property would also be acquired from Willamette Aviation for the Runway 17 parallel taxiway and run-up apron.

Departure / Approach Surface

As shown in Exhibit 5K, relocation of the Runway 17 threshold impacts the departure and approach surface. The departure surface extends upward and outward at a slope of 40:1 from the threshold. As the threshold moves north, the departure surface is lower over structures at **Columbia Helicopters**; thereby making them obstructions to navigation. Existing structures would likely be required to have obstruction lights; however, **future development may be restricted to prohibit penetrations to the departure surface.** Similarly, the approach surface, which begins 200 feet beyond the runway threshold, would be lowered over Arndt Road and the power lines. Although the power lines would remain below the approach surface, the safety margin between approaching aircraft would be reduced and that may result in an increase to the Airport's approach minimums, which are typically 1 ½ statute mile (sm) visibility for Category C and D aircraft (depending on the approach, Category C minimums are as low as 1 ¼ sm). Weather data shows that weather is below 1 sm visibility 5% of the time. The Airport would be below Approach Category C and D minimums a higher percentage of the time. Low visibility weather is not spread evenly throughout the year. In the months of May through August, visibility is below 1 sm less than 1% of the time on average, but in the months of November through January the weather is below approach minimums more than 10% of the time. Given this information, it would be imprudent to raise the existing minimums, which would virtually close the Airport in low visibility conditions.

Land Use

The majority of land identified for acquisition is currently zoned exclusive farm use. A portion of the land associated with home sites is zoned acreage residential. Land north of Arndt Road falls within the jurisdiction of Clackamas County; whereas everything to the south is within the Marion County boundary. Private property – Columbia Helicopters and Willamette Aviation – would be impacted by land acquisition and land use zoning restrictions on building height.

To maintain compatibility with FAA guidance, the acquired property should be rezoned to maintain airport compatibility.

Environmental

The anticipated environmental impact with this runway length option is minimal. Areas where potential impacts are expected include: water quality, farmland, noise, and temporary construction impacts. There would be increased stormwater runoff due to the increased impervious surface, which can be mitigated with adjustments to the existing stormwater drainage system. Farmlands would be minimally impacted; even though there is acquisition of farmland, farm-related activities could remain on the subject property consistent with FAA guidance. Noise is expected to increase over the planning period, as detailed in Chapter Five; however, the Airport's runway configuration has an insignificant impact on

noise according to FAA National Environmental Policy Act regulations. Temporary construction impacts will be offset by implementation of best management practices and impact avoidance.

Noise Abatement

New instrument departures, along with publish noise mitigation procedures and the use of the calm wind runway (Runway 35) are consistent with the northern runway length option. However, noise would be shifted slightly closer to the Charbonneau community.

Air Traffic Control Tower (ATCT)

Design of the ATCT included simulations at the FAA's Airway Facilities Tower Integration Laboratory (AFTIL). During that simulation no runway extension to the north was modeled. If a northern extension were pursued, the AFTIL work may need to be redone to ensure line of sight visibility from the ATCT to the extended runway end. The cost of the additional simulation could cost upwards of $200,000.

Construction

An extension to both ends of Runway 17/35 will require a two-phased construction approach. Temporary displaced thresholds will be utilized during construction, adding duplicate efforts for the contractor, adding time to construction and reducing operational efficiency of the airport.

Cost Estimate

The northern extension option is estimated to cost $9,606,000, as shown in the following table. Detailed cost estimates are attached for reference. A more detailed discussion regarding the cost estimating is included later in this analysis.

Northern Extension Option

#	Year	Description	Total Cost	ODA share	FAA Share
Runways 17 (400') and 35 (600') Extension					
14A	2018	Avigation Easement Acquisition (R17 RPZ)	$ 36,000.00	$ 1,800.00	$ 34,200.00
19A	2018	Property Acquisition (R17 and R35 RPZ)	$ 3,963,000.00	$ 198,150.00	$ 3,764,850.00

Aurora State Airport
Aurora, OR

Exhibit 5J
Preferred Alternative
Revised 06/27/11

03437-AIRP-EX5J_MC.DWG

Key Features

The following discussion details the southern runway extension option to provide a comparison against the northern extension option.

Runway Length

Runway 35 would be extended to the south by 1,000 feet for a total runway length of 6,004 feet, which is the ideal runway length to reduce a majority of the Airport's constrained operations. Keil Road would be relocated, as a result of the extension.

Property Acquisition

Extending Runway 35 would require the relocation of four residences and agricultural lands amounting to approximately 44.5 acres. Additionally, avigation easements would be sought from Columbia Helicopters to secure control of approximately 2.6 acres in the existing Runway 17 RPZ.

Departure / Approach Surface

A southern extension to Runway 35 would require the removal of obstructions, namely trees, to clear the approach and departure surfaces. No other buildings or facilities will be affected.

Land Use

All land use actions would be within Marion County's jurisdiction. Official action would be to designate the acquired land to "Public" to ensure compatibility with airport operations. Per FAA guidance, some agricultural uses are compatible with airport operations. No development would occur within the areas to be acquired, beyond relocation of Keil Road.

Environmental

The environmental considerations for the southern extension option are similar to those stated above. Noise would shift slightly farther south as a result of the longer extension to Runway 35.

Noise Abatement

New instrument departures, along with published noise mitigation procedures and the use of the calm wind runway (Runway 35) are consistent with the northern runway length option. The new instrument departures, along with the noise abatement techniques, are a culmination of ODA's public involvement that included coordination with the Positive Aurora Airport Management group and local communities.

Air Traffic Control Tower

The AFTIL simulation included modeling of a 1,000-foot southern extension. Extending Runway 35 would not require any additional AFTIL modeling.

Construction

Extension of Runway 35 would require the use of a single temporary displaced threshold. Keil Road would be relocated prior to runway construction.

Cost Estimating

The cost associated with the southern runway extension option is $7,169,000, see details in the following table.

Southern Extension Alternative					
#	Year	Description	Total Cost	ODA share	FAA Share
Runway 35 (1000') Extension					
14	2018	Avigation Easement Acquisition (R17 RPZ)	$ 44,000.00	$ 2,200.00	$ 41,800.00
19	2018	Property Acquisition (R35 RPZ)	$ 2,561,000.00	$ 128,050.00	$ 2,432,950.00
20	2019	Keil Road Relocation	$ 1,427,000.00	$ 71,350.00	$ 1,355,650.00
21	2020	Runway Extension (R35 - 1000')	$ 3,116,000.00	$ 155,800.00	$ 2,960,200.00
22	2020	Install Runway 17 PAPIs	$ 65,000.00	$ 3,250.00	$ 61,750.00
Runway 35 (1000') Extension Capital Costs			*$ 7,169,000.00*	*$ 358,450.00*	*$ 6,810,550.00*

Comparison of the Two Options

Key differences between the northern and southern runway extension options are presented below.

Runway Length

A runway length of 6,004 feet would be achieved in both options.

Property Acquisition

Total property acquisition is greater for the southern runway extension option by a margin of approximately 13 acres. However, the northern extension option requires the acquisition of two additional homes, because the shorter extension of Runway 35 places the RPZ over more residences. The avigation easement with Columbia Helicopters is also greater in the northern extension option by 1.1acres. Also 0.8 acres would be purchased from Willamette Aviation for the Parallel Taxiway extension and the run-up apron.

Departure / Approach Surface

Both options require removal of trees to clear the departure and approach surfaces. However, an extension to the north will also require obstruction lighting for existing Columbia Helicopter buildings and will likely limit the businesses' future development opportunities or raise the Airport's approach minimums and impact the departure surfaces.

The northern extension option would allow Arndt Road and the adjacent power lines to exist within the RPZ, which the FAA allows and at the same time discourages. Since the approach surface would be closer to the road and power lines, it is likely the approach minimums will be raised – which is an undesirable consequence as it would make the Airport inaccessible during some low visibility conditions.

The southern extension option would create clear RPZs.

Land Use

Both alternatives will require the rezoning of exclusive farm use property to public, in order to ensure compatibility with airport operations. However, as stated above, farm-related activity can occur within the areas according to FAA guidance.

The northern extension option will require coordination with both Clackamas and Marion Counties. Statements given at the Master Plan's public meetings have lead the planning team and ODA to believe Marion County is a willing partner with the Airport. It is unclear at this time what Clackamas County's position would be during any potential rezoning actions.

Environmental

Noise exposure would shift slightly farther south in the southern runway extension option. However, the difference is minimal and more consistent with the calm wind runway and published noise abatement procedures.

Noise Abatement

There is no appreciable difference between the two options; however, the southern extension option would likely move noise farther from Charbonneau and closer to housing communities around Aurora.

Air Traffic Control Tower

Remodeling of the AFTIL simulation would likely be required under the northern extension option, which could cost up to $200,000. The southern extension is compatible with the current AFTIL modeling and no additional work would be necessary.

Construction

The construction phasing for the northern extension option – by use of two temporary displaced thresholds – creates duplicity of efforts, which is reflected in the cost estimating.

Cost Estimating

The northern extension option is $2,437,000 more than that of the southern extension option, an increase of roughly 35%. The primary causes for this increase is:

- Additional avigation easement acquisition from Columbia Helicopters
- Property acquisition of RPZ property north of Arndt Road (considered to have more value than land south of the Airport)
- Acquisition of property from Willamette Aviation
- Purchase of two additional residences, as a result of the shorter extension to Runway 35
- Additional pavement required for the Runway 17 run-up apron and connector taxiway, with corresponding lighting improvements
- Relocation of the Runway 17 omnidirectional approach lighting system (ODALS)
- Increased unit prices for temporary flagging, marking, signage, staging and mobilization, as well as project coordination, as a result of the two temporary displaced thresholds required to extend both runway ends in the northern extension option.

Summary

In terms of benefits to the Airport and reducing constrained operations, the northern and southern runway extension options are similar as they increase Runway 17/35 to the desired length of 6,004 feet. The greatest difference between the options is cost. **The northern extension would require an additional $2.4 million to construct** and yield no benefit above and beyond the southern extension. Intangible costs for the northern extension are also greater. **For instance, while FAA guidance would allow Arndt Road and the power lines within the Runway 17 RPZ, the agency recommends keeping them out of the RPZ when practical to increase safety, and the Airport's approach minimums would likely be impacted. Additionally, constraints to Columbia Helicopters are not desirable as they are a prominent employer within Marion County that creates over 400 family wage jobs.** Additionally, working with one county for land use actions is more desirable than creating a situation of going through land use revisions in two counties.

Although the FAA has directed ODA to consider extending the runway north on land already owned by the State, this supplemental information clearly shows that an extension on State-owned land does not alleviate the existing and forecasted constrained operations at the Airport. An extension of 1,000 feet, however, would allow for unconstrained operations by aircraft currently using the Airport. The cost of extending the runway via the northern extension option far exceeds the cost of the southern extension option and does not gain any appreciable benefit. **Therefore, the southern extension option – reflected by the Preferred Alternative – remains the recommended course of action.**

November 18, 2011

Mr. Mitch Swecker
Director, Oregon Department of Aviation
3040 25th Street, SE
Salem, OR 97302-1125

Dear Mr. Swecker,

This letter is in response to your recent submission of a Modification to Design Standards for the addition of a displaced threshold north of Runway 17 at the Aurora State Airport.

Although we realize it is the preference of the Aurora State Airport Board to pursue the 800 foot displaced threshold in order to minimize the impact to private property, the FAA's position is that this is not adequate justification for funding an extension of limited use. Since a 1000 foot Runway Safety Area can be achieved at the north end of the proposed 800 foot surface and the land is already located on airport property, we would support a full runway extension – not a displaced threshold.

In addition, we understand that once you receive this disapproval of the displaced threshold, a 1000 foot extension to the south end of the runway will be pursued. Since an extension to the south includes land that is not located on airport property, we would not fund this land acquisition as long as sufficient airport-owned property lies undeveloped to the north.

If you have any questions, you may contact Bruce Fisher at 425.227.2649 or me at 2657.

Sincerely,

Stanley C. Allison
Acting Manager, Seattle Airports District Office

cc: Mr. Rainse Anderson, WH Pacific, Inc.

Supplemental Data:

Excerpt from Chapter Four, Runway Length Calculation

Runway Length Justification Process

FAA guidance states that to justify funding a runway extension, at least 500 annual itinerant aircraft operations must exhibit a need for an extension now or within the next five years. Determining the particular aircraft model(s) critical for runway length is much easier at a commercial service airport than at a general aviation airport because at a commercial service airport individual airlines mostly use the same type of airplanes and they publish flight schedules that facilitate quantifying numbers of operations and stage lengths. Gathering such data for a general aviation airport is more difficult. In addition, the FAA requires rigorous justification for extending runways at general aviation airports, including documentation from the operators of airplanes needing a longer runway with the individual N numbers of their airplanes and number of constrained operations. A constrained operation is one that must reduce payload for takeoff, or stop en route for fuel, for example.

To quantify constrained operations at Aurora State Airport, questionnaires were distributed to the operators of larger aircraft that use the Airport frequently. Transient aircraft operators were identified from IFR flight plan records. The questionnaires received are in **Appendix I** and the operators who identified constrained operations are listed in **Table 4E**.

Table 4E contains a list of business jets that have operated at the Airport in recent years, as documented by IFR flight plans. The table also indicates which airplane models are based at the Airport and gives the number of constrained operations reported by based and transient users of the Airport. The table lists airplane models in the order of runway length required at maximum takeoff weight, from shortest to longest. Many models listed in the table need a longer runway at maximum takeoff weight than Aurora State Airport's 5,004 feet; these airplanes can use the Airport because they are operating at less than their maximum takeoff weights and/or the temperature is lower than 84 degrees. Usually, airplanes are constrained for takeoff due to high summer temperatures; however, for some airplanes operating under air taxi or fractional jet regulations, the constrained operation is landing on a wet or slippery runway. In addition, the lengths in Table 4E are based solely on aircraft performance requirements. Some operators may have additional requirements based on company operations specifications or insurance.

Source: WHPacific, 2010, using business jet characteristics published by the Central Region FAA in 2001, manufacturers' specifications, based aircraft from Oregon Department of Aviation aircraft registration records, constrained operators from runway length survey conducted in 2009 and 2010. List includes only business jet models that have documented operations at the Airport according to IFR flight plan records or an operator who wants to use the Airport. Takeoff distances are based only on aircraft performance; federal aviation regulations, company policies, or insurance requirements may require more length. Takeoff distances for standard conditions were adjusted (+14.8%) to account for design conditions at Aurora state Airport.

The runway lengths listed in Table 4E use the manufacturers' takeoff distance for standard conditions (sea level and 59 degrees F). These lengths were increased 14.8% to account for the higher elevation (200 feet MSL), higher design temperature (84 degrees), and runway gradient (2 feet of difference between runway high and low points). The formula for determining the amount of increase is:

Altitude Correction
(7% per 1,000' above sea level)

L = Takeoff length @ sea level
L1 = Length corrected for altitude
L1 = (.07 * E / 1000) * L + L

Temperature Correction
(0.5% per degree above standard temperature in hottest month)

T1 = Adjusted Standard Temperature
T = Mean Max High Temperature
L2 = Length corrected for altitude & temperature

(Std Temp adjusted to Sea Level)

T1 = 59 - (3.566 * E / 1000)
L2 = (.005*(T - T1)) * L1 + L1

Effective Gradient Correction (takeoff only)	
(10' for each 1' difference between High / Low Point)	G = Difference between high / low point in feet L3 = RW length corrected for altitude, temperature & gradient L3 = G * 10 + L2

For three aircraft models, operators report constrained operations although the takeoff distance listed in Table 4E is less than the length of Runway 17/35. Two mentioned constraints on hot summer days, which are likely days when the temperature exceeds 84 degrees.

The runway length survey (Appendix I) identified the number of aircraft operations constrained at the Airport annually total 473, using only existing aircraft with N numbers and operators' names identified and using the average number of constrained operations if the operator identified a range of operations. Operators who wished to remain anonymous identified 12 more annual constrained operations. One operator based at the Airport, RJ2/DB Aviation, plans to replace its 650 Citation III/VI with a 750 Citation X, which would be constrained by runway length more often (an estimated 40 times per year compared to 30 for the existing aircraft).

To justify funding a runway extension, the FAA will not accept information for which the operator or the aircraft is not specifically identified. The identified number of constrained operations, 473, does not meet the 500 operations threshold at present time. Applying to 473 an annual growth rate of 3.6%[1], the number of annual constrained operations would reach 500 in 2012.

The 500 annual constrained operations threshold is projected to occur within five years. Even if jet traffic does not grow as fast as projected, it is likely the number of constrained operations will exceed 500 within the 20-year planning period. Consequently, ODA may want to consider planning for a runway extension now, in order to protect the airspace needed, among other things. To justify FAA funding for a planned extension, operators may need to be surveyed again in the future to identify operations that may be constrained.

Table 4E indicates the longest runway required for ARC C-II aircraft (Bombardier CL-601 and CL-604) that use the Airport is 6,544 feet, at maximum takeoff weight. This is 1,540 feet longer than the existing Runway 17/35. The longest runway required for an Aircraft Approach Category B aircraft (Raytheon/Hawker 125-800) is 6,176 feet, at maximum takeoff weight. This is 1,172 feet longer than the existing Runway 17/35. Most takeoffs are at weights under the certified maximum, so that the runway length needed is less. On the other hand, temperatures in the summer can exceed the 84 degrees used to determine runway length in Table 4E.

In the formulation of development alternatives, one or more alternatives might consider a runway extension, in order to evaluate relevant consequences.

---

[1] *Table 3M in Chapter Three shows the jet operations forecast, from 10,909 annual operations in 2010 to 22,389 annual operations in 2030, which equates to a 3.6% average annual growth rate.*

Chapter Six: AIRPORT LAYOUT PLAN

Airport Master Plan Update

Aurora State Airport

The Airport Layout Plan (ALP) drawings are a pictorial culmination of the master planning process. A major purpose of the ALP drawing set is to establish funding eligibility for the FAA's Airport Improvement Program (AIP), as capital projects must appear on an FAA-approved ALP to receive AIP grant funding.

The ALP has been developed with input from the Planning Advisory Committee (PAC), as well as from the public. The Draft Preferred Alternative was available for public comment from March 31 through April 21, 2011. Based on direction from the Oregon Aviation Board on April 28, 2011, declared distances – through the means of displaced thresholds[1] – were analyzed and presented to the PAC and public on June 7, 2011 to gather input relative to runway length. Comments were taken on the declared distances until June 21, 2011. On June 23, 2011 the Oregon Aviation Board recommended the ALP include an 800-foot northward extension of runway pavement and 800-foot displaced threshold to Runway 17. The Board determined additional runway length is justified at the Aurora State Airport and the use of declared distances is the most advantageous and neighborly method of increasing the runway's usable length. However, if the FAA's National Office does not approve the displaced threshold, the Board recommends pursuing an extension to Runway 35. As a result, both the northern displaced threshold and southern extension are shown on the ALP drawing set. Only one of these projects will be pursued, as is reflected in the capital improvement plan in Chapter Seven. It is emphasized the preferred action, based on the Board's recommendation, is to pursue the displaced threshold to mitigate the runway length deficiency at the Airport.

AIRPORT LAYOUT PLAN DRAWINGS

The following paragraphs describe the specific elements found on each sheet within the ALP drawing set.

[1] Please refer to Chapter 5 for an explanation of displaced thresholds, their application to airport design, and the use of declared distances.

Cover Sheet (CS)

The cover sheet is an index to the airport layout plan drawing set. It also provides pertinent information such as the airport sponsor, airport name, grant number the project is funded through, location and vicinity maps, and date the plan was completed. Also included is the Airport wind rose, which depicts the wind data discussed in Chapter Four.

Airport Layout Plan (Sheet 1)

The ALP depicts the current airport layout and proposed improvements to the Airport for the 20-year planning period. Detailed descriptions of the improvements and expected capital costs over the next 20 years are included in Chapter Seven*, Capital Improvement Plan*. The Preferred Alternative was the basis for determining the proposed improvements at the Airport. The ALP is a development guide; the timing of development depends upon when it is needed and can be funded.

As recommended by the Oregon Aviation Board at their June 23, 2011 meeting, the ALP retains two alternatives relating to runway length. The ALP depicts an 800-foot displaced threshold to Runway 17 and a 1,000-foot extension to Runway 35. These projects are mutually exclusive and it is the preference of the Board to pursue the displaced threshold option. However, if the FAA does not approve the displaced threshold, the extension to Runway 35 will be pursued. When the FAA decides, the ALP will be updated to identify only the FAA-approved alternative.

Other items reflected on the ALP include, but are not limited to:

- Runway protection zone, runway object free area, runway safety area and other standard airport dimensions
- Runway approach visibility minimums
    - Runway 17 – Visibility of 1 statute mile (sm) or greater
    - Runway 35 – Existing visibility of 1 sm or greater; ultimate approach minima of greater than ¾ sm.
- Data tables for the Airport, as well as data relating to the runway and facilities at the Airport
- A table identifying the modifications to standards requested
    - Modification to the runway object free area is requested, as Highway 551 encroaches into the area slightly.
    - Modification of the application of a displaced threshold to reduce off-airport impact from Part 77 and airport design surfaces.
- Land identified for avigation easement acquisition and fee acquisition
- Capital projects recommended in Chapter Five

Airport Airspace (Sheet 2)

This drawing shows the Part 77 Imaginary Surfaces for the future layout of the Airport with a USGS topographic map as the background. The Part 77 surfaces are the basis for protecting airspace around an airport; therefore, it is ideal to keep these surfaces clear of obstructions whenever possible. The FAA decides if any of the obstructions to Part 77 surfaces are hazardous to aviation. Recent obstruction removal projects at and near the Airport have cleared these surfaces of any known obstructions.

Part 77 defines five distinct surfaces, each with a different size and shape. The dimensions of these surfaces are based on the type of runway and the type of approach ultimately planned for the Airport. The imaginary surfaces are defined below.

Primary Surface. The primary surface is rectangular, is centered on the runway, extends 200 feet beyond each end of the runway, and has a width that varies according to airport-specific criteria. The elevation of the primary surface corresponds to the elevation of the nearest point of the runway centerline. The width of the primary surface of Runway 17/35 is 500 feet.

Approach Surface. Each runway end has an approach surface. The approach surface is centered on the extended runway centerline, starts at the end of the primary surface (200 feet beyond each end of the runway), and has a width equal to that of the primary surface. Approach surfaces slope upward and outward from the runway ends.

The ultimately planned approach surfaces at the Airport reflect nonprecision instrument approaches to Runways 17 and 35. The approach surface has an inner width of 500 feet, extends outward 10,000 feet to an outer width of 3,500 feet, and rises up at a slope of 34:1.

Runway Protection Zones (RPZs) are not Part 77 surfaces, but mirror the inner portions of approach surfaces on the ground. The existing and ultimate Runway 17 RPZ dimensions are 500 feet (inner width) by 1,700 feet (length) by 1,010 feet (outer width). The existing Runway 35 RPZ dimensions mirror the Runway 17 dimensions. However, the ultimate Runway 35 RPZ dimensions are 1,000 feet (inner width) by 1,700 feet (length) by 1,510 feet (outer width), to accommodate the approach with minimums greater than ¾ sm.

Transitional Surface. The transitional surface is a sloping 7:1 surface that extends outward and upward at right angles to the runway centerline from the sides of the primary surface and from the sides of the approach surfaces.

Horizontal Surface. The horizontal surface is a flat, elliptical surface at an elevation 150 feet above the established airport elevation. The extent of the horizontal surface is determined by swinging arcs of a 10,000-foot radius from the center of each end of the primary surface.

Conical Surface. The conical surface extends outward and upward from the horizontal surface at a slope of 20:1 for a horizontal distance of 4,000 feet.

Airport Approach Surfaces (Sheet 3)

This drawing presents a larger scale plan and profile view of the approach surfaces shown in the Airport Airspace Drawing. The existing and ultimate runway ends are shown on the plan sheet. The highest composite terrain, along with known features, is shown in the profile view. There are no known obstructions within the Airport's approach surface.

Inner Portion of the Runway 17/35 Approach Surfaces (Sheet 4)

This drawing provides plan and profile views of the portions of approach surfaces that are closest to the runway, encompassing the existing and ultimate RPZs.

Terminal Area Plan (Sheet 5)

The Terminal Area Plan drawing provides a large-scale view of the terminal area, so that features such as aprons, buildings, hangars, and parking lots are easier to discern.

Land Use and Noise Contours (Sheet 6 and 7)

A land use map has been developed for the Airport and the surrounding area. This map includes the land uses on and around the Airport according to Marion and Clackamas Counties, as applicable.

Land uses around airports should be compatible with airport operations. Land use compatibility issues that are of the greatest concern at airports include:

- Aircraft Noise
- Nearby Lighting
- Glare, Smoke and Dust Emissions
- Bird Attractions and Landfills
- Airspace Obstructions
- Electrical Interference
- Concentrations of People

Current zoning on Airport Property is listed as Public and is compatible with airport operations. However, not all property within the Airport Environs – the footprint of the land nearby the Airport within the boundaries of the four surrounding roads – is zoned in a manner suitable for airport-related development recommended in this Master Plan. Marion County has land use jurisdiction over the subject property and any private developer would have to work with the County to ensure proper zoning is in place prior to any development.

Noise contours were developed for the Airport, based on existing and forecasted aircraft operations, in accordance with FAA regulations using the Integrated Noise Model (INM) version 7.0. INM produces contours representative of average weighted sound exposure levels. According to FAA guidance, 65 dBA is the threshold for aircraft noise incompatibility with some land uses. [2] The three noise contour sets modeled for the Airport are:

- Existing Conditions (2010) - At present, the 65 dBA contour line extends off Airport Environs to the north, south and west. Some residential areas west of the Airport are within the 65 dBA and the 70 dBA lines.
- Displaced Threshold Option (2020) - The forecasted increase in operations and changes in aircraft fleet, cause the 65 dBA contour line to extend further off airport by 2020; however, the eastern 65 dBA noise contour line remains nearly all within the Airport Environs. More

[2] For more information about land use incompatibility with airport noise, see FAA Advisory Circular 150/5020-1, *Noise Control and Compatibility Planning for Airports.*

residential homes would be affected by noise exposures of 65 dBA. The displaced threshold to Runway 17 does not cause a significant shift northward of the contour lines.

- Runway Extension Option (2020) - As a result of the extension southward, the noise profile shifts to the south when compared to the previous profiles. Under this option, noise is shifted further away from Charbonneau, but closer to the City of Aurora and its surrounding communities.

Details of how the noise contours were developed are discussed in Chapter Five, *Airport Development Alternatives*.

Runway Departure Surfaces (Sheet 8)

The Runway Departure Surfaces Plan depicts the plan and profile views of the Runway 17/35 departure surfaces, which apply to runways with instrument departure procedures. Each departure surface at the Airport begins at the departure end of the runway at a width of 1,000 feet, extends outward 10,200 feet to an outer width of 6,466 feet, and slopes up at 40:1.

Airport Property Map (Sheet 9)

This drawing provides a history of the ODA's airport property acquisition by showing and listing all land transactions.

Runway 35 Latitude	45°14'25.148"N	45°14'15.350"N
Longitude	122°46'16.515"W	122°46'18.251"W

Notes

Horizontal datum is NAD 1983, vertical datum is NAVD88.

The Airport is flat. Elevations / ground contours vary by less than 5 feet and are not shown. Drainage features are typically 2-3 feet lower than adjacent land.

Building restriction line is based on a 35-foot building located 495 feet from the runway centerline not penetrating FAR Part 77 surfaces for the Airport.

A Residential Through The Fence (RTTF) access exists at hangar #64 at the Wylee Condominium Association. The tenant is the resident caretaker for the airport.

Modifications to Standards

	Standard Being Modified	Proposed Action
1	Advisory Circular (AC) 150/5300-13, para 307 (Runway Object Free Area)	The standard runway object free area (OFA) for Airport Reference Code C-II airports is 800 feet. Highway 551 runs north/south parallel to Runway 17/35; the approximate distance from the Runway 17/35 centerline to the Highway 551 centerline is 400 feet. As the airport geometry is not changing from the current condition, the Oregon Department of Aviation (ODA) requests a modification of the OFA design standard to allow the runway and highway to remain in their current positions.
2	AC 150/5300-13, Appendix 14 (Declared Distances)	The ODA requests the existing threshold for Runway 17 be referenced in determining FAR Part 77 surfaces and design standard surfaces referenced in AC 150/5300-13 (*i.e.*, RSA, RPZ, OFA, OFZ).

OREGON DEPARTMENT OF AVIATION

THE PREPARATION OF THIS DOCUMENT MAY HAVE BEEN SUPPORTED, IN PART, THROUGH THE AIRPORT IMPROVEMENT PROGRAM FINANCIAL ASSISTANCE FROM THE FEDERAL AVIATION ADMINISTRATION (PROJECT NUMBER 3-41-0004-015) AS PROVIDED UNDER TITLE 49, UNITED STATES CODE, SECTION 47104. THE CONTENTS DO NOT NECESSARILY REFLECT THE OFFICIAL VIEWS OR POLICY OF THE FAA. ACCEPTANCE OF THIS REPORT BY THE FAA DOES NOT IN ANY WAY CONSTITUTE A COMMITMENT ON THE PART OF THE UNITED STATES TO PARTICIPATE IN ANY DEVELOPMENT DEPICTED THEREIN NOR DOES IT INDICATE THAT THE PROPOSED DEVELOPMENT IS ENVIRONMENTALLY ACCEPTABLE IN ACCORDANCE WITH APPROPRIATE PUBLIC LAWS.

OREGON DEPARTMENT OF AVIATION

THE PREPARATION OF THIS DOCUMENT MAY HAVE BEEN SUPPORTED, IN PART, THROUGH THE AIRPORT IMPROVEMENT PROGRAM FINANCIAL ASSISTANCE FROM THE FEDERAL AVIATION ADMINISTRATION (PROJECT NUMBER 3-41-0004-015) AS PROVIDED UNDER TITLE 49, UNITED STATES CODE, SECTION 47104. THE CONTENTS DO NOT NECESSARILY REFLECT THE OFFICIAL VIEWS OR POLICY OF THE FAA. ACCEPTANCE OF THIS REPORT BY THE FAA DOES NOT IN ANY WAY CONSTITUTE A COMMITMENT ON THE PART OF THE UNITED STATES TO PARTICIPATE IN ANY DEVELOPMENT DEPICTED THEREIN NOR DOES IT INDICATE THAT THE PROPOSED DEVELOPMENT IS ENVIRONMENTALLY ACCEPTABLE IN ACCORDANCE WITH APPROPRIATE PUBLIC LAWS.

Chapter Seven: CAPITAL IMPROVEMENT PLAN

Airport Master Plan Update

Aurora State Airport

Through the evaluation of the facility requirements, identification of the Preferred Alternative, and the development of the Airport Layout Plan, the improvements needed at the Aurora State Airport over the next 20-year period have been determined. The Capital Improvement Plan (CIP) provides the basis for planning the funding of these improvements. The planned phases of development are in the 5-, 10- and 20-year time frames.

Additionally, this chapter presents a financial implementation analysis for Aurora State Airport and examines various facets of the financial operating condition of the Airport.

CAPITAL IMPROVEMENT PROJECTS

The CIP develops the timeline for airport improvements and estimated costs for those improvements. The plan is divided into three phases: Phase I (2012 - 2016), Phase II (2017 - 2021), and Phase III (2022 - 2031).

Below is the anticipated plan for the Airport to meet projected demand. Funding for these projects has not yet been committed and the actual costs may vary depending upon final construction costs. The date of implementation may also vary due to funding availability.

Phase I (2012-2016)

Phase I is the first five years of the planning period, through 2016. Phase I development projects are further broken down into specific years. Projects in this phase include:

Construct Air Traffic Control Tower (2012). The ATCT project has been funded through the *Connect*Oregon III Grant Program. The purpose of the project is to increase safety by providing aircraft separation and sequencing at the Airport. The ATCT will also assist with the Airport's noise abatement

efforts, by directing traffic away from noise sensitive areas during approach, departure, and while in the pattern. The location of the tower is shown on the ALP drawing.

Construct Service Road (2012). In order for ground vehicles to operate safely, a service road will be constructed to separate vehicles from taxiing aircraft. The service road is shown in blue on the ALP.

Pavement Maintenance Program (PMP) Repairs (2013). ODA's share for pavement maintenance through this program is 75% of the total repair cost. Actual work items will be identified in the year prior to maintenance actions.

Construct Helicopter Parking Locations (2014). A safety deficiency identified in the planning process was the lack of helicopter parking locations on state property. As such, two such pads have been included on the ALP for future construction.

Reconstruct State-Leased Ramp (2014). The state-leased apron in front of Aurora Aviation has failed and is in need of reconstruction. This item is programmed for 2014, to be constructed in conjunction with the helicopter parking pad project.

Taxilane Development for Hangar Access (2014). This item includes prep work for hangar development in the following construction season.

Hangar Development (2015). An area for hangar development was identified on the ALP. The CIP breaks the development of the hangar area into three phases, as development will likely occur over a span of many years to react to demand. Each phase represents development of approximately 10 hangars, or 44,000 square feet of hangar space.

Carryover Entitlements (2015). ODA currently receives funding for the Airport through the Non-Primary Entitlement Program, funded by the Federal Aviation Administration (FAA). These funds can be accrued and carried over for up to four years, so that the airport sponsor can bank the funds in anticipation for upcoming projects. It is recommended ODA carryover the entitlement funds in 2015 in preparation for the upcoming runway improvement project (to be further discussed below).

Conduct Environmental Assessment for Runway Improvements (2016). The runway improvement project will require review under the National Environmental Policy Act (NEPA). At this time it is anticipated the appropriate environmental review will be an Environmental Assessment (EA).

PMP Repairs (2016). The PMP operates on a three-year cycle. Specific pavement maintenance items will not be identified until 2015.

Phase II (2017-2021)

Phase II is the second five years of the planning period, 2017-2021. Projects during this phase include:

Aurora Rural Fire Protection District (RFPD) Response Facility (2017). The Aurora RFPD has requested an area on the Airport be reserved for a future response facility, which is reflected on the ALP. It is anticipated the facility will be constructed during Phase II of the CIP.

Carryover Entitlements (2017). It is recommended that ODA complete the EA in 2017 and carryover any entitlement funds for the upcoming runway improvement project.

Displace Runway 17 Threshold (2018-2020). As stated in Chapter Six, the Oregon Aviation Board has requested a modification to standards for application of declared distances at the Airport. If approved, it is anticipated the work associated with displacing the threshold will occur over a multi-year period. Specific items related to the Runway 17 displaced threshold are:

- Property acquisition for the extended runway and taxiway pavements (2018) - approximately 2.2 acres.
- Avigation easement acquisition for the Runway 17 runway protection zone (2018) - approximately 2.6 acres.
- Carryover entitlements (2019).
- Extend runway and taxiway pavement and displace the Runway 17 threshold by 800 feet (2020).
- Install precision approach path indicators to Runway 17 and Runway 35 (2020).
- Construct Runway 17 run-up area (2020).

Extend Runway 35 (2018-2020). If the FAA does not approve the Runway 17 displaced threshold, a 1,000-feet extension to Runway 35 will be pursued. The extension would occur over a multi-year period, which would include:

- Property acquisition for the Runway 35 runway protection zone (2018) - approximately 44.5 acres.
- Relocation of Keil Road, as shown on the ALP (2019).
- Extension of Runway 35 by 1,000 feet (2020).
- Installation of precision approach path indicators (2020).

The runway extension pavement would remain within the current Airport boundary. Additional land acquisition is needed to secure the runway safety area and runway protection zone, to maintain compatible land uses within these areas. Farm use is a compatible land use in these areas, with a few exceptions.

PMP Repairs (2019). Specific pavement maintenance items will not be identified until 2018.

Taxilane Development for Hangar Access (2019). This item includes preparation for hangar development in the 2021 construction season.

Runway 17/35 Strengthening Overlay (2020). In conjunction with one of the above-stated runway improvement projects, the runway would be overlaid to increase the pavement strength to 60,000 lbs dual wheel gear by constructing a ½" grind and 3" overlay along with 2.5" transitions to connector taxiways.

Hangar Development (2021). An area for hangar development was identified on the ALP. The CIP breaks the development of the hangar area into three phases, as development will likely occur over a span of many years to react to demand. This would be the second phase of development.

Update Master Plan (2021). Master Plans are typically updated every eight to ten years. It is recommended this plan be updated after completion of the runway improvement project.

Phase III (2022-2031)

Phase III is the last ten years of the planning period, 2022-2031. Specific years for these projects were not identified, except for PMP, as any projection would be speculative. Projects falling within this timeframe include:

PMP Repairs (2022, 2025, 2028, 2031). Specific pavement maintenance items will not be identified until the year prior to the program cycle.

Apron Development. Additional tiedown apron parking is identified in the ALP and should be constructed when demand necessitates.

Taxilane Development for Hangar Access. This item includes preparation for hangar development in the following construction season.

Hangar Development. An area for hangar development was identified on the ALP. The CIP breaks the development of the hangar area into three phases, as development will likely occur over a span of many years to react to demand. This would be the final phase of development.

Cargo Apron. In accordance with the Oregon Aviation Plan recommendation, an area for cargo loading/unloading has been identified for construction.

Relocate Fuel Tanks. The Aurora Aviation fuel tanks are in an area that could be better used for other purposes. Once the tanks reach their useful life, they should be replaced elsewhere on the Airport (a location is identified on the ALP).

Construct Runway 17 Run-Up Area. Once the fuel tanks have been relocated, the area where they are currently located should be reconfigured to serve as a run-up area for Runway 17. (This assumes the displaced threshold project was not approved, and therefore the run-up area was not constructed as per the work items for the displaced threshold project).

PROJECT COSTS

A list of improvements and costs over the next 20 years are in **Table 7A**. All costs are estimated in 2011 dollars. Total project costs include construction, temporary flagging and signing, construction staking, testing, engineering, administration, and contingency, as applicable. Power utilities are included in all new hangar projects. No water service cost was added for the hangar developments. Project estimates are included in **Appendix L** for more detailed cost information.

Table 7A. Aurora State Airport Proposed Capital Improvement Plan with Costs

Aurora State Airport CIP 2012 – 2031							
#	Year	Description	Total Cost	ODA share	FAA Share	Private Share	Other Funding

[2] *ODA share for PMP is 75% of total cost*
[3] *Items 13-18 or Items 19-22 to be implemented, pending FAA determination*
[4] *If no displaced threshold project; construct R17 run-up at same time as fuel tank relocation project.*

FINANCIAL PLAN

This section presents the financial implementation analysis for Aurora State Airport and will examine various facets of the financial operating condition of the Airport. In addition, this chapter examines the Airport's historic operating revenues and expenses, and provides projections for future financial results. The projections of Airport revenues and expenses focus on incremental periods similar to the planning periods of this Master Plan's CIP: Phase I (Short Term, 2012-2016), Phase II (Intermediate Term, 2017-2021), and Phase III (Long Term, 2022-2031). These planning periods are used to identify the ability of the Airport to contribute to the local share of anticipated project costs, as required. It should be noted that Aurora State's Master Plan CIP is used as a guideline, and that capital projects should be undertaken when demand warrants and funding becomes available.

Financial Implementation Analysis Approach

The overall approach for the development of the financial implementation analysis included the following elements:

- Gathered and reviewed key airport documents related to historical financial results, capital improvement plans, operating budgets, regulatory requirements, and airport policies
- Evaluated Airport rates/charges and compared them with other airports
- Analyzed the existing operating and financial environment, as well as the overall financial management philosophy

- Reviewed the Master Plan CIP, cost estimates, and development schedule anticipated for the planning period in order to project the overall financial requirements for the program
- Determined and analyzed the sources and timing of capital funding available to meet the financial requirements for funding the CIP
- Analyzed historical operating revenues, developed operating revenue assumptions, and projected future operating revenues for the planning period
- Analyzed historical operating expenses, developed operations and maintenance expense assumptions, and projected future operating costs for the planning period
- Completed results of the analysis and evaluation in a Financial Plan Summary that provides conclusions regarding the financial practicality of the CIP

Airport Rates Comparison

Airport revenues are typically generated through user fees charged for the facilities and services that are provided. These fees are normally based on market conditions in the area and vary airport-to-airport. The airports pricing strategy should be to charge "market" rents for land and improvements (as is mandated by the FAA). Although limited data on existing rates for Aurora and other Oregon airports was provided for this study, a discussion on a broad range of typical airport rates and charges is provided below. Some of the typical rates highlighted within this section were produced by the *AAAE Rates and Charges Survey* conducted by the American Association of Airport Executives. These rates were determined from a small representative sample of airports throughout country and should be considered for comparison purposes only. Rates set by the ODA at Aurora State Airport should be determined through close coordination with airport and ODA management and based on the unique condition, amenities, location and demand for facilities.

Ground (Land) Lease

Nationally, most airport tenants lease land from an airport on which they have constructed hangars and other aviation-related facilities. Generally, the lease rate should be adjusted every three years to keep pace with changes in the general price levels as reflected in the U.S. Department of Labor's Bureau of Labor Statistics Consumer Price Index (CPI).

Table 7B contains the results of a 2008 ODA ground lease rate survey which compares the lease rates of Aurora State Airport to several other general aviation airports throughout Oregon. Land lease rates range from $0.08 to $0.25 per square foot annually. Due to its location and demand, ground lease rates at Aurora are higher than all other airports surveyed throughout the state. The average ground lease rate of those surveyed is $0.105 per square foot.

Table 7B. Oregon Airport Ground Lease Rates

Airport	Annual Rate (sq. ft.)	Airport	Annual Rate (sq. ft.)
Alkali Lake	$ 0.08	Nehalem Bay	$ 0.08
Aurora	$ 0.25	Oakridge	$ 0.08
Bandon	$ 0.18	Owyhee Reservoir	$ 0.08
Cape Blanco	$ 0.10	Pacific City	$ 0.08
Cascade Locks	$ 0.08	Pinehurst	$ 0.08
Chiloquin	$ 0.09	Prospect	$ 0.08
Condon	$ 0.08	Rome	$ 0.08
Cottage Grove	$ 0.15	Siletz Bay	$ 0.13
Independence	$ 0.18	Toketee	$ 0.08
Joseph	$ 0.11	Toledo	$ 0.08
Lebanon	$ 0.16	Wakonda	$ 0.08
McDermitt	$ 0.08	Wasco	$ 0.08
McKenzie Bridge	$ 0.08		

Source: Ground lease surveys commissioned by ODA, January 2008

Based on a national survey of 38 similar airports, the average airport receives $0.24 per square foot for unimproved ground leases. Based on this and the high degree of rate fluctuation between airports, the ground lease rate at Aurora State Airport appears to be consistent with its attributes and industry standards. For ground leases with improved features including smooth/flat grading, utilities nearby, and convenient/established access, on average, airports collect $0.33 or more per square foot each year.

Landing Fees

Less than 30 percent of airports throughout the country collect landing fees. Of those, less than half are collected by the Fixed Base Operator (FBO) on the airport and the fees are generally waived if fuel is purchased. The methodology used for determining landing fees varies widely and is as different as each airport. The following is a brief list of some of the landing fee methodologies applied at various airports;

- Only Aircraft over 50,000 lbs.
- $0.60 per 1,000 lbs. of max. gross take-off weight
- $0.08 per 1,000 lbs. for each aircraft
- $1.00 per 1,000 lbs. of max. landing weight over 12,500 lbs.
- $0.35 per 1,000 lbs. max. gross landing weight
- $1.50 per 1,000 lbs. max. gross take-off weight over 12,500 lbs.
- $1.00 per 1,000 lbs. max. gross landing weight for non-based aircraft with empty weights over 30,000 lbs.
- $0.07 per 1,000 lbs. for aircraft over 35,000 lbs.

These rates are provided for informational purposes. To remain competitive, it is not suggested that Aurora State Airport introduce/adjust a landing fee.

Tie Down Fees

A majority of airports charge a monthly tie-down fee for single engine aircraft. Based on a national survey, the average tie down fee is about $45.00 per month, although this varies greatly between

airports based on location and demand. Some airports collect a separate fee for multi-engine aircraft since they are larger and take up more room. These aircraft, however, typically use hangar storage due to their higher value. The average monthly tie down fee for multi-engine aircraft is $52.00. Many airports charge a daily tie-down fee. Though, like landing fees, many FBOs may waive this fee with the purchase of fuel.

T-Hangar/Conventional Hangar Rates

T-hangars provide individual hangars within a larger contiguous building. T-hangars are the most basic and affordable form of aircraft hangar infrastructure available to aircraft owners. Generally, they are built to hangar a single engine to a small multi-engine aircraft. Aircraft larger than these will require conventional hangar space. T-Hangar facilities provide an area of approximately 1,300 square feet per individual storage unit.

The AAAE Rates and Charges Survey determined monthly hangar fees at an average of $306.00 per month. However, the survey did not differentiate if the hangars were large or small. There are numerous factors that influence the price airports set for hangar fees, some of these being airport location, hangar amenities, demand, etc. At those airports which responded to the survey, fees ranged greatly from $78.00 to $1,200 per hangar per month.

Many airports throughout the country are choosing to lease land to an FBO or developer to construct T-hangars or conventional hangars and lease the individual units to aircraft owners. This trend is growing in popularity because it frees the airport from the burden of leasing and maintaining the space as well as collecting rent from multiple tenants.

Community Hangar Rates

Normally, community hangars are not owned or operated by the airport and are designed to accommodate numerous aircraft ranging in size from single engine aircraft up to large jets. This allows the aircraft owner the ability to have a larger space than a T-hangar while lowering costs by sharing space with other tenants. The average fee per month for community hangar space to accommodate a small multi-engine aircraft was $345.00. As with many of the other rates and charges discussed in this section, the rates in community hangars vary greatly based upon location, amenities, demand, etc.

Fuel Flowage Fee

In addition to charging FBOs land and/or facilities rent, some airports charge a fuel flowage fee to allow the service provider the right to sell fuel at the airport. In a national survey of 88 airports, 29 airports charged a fuel flowage fee to anyone selling fuel. The fee averaged $0.07 per gallon which is typically passed along to the customer purchasing fuel. Fuel flowage fees had a broad range, with the lowest being $0.03 and the highest being $0.20 per gallon. ODA charges fuel flowage fees at the Aurora State Airport.

There are many other rates and charges common to airports throughout the country. Those described above are some of the most common.

Capital Funding Sources

The development of the Aurora State Airport's Master Plan CIP is anticipated to be funded from several sources. These sources include federal grants, state grants, net operating revenues/cash reserves, and other unidentified funding sources, including private funding. Each of these sources of funds is described in the following sections.

Federal Aviation Administration (FAA) Funding

To promote the development of airports to meet the nation's needs, the Federal Government embarked on a Grants-In-Aid Program to units of state and local government after the end of World War II. Following multiple earlier versions of federal funding programs, the Airport Improvement Program (AIP) was established through the Airport and Airway Improvement Act of 1982. The initial AIP provided funding legislation through fiscal year 1992, but since then, it has been authorized and appropriated on a yearly or even quarterly basis. Funding for the AIP is generated through taxes on airline tickets, freight way bills, international departure fees, general aviation fuel, and jet fuel.

AIP grants include entitlement grants, which are allocated among airports by a formula that is driven by passenger enplanements, and by discretionary grants that are awarded in accordance with specific guidelines. Generally, primary airports receive entitlements based on the number of enplaning passengers and landed cargo weights, while non-primary airports, which include general aviation airports, likewise receive some entitlements and may also be eligible for federal state apportionment funding. The total amount of state apportionment funding is based on an area/population formula for the state, while the amount of non-primary entitlements is computed from the needs list for the particular airport in the published National Plan of Integrated Airport Systems (NPIAS). Federal Airport Improvement Funds must be spent on FAA-eligible projects as defined in FAA Order 5100.38C "*Airport Improvement Program (AIP) Handbook*." The handbook and the latest authorization state that:

- An airport must be included in the current version of the NPIAS;
- Non-primary entitlement funds of $150,000 per year can be accumulated for up to four years;
- The federal portion of AIP grants increases to 95% for all general aviation airports; and
- If an airport has no airside improvement needs, entitlement funds can be used for certain landside projects.

General aviation and commercial service airports also compete for federal discretionary funds. These funds are awarded based on priority ratings given to each potential project by the FAA. The prioritization process makes certain that the most important and beneficial projects (as viewed by the FAA) are the first to be completed, given the availability of adequate discretionary funds. Federal funding is limited to development that is justified to meet aviation demand according to FAA guidelines. Each NPIAS airport development project is subject to eligibility and justification requirements as part of the normal AIP funding process.

As of the writing of this document, the AIP program is due for reauthorization and will likely see changes. The future of the AIP program may include changes to federal share amounts, non-primary entitlements, set-asides, and/or passenger facility charges (PFCs).

However, under the current reauthorization legislation and based on its inclusion in the NPIAS, the Aurora State Airport is currently eligible to receive entitlements of $150,000 per year from 2010 through 2030. Additional funding could be realized through state apportionment funding and AIP discretionary funding, based on the aforementioned project eligibility ranking methodology. For the Aurora State Airport CIP, this financial plan assumes total AIP grant awards (entitlement/discretionary) funding of $370,000 for the Phase I period, $11.4 million during Phase II, and $3.1 million for Phase III.

Oregon Department of Aviation (ODA)

Airports that are owned by local municipalities or governments are typically responsible for capital improvement project costs remaining from funding not eligible through FAA grants mentioned above. As a state owned airport, the CIP for Aurora State Airport is managed by ODA. Improvements at Aurora State, along with the needs of over 30 state airports, are balanced as funds are available. Demand for funding far exceeds the annual funding; the result is that many projects are deferred over extended periods until funding can be obtained. The state also looks to local communities to support the funding of capital improvement projects.

ODA administers several programs for funding airport planning, construction and maintenance projects. As mentioned before, Aurora State Airport must compete with other airports in the state through these funding programs. The following is a description of each funding program:

Pavement Maintenance Program (PMP).

The pavement maintenance program provides a resource for airfield pavement maintenance projects. The program funds pavement maintenance and associated improvements (crack filling, repair, sealcoats, etc.), which have not traditionally been eligible for FAA funding. The PMP may also be expanded to include pavement overlays, which could potentially be used for Runway 17/35, where FAA funding is not available.

Funding for the PMP is generated through collection of aviation fuel taxes. ODA manages the PMP through an annual consultant services contract and work is programmed on a 3-year regional rotation. The program includes a regular schedule of inspection and subsequent field work. Benefits from the PMP include:

- Economy of scale in bidding contracts
- Federal/State/Local partnerships that maximize airport improvement funds
- PMP is not a grant program and local match is on a sliding scale (50% - 5% required)

The PMP includes the following features:

- Review prior year's Pavement Condition Index (PCI) reports
- Only consider PCIs above 70
- Apply budget
- Limit work to patching, crack sealing, fog sealing, slurry sealing
- Add allowance for striping
- Program to include approximately 20 airports per year, depending on funding levels

Financial Assistance to Municipalities (FAM) Grant Program

ODA also provides limited funding assistance through the FAM Grant Program to foster a statewide system of airports by providing the discretionary award of financial assistance for airport planning, development and capital improvement projects. Program funding depends upon the dedicated FAM Grant Program amount in the ODA's biennial budget, as approved by the Oregon Legislature; and ODA policies and priorities.

The FAM details include the following:

- Maximum possible annual grant amount per airport is $25,000
- The local match requirement parallels the PMP that links the match amount to the airport category as designated in the Oregon Aviation Plan
- The match structure progresses from 5% to 50% based on airport category
- Eligible airport capital improvement projects and planning projects are to be selected on a priority basis
- FAM Grants may also be used as sponsor match for Federal Aviation Administration AIP grants

For the Aurora State Airport CIP, this financial plan assumes state apportionment of $720,000 in Phase I, $620,000 in Phase II, and $270,000 in Phase III.

Other Capital Funding

The traditional funding sources described in previous paragraphs are often insufficient to finance the full range of projects programmed for development during a CIP. Due to the lack of traditional funding, other non-traditional funding sources will be needed to implement non-eligible AIP projects. Alternative sources of funds will require about $6.8 million in Phase I, $1.2 million in Phase II, and $1.2 million in Phase III. The sources of these other funding needs have been identified in broad terms and will likely be needed to supplement the total capital shortfall of almost $10 million through the 20-year planning period. If these funding sources cannot be ultimately obtained in the time frames needed, the associated projects will have to be delayed until such time as appropriate funding can be identified.

Note that non-traditional funding sources for airport development may include the following sources:

- *Connect*Oregon III
- General Fund Revenues
- Bond Issues
- Private Funding

Of these, general fund revenues and general obligation bonds are by far the most common funding sources. Revenue bonds supported by airport generated revenues are seldom used at general aviation airports because most general aviation airports do not generate enough money to pay operating expenses and the debt service of capital funding requirements.

*Connect*Oregon III

The 2009 Oregon Legislature approved $95 million in lottery-backed bonds for the *Connect*Oregon III program and $5 million for rural airports as part of HB 2001, the Jobs and Transportation Act. Building

on the success of the first two authorizations in 2005 and 2007, ConnectOregon III will continue to improve the connections between the various modes of transportation throughout the state.

General Fund Revenues

Capital development expenditures from general fund revenues have been somewhat difficult to obtain in recent years. One reason for this difficulty is the shortfall in local general fund revenues. Budgetary problems have created an environment where local funding is uncertain. The amount of general fund support for airport improvement projects varies by airport and is generally based upon the local tax base, priority of the development project, historical funding trends, and local attitudes concerning the importance of aviation.

Bond Funds

Airport authorities can issue bonds without approval from the city or county. However, they must use their own revenue to repay the bonds. Airport revenue is typically used to repay these bonds. For an airport operated by a state, like Aurora, bond issues funding the state share of airport development projects would likely compete with bond issues for other types of state improvements. As with the general fund apportionment, bond issues supporting airport development depend greatly on the priority assigned to such projects by the state and local community.

Private Funds

Items such as storage and maintenance hangars, fuel systems, and pay parking lots are not typically eligible for federal or other grant funding assistance at public airports because they generate income for the airport. Airport operators sometimes work with FBOs or other local businesses to fund these types of improvements.

With respect to Aurora State Airport, each of these options would need to be weighed independently to determine the appropriateness of their potential application for eligible projects.

Financial Analysis and Implementation Plan

This section evaluates the financial reasonableness of implementing the Master Plan CIP during the planning period (2012 through 2031).

Estimated Project Costs and Development Schedule

A listing of capital improvement projects has been assembled based on the preferred development alternative for the Aurora State Airport established in earlier sections of this Master Plan. This project list has been coordinated with the Airport Layout Plan (ALP) drawing set and the CIP, both of which should be continuously updated by airport management, as required. Generally, the CIP itself has three primary purposes:

1. Identify improvement projects that will be required at an airport over a specific period of time;
2. Estimate the order of implementation of the projects included in the plan; and
3. Estimate the total costs and funding sources of the projects.

It is important to note that as the CIP progresses from project planning in the current year to projects planned in future years, the plan becomes less detailed and more flexible. Additionally, the CIP is typically modified on an annual basis as new projects are identified, projects change, and financial environments evolve.

For Aurora State Airport, each proposed capital improvement project over the 20-year planning horizon has been assigned to one of three specific planning periods: Phase I, short term (2012-2016); Phase II, intermediate term (2017-2021); and Phase III, long term (2022-2031) as shown in the above Table 7A. This table also includes estimates of the funding source eligibility for each project. Note that the estimates contained in this table were derived from analyzing similar projects, but should be re-evaluated at the time of initiation.

Phase I contains approximately $7.9 million in capital projects including air traffic control tower construction, service road construction, apron repair, hangar and associated taxilane construction, helipad development and an environmental assessment for runway enhancements to take place later in the planning period. It is estimated that the sponsor (ODA) share of Phase I capital costs will be approximately $582,600 and the federal share will be about $2,511,200 with the balance (approximately $4.8 million) coming from other sources.

Phase II contains approximately $12.0 million in total capital projects. Most projects in this phase are related to Runway 17/35 improvements and include runway paving, possible road relocation as well as property acquisitions for runway protection zones (RPZ), avigation easements and runway improvements. Other projects in this phase are for hangar and associated taxilane construction and airfield support systems. The ODA share of the proposed development plan in Phase II is approximately $500,000 while most of the funding is coming from the FAA. The emergency response facility, hangar and taxilane development is funded from private sources.

It is important to note, either project items 13-18 or items 19-22 may be implemented, depending on FAA determination. This being the case, total project costs associated with this phase are listed by the most costly alternative (runway extension) to plan conservatively in the financial analysis.

Phase III contains $4.5 million in total capital projects, including apron development as well as fuel tank relocation and Runway 17 run-up area development. As with all other phases, this phase also includes hangar and associated taxilane development to keep pace with expected demand. In addition, like all other phases, this phase includes on-going PMP projects to maintain the Airport's runway and taxiway system. About $200,000 are expected to be funded by ODA in this phase. The FAA share is approximately $2.1 million, with the remainder coming from private sources.

Airport Revenues and Expenses

For Aurora State Airport, operating revenues are realized from the following primary sources:

- Licenses and Fees
- Rents and Royalties
- Miscellaneous Revenues

Landside facility development and levels of aviation activity are typically the primary factors affecting airport operating revenues. Note that as additional airport development occurs, the number of based aircraft and aircraft operations will normally increase and new/updated leases will be enacted, typically resulting in airport operating revenues increasing in a corresponding fashion.

Airport operating revenues are offset by airport operating expenses, typically referred to as Operation and Maintenance (O&M) costs. Airport operating expenses are comprised of the day-to-day costs incurred by operating the airport. Primary components of O&M costs at Aurora State Airport include Salaries and Wages as well as Services and Supplies and are made up of the following:

- Personnel Services – Includes full-time salaries, overtime pay, accrued personal leave, payroll taxes, health insurance, pension and retirement benefits, unemployment insurance and workers' compensation expense.
- Fixed Costs – Includes building rentals, insurance (building, vehicle, liability, etc.), phones (cell/land), utilities (power, natural gas, trash, etc.), irrigation assessments, etc.
- Administrative Costs – Includes office supplies, postage, printing, computer software, personnel equipment, operations supplies, advertising, marketing, training, dues, small equipment, etc.
- Operations Expenses – Includes repair/maintenance of buildings (hangars, terminal), ground maintenance (asphalt, pests, snow, weeds, lawns), vehicles (repair, maintenance, fuel), repair/maintenance of equipment (fuel island, beacon, windsock, NAVAIDS, taxiway/runway lights), security (fences, gates, cameras), etc.
- Contractual Services – Includes large maintenance projects, background checks, lot surveys, consultant services, merchant fees, etc.

The ODA oversees two funds as a part of the operation at Aurora State Airport: the Public Transportation Fund and Capital Projects Fund.

Public Transportation Fund

Revenues of this fund are generated through the collection of Airport fees, licenses, rents, royalties and other sources. The Public Transportation Fund expenses are used to maintain the day-to-day operations of the Airport as well as to pay for some professional services required by the Airport. A large share of revenue in the Fund is from federal sources, other grants and fund transfers. Similarly, a substantial expense to this fund is through professional service expenses incurred by the Airport for projects. These items are not considered part of the Airport's daily operating budget and will not be included in the analysis of operating income.

Capital Projects Fund

Typically, capital costs associated with infrastructure development comes the Capital Projects Fund budget. The primary source of revenue for the Capital Projects Fund is from the FAA through AIP eligible project grants. Additional funds may come from other sources as well.

The historic revenues and expenses for these two funds, as they are related to Aurora State Airport, over fiscal years 2007 to 2010 are presented in **Table 7C**.

Table 7C. Aurora State Airport Funds

	FY2007	FY2008	FY2009	FY2010
Public Transportation Fund				
Licenses and Fees	$ 869.94	$ 116,748.35	$ 122,970.60	$ 128,357.96
Rents and Royalties	149,205.80	55,342.11	44,461.20	63,428.09

Revenues	*$ 161,909.59*	*$ 173,897.81*	*$ 179,081.42*	*$ 204,095.96*
Salaries and Wages	19,288.20	19,234.37	19,263.29	14,426.09
Services, Supplies, Other	65,793.70	56,666.85	38,435.26	81,609.40
Expenses	*$ 85,081.90*	*$ 75,901.22*	*$ 57,698.55*	*$ 96,035.49*
Operating Income	$ 76,827.69	$ 97,996.59	$ 121,382.87	$ 108,060.47
Capital Projects Fund				
Revenues	$ 207,856.00	$ 2,905,882.60	$ 1,857,084.51	$ 13,198.01
Expenses	155,561.62	3,524,431.15	1,005,192.61	0.01
Capital Projects Fund Total	$ 52,294.38	$ (618,548.55)	$ 851,891.90	$ 13,198.00

** Public Transportation Fund balances above do not reflect federal or other grant contributions as well as professional service fee expenses (which may be eligible for grant reimbursement)*

Projected Airport Operating Revenues and Expenses

The continued growth of Aurora State Airport, in terms of activity, tenants, new leases and facility development, will impact the Airport's operating revenues and expenses over the planning period. Actual future financial outcomes will be determined by a variety of factors, many of which are impossible to identify at the current time. However, the projections for airport operating revenues and expenses are based on recent financial results, year-to-date revenues and expenses for 2011, and activity and tenant growth trends identified in Chapter Three.

Projections of future airport operating revenues and expenses at Aurora State Airport for the periods 2015 through 2030 are presented in **Table 7D**. The following information for operating revenues was established through close consideration of historical trends, as well as proposed airport development initiatives and how they might impact those future revenues. In most cases, revenue projections resulted from normal growth factors refined to more closely reflect the circumstances of Aurora State Airport. The table below projects the Public Transportation Fund only, since Capital Project funds are determined almost solely on project eligibility and grant availability which fluctuates greatly from year-to-year. Further, it is important to note that federal revenue and contributions from other funds as well as professional service expenses to the Public Transportation Fund are not included in this projection as they have varied significantly from year-to-year and do not reflect true operating income.

Table 7D. Projected Aurora State Airport Operating Revenues and Expenses

	Current FY2011	FY2015	FY2020	FY2025	FY2030
Public Transportation Fund					
Licenses and Fees	$ 128,357.96	$ 145,000	$ 176,000	$ 224,000	$ 300,000
Rents and Royalties	63,428.09	71,000	87,000	111,000	148,000
Other Misc. Revenues	12,309.91	14,000	17,000	22,000	29,000
Revenues	*$ 204,095.96*	*$ 230,000*	*$ 280,000*	*$ 357,000*	*$ 477,000*
Salaries and Wages	14,336.84	16,000	19,000	24,000	33,000
Services, Supplies, Other	96,035.49	108,000	128,000	164,000	219,000
Expenses	*$ 110,372.33*	*$ 124,000*	*$ 147,000*	*$ 188,000*	*$ 252,000*
Operating Income	$ 93,723.63	$ 106,000	$ 133,000	$ 169,000	$ 225,000

**Does not include federal or other grant revenues or professional service expenses*

Revenues were projected to increase at standard rates (starting at 3% annually) that will increase beyond FY2015 to account for increased tenants and the resulting volume of activity. In operating expenses, increases in salaries, as well as overall operational activities are based on accepted inflationary growth rates (primarily a 3% annual growth), with slightly higher growth factors for fuel costs in order to account for some volatility in the supply market, as well as for the overall personnel costs.

Based on anticipated CIP project costs and the projected operating income shown above, annual income from the Airport's operation will be sufficient to cover the ODA share of CIP project related costs in Phase I. The ODA share of CIP Phase I costs amounts to $582,600. When projected income is interpolated from the table above for each year FY2011 through FY2016, it is estimated that the Airport could expect about $610,000 in operating income over the 6-year period to go toward CIP projects. Additionally, ODA's projected income during CIP Phases II and III is expected to cover the agency's project share.

Financial Plan Summary

The primary goal is for the Airport to evolve into a facility that will best serve the air transportation needs of the region while simultaneously developing into a self-sustaining economic generator. This Master Plan Update can best be described as being the road map to helping the Airport achieve these goals. But it should be recognized that planning is a continuous process that does not end with the completion of the Master Plan in that the fundamental basic issues that have driven this Master Plan will remain valid for many years. Therefore, the ability to continuously monitor the existing and forecast status of airport activity will be a key ingredient in maintaining the applicability and relevance of this study.

In order to realize those goals through the successful implementation of airport development projects, sound and measured decisions by the ODA must be made. Two of the most important factors in influencing the decision to move forward with a specific improvement are airport activity and funding timing. Both factors must be considered in the implementation of this Master Plan in that while airport

activity levels provide the "what" and the "why" in the establishment of airport improvements, the timing of funding provides the "how." Through the course of this Master Plan effort, the "what" and the "why" have been discussed in detail in previous sections. This chapter has addressed the "how" by providing an overview of the sources of potential funding and the practical financial realities required to implement this overall airport development program. However, although every effort has been made in this chapter to conservatively estimate when facility development may be required, aviation demand and the availability of financial resources for capital projects will ultimately dictate when facility improvements need to be implemented, accelerated or delayed.

Previous sections of this analysis provided a practical approach for scheduling capital expenditures to match the availability of capital financing. It is important to note, however, that ODA does not allocate any indirect revenues or expenses to any of their 28 airports. All the expenses and revenues on the statements provided are those that are specific to Aurora State Airport. As such, any additional ODA revenues would not be allocated to Aurora State Airport until the project costs are incurred and revenues are transferred. Based on ODA acceptance of CIP projects and the understanding that funding for the state's obligation will be met at the time of project implementation, the Master Plan CIP is financially possible.

Key assumptions supporting the financial plan relate to the availability and timeliness of the funding sources that have been indicated. Continuation of the AIP entitlement program at authorized funding levels is essential. Receiving state apportionment and AIP grants of approximately $1.1 million during Phase I, almost $12 million during Phase II, and $3.4 million during Phase III as indicated are critical to the financial feasibility of implementing these projects.

Appendix A:
GLOSSARY OF TERMS AND ACRONYMS

Airport Master Plan Update

Aurora State Airport

Appendix A
GLOSSARY OF TERMS

DEFINITIONS

ACCELERATE – STOP DISTANCE AVAILABLE (ASDA). See declared distances.

AIR CARRIER. An operator, which: (1) performs at least five round trips per week between two or more points and publishes flight schedules which specifies the times, days of the week, and places between which such flights are performed; or (2) transport mail by air pursuant to a current contract with the U.S. Postal Service. Certified in accordance with Federal Aviation Regulation (FAR) Parts 121 and 127.

AIR ROUTE TRAFFIC CONTROL CENTER (ARTCC). A facility established to provide air traffic control service to an aircraft operating on an IFR flight plan within controlled airspace and principally during the enroute phase of flight.

AIR TAXI. An air carrier certificated in accordance with FAR Part 135 and authorized to provide, on demand, public transportation of persons and property by aircraft. Generally operates small aircraft for hire for specific trips.

AIRCRAFT. An aircraft is a device that is used or intended to be used for flight in the air.

AIRCRAFT APPROACH CATEGORY. A grouping of aircraft based on 1.3 times the stall speed in their maximum certificated landing weight. The categories are as follows:

- Category A: Speed less than 91 knots.
- Category B: Speed 91 knots or more, but less than 121 knots.
- Category C: Speed 121 knots or more, but less than 141 knots.
- Category D: Speed 141 knots or more, but less that 166 knots.
- Category E: Speed greater than 166 knots.

AIRPLANE. Means an engine-driven fixed-wing aircraft heavier than air that is supported in flight by the dynamic reaction of the air against its wings.

AIRPLANE DESIGN GROUP (ADG). A grouping of aircraft based upon relative wingspan or tail height (whichever is most demanding). The groups are as follows:

Group	Tail Height (ft)	Wingspan (ft)
1	<20	<49
II	20 - <30	49 - <79
III	30 - <45	79 - <118
IV	45 - <60	118 - <171
V	60 - <66	171 - <214
VI	66 - <80	214 - <262

AIRPORT. An airport is an area of land or water that is used or intended to be used for the landing and takeoff of aircraft, and includes its buildings and facilities, if any.

AIRPORT ELEVATION. The highest point on an airport's usable runway expressed in feet above mean sea level (MSL).

AIRPORT LAYOUT DRAWING (ALD). The drawing of the airport showing the layout of existing and proposed airport facilities.

AIRPORT REFERENCE CODE (ARC). A coding system used to relate airport design criteria to the operational (Aircraft Approach Category) to the physical characteristics (Airplane Design Group) of the airplanes intended to operate at the airport.

AIRPORT REFERENCE POINT (ARP). The latitude and longitude of the approximate center of the airport.

AIRPORT TRAFFIC CONTROL TOWER (ATCT). A central operations facility in the terminal air traffic control system, consisting of a tower, including an associated instrument flight rule (IFR) room if radar equipped, using air/ground communications and/or radar, visual signaling, and other devices to provide safe and expeditious movement of terminal air traffic.

ALERT AREA. See special-use airspace.

ANNUAL INSTRUMENT APPROACH (AIA). An approach to an airport with the intent to land by an aircraft in accordance with an IFR flight plan when visibility is less than three miles and/or when the ceiling is at or below the minimum initial approach altitude.

APPROACH LIGHTING SYSTEM (ALS). An airport lighting facility, which provides visual guidance to landing aircraft by radiating light beams by which the pilot aligns the aircraft with the extended centerline of the runway on his/her final approach and landing.

APPROACH MINIMUMS. The altitude below which an aircraft may not descend while on an IFR approach unless the pilot has the runway in sight.

AUTOMATIC DIRECTION FINDER (ADF). An aircraft radio navigation system, which senses and indicates the direction to a non-directional radio beacon (NDB) ground transmitter.

AUTOMATED WEATHER OBSERVATION STATION (AWOS). Equipment used to automatically record weather conditions (i.e. cloud height, visibility, wind speed and direction, temperature, dew-point, etc.).

AUTOMATED TERMINAL INFORMATION SERVICE (ATIS). The continuous broadcast of recorded non-control information at towered airports. Information typically includes wind speed, direction and active runway.

AZIMUTH. Horizontal direction expressed as the angular distance between true north and the direction of a fixed point (as the observer's heading).

BASE LEG. A flight path at right angles to the landing runway off its approach end. The base leg normally extends from the downwind leg to the intersection of the extended runway centerline. See Traffic Pattern.

BEARING. The horizontal direction to or from any point, usually measured clockwise from true north or magnetic north.

BLAST FENCE. A barrier used to divert or dissipate jet blast or propeller wash.

BUILDING RESTRICTION LINE (BRL). A line that identifies suitable building area locations on the airport.

CIRCLING APPROACH. A maneuver initiated by the pilot to align the aircraft with the runway for landing when flying a predetermined circling instrument approach under IFR.

CLASS A AIRSPACE. See Controlled Airspace.

CLASS B AIRSPACE. See Controlled Airspace.

CLASS C AIRSPACE. See Controlled Airspace.

CLASS D AIRSPACE. See Controlled Airspace.

CLASS E AIRSPACE. See Controlled Airspace.

CLASS G AIRSPACE. See Controlled Airspace.

COMPASS LOCATOR (LOM). A low power, low/medium frequency radio-beacon installed in conjunction with the instrument landing system at one or two or the marker sites.

CONTROLLED AIRSPACE. Airspace of defined dimensions within which air traffic control services are provided to instrument flight rules (IFR) and visual flight rules (VFR) flights in accordance with the airspace classification. Controlled airspace in the United States is designated as follows.

CLASS A. The airspace from 18,000 feet mean sea level (MSL) up to but not including 60,000 MSL (flight level FL600).

CLASS B. Generally, the airspace from the surface to 10,000 feet MSL surrounding the nation's busiest airports. The configuration of Class B airspace is unique to each airport, but typically consists of two or more layers of airspace and is designed to contain all published instrument approach procedures to the

airport. An air traffic control clearance is required for all aircraft to operate in the area.

CLASS C. Generally, the airspace from the surface to 4,000 feet above the airport elevation (charted as MSL) surrounding those airports that have an operational control tower and radar approach and are served by a qualifying number of IFR operations or passenger enplanements. Although individually tailored for each airport, Class C airspace typically consists of a surface area with a five nautical miles (nm) radius and an outer area with a 10 nm radius that extends from 1,200 feet to 4,000 feet above the airport elevation. Two-way radio communication is required for all aircraft.

CLASS D. Generally, that airspace from the surface to 2,500 feet above the airport elevation (charted as MSL) surrounding those airports that have an operational control tower. Class D airspace is individually tailored and configured to encompass published instrument approach procedures. Unless otherwise authorized, all persons must establish two-way radio communications.

CLASS E. Generally, controlled airspace not classified as Class A, B, C or D. Class E airspace extends upward from either the surface or a designated altitude to the overlying or adjacent controlled airspace. When designated as a surface area, the airspace will be configured to contain all instrument procedures. Class E airspace encompasses all Victor Airways. Only aircraft following instrument flight rules are required to establish two-way radio communications with air traffic control.

CLASS G. Generally, that airspace not classified as Class A, B, C, D or E. Class G airspace extends from the surface to the overlying Class E airspace

CONTROLLED FIRING AREA. See special-use airspace.

CROSSWIND. Wind flow that is not parallel to the runway of the flight of an aircraft.

CROSSWIND LEG. A flight path at right angles to the landing runway off its upwind end. See Traffic Pattern.

DECLARED DISTANCES. The distances declared available for the airplane's takeoff run, takeoff distance, accelerate-stop distance and landing distance requirements. The distances are:

TAKEOFF RUN AVAILABLE (TORA). The runway length declared available and suitable for the ground run of an airplane taking off.

TAKEOFF DISTANCE AVAILABLE (TODA). The TORA plus the length of any remaining runway and/or clearway beyond the far end of the TORA.

ACCELERATE – STOP DISTANCE AVAILABLE (ASDA). The runway plus stopway length declared available for the acceleration and deceleration of an aircraft aborting a takeoff.

LANDING DISTANCE AVAILABLE (LDA). The runway length declared available and suitable for landing.

DISPLACED THRESHOLD. A threshold that is located at a point on the runway other than the designated beginning of the runway.

DISTANCE MEASURING EQUIPMENT (DME). Equipment (airborne and ground) used to measure, in nautical miles, the slant range distance of an aircraft from the DME navigational aid.

DNL. The 24-hour average sound level, in A-weighed decibels, obtained after the addition of ten decibels to sound levels for the periods between 10 pm and 7 am as averaged over a span of one year. It is the FAA standard metric for determining the cumulative exposure of individuals to noise.

DOWNWIND LEG. A flight path parallel to the landing runway in the direction opposite to landing. The downwind leg normally extends between the crosswind leg and the base leg. Also see Traffic Pattern.

EASEMENT. The legal right of one party to use a portion of the total rights in real estate owned by another party. This may include the right of passage over, on or below property; certain air rights above property, including view rights; and the rights to any specified form of development or activity, as well as any other legal rights in the property that may be specified in the easement document.

ENPLANED PASSENGERS. The total number of revenue passengers boarding aircraft, including originating, stop-over, and transfer passengers, in scheduled and non-scheduled services.

FINAL APPROACH. A flight path in the direction of landing along the extended runway centerline. The final approach normally extends from the base leg to the runway. See Traffic Pattern

FIXED BASE OPERATOR (FBO). An FBO typically offers the following services (or a combination thereof): aircraft charter operation, aircraft rental, aircraft storage, flight training, aircraft sales/leasing, aircraft component maintenance, aircraft parts sales, and aircraft maintenance.

FRANGIBLE NAVAID. A navigational aid which retains its structural integrity and stiffness up to a designated maximum load, but on impact from a greater load, breaks, distorts, or yields in such a manner as to present the minimum hazard to aircraft.

GENERAL AVIATION. That portion of civil aviation that encompasses all facets of aviation except air carriers holding a certificate of convenience and necessity, and large aircraft commercial operators.

GLIDE SLOPE (GS). Provides vertical guidance for aircraft during approach and landing. The glide slope consists of 1) electronic components emitting signals which provide vertical guidance by reference to airborne instruments during instrument approaches such as ILS; or 2) visual ground aids, such as VASI, which provide vertical guidance for VFR approach or for the visual portion of an instrument approach and landing.

GLOBAL POSITIONING SYSTEM (GPS). A system of 24 satellites used as reference points to enable navigators equipped with GPS receivers to determine their latitude, longitude and altitude.

HELIPAD. A designated area for the takeoff, landing and parking of helicopters.

HIGH-SPEED EXIT TAXIWAY. A long radius taxiway designed to expedite aircraft turning off the runway after land (at speeds up to 60 knots), thus reducing runway occupancy time.

INSTRUMENT APPROACH. A series of predetermined maneuvers for the orderly transfer of an aircraft under instrument flight conditions from the beginning of the initial approach to a landing or to a point from which a landing may be made visually.

INSTRUMENT FLIGHT RULES (IFR). Rules governing the procedures for conducting instrument flight. Also a term used by pilots and controllers to indicate type of flight plan.

INSTRUMENT LANDING SYSTEM (ILS). A precision instrument approach system, which normally consists of the following electronic components and visual aids: 1) localizer, 2) glide slope, 3) outer marker, 4) middle marker and 5) approach lights.

LANDING DISTANCE AVAILABLE (LDA). See declared distances.

LOCAL TRAFFIC. Aircraft operating in the traffic pattern or within site of the tower, or aircraft known to be departing or arriving from the local practice areas, or aircraft executing practice instrument approach procedures. Typically, this includes touch-and-go training operations.

LOCALIZER. The component of an ILS, which provides course guidance to the runway.

LOCALIZER TYPE DIRECTIONAL AID (LDA). A facility of comparable utility and accuracy to a localizer, but is not part of a complete ILS and is not aligned with the runway.

LORAN. Long range navigation, an electronic navigational aid which determines aircraft position and speed by measuring the difference in the time of reception of synchronized pulse signals from two fixed transmitters. Loran is used for enroute navigation.

MICROWAVE LANDING SYSTEM (MLS). An instrument approach and landing system that provides precision guidance in azimuth, elevation, and distance measurement.

MILITARY OPERATIONS AREA (MOA). See special-use airspace.

MISSED APPROACH COURSE (MAC). The flight route to be followed if, after an instrument approach, a landing is not effected, and occurring normally when the aircraft has descended to the decision height and has not established visual contact or when directed by air traffic control to pull up or to go around again.

MOVEMENT AREA. The runways, taxiways, and other areas of an airport which are utilized for taxiing/hover taxiing, air taxiing, takeoff, and landing of aircraft, exclusive of loading ramps and parking areas. At those airports with a tower, air traffic control clearance is required for entry onto the movement area.

NAVAID. A term used to describe any electrical or visual air navigational aid, light, sign, and associated supporting equipment.

NOISE CONTOUR. A continuous line on a map of the airport vicinity connecting all points of the same noise exposure level.

NONDIRECTIONAL BEACON (NDB). A beacon transmitting nondirectional signals whereby the pilot of an aircraft equipped with direction finding equipment can determine his/her bearing to and from the radio beacon and home on, or track to, the station. When the radio beacon is installed in conjunction with the Instrument Landing System marker, it is normally called a compass locator.

NONPRECISION APPROACH PROCEDURE. A standard instrument approach procedure in which no electronic glide slope is provided, such as VOR, TACAN, NDB or LOC.

OBJECT FREE AREA (OFA). An area on the ground centered on a runway, taxiway or taxilane centerline provided to enhance the safety of aircraft operations by having the area free of objects, except for objects that need to be located in the OFA for air navigation or aircraft ground maneuvering purposes.

OBSTACLE FREE ZONE (OFZ). The airspace below 150 feet above the established airport elevation and along the runway and extended runway centerline that is required to be kept clear of all objects, except for frangible visual NAVAIDs that need to be located in the OFZ because of their function, in order to provide clearance for aircraft landing or taking off from the runway, and for missed approaches.

OPERATION. A takeoff or landing.

OUTER MARKER (OM). An ILS navigation facility in the terminal area navigation system located four to seven miles from the runway edge on the extended centerline indicating to the pilot that he/she is passing over the facility and can begin final approach.

PRECISION APPROACH. A standard instrument approach procedure, which provides runway alignment and glide slope (descent) information. It is categorized as follows:

CATEGORY I. A precision approach which provides for approaches with a decision height of not less than 200 feet and visibility not less than ½ mile or Runway Visual Range (RVR) 2400 with operative touchdown zone and runway centerline lights.

CATEGORY II. A precision approach, which provides for approaches with a decision height of not less than 100 feet and visibility not less that 1200 feet RVR.

CATEGORY III. A precision approach, which provides for approaches with minima less than Category II.

PRECISION APPROACH PATH INDICATOR (PAPI). A lighting system providing visual approach slope guidance to aircraft during a landing approach. It is similar to a Visual Approach Slope Indicator (VASI) but provides a sharper transition between the colored indicator lights.

PRECISION OBJECT FREE ZONE (POFZ). An area centered on the extended runway centerline, beginning at the runway threshold and extending behind the runway threshold that is 200 feet long by 800 feet wide. The POFZ is a clearing standard, which requires the POFZ to be kept clear of above ground objects protruding above the runway safety area edge elevation (except for NAVAIDs). The POFZ applies to all new authorized instrument approach procedures with less than ¾ mile visibility.

PROHIBITED AREA. See special-use airspace.

REMOTE TRANSMITTER / RECEIVER (RTR). See remote communications outlet. RTRs serve ARTCCs.

RELIEVER AIRPORT. An airport to serve general aviation aircraft, which might otherwise use a congested air-carrier served airport.

RESTRICTED AREA. See special-use airspace.

RNAV. Area Navigation – airborne equipment, which permits flights over determined tracks within prescribed accuracy tolerances without the need to overfly ground-based navigation facilities. Used enroute and for approaches to an airport.

RUNWAY. A defined rectangular area on an airport prepared for an aircraft landing and taking off. Runways are normally numbered in relation to their magnetic direction, rounded off to the nearest 10 degrees. The runway heading on the opposite end of the runway is 180 degrees from that runway end. Aircraft can takeoff or land from either end of a runway, depending upon wind direction.

RUNWAY BLAST PAD. A surface adjacent to the ends of runways provided to reduce the erosive effect of jet blast and propeller wash.

RUNWAY END IDENTIFIER LIGHTS (REIL). Two synchronized flashing lights, one on each side of the runway threshold, which provide rapid and positive identification of the approach end of a particular runway.

RUNWAY GRADIENT. The average slope, measured in percent, between the two ends of a runway.

RUNWAY PROTECTION ZONE (RPZ). An area off the runway end to enhance the protection of people and property on the ground. The RPZ is trapezoidal in shape. Its dimensions are determined by the aircraft approach speed and runway approach type/minima.

RUNWAY SAFETY AREA (RSA). A defined surface surrounding the runway prepared or suitable for reducing the risk of damage to airplanes in the event of an undershoot, overshoot or excursion from the runway.

RUNWAY VISUAL RANGE (RVR). An instrumentally derived value, in feet, representing the horizontal distance a pilot can see down the runway from the runway end.

RUNWAY VISIBILITY ZONE (RVZ). An area on the airport to be kept clear of permanent objects so that there is an unobstructed line-of-site from any point five feet above the runway centerline to any point five feet above an intersecting runway centerline.

SEGMENTED CIRCLE. A system of visual indicators designed to provide traffic pattern information at airports without operating control towers.

SHOULDER. An area adjacent to the edge of paved runways, taxiways or aprons providing a transition between the pavement and the adjacent surface; support for aircraft running off the pavement; enhanced drainage; and blast protection. The shoulder does not necessarily need to be paved.

SLANT-RANGE DISTANCE. The straight line distance between an aircraft and a point on the ground.

SPECIAL USE AIRSPACE. Airspace of defined dimensions identified by a surface area wherein activities must be confined because of their nature and/or wherein limitations may be imposed upon aircraft operations that are not a part of those activities. Special-use airspace classifications include:

ALERT AREA. Airspace that may contain a high volume of pilot training activities or an unusual type of aerial activity, neither of which is hazardous to aircraft.

CONTROLLED FIRING AREA. Airspace wherein activities are conducted under conditions so controlled as to eliminate hazards to nonparticipating aircraft and to ensure the safety of persons or property on the ground.

MILITARY OPERATIONS AREA (MOA). Designated airspace with defined vertical and lateral dimensions established outside Class A airspace to separate/segregate certain military activities from instrument flight rule (IFR) traffic and to identify for visual flight rule (VFR) traffic where these activities are conducted.

PROHIBITED AREA. Designated airspace within which the flight of aircraft is prohibited.

RESTRICTED AREA. Airspace designated under FAR 73, within which the flight of aircraft, while not wholly prohibited, is subject to restriction. Most restricted areas are designated joint use. When not in use by the using agency, IFR/VFR operations can be authorized by the controlling air traffic control facility.

WARNING AREA. Airspace, which may contain hazards to nonparticipating aircraft.

STANDARD INSTRUMENT DEPARTURE (SID). A preplanned coded air traffic control IFR departure routing, preprinted for pilot use in graphic and textual form only.

STANDARD TERMINAL ARRIVAL (STAR). A preplanned coded air traffic control IFR arrival routing, preprinted for pilot use in graphic and textual or textual form only.

STOP-AND-GO. A procedure wherein an aircraft will land, make a complete stop of the runway, and then commence a takeoff from that point. A stop-and-go is recorded as two operations: one operations for the landing and one operations for the takeoff.

STOPWAY. An area beyond the takeoff runway, no less wide than the runway and centered on the extended centerline of the runway, able to support an airplane during an aborted takeoff, without causing structural damage to the airplane, and designated for use in decelerating the airplane during an aborted takeoff.

STRAIGHT-IN LANDING / APPROACH. A landing made on a runway aligned within 30 degrees of the final approach course following completion of an instrument approach.

TACTICAL AIR NAVIGATION (TACAN). An ultra-high frequency electronic air navigation system, which provides suitably-equipped aircraft a continuous indication of bearing and distance to the TACAN station.

TAKEOFF DISTANCE AVAILABLE (TODA). See declared distances.

TAKEOFF RUN AVAILABLE (TORA). See declared distances.

TAXILANE. The portion of the aircraft parking area used for access between taxiways and aircraft parking positions.

TAXIWAY. A defined path established for the taxiing of aircraft from one part of an airport to another.

TAXIWAY SAFETY AREA (TSA). A defined surface alongside the taxiway prepared or suitable for reducing the risk of damage to an airplane unintentionally departing the taxiway.

TETRAHEDRON. A device used as a landing indicator. The small end of the tetrahedron points in the direction of landing.

THRESHOLD. The beginning of that portion of the runway available for landing. In some instances the landing threshold may be displaced.

TOUCH-AND-GO. An operation by an aircraft that lands and departs on a runway without stopping or exiting the runway. A touch-and-go is recorded as two operations: one operation for the landing and one operation for the takeoff.

TOUCHDOWN ZONE (TDZ). The first 3,000 feet of the runway beginning at the threshold.

TOUCHDOWN ZONE ELEVATION (TDZE). The highest elevation in the touchdown zone.

TOUCHDOWN ZONE (TDZ) LIGHTING. Two rows of transverse light bars located symmetrically about the runway centerline normally at 100-foot intervals. The basic system extends 3,000 feet along the runway.

TRAFFIC PATTERN. The traffic flow that is prescribed for an aircraft landing or taking off from an airport. The components of a typical traffic pattern are the upwind leg, crosswind leg, downwind leg, and final approach.

UNICOM. A nongovernmental communication facility, which may provide airport information at certain airports. Locations and frequencies of UNICOMs are shown on aeronautical charts and publications.

UPWIND LEG. A flight path parallel to the landing runway in the direction of landing. See traffic pattern.

VECTOR. A heading issued to an aircraft to provide navigational guidance by radar.

VERY HIGH FREQUENCY / OMNIDIRECTIONAL RANGE STATION (VOR). A ground-based electronic navigation aid transmitting very high frequency navigation signals, 360 degrees in azimuth, oriented from magnetic north. Used as the basis for navigation in the national airspace system. The VOR periodically identifies itself by Morse code and may have an additional voice identification feature.

VERY HIGH FREQUENCY OMNIDIRECTIONAL RANGE STATION / TACTICAL AIR NAVIGATION (VORTAC). A navigation aid providing VOR azimuth, TACAN azimuth and TACAN distance-measuring equipment (DME) at one site.

VICTOR AIRWAY. A control area or portion thereof established in the form of a corridor, the centerline of which is defined by radio navigational aids.

VISUAL APPROACH. An approach wherein an aircraft on an IFR flight plan, operating in VFR conditions under the control on an air traffic control facility and having an air traffic control authorization, may proceed to the airport of destination in VFR conditions.

VISUAL APPROACH SLOPE INDICATOR (VASI). An airport lighting facility providing vertical visual approach slope guidance to aircraft during approach to landing by radiating a directional pattern of high-intensity red and white focused light beams, which indicate to the pilot whether or he or she is on path. Some airports serving large aircraft have three-bar VASIs that provide two visual guide paths to the same runway.

VISUAL FLIGHT RULES (VFR). Rules that govern the procedures for conducting flight under visual conditions. The term VFR is also used in the United States to indicate weather conditions that are equal to or greater than minimum VFR requirement. In addition, it is used by pilots and controllers to indicate type of flight plan.

WIDE AREA AUGMENTATION SYSTEM (WAAS). The Wide Area Augmentation System (WAAS) uses a system of ground stations to provide necessary augmentations to the GPS Standard Positioning Service (SPS) navigation signal. A network of precisely surveyed ground reference stations is strategically positioned across the country to collect GPS satellite data. Using this information, a message is developed to correct any signal errors.

WARNING AREA. See special-use airspace.

ACRONYMS / ABBREVIATIONS

AC. Advisory circular

ADF. Automatic direction finder

ADG. Airplane design group

AFSS. Automated flight service station

AGL. Above ground level

AIA. Annual instrument approach

AIP. Airport improvement program

ALS. Approach lighting system

ALSF-1. Standard 2,400-foot high-intensity approach lighting system with sequenced flashers (Cat I configuration)

ALSF-2. Standard 2,400-foot high-intensity approach lighting system with sequenced flashers (Cat II configuration)

APV. Instrument approach procedure with vertical guidance

ARC. Airport reference code

ARFF. Aircraft rescue and firefighting

ARP. Airport reference point

ARTCC. Air route traffic control center

ASDA. Accelerate-stop distance available

ASR. Airport surveillance radar

ASOS. Automated surface observation station

ATCT. Air traffic control tower

ATIS. Automated terminal information service

AVGAS. Aviation gasoline (typically 100 low lead (LL))

AWOS. Automated weather observation station

BRL. Building restriction line

CFR. Code of Federal Regulations

CIP. Capital improvement program

CPO. Community Planning Organization

DME. Distance measuring equipment

DNL. Day-night noise level

DWL. Runway weight bearing capacity for aircraft with dual wheels per strut

DTWL. Runway weight bearing capacity for aircraft with dual-tandem type landing gear

EAA. Experimental Aircraft Association

FAA. Federal Aviation Administration

FAM. Financial Aid to Municipalities

FAR. Federal Aviation Regulation

FBO. Fixed base operator

FY. Fiscal year

GA. General Aviation

GPS. Global positioning system

GS. Glide slope

HIRL. High-intensity runway edge lighting

IFR. Instrument flight rules

ILS. Instrument landing system

IM. Inner marker

LDA. Landing distance available

LIRL. Low-intensity runway edge lighting

LMM. Compass locator at middle marker

LOC. ILS localizer

LOM. Compass locator at ILS outer marker

LORAN. Long range navigation

MALS. Medium-intensity approach lighting system

MALSR. Medium-intensity approach lighting system with runway alignment indicator lights

MIRL. Medium-intensity runway edge lighting

MITL. Medium-intensity taxiway edge lighting

MLS. Microwave landing system

MM. Middle marker

MOA. Military operations area

MSL. Mean sea level

NAVAID. Navigational aid

NDB. Nondirectional radio beacon

NM. Nautical mile (6,076.1 feet)

NOTAM. Notice to airmen

NPIAS. National plan of integrated airport systems

NPRM. Notice of proposed rulemaking

ODA. Oregon Department of Aviation

ODALS. Omnidirectional approach lighting system

OFA. Object free area

OFZ. Object free zone

OM. Outer marker

OPA. Oregon Pilots Association

PAC. Project Advisory Committee

PAPI. Precision approach path indicator

PFC. Passenger facility charge

PCL. Pilot-controlled lighting

PLASI. Pulsating visual approach slope indicator

PMP. Pavement Maintenance Program

POFA. Precision object free area

PVASI. Pulsating/steady visual approach slope indicator

RCO. Remote communications outlet

REIL. Runway end identifier lights

RNAV. Area navigation

RPZ. Runway protection zone

RTR. Remote transmitter/receiver

RVR. Runway visibility range

RVZ. Runway visibility zone

SALS. Short approach lighting system

SASP. State Aviation System Plan

SEL. Sound exposure level

SID. Standard instrument departure

SM. Statute mile (5,280 feet)

SRE. Snow removal equipment

SSALF. Simplified short approach lighting system with sequenced flashers

SSALR. Simplified short approach lighting system with runway alignment indicator lights

STAR. Standard terminal arrival route

SWL. Runway weight bearing capacity for aircraft with single-wheel type landing gear

STWL. Runway weight bearing capacity for aircraft with single-wheel tandem type landing gear

TACAN. Tactical air navigation

Airport Master Plan Update

Aurora State Airport

U.S. Department
of Transportation
**Federal Aviation
Administration**

Northwest Mountain Region
Seattle Airports District Office
1601 Lind Avenue S.W., Suite 250
Renton, Washington 98057-3356

October 19, 2012

Mr. Mitch Swecker, Director
Oregon Dept. of Aviation
3040 25th Street, SE
Salem, OR 97302

Dear Mr. Swecker,

The Aurora State Airport Layout Plan (ALP) dated March, 2012 and submitted by WH Pacific, Inc., is hereby approved. A signed copy of the ALP is enclosed.

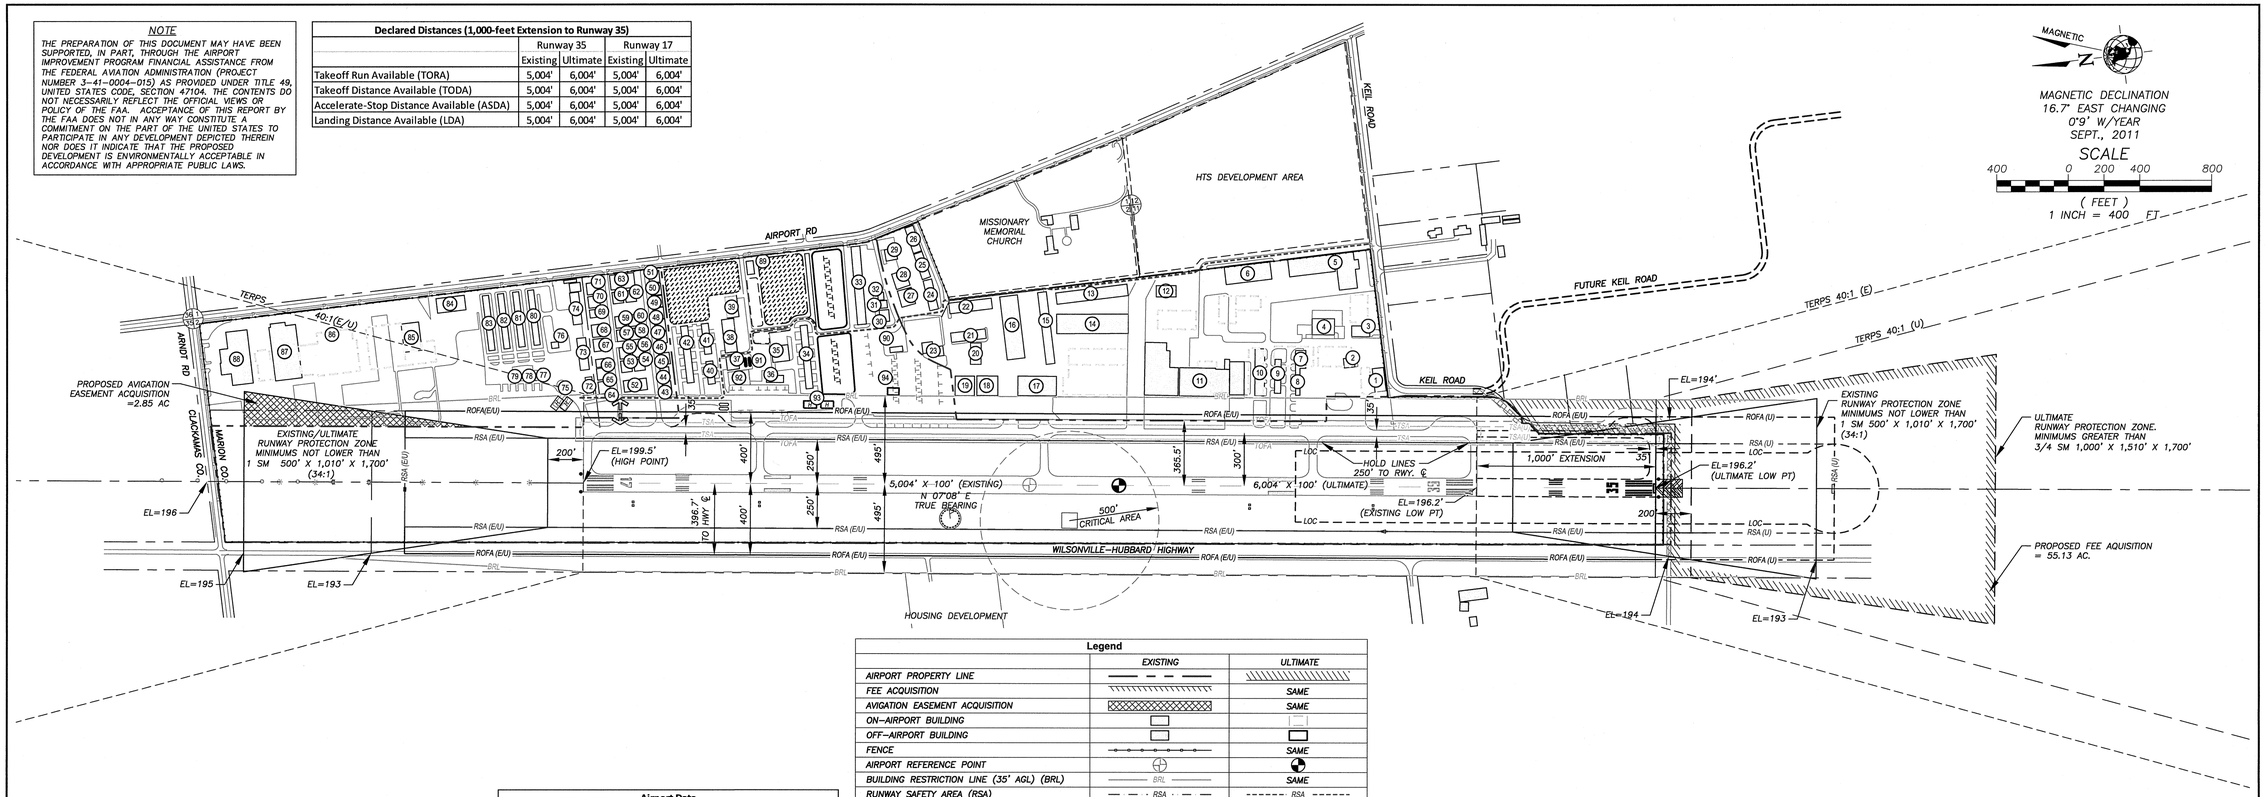
This approval considers only the safety, utility, and efficiency of the Aurora State Airport, and is conditioned on acknowledgment that any development on airport property requiring federal environmental approval must receive such written approval from the Federal Aviation Administration (FAA) prior to commencement of the subject development. This ALP approval is also conditioned on acceptance of the plan under local land use laws. We encourage appropriate agencies to adopt land use and height restrictive zoning based on the plan since action toward this end is a prerequisite of the Airport Improvement Program (AIP). Grant Assurance 21, Compatible Land Use, requires airport sponsors to take appropriate action, including the adoption of zoning laws to restrict the use of land adjacent to, or in the immediate vicinity of the airport, to activities and purposes compatible with normal airport operations including the arrival and departure of aircraft. The FAA recognizes residential development adjacent to the airport property as an incompatible land use.

Approval of the plan does not indicate that the United States will participate in the cost of any development proposed. When airport construction, alteration, or deactivation is undertaken, such action requires notification and review in accordance with the provisions of Part 77 and Part 157 of the Federal Aviation Regulations.

Please attach this letter to the approved Airport Layout Plan and retain it in the airport files for future use under the Airport Improvement Program.

Sincerely,

Carol A. Suomi
Manager, Seattle Airports District Office



Encl: Aurora ALP dtd Mar 2012

Mr. Rainse Anderson, WHP

NOTE

THE PREPARATION OF THIS DOCUMENT MAY HAVE BEEN SUPPORTED, IN PART, THROUGH THE AIRPORT IMPROVEMENT PROGRAM FINANCIAL ASSISTANCE FROM THE FEDERAL AVIATION ADMINISTRATION (PROJECT NUMBER 3-41-0004-015) AS PROVIDED UNDER TITLE 49, UNITED STATES CODE, SECTION 47104. THE CONTENTS DO NOT NECESSARILY REFLECT THE OFFICIAL VIEWS OR POLICY OF THE FAA. ACCEPTANCE OF THIS REPORT BY THE FAA DOES NOT IN ANY WAY CONSTITUTE A COMMITMENT ON THE PART OF THE UNITED STATES TO PARTICIPATE IN ANY DEVELOPMENT DEPICTED THEREIN NOR DOES IT INDICATE THAT THE PROPOSED DEVELOPMENT IS ENVIRONMENTALLY ACCEPTABLE IN ACCORDANCE WITH APPROPRIATE PUBLIC LAWS.

Notes
Horizontal datum is NAD 1983, vertical datum is NAVD88.
The Airport is flat. Elevations / ground contours vary by less than 5 feet and are not shown. Drainage features are typically 2-3 feet lower than adjacent land.
Building restriction line is based on a 35-foot building located 495 feet from the runway centerline not penetrating FAR Part 77 surfaces for the Airport.
A Residential Through The Fence (RTTF) access exists at hangar #64 at the Wylee Condominium Association. The tenant is the resident caretaker for the airport.

Modifications to Standards		
	Standard Being Modified	Proposed Action
1	Advisory Circular (AC) 150/5300-13, para 307 (Runway Object Free Area)	The standard runway object free area (OFA) for Airport Reference Code C-II airports is 800 feet. Highway 551 runs north/south parallel to Runway 17/35; the approximate distance from the Runway 17/35 centerline to the Highway 551 centerline is 400 feet. As the airport geometry is not changing from the current condition, the Oregon Department of Aviation (ODA) requests a modification of the OFA design standard to allow the runway and highway to remain in their current positions.
2	AC 150/5300-13, Appendix 14 (Declared Distances)	The ODA requests the existing threshold for Runway 17 be referenced in determining FAR Part 77 surfaces and design standard surfaces referenced in AC 150/5300-13 (*i.e.*, RSA, RPZ, OFA, OFZ).

Renton, Washington 98057-4056

June 7, 2011

Mr. Rainse Anderson
Director of Aviation
WH Pacific, Inc.
9755 SW Barnes Road, Suite 300
Portland, OR 97225

Dear Mr. Anderson:

This letter is in response to your e-mail of May 15, 2011, in which you requested clarification of the application of declared distances at the Aurora State Airport in Oregon. It is our understanding that although the current Master Plan study indicates that there are constrained operations that justify a runway extension, it recommends using declared distances as a way to gain limited operational use of new pavement because pursuing an extension would not be feasible due to the negative environmental and/or business related impacts.

The purpose of declared distances is described in Federal Aviation Administration Advisory Circular 150/5300-15 (Airport Design) Appendix 14, which states:
"The purpose of declared distances in airport design is to provide an equivalent runway safety area (RSA), runway object free area (ROFA), or runway protection zone (RPZ) in accordance with the design standards in Chapters 2 and 3 at existing constrained airports where it is otherwise impracticable to meet standards by other means. Declared distances are also employed when there are obstructions in the runway approaches and/or departure surface that are beyond the ability of the airport owner to remove and result in a displaced runway threshold or change in the departure end of the runway."

The Master Plan's Chapter 5 (Scenarios 1 & 2), proposes an alternative that adds pavement before newly displaced thresholds (thereby necessitating the application of declared distances) to meet the constrained operations of aircraft; however, it does not consider this additional pavement as a runway extension. Upon careful review of these proposals, our determination is that these pavement extensions are in fact limited use runway extensions despite the application of declared distances. A rule of thumb is that; ***anything that increases the takeoff run available from the existing total runway length is a runway extension***.

In summary, we would not participate in funding proposals that would provide only partial and/or limited use of a runway extension.

If you have any other questions, please contact Bruce Fisher at 425.227.2649 or me at: 425.227.2657.

Sincerely,

Carolyn T. Read
Acting Manager, Seattle Airport District Office

Subject: Aurora State Airport-Master Plan

Bruce/Stan,

The Aurora State Airport Preferred Alternative public comments were gathered until April 21, and were then discussed by the Oregon Aviation Board on April 28. As you will recall, a runway extension was shown to be justified in prior chapters of the Master Plan Update. However, a runway extension was not included in the proposed Preferred Alternative for several reasons. As a result of the comments given (available here), we have developed two additional scenarios that utilize displaced thresholds to gain takeoff length available in an attempt to "meet in the middle" of the airport user safety needs and community concerns. The scenarios are as such (drawings attached):

Scenario #1
Add 600-feet displaced threshold to Runway 35 and 200-feet displaced threshold to Runway 17 to acquire the following declared distances.

Scenario #1 Declared Distances		
	R35	R17
Takeoff Run Available (TORA)	5,604'	5,204'
Takeoff Distance Available (TODA)	5,604'	5,204'
Accelerate-Stop Distance Available (ASDA)	5,804'	5,804'
Landing Distance Available (LDA)	5,004'	5,004'

Scenario #2
Add 800-feet displaced threshold to Runway 17 to achieve the following declared distances.

Scenario #2 Declared Distances		
	R35	R17
Takeoff Run Available (TORA)	5,004'	5,804'
Takeoff Distance Available (TODA)	5,004'	5,804'
Accelerate-Stop Distance Available (ASDA)	5,804'	5,804'
Landing Distance Available (LDA)	5,004'	5,004'

As we have discussed the scenarios internally, and with ODA, we recognize there are (at least) two separate issues from FAA's perspective. The first issue relates to the technical application of the declared distances and the second is in regards to funding such projects. At this time we are concerned with the technical issues and wish to defer the funding issue to a later time, if needed.

Specifically, the technical concerns we have relate to the TERPS and Part 77 surfaces and how they would be applied at the Airport. Per our understanding of the RSA, OFA, and RPZ we believe these surfaces will be located in relation to the threshold (not end of pavement).

As for the departure/TERPS surface, AC 150/5300-13 Appendix 2, Figure A2-3, states "Surface (TERPS) starts at end of clear way if one is in place." Would the pavement behind the threshold be considered a “clearway” at Aurora? If we do not have to designate the pavement as a clearway to leave the departure surface in its current location this would be desirable. Moving the surface would create impacts to Columbia Helicopters’ future expansion plans.

As for Part 77 surfaces, we read AC 150/5300-13 Appendix 14, Para 1.b, that states "Where declared distances differ, the primary surface extends 200 feet beyond each end of the runway or the far end of each TODA, whichever is further, to protect departures to the extent of the 14 CFR Part 77 approach surface for that runway end.” So it is our interpretation that the primary surface would be relative to the paved surface, rather than the threshold, even if that portion of the pavement were only available for takeoff and not landing (*i.e.*, approach surface). Correct?

Additionally, while running the AFTIL simulation labs last week, a 1,000’ extension to the south was modeled – as you know. This was done to preserve the ability to extend the runway in the future. While an extension of pavement to the north was not modeled, given the topography and building layout at the Airport, it is not anticipated there would be any issues with tower cab visibility.

The use of declared distances at Aurora, while perhaps unconventional, is an attempt on our behalf to provide a viable airport that meets user needs and still be neighborly. Controversy over any true runway extension would likely thwart the environmental process, and we have good reason to believe it would be challenged on a legal basis for violation of Oregon’s Statewide Planning Goals (farmland protection). From responses given by operators, it is clear a longer runway is justified at Aurora. While the declared distances would not fully utilize the runway in all directions, it is a compromise that adds substantial operational value and safety for the constrained business jets while not impacting the existing businesses development plans by changing approach and departure surfaces. The Oregon Aviation Board views this option favorably as an agreeable solution to the challenges presented.

In closing, we look forward to FAA’s official position on the application of declared distances at the Aurora State Airport and clarification of the technical issues associated with them. Mitch Swecker, ODA, will be at your office on May 18-19. It is my hope that you will be able to discuss this letter with your colleagues prior to that date and to arrange an in-person meeting May 18.

Please contact me if you have any questions.

Regards,
Rainse

Dear Mr. Hedlund:

Airport Improvement Program (AIP) Project Number 3-41-0004-015
Approval of Activity Forecasts – Aurora State Airport Master Plan Update

I have reviewed Chapter 3 of the Airport Master Plan Update submitted by Mr. Rainse Anderson of WH Pacific, Inc.

I find adequate justification exists for the figures cited in the Forecasts of Aviation Activity and hereby approve the Forecast Summary. This chapter appears to be well-done and I believe that you and your Consultant(s) are off to a good start.

If you have any questions, please feel free to contact me at: 425.227.2649 or by e-mail at: bruce.fisher@faa.gov.

Sincerely,

Bruce C. Fisher
Airport Planner, Oregon / Idaho

Appendix C: AIRPORT USER SURVEY

Airport Master Plan Update

Aurora State Airport

WHPacific
OREGON DEPARTMENT OF AVIATION

Aurora State Airport User Survey
Survey Summary
July 2010

Background

In the fall of 2009, The Oregon Department of Aviation began the process of updating the 2000 Aurora State Airport Master Plan. The Airport Master Plan is ten years old and needs to be updated to reflect new facilities, current projections of airport activity, new environmental and other regulatory constraints, and to plan for future use of the airport.

To support this process, the Oregon Department of Aviation conducted a survey as part of the project kick-off in October 2009. The survey asked airport users and interested parties about their aircraft and airport use and suggestions for improvements. The following is a summary of their responses. An appendix of all responses is also available.

In total, 61 people responded to the survey. 31 of these respondents completed the survey online and 30 mailed or faxed in hard copies to the project team.

Aircraft Use and Landings

Aircraft Use
The survey asked respondents to indicate whether they own or fly an aircraft. 49 respondents indicated that they do own or fly an aircraft and 12 respondents indicated that they do not.
(All participants answered this question)

The responses below are classified by Aircraft Reference Code (ARC). The ARC is commonly used to group similar aircraft, and is represented by a letter designation and Roman numeral. The letter designation (A, B, C, etc.) is the aircraft approach category, which is representative of the aircraft's approach speed. The Roman numeral (I, II, III, etc.) represents the airplane design group and is determined by physical characteristics of the airplane (either wingspan or tail height, whichever is most demanding). Below is a table showing the number of responses by ARC, along with aircraft representative of each ARC.

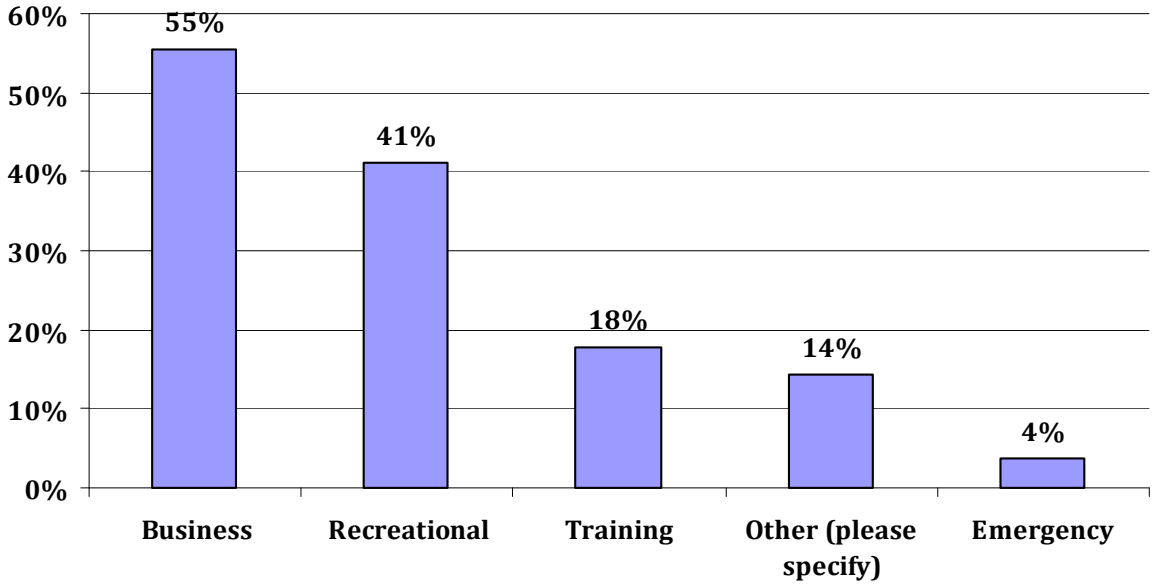
ARC	Approach Speed (Aircraft Approach Category)	Airplane Design Group (Wingspan / Tail Height)	Representative Aircraft	Number of Responses
A-I	< 91 knots	< 49' / < 20'	Cessna 172	54
A-II	< 91 knots	49'-79' / 20'-30'	Pilatus PC-12	3
B-I	91-121 knots	< 49' / < 20'	Lear Jet 45	3
B-II	91-121 knots	49-79' / 20'-30'	Beechcraft King Air 200	10
-	-	-	Helicopter	10
-	-	-	Aircraft with Unknown ARCs	6
			Total	86

The appendix has a full listing of aircraft types reported by respondents.

Annual Landings
Respondents estimated their annual number of landings, including touch and go landings.
(51 participants answered this question.)

The table below summarizes their responses:

Range of estimated annual landings	Number of responses
None	4 responses
17-50	7 responses
55-80	9 responses
100-190	9 responses
200-300	14 responses
350-450	3 responses
500-600	2 responses
2000	2 responses



Respondents estimated the percentage of annual landings made at Aurora State Airport. *(53 participants answered this question.)*

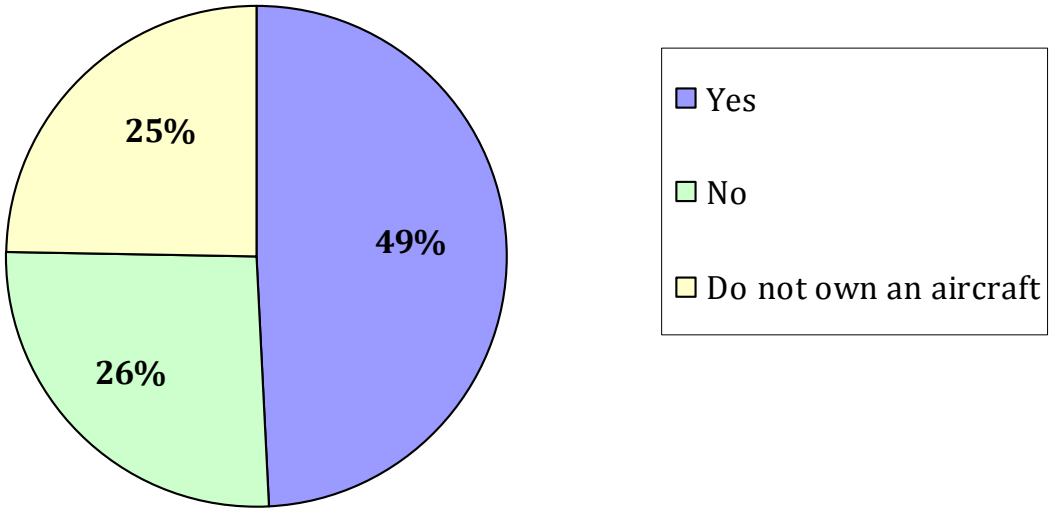
Estimated percentage of annual landings at Aurora State Airport	Number of responses *(total)*	Number of responses *(for participants who answered that their aircraft is based at Aurora State Airport)*	Number of responses *(for participants who answered that their aircraft is NOT based at Aurora State Airport or do not own an aircraft)*
0%	4	0	4
2-5%	5	0	5
10%	1	1	0
20-29%	4	0	4
30-45%	10	9	1
50%	10	7	2
60-75%	10	8	3
80-90%	4	4	0
100%	2	1	1

Primary use of Aurora State Airport

Respondents indicated how they primarily use the airport. Over 55% of participants use the airport for business purposes. *56 participants responded to this question.*

How do you primarily use the Aurora State Airport?

Eight respondents indicated that they have an "other" primary use for the airport. The following other uses were listed:

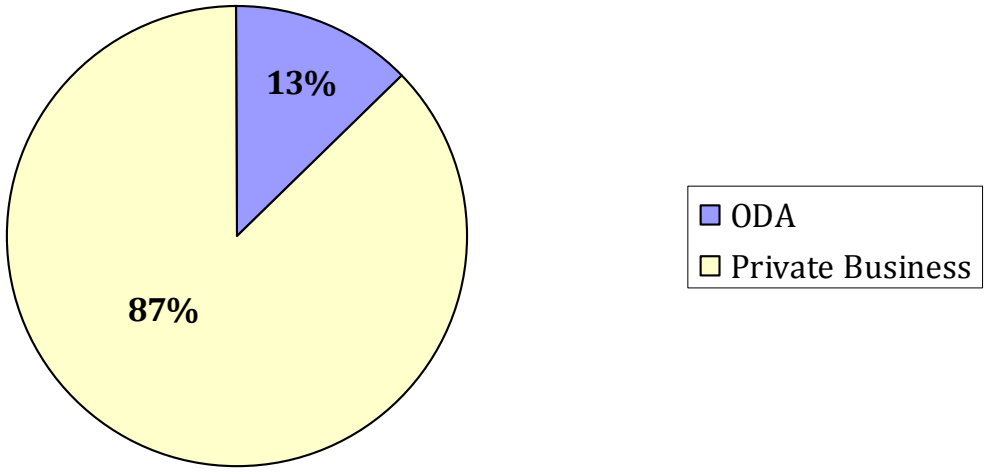


- Personal transportation/personal travel *(4 responses)*
- I live by the airport but I do not fly *(2 responses)*
- Telephone/ Broadband utility company *(1 response)*
- Volunteer *(1 response)*

Aircraft Base and Leasing

Aircraft Base

Respondents indicated whether their aircraft is based at Aurora State Airport. 49% indicated that their aircraft is based at Aurora State Airport, 26% said no, and 25% indicated that they do not own an aircraft.
(All participants responded to this question.)

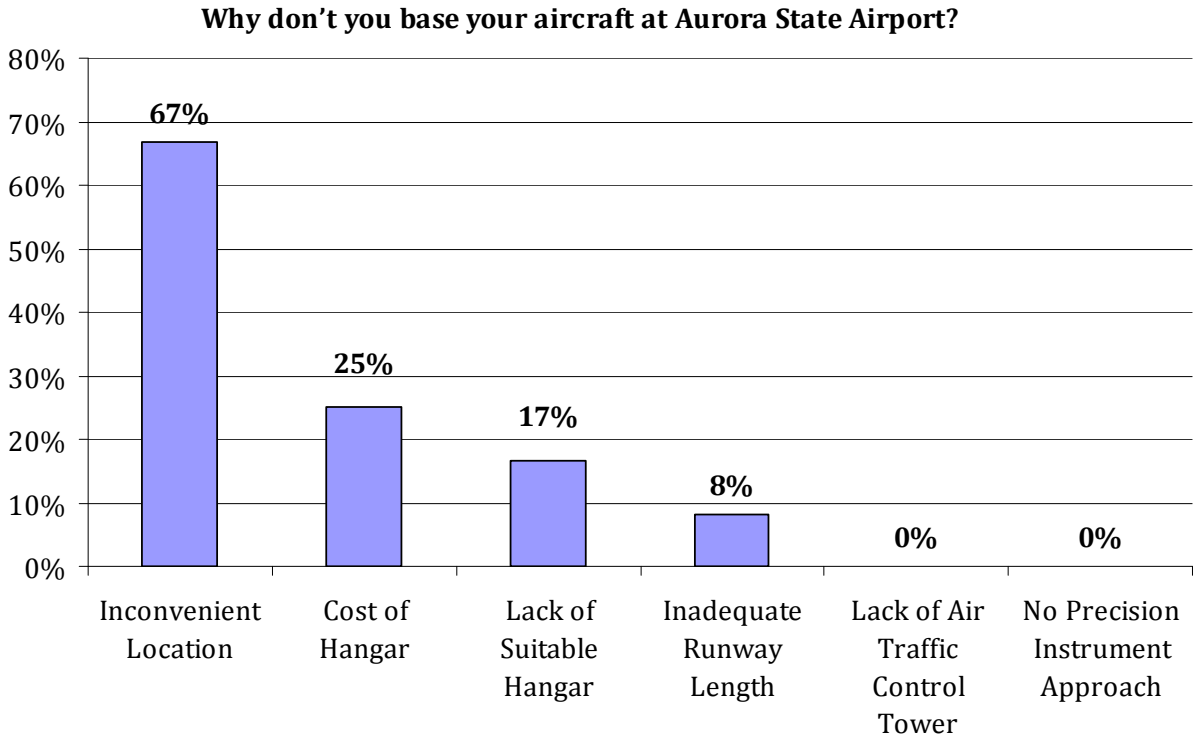


Is your aircraft based at Aurora State Airport?

Aircraft Storage and Tie-down

Those participants that do keep an aircraft at the Aurora State Airport indicated whether they lease or rent aircraft storage or tie-down from the Oregon Department of Aviation or from a private business. 87% indicated that they lease or rent from a private business. *(31 participants answered this question.)*

Do you lease or rent aircraft storage or tiedown from the Oregon Department of Aviation or from a private business?



Aircraft based at other Airports
Those participants who do not keep an aircraft at the Aurora State Airport indicated where they base their aircraft.
(14 participants answered this question.)

The following airport codes were listed:

- Corvallis, OR (CVO) (2 respondents)
- Hubbard, OR (Lenhardt Airpark) (7S9) (2 respondents)
- Troutdale, OR (TTD) (2 respondents)
- Medford, OR (MFR)
- La Grande, OR (LGD)
- Newburg, OR (Sportsman Airpark) (2S6)
- Sunset Airpark
- Hillsboro, OR (Stark's Twin Oak) (7S3)
- Scappoose, OR (SPB)
- San Jose, CA (SJC)
- Eugene, OR (EUG)
- Salem, OR (SLE)

Those participants who do not keep an aircraft at the Aurora State Airport indicated why they do not base their aircraft there. Most cited inconvenient location.
(12 participants answered this question.)

Four participants left other responses:

- In the process of building a 135,000 square foot hangar in property adjacent to airport
- Aircraft are conveniently based at my home airport (2 responses)
- Based in Eugene (BIZ)

Airport Improvements

Respondents were asked to provide suggestions for improving Aurora State Airport. *(50 participants responded to this question.)*

The most commonly suggested improvements were the following:

- Build a control tower. (25 comments)
  - 25 respondents commented that a control tower is the most needed improvement. Six of these noted that a control tower is needed for safety and three thought that it would help with noise abatement. One person added that a control tower could reduce conflicts in IFR/VFR traffic.
- Lengthen runway. (14 comments)
  - 14 respondents suggested lengthening the runway. Two suggested adding 1,000 ft to the existing length, and two suggested a 6,000-foot length.
- Add precision instrument ILS approach. (10 comments)

  - Ten participants suggested a precision instrument ILS approach. One noted that this would help with the problem of fog, and another added that an ILS approach could reduce the chance of accidents.
- Change calm wind runway back to R17. (9 comments)
  - Nine participants suggested changing the calm wind runway back to R17. Two noted that the current calm wind designation of R35 creates a safety conflict.
- Improve airport roads and address traffic issues. (8 comments)
  - Eight respondents suggested various improvements to the airport internal roads and traffic issues. Three suggested general airport road improvements for safety. One said that traffic issues on Airport Road are a concern. One said there is too much hangar construction at Southend airpark. One suggested relocating Keil, as it is a dangerous road. One suggested changing Ehlen Road and Highway 515.
- Provide public sewer and water facilities. (6 comments)
  - Six participants suggested connecting the airport to City of Aurora sewer and water facilities.
- Add a restaurant or café. (4 comments)
  - Four respondents suggested adding a restaurant or café. One suggested using Nampa, ID or Caldwell, ID as an example.
- Lower approach minimums. (3 comments)
  - Three participants suggested lowering minimums. One suggested clearing obstacles to meet TERPS requirement for lower RNAV (GPS) approach minimums.
- Do not build a control tower. (3 comments)
  - Three people commented that a control tower should not be built. One noted that a control tower would not be cost effective.
- Consider the neighborhood in planning. (3 comments)
  - One person who lives near the Aurora State Airport commented that large jet planes make too much noise, and would like to see only smaller aircraft at the airport. One asked that local neighbors be informed of this process and results. A third suggested using design and building standards in the planning process that enhance the neighborhood.
- Get radar coverage/radar approach in the area. (2 comments)
- Improve lighting and install approach path lighting on Runway 35. (2 comments)

The following lists some other suggestions made by respondents. A full list of comments can be found in the appendix.

- Add run-up areas for safety.
- Add commercial service.
- Begin the master planning project by developing a vision statement.
- Allow for more developable land inside of Keil Road, Airport Way, Hwy 515, and Arndt Road.

- Get controlled airspace.
- Support ancillary airport and flight business.
- Provide better non-aircraft access.
- Increase hangar lease locations for new construction.
- Have an area for grass landings.
- Glideslope.
- Add mufflers and reduce noise.
- Provide lower cost hangars.
- The bigger taxiways were a great addition.
- Acquire land surrounding airport for future growth.
- The single runway is close to the maximum traffic possible. Lengthening a single runway or adding a tower will not solve this problem.
- Change nothing at all; the airport has all I need.
- May acquire large aircraft, would like to see increased weight restriction on runway (65,000 lb) to match taxiway.
- Need jet maintenance.
- Provide better control of entry of helicopter traffic.

Aurora State Airport User Survey
Appendix of All Responses
July 2010

This appendix includes all questions asked on the Aurora State Airport User Survey and all responses received.

Question# 1: What zip code do you live in?

61 total responses:

Question# 2: Do you own or fly an aircraft? If so, list model/type of aircraft.

61 total responses:

- No 12 responses
- Yes 49 responses

The 49 respondents that answered "yes" provided the following model/type of aircraft:

- Beechcraft King Air (BE-200)
- Cessna P210 Centurion
- Piper J3, Cessna 180, Cessna T210, Cessna 310, Aero Commander 680V
- Cessna 172
- Beechcraft Bonanza F33A
- Single engine
- Beechcraft P-35 Bonanza
- Large Sikorsky and Bell Type I Helicopters
- Piper Arrow
- PA-30 Piper Twin Comanche
- Cessna 172
- Aviat Husky
- Piper Aztec
- Piper PA-32-300
- Globe Swift
- Cessna 182RG
- Cessna 205, J-4a Cub, 415d Ercoupe, N3N-3 navy
- Cessna TR182
- Piper Comanche
- Van's RV-4, Van's RV-10, Van's RV-12
- Van's Aircraft RV-6, 7, 7A, 8, 8A, 9A, 10, 12; Own RV-7A
- Van's RV-6
- RV-9A
- V35-B Bonanza
- PA45 Piper Malibu and XLZ Liberty
- Cessna 172 SP
- Astra 1125/G100
- Cessna 205, J-4a CUB, N3N-3 Navy, Cessna 414
- Mooney M20F
- EC-135 Helicopter, AS350 B3 Helicopter
- Cessna 140 and Cessna 182
- Cessna Citation 560XL
- Single engine and multi-land
- IA 1125 Astra, SR-22 Cirrus
- Cessna Citation XL
- Pilatus PC-12/47E
- Cessna 18L
- Cessna 400TT
- Cessna 550, PAY2, Beechcraft King Air (BE-200)
- Lear Jet 45
- 6X Helo MD500E, King Air C90GTi, King Air B350
- Pilatus PC-12
- DeHavilland Beaver N56TM, DeHavilland Tiger Moth N82TM, Cessna 185 N84TM, J3-Cub N3TM
- Cessna Citation
- RV-8
- Beechcraft King Air (BE-200)
- Beech Debonair
- Beechcraft King Air (BE-200), Cessna 172, Cessna 152
- Falcon F-900
- Pilatus PC-12

Question# 5: How do you primarily use the Aurora State Airport?

56 total responses:

- Business 31 responses
- Recreational 23 responses
- Training 10 responses
- Other (please specify) 8 responses
- Emergency 2 responses

Those that responded "Other" specified the following:

- I live by the airport I do not fly
- Telephone/ Broadband utility company
- Volunteer
- Personal transportation
- transportation
- don't I live in the neighborhood
- Personal transportation
- Personal travel

Question# 6: Is your aircraft based at Aurora State Airport?

61 total responses

- Yes 30 responses
- No 16 responses
- Do not own an aircraft 15 responses

Question# 7: Do you lease or rent aircraft storage or tiedown from the Oregon Department of Aviation or from a private business?

31 total responses:

- ODA 4 responses
- Private Businesses 27 responses

Question# 8: Where is your aircraft based? (List Airport ID)

14 total responses:

- Corvallis, OR (CVO) (2 respondents)
- Hubbard, OR (Lenhardt Airpark) (7S9) (2 respondents)
- Troutdale, OR (TTD) (2 respondents)
- Medford, OR (MFR)
- La Grande, OR (LGD)
- Newburg, OR (Sportsman Airpark) (2S6)
- Sunset Airpark
- Hillsboro, OR (Stark's Twin Oak) (7S3)
- Scappoose, OR (SPB)
- San Jose, CA (SJC)
- Eugene, OR (EUG)
- Salem, OR (SLE)

Question# 9: Why don't you base your aircraft at Aurora State Airport? (Select all that apply.)

12 total responses:

- Inconvenient Location 8 responses
- Cost of Hangar 3 responses
- Lack of Suitable Hangar 2 responses
- Inadequate Runway Length 1 responses
- Lack of Air Traffic Control Tower 0 responses
- No Precision Instrument Approach 0 responses
- Other (please specify) 4 responses

Those that answered "other" specified the following:

- In the process of building a 135,000 square foot hangar in property adjacent to airport
- Aircraft are conveniently based at my airport home
- TTD is closer to home
- Based in Eugene (BIZ)

Question# 10: What suggestions do you have for improving Aurora State Airport?

50 total responses:

- Add commercial service

- I have lived here since 1976. I am NOT for any growth in the Aurora airport. The larger jet planes make too much noise on take off and landing as they pass over my home. I would like to see the larger jets minimized. The smaller aircraft are not an issue with me. Only the noisy larger jets.
- Traffic issues on Airport Road are a concern.
- Begin the master planning project by developing a vision statement. Connect to City of Aurora utilities. Get a restaurant. Allow for more developable land inside of Keil road, airport way, HWY 51, and Arndt Rd. Get controlled Airspace, get radar coverage in the area. Give John Wilson a raise.
- Support ancillary airport and flight business
- Control Tower for safety and noise abatement, better non-aircraft access
- tower and run-up areas for safety
- We need a restaurant at the airport and the associated infrastructure (sewer, etc) to support it.
- Increase hangar lease locations for new construction.
- 1. Install a new aircraft central tower to control landing. 2. Provide city water and sewer facilities
- First on my list is the need for a control tower.
- Run-up area runway 17. Clear obstacles to meet TERPS requirement for lower RNAV (GPS) approach minimums. Install approach path lighting on runway 35.
- Control tower as soon as you can get it.
- Needs Control tower
- Have a area for grass landings
- Glideslope and control tower
- Mufflers, noise reduction. Also, please inform the local neighbors or let them know what is going on.
- Go back to calm runway 17. the current 35 creates a safety conflict with actual IFR breakouts into VFR and ditto for training IFR in VFR conditions
- Open a tower.
- Utilize better planning methods for building and site development. Have design and building standards that enhance the neighborhood.
- Cafe/restaurant on field. Lower cost hangars.
- Do NOT add a control tower. The bigger taxiways were a great addition. At this time acquire land surrounding airport for future growth. Add a cafe (many people work here). Use Nampa, ID or Caldwell, ID as example.
- Nothing at all, has all I need.
- Do not put in tower - not cost effective. Calm wind runway should be 17. Run up area at 17 (should not have been put at 35).
- Precision instrument approach because of all the fog.
- Look forward to the new tower.
- Should increase runway length.
- For safety - change calm wind runway back to 17 (immediately). Provide for a proper 17 run-up area. Take into future planning consideration the fact that we have only a single runway which under normal economic conditions is close to the

maximum traffic possible now. A tower will not improve this restriction on growth, nor will the lengthening of the single runway solve the problem.

- Precision approach
- Add control tower to deconflict IFR/UFR traffic or eliminate/change instrument approaches to 17.
- Do not put a tower here. Change calm wind runway back to one seven.
- Put run-up area at one seven.
- Control tower. Lengthen runway, add 1000 feet. Precision ILS approach.
- Lengthen runway by 1,000 ft for one longer size. Private jets, Gulfstream, for training and business which would increase weight capacity. The need for a tower for safety.
- Increased runway length, ILS approach. We are limited by runway length at full fuel (24, 650 ft). May acquire large a/c, would like to see increased weight restriction on runway (65,000 ft) to match taxiway.
- A longer runway would be nice.
- There is too much hangar construction at Southend airpark with too limited taxi space.
- precision app, tower
- Tower, tower, tower. ILS
- Runway length increase, ILS
- Need longer runway and tower. Need jet maintenance.
- Get the tower built and operating ASAP
- Lengthen runway. Control tower.
- Need a control tower for safety and noise abatement. 6,000 foot runway. Lower minimums. Airport road improvements for safety. Public sewer and water.
- Control tower for safety and noise abatement. 6,000 foot runway. Lower minimums. Airport road improvements for safety. Public Sewer and water.
- Install tower
- Control Tower/radar approach. Relocate dangerous road on south end (Keil). Better control of entry of helicopter traffic. New ground transportation access. Changing Ehlen Rd and 515.
- With the increasing mix of GA and Jet aircraft, the probability of a mishap or accident is increasing accordingly. A tower and ILS approach could help.
- Lengthen and strengthen runway. Improve lighting, ILS, tower, interior road, public water and sewer systems
- Runway should be longer, tower, ILS system
- Control tower NEEDED. Longer runway (for safety).

Aurora State Airport User Survey

Aircraft and Airport Use Information

1. What zip code do you live in?

2. Do you own or fly an aircraft?

- ◯ No
- ◯ Yes (if so, list model/type of aircraft)

3. Estimate your number of annual landings. (Include Touch & Go)

4. What percent of your annual landings are at Aurora State Airport?

5. How do you primarily use the Aurora State Airport?

- ☐ Business
- ☐ Training
- ☐ Recreational
- ☐ Emergency
- ☐ Other (please specify)

*** 6. Is your aircraft based at Aurora State Airport?**

- ◯ Yes
- ◯ No
- ◯ Do not own an aircraft

INSTRUMENT APPROACH PROCEDURE CHARTS

A IFR ALTERNATE AIRPORT MINIMUMS

Standard alternate minimums for non precision approaches are 800-2 (NDB, VOR, LOC, TACAN, LDA, VORTAC, VOR/DME, ASR or WAAS LNAV); for precision approaches 600-2 (ILS or PAR). Airports within this geographical area that require alternate minimums other than standard or alternate minimums with restrictions are listed below. NA - means alternate minimums are not authorized due to unmonitored facility or absence of weather reporting service. Civil pilots see FAR 91. IFR Alternate Airport Minimums: Ceiling and Visibility Minimums not applicable to USA/USN/USAF. Pilots must review the IFR Alternate Airport Minimums Notes for alternate airfield suitability.

29 JUL 2010 to 26 AUG 2010

ARLINGTON, WA

ARLINGTON MUNI

TAKE-OFF MINIMUMS: **Rwy 11,** 600-2 or std. with a min. climb of 350' per NM to 700. **Rwy 34,** 500-2 or std. with a min. climb of 260' per NM to 700.

DEPARTURE PROCEDURE: **Rwy 11,** turn right. **Rwy 16**, climb direct to WATON LOM. **Rwys 29,34**, turn left. **All aircraft** climb direct to WATON LOM. Aircraft departing WATON LOM on bearings 150° CW 200° and bearings 260° CW 340° from WATON LOM continue climb on course. Aircraft departing WATON LOM on bearings 340° CW 150° from WATON LOM climb in holding pattern (S, left turns, 339° inbound) to 4500 then continue climb on course. Aircraft departing WATON LOM on bearings 200° CW 260° from WATON LOM climb in holding pattern (S, left turns, 339° inbound) to 1500 then continue climb on course.

ASTORIA, OR

ASTORIA RGNL

TAKE-OFF MINIMUMS: **Rwy 8**, 800-3 or std. with a min. climb of 320' per NM to 900. **Rwy 13**, 700-2 or std. with a min. climb of 350' per NM to 800.

DEPARTURE PROCEDURE: **Rwys 8,31,** turn left. **Rwy 13**, climb runway heading to 800 then climbing right turn. **Rwy 26**, turn right. Aircraft departing northwestbound climb via AST R-290 on course. **All other aircraft** climb to 1500 or above via AST R-290 then left turn to AST VOR/DME and continue climbing on course.

AUBURN, WA

AUBURN MUNI

DEPARTURE PROCEDURE: Use AUBURN DEPARTURE.

AURORA, OR

AURORA STATE

DEPARTURE PROCEDURE: **Rwy 17**, turn right, thence... **Rwy 35**, turn left, thence... ...Aircraft proceeding via V23 climb on course; All others climb in UBG VOR/DME holding pattern (hold south, left turn, 003° inbound) to cross UBG VOR/DME at or above MEA/MCA for direction of flight.

NOTE: **Rwy 17,** multiple trees 31' from departure end of runway, 273' right of centerline, up to 90' AGL/270' MSL. Multiple trees beginning 979' from departure end of runway, 247' right of centerline up to 113' AGL/316' MSL. Road 254' from departure end of runway, 350' left of centerline, 16' AGL/209' MSL. **Rwy 35,** multiple trees and road beginning 31' from departure end of runway, 163' left of centerline, up to 138' AGL/329' MSL. Multiple trees beginning 973' from departure end of runway, 281' right of centerline, up to 58' AGL/253' MSL.

BAKER, MT

BAKER MUNI

NOTE: **Rwy 13,** 51' derrick 2200' from departure end of runway on centerline. 100' trees south of airport, near runway, various locations. **Rwy 31,** 146' antenna on tower 4000' from departure end of runway, 1800' left of centerline. 114' rod on OL antenna 3800' from departure end of runway on centerline.

BAKER CITY, OR

BAKER CITY MUNI

TAKE-OFF MINIMUMS: **Rwy 8**, 900-2 or std. with a min. climb of 315' per NM to 6000, (788' per min. at 150K, 1050' per min. at 200K, 1313' per min. at 250K). **Rwy 13**, 1400-2 or std. with a min. climb of 310' per NM to 6000 (775' per min. at 150K, 1033' per min. at 200K, 1292' per min. at 250K). **Rwy 17**, NA. **Rwy 31**, 1300-2 or std. with a min. climb of 240' per NM to 6000 (600' per min. at 150K, 800' per min. at 200K, 1000' per min. at 250K). **Rwy 35**, CAT C,D 1000-2; or std. with a min. climb of 240' per NM to 6000 (600' per min. at 150K, 800' per min. at 200K, 1000' per min. at 250K).

DEPARTURE PROCEDURE: **Rwys 8,13**, turn left. **Rwys 26,31,35,** turn right. **All aircraft** climb direct BKE VOR/DME. Continue climb in BKE holding pattern (SE, right turns, 298° inbound) to cross BKE VOR/DME at or above MCA or MEA for route of flight.

BELLINGHAM, WA

BELLINGHAM INTL

DEPARTURE PROCEDURE: **Rwy 16,** climb heading 160° to 600, then climbing right turn direct HUH VORTAC. Do not exceed 210 KIAS until established northbound. **Rwy 34,** climb heading 340° to 600, then climbing left turn to intercept HUH R-145 to HUH VORTAC, continue climb in holding pattern (northwest, right turn, 149° inbound) to MEA as appropriate for direction of flight.

NOTE: **Rwy 16,** lighted windsock 9' from departure end of runway, 259' right of centerline, 16' AGL/181' MSL. Multiple trees beginning 747' from departure end of runway, 405' right of centerline, up to 68' AGL/213' MSL. Multiple trees beginning 1128' from departure end of runway, 57' left of centerline, up to 104' AGL/249' MSL. **Rwy 34,** lighted windsock 93' from departure end of runway, 516' right of centerline, 27' AGL/169' MSL. multiple trees beginning 1372' from departure end of runway, 619' right of centerline, up to 134' AGL/246' MSL.

BEND, OR

BEND MUNI (BDN)

AMDT 4 09183 (FAA)

DEPARTURE PROCEDURE: Use BEND DEPARTURE.

BIG PINEY, WY

MILEY MEMORIAL FIELD

TAKE-OFF MINIMUMS: **Rwys 8,26,** NA.

DEPARTURE PROCEDURE: **Rwy 13,** climb to 8400 via BPI R-124. **Rwy 31,** climb to 10800 via BPI R-320 thence all aircraft climb on course.

Airport Master Plan Update

Aurora State Airport

Aurora State Airport Master Plan & Airport Layout Plan Update

Kick-Off Meeting Summary

November 3, 2009
Maplewood Grange Hall
6:00 – 7:30 p.m.

Attendees:

Oregon Department of Aviation: Gregg Dal Ponte, Interim Director; Mark Gardiner, State Aviation Board Chair; Christopher Cummings, Planning & Projects Manager; Mitch Swecker, State Airports Manager; and John Wilson, Airport Operations Specialist

WHPacific, Inc: Rainse Anderson, Project Manager; Sara Funk, Senior Aviation Planner; and Sarah Lucas, Aviation Planner

Members of the Public: 65 people signed in. Refer to attached sign-in sheets

Welcome and Introductions	Gregg Dal Ponte opened the meeting at 6:10 pm by welcoming everyone and thanking them for their attendance. Mr. Dal Ponte then introduced the ODA staff attending the meeting, prior to introducing the consultant team's Project Manager, Rainse Anderson. Mr. Anderson introduced his project team: Sara Funk and Sarah Lucas. Personally, Mr. Anderson has completed numerous planning, environmental and engineering projects at the Aurora State Airport for the past 32 years. Ms. Funk and Ms. Lucas have completed numerous airport master plans and other planning studies. The following information was presented in a PowerPoint format, which has been placed on the project website.
Purpose of the Master Plan Update	Mr. Anderson reviewed the purpose of updating the master plan, which is a document that guides the development of the Airport over a 20-year planning period. The last master plan was completed in 2000. Typically, general aviation airports, like Aurora State, have the master plan updated every seven to ten years. The focus of the Master Plan is to update the inventory, demand forecasts, Airport Layout Plan (ALP) and capital improvement plan (CIP). Additionally, to be eligible for federal or state funding, a project must be shown on the approved ALP.
Project Components	Ms. Funk and Ms. Lucas reviewed the individual components of a master plan, which are:

- *Chapter 1 – Airport Issues and Goals*
- *Chapter 2 – Airport Inventory*
- *Chapter 3 – Aeronautical Activity Forecast*
- *Chapter 4 – Facility Requirements*
- *Chapter 5 – Airport Alternatives*
- *Chapter 6 – Airport Layout Plan and Associated Drawings*
- *Chapter 7 – Capital Improvement Plan*

Federal Aviation Administration (FAA) Advisory Circular (AC) 150/5070-6B, *Airport Master Plans*, and other relevant ACs, Federal Orders and Aviation Regulations will be used for project guidance.

Details of each chapter are:

- Chapter 1 – Airport Issues and Goals
  - Dissemination of surveys to better understand Airport use:
    - User Survey (available at tonight's meeting, FBOs and project website: www.aurorastateairport.org)
    - Runway Usage Survey (to be mailed to businesses, responses will be reported in chapter)
  - Interview FBOs at nearby airports
  - Strategic Role
- Chapter 2 – Airport Inventory
  - On-site inspection of airport facilities (Airfield, Landside and Airport Support Facilities)
  - Airspace
  - Land Use Planning and Zoning
  - Environmental Inventory
  - Aviation Activity Data
  - Airport Financial Data
- Chapter 3 – Aeronautical Activity Forecast
  - Critical Aircraft
  - Based Aircraft
  - Operations Forecast
  - *To be approved by the FAA*
- Chapter 4 – Facility Requirements
  - Identify the ability of the airport facilities to meet forecasted demand and other needs
- Chapter 5 – Airport Alternatives
  - Three build alternatives, in addition to the no build alternative, will be

developed to address the needs identified in Chapter 4.

- Chapter 6 – Airport Layout Plan and Associated Drawings
  - Airport Layout Plan (ALP)
  - Airport Airspace Drawing
  - Inner Portion of the Approach Surface Drawing
  - Terminal Area Drawing
  - Land Use and Noise Contour Drawing
  - Runway Departure Surfaces Drawing
  - Airport Property Map (Exhibit A)
  - *To be approved by the FAA*
- Chapter 7 – Capital Improvement Plan
  - Will identify the cost associated with the ALP improvements and potential funding sources for the projects.

Project Schedule

Mr. Anderson relayed the project is on an 18-month schedule, which allocates review period for ODA, FAA and PAC prior to each public meeting. There will be a total of seven meetings that include a public kick-off meeting, six PAC work sessions and five open houses.

The meeting schedule is subject to change; however, tentative dates for upcoming meetings are:

- Public Kick-Off Meeting – November 3, 2009
- PAC Meeting #1 – January 2010
- PAC Meeting #2 * – April 2010
- PAC Meeting #3 * –June 2010
- PAC Meeting #4 * – September 2010
- PAC Meeting #5 * – December 2010
- PAC Meeting #6 * – January 2011

** Immediately following these PAC meetings, there will be public open houses to cover the same topics of the PAC meeting (the first open house will cover the topics of both meeting #2 and meeting #1).*

The project website www.aurorastateairport.org will have specific dates posted, as soon as they are determined.

Planning Advisory Committee (PAC) Formation; Roles and Responsibilities

Mitch Swecker discussed the Planning Advisory Committee (PAC), which is still being developed. The PAC will represent members who have varying interests in the Airport. Current members of the PAC represent Marion County, Clackamas County, City of Aurora, City of Wilsonville, Aurora Fire District, Airport Fixed Base Operators (3), Oregon Department of Aviation, Charbonneau, and Deer Creek. Four at-large representatives will be selected for the following groups: Community Representative, Airport Business, On-

Airport Tenant, and Off-Airport Tenant.

A review panel, consisting of four ODA employees, will conduct a blind review to select the at-large PAC representatives based on application responses. If interested in serving as an at-large representative, please complete the application posted at www.aurorastateairport.org. Applications for the at-large positions are due by November 17, 2009.

Mr. Anderson reminded attendees the PAC is an advisory committee to ODA and ODA has final authority over the Master Plan. If serving on the PAC, members are asked to provide input to help produce a plan that balances a wide range of airport stakeholder needs and concerns; bring forward comments and concerns of those they represent; and help disseminate accurate information about the plan.

Discussion of Goals and Issues for Plan

Once the presentation was completed, attendees were able to comment and ask ODA and WHPacific specific questions about the master plan update. Below is a summary of the questions/comments and responses (*in italics*).

- There is a survey of airport users – what consideration will there be for non-airport users? *The PAC meetings and public open houses provide representation for airport neighbors.*
- Please elaborate the four at-large PAC positions. *The at-large PAC positions will be for people representing one of the following: community resident, airport business, on-airport tenant, and off-airport tenant.*
- Is there a formal tie between the Plan and agencies? *Yes, the Plan, once approved by ODA, FAA, and the State Aviation Board, will be taken to Marion County for formal adoption into the County's Comprehensive Plan.*
- The website should have a place for comments. *Yes, the website has a comment form.*
- The alternatives will have varying impacts on the surrounding community. What analysis will be done to address this? *Each alternative will have noise contours drawn, as well as an environmental review that includes factors such as social impacts, socioeconomic impacts, etc.*
- Are there records of airport operations for the last ten years? *Operations data for airports without air traffic control towers is difficult to acquire and we rely on any historical data that is available, which includes the ODA RENS acoustical counter information. The last count was completed in the 2002-2003 cycle, which reported 62,926 operations. The RENS program is no longer operational.*
- If it takes 18 months to do a count and the project timeline is 18 months, why not do a count now to ensure an accurate baseline? *Even if the RENS program were operational, the forecasts are done during the beginning stages of a master plan update so it would*

actually add 12-18 months to the project schedule.

- Isn't federal funding and prioritization based on aircraft operations? *No, federal funding is not contingent upon aircraft operations. Instead, funding for a general aviation airport like Aurora State is based on the airport's need and the demand for the project. Having a project on an approved ALP (making it eligible for federal funding) does not necessarily justify the funding. Additional justification may be required, depending on the project.*
- What was the impetus for updating the 2000 Master Plan? *To reflect current conditions and changes at an airport, most general aviation airports will have the master plan updated every seven to ten years.*
- How does the air traffic control tower fit into the plan? *The FAA will be completing an independent tower survey in March 2010. A benefit cost analysis was completed and showed a tower is justified at Aurora State. Funding for the project has not been secured at this time.*
- The last master plan did not discuss an air traffic control tower, but it was shown in the ALP. How can that happen? *Showing a project on the ALP does not justify funding, so it is possible one was shown without much discussion within the master plan. The 1976 Master Plan did show a tower.*
- Having an air traffic control tower means more large aircraft operating at the Airport. *Having an air traffic control tower at the Airport does not necessarily mean increased traffic, louder traffic, or larger aircraft. Traffic may actually lessen because smaller aircraft may displace to un-controlled airports. Additionally, new technology has created many jet engines that are quieter than propeller driven aircraft. The air traffic control tower is for safety.*
- What type of fire protection does the Airport have? *The Aurora Fire District protects the Airport. The District has a crash truck that will be used at the Airport and they are currently training volunteers (fire trucks are only required at commercial service airports). Through funding from private business partnership, a fire suppression system was recently installed at the Airport, with a mainline and fire hydrants running the full length of the Airport. The City of Aurora doesn't even have a fire suppression system.*
- The Airport does not have a vision statement. Will one be included in the Plan? *The strategic analysis and review of issues/goals will create an opportunity to develop the Airport's vision.*
- Will there be a study on adjacent property evaluation? *No, a property valuation will not be completed.*
- Is sewer and water an issue at the Airport? *Yes, currently all septic needs are met with individual septic systems and drain fields. The land could be better utilized if not needed for the drain fields. Water is currently supplied by individual well.*

- The Airport has many benefits such as emergency and disaster relief, tax income, job creation and tourism. Is this addressed in the Plan? *Yes, the strategic role analysis will identify these advantages. Additionally, Aurora State is outside of the 100-year floodplain unlike other I-5 airports (i.e., Chehalis).*
- Are Marion and Clackamas County represented on the PAC? *Yes.*
- The 2000 Master Plan is straightforward and doesn't incorporate some of the considerations other modes of transportation include. Will the goals of SB 680 be included? *The FAA provides guidance for an airport master plan and this master plan is primarily funded by the FAA. The airport master plan scope was developed to fit the FAA's criteria, while also tailoring the project to Aurora State Airport.*
- What agency or external involvement will there be during the planning process? *Many local and state agencies will be notified about upcoming public meetings, some of which are on the PAC, and the final Plan will be taken to Marion County for adoption within the Comprehensive Plan.*

Future Meeting Dates and Times

The next meeting will be a PAC meeting open to the public to discuss draft Chapters 1 and 2 (issues/goals and inventory) and it is tentatively scheduled for January 2010. Location is yet to be determined.

The meeting adjourned at 7:30 pm.

Aurora State Airport Master Plan

Planning Advisory Committee (PAC) Meeting #1

July 22, 2010
Charbonneau Country Club

MEETING SUMMARY

Welcome and Introductions

At 6:10 the meeting commenced. Chris Cummings, Oregon Department of Aviation (ODA) Planning and Projects Manager, welcomed everyone and thanked them for attending. Mr. Cummings gave an overview of what ODA does as an agency, which includes owning and managing 28 airports in Oregon. The Aurora State Airport (Airport) is the largest and busiest Airport that ODA owns. Other ODA employees attending the meeting were introduced: Doug Hedlund, Interim Director; John Wilson, Airport Operations Specialist; Mitch Swecker, State Airports Manager; and Sandi Larsen, Planning Analyst. The Consultant, WHPacific, who is preparing the Master Plan (Plan) was then introduced. WHPacific team members were Rainse Anderson, Project Manager; Sara Funk, Senior Aviation Planner; and Sarah Lucas, Aviation Planner. Other sub-consultants on the project are (not in attendance): Bergman Photographic Services, aerial photography; Corvid Consulting, environmental services; and Jeanne Lawson and Associates, public outreach.

The Planning Advisory Committee (PAC) then introduced themselves. Below is a list of the PAC members (all were present at the meeting), along with their affiliations.

- Bruce Bennett – Aurora Aviation
- Jim Bernard – Clackamas County Board of Commissioners
- Jim Hansen – On-Airport / Tenant
- Tony Helbling – Off-Airport / Tenant & Business (Wilson Construction Co)
- John Henri – City of Canby
- Tony Holt – Charbonneau Country Club
- Steve Hurst – City of Wilsonville
- Nick Kaiser – Community
- Roger Kaye – Friends of Marion County
- Rick Kosta – Deer Creek Estates
- James Meirow – City of Aurora
- Ted Millar – Aurora State Airport Business – Southend Airpark
- Patty Milne – Marion County Board of Commissioners
- Fred Netter – Aurora Fire District

- Dan Riches – Columbia Helicopters
- Scott Starr – Wilsonville Chamber of Commerce
- Mitch Swecker – Oregon Department of Aviation
- David Waggoner – Willamette Aviation
- Craig Wilmes – Aurora Jet Center

The PAC was formed by ODA to represent varying interests at the Airport that includes on and off-airport businesses, local government agencies, surrounding communities and four at-large positions. The at-large positions were announced as available at the November 2009 kick-off meeting and applications were submitted to ODA. ODA performed a double-blind review of the applications to select the at-large representatives.

Review of Process and Revised Schedule

The WHPacific Consulting Team then described the Master Plan's purpose, process, the PAC's involvement and the project schedule. Below is an overview of the information discussed.

Purpose of the Master Plan – A Master Plan is a document that guides the development of the Airport over a 20-year planning period. The focus of the Master Plan is to update the inventory, demand forecasts, Airport Layout Plan (ALP) and capital improvement plan (CIP). To be eligible for federal or some state funding, a project must be shown on the approved ALP.

The Master Plan Process – The Master Plan will consist of seven chapters: 1) Airport Issues and Goals, 2) Airport Inventory, 3) Aeronautical Activity Forecast, 4) Facility Requirements, 5) Airport Alternatives, 6) Airport Layout Plan and Associated Drawings, and 7) Capital Improvement Plan. The Forecast and Airport Layout Plan will require Federal Aviation Administration (FAA) approval. Once a final draft is complete, ODA will present the Plan to the State Aviation Board for approval and submittal to the FAA. ODA will request the Plan be adopted into the Marion County Comprehensive Plan.

Parameters of the Plan – An overview of what the Plan will not do was then given. The Plan will not:

- Analyze the Airport's economic impact; this information is included in the 2007 Oregon Aviation Plan
- Prepare a surface transportation plan for off-airport area; the Plan will consider local transportation system plans.
- Change land use designations; existing land use designations for the Airport and surrounding area will be identified and any deficiencies will be noted
- Develop a vision statement for the Airport; rather, it will focus on the Airport's strategic role and issues/goals.
- Commit FAA or ODA to fund improvements in the Plan; development will only be funded if justified

Several PAC members had questions about the Plan's parameters. These questions and answers were:

Q – Why will there not be a vision statement for the Airport in the Plan? How can you develop a plan without a vision?
A – We are gathering the goals and issues from all parties now, without them you can't develop a vision. As the Plan progresses, a vision of the airport may develop, but it won't be in the form of a one sentence vision statement.

Q – Who signed off on no impact to Clackamas County?
A – No one signed off on anything to that effect. The Plan will consider Clackamas County, as well as all surrounding areas. However, the Airport is located in Marion County and they will be the ones adopting the Plan into the Comprehensive Plan. The Intergovernmental Agreement (IGA) that shows an impact area is completely separate from the Plan and is not considered.

Q – Is ODA coming to the table with an agenda?
A – No. Financial self-sufficiency, however, is desired for all state-owned airports.

Q – Can a plan be set firm without surface transportation planning?
A – The plan will consider local surface transportation planning, but it is not a surface transportation plan.

Q – Is the IGA tied to the air traffic control tower?
A – No, the IGA is not tied to the tower except that Marion County will be the county that approves permit applications for construction.

At this point, WHPacific clarified the Airport's "fence." There is a difference between the state's property and the fence around the Airport environs. Accessing the Airport from private property to the state's airport property is called going "through-the-fence." The perimeter fence, which includes state and private property, is for safety and security purposes.

PAC Roles and Responsibilities – The PAC is an advisory committee to ODA; ODA has final authority over the Master Plan. Members are asked to provide input to help produce a plan that balances a wide range of airport stakeholder needs and concerns; bring forward comments and concerns of those they represent; and help disseminate accurate information about the plan.

Project Schedule – There are approximately 12 months remaining in the project. The schedule allocates review periods of all documents prior to each PAC meeting for ODA, FAA and PAC members. In total, the project includes a kick-off meeting (held November 2009), six PAC work sessions and five open houses.

The remaining meeting schedule is as follows. (Note, meeting dates and times are subject to change.)

*PAC Meeting #2 * – September 30, 2010*
- Discuss draft chapters of the issues and goals, inventory, and draft forecast (Chapters 1,2 and 3)

*PAC Meeting #3 * – December 2, 2010*
- Discuss the draft facility requirements chapter (Chapter 4) and identify possible development alternatives

*PAC Meeting #4 * – February 1, 2011*

- Evaluate the draft airport alternatives (Chapter 5)

*PAC Meeting #5 * – June 9, 2011*

- Discuss the draft ALP and CIP (Chapters 6 and 7)

*PAC Meeting #6 * – July 14, 2011*

- Present the Final Report

** All meetings will occur on Thursday nights. Immediately following these PAC meetings, there will be public open houses to cover the same topics of the PAC meeting (the first open house will cover the topics of both meeting #2 and meeting #1).*

Introduction to Master Plan Goals and Issues

The Master Plan goals will be used in the Plan as a means to create and evaluate development alternatives. They also set the tone of the report. WHPacific gave examples of what the goals may be, such as safety, operational efficiency, public acceptance and protection from incompatible land uses. Issues are identified to help direct the effort to the things that are most important to resolve in the Plan. Regarding issues, WHPacific reported on the issues heard at the kick-off meeting and what was submitted on the airport user surveys. Issues from the kick-off meeting related to runway length, calm wind runway designation, air traffic control tower, precision approach, noise, public outreach, surface transportation planning and land use planning. The major issues identified in the user survey are the following: build an air traffic control tower (25 for, 3 against), lengthen runway, add precision instrument approach, change calm wind runway back to 17, improve airport roads and address traffic issues, and provide public sewer and water facilities.

PAC Discussion of Goals and Issues

Goals for the Plan, as stated by PAC members:

- Jim Hansen – Would like to see by the end of the process (directly or parallel) a clear vision statement defining what the Airport will be like in the foreseeable future (30-50 years) that is embraced by stakeholders in terms of safety, noise, development scale and flavor. The Plan's preparers need to get really high quality, great information about actual operations at the Airport and relationship of the Airport and economic growth. Is there a way to make sure the plan is really implemented?

- Steve Hurst – Consider all areas of impact: service area definition. Goals should be established, not foregone. Proceed in good faith. Measure supply and demand equally. Just because there is demand for something, we are not required to supply it.

- Nick Kaiser – Consider livability for airport neighbors. Traffic issues and noise must be considered.

- Tony Holt – All communities need to be listened to and their points of view taken into account.
- Jim Meirow – Property between airport and Aurora should be considered. The airport will grow and we need to know where it is going. Consider the impacts of an air traffic control tower.
- Jim Bernard – Look at what impacts the airport would have versus the cost of addressing those impacts and include Oregon Department of Transportation (ODOT) costs for roadway improvements.
- Fred Netter – Consider the additional load put on the fire district (FD) that may occur as a result of expansion. FD has very little control over what happens at the airport, but is responsible for it. Why pay (community) to subsidize what's happening at the airport? FD must have ability to cover the airport. These costs should be included in the Plan. We have heard safety is #1, as it is for the FD. However, expansion has an impact associated with it on our equipment.
- David Waggoner – Inside the fence: safety and safety only. Outside the fence: give a careful look at how the investment will play out (benefits vs. costs).
- Bruce Bennett – The Plan doesn't direct or drive the economy. Safety is first, which includes runway length. The plan needs to determine what the actual need at the Airport is for runway length. The Plan should include integration with other systems, *i.e.*, fire suppression system.
- Patty Milne – Keep issues separate and don't mix issues. Stay focused on the Plan and its process. Twenty years is a long way out, and while there are issues today, we must consider the future.
- Dan Riches – Safety first. The airport has to be responsive to the needs of airport business users.
- Mitch Swecker – Safety. Everybody should come to the table with an open mind.
- John Henri – Safety at the Airport and look at the safety of city/county streets and roads. Must look at all of the transportation infrastructure needs. Does airport expand to whatever it wants to be or should there be constraints to its growth?
- Roger Kaye – Agricultural lands are very important to the community. Worried how the increase of airport traffic will impact the farmers and farming operations. Should not forget the Salem airport needs protection, too.
- Ted Millar – As we go forward, remember the Airport is important in the National Plan of Integrated Airport Systems (NPIAS). The Airport's location on I-5 is ideal and the Airport needs to service the communities. An airport grows to provide services. The Airport is a reliever to PDX (*note, it is not an FAA designated reliever at this time*). Corporate aviation is very important for large companies. Provide future growth potential for efficient business operations.

- Jim Bernard – The Airport has impacts to air transportation, not just road traffic.

Issues at the Airport were then discussed:

- Scott Starr – First there are questions about air traffic volume, will status quo be maintained? What is the capacity of the planes? Are there going to be any airspace changes?
- Bruce Bennett – Runway length and strength limits some operations. Zoning is necessary to protect the Airport. Agriculture is a good neighbor for the Airport.
- Tony Holt – In the last Plan noise was taken out and done separately. We need to discuss noise in this Plan. Forecasting: there is absolutely no way to track operations. Starting a forecast without historic data is difficult. How will it be accomplished?
- Rick Kosta – Deer Creek was established circa 1972. At that time Aurora was a smaller airport. Noise is a concern.
- Jim Bernard – Operations volume, frequency, and traffic direction is of concern. Will growth limitations be considered, as with the IGA between ODA and other entities? Clackamas County is impacted and that isn't being addressed. There are also through-the-fence concerns.
- Steve Hurst – Reaffirming that hopefully we'll be able to collect good information to make a true plan. Measure demand accurately.
- Fred Netter – As for collecting data, we need to come up with is what has happened safety wise in the past. What has/hasn't worked at other airports and Aurora?
- Rick Kosta – Reference to the IGA. To ODA: why would ODA sign an IGA at a time when we are trying to expand participation?
- John Henri – These processes do work.
- Craig Wilmes – An air traffic control tower is for safety and involvement with all stakeholders is key for the process and economic development.

Summary and Next Steps

WHPacific will prepare drafts of the Issues and Goals (Chapter 1), Inventory (Chapter 2), and Forecasts (Chapter 3) and submit to ODA, PAC and FAA. ODA must receive FAA approval of the Forecast Chapter. The next PAC meeting will cover the first three chapters, tentatively set for September 30. The PAC meeting will be from 5:30 – 7:00 pm and the open house from 7:00 – 8:00 pm.

The Positive Aurora Airport Management (PAAM) groups meet on Thursday mornings, and it was requested the meetings be moved to another night of the week. However, for County Commissioners and City Councilors Thursday nights work best. All future meetings will be held on Thursdays.

Public Comments

The following public comments were given:

- Will the Plan consider the balloonist a safety issue?
  - No, balloonists have a right to the airspace in accordance with FAA regulations.

- Has ODOT and the Counties been invited to these meetings?
  - Yes, they have been and will continue to be invited.

- I've been through planning processes before and this is a good process. Airplanes are getting quieter.

- What is WHPacific's experience and what are they being paid?
  - Rainse Anderson has worked as an airport engineer and at the Aurora Airport since 1977. In total, he has worked on over 300 airport planning and engineering projects in the Pacific Northwest. Sara Funk has over 20 years of planning experience throughout the United States and brings a breadth of knowledge to the plan. Sarah Lucas has worked at WHPacific as a planner for four years, prior to that she was a planner for ODA and the Nebraska Aeronautics Division, and has been a commercial pilot for eight years. The fee for the Plan is $306,149.46 (includes sub-consultant work).

- Canby should be involved in the process.

- Clackamas County has committed to keeping the area south of the Willamette River rural. Part of this was due to the cost in upgrading the infrastructure to meet industrial demands. The freeways are for freight, not commuters. What is the Airport's acreage footprint going to be set at? Charbonneau was planned in 1970 and was always planned to be the size it is today and it has never grown outside those boundaries.

- How are the forecasts going to be completed?
  - The forecasts are completed by studying existing demographic and population forecasts for the area, in addition to national forecasts. There are strong correlations between population and specific demographic statistics to indicate airport activity at general aviation airports like Aurora State.

Meeting Adjournment

The meeting adjourned at 8:40 pm.

Aurora State Airport Master Plan & Airport Layout Plan Update – Planning Advisory Committee Meeting #1

Aurora State Airport Master Plan

Planning Advisory Committee (PAC) Meeting #2

September 30, 2010
American Legion, Aurora, OR

MEETING SUMMARY

Attendees

Oregon Department of Aviation – Chris Cummings, Sandra Larsen, John Wilson, and Mitch Swecker (also a PAC member)

Oregon Aviation Board – Mark Gardiner

WHPacific – Rainse Anderson, Sara Funk, and Sarah Lucas

JLA Public Involvement – Adrienne DeDona and Sylvia Ciborowski

PAC – Bruce Bennett, Jim Bernard, Jim Hansen, Tony Helbling, John Henri, Susie Stevens (for Tony Holt), Steve Hurst, Nick Kaiser, Rick Kosta, James Meirow, Ted Millar, Patti Milne, Fred Netter, Dan Riches, Roger Kaye, Ray Phelps (for Scott Starr), and Dave Waggoner

Public Attendees – See attached sign-in sheets

Opening Remarks

The meeting commenced at 5:10 pm, with welcoming comments from Chris Cummings. Mark Gardiner, Oregon Aviation Board Chairman, also spoke; outlining recent policies adopted by the Board and dispelled misconceptions surrounding the Aurora State Airport (Airport) and the Master Plan process. The policies are:

Aurora State Airport Mission

Consistent with the 2000 Master Plan, the 2007 Oregon Aviation Plan (both endorsed and approved by FAA), and consistent with the direction in the current Master Planning effort, the Oregon Aviation Board re-affirms that the mission of the Aurora State Airport is and will remain a general aviation airport serving business and personal aviation.

Aurora State Airport Tower

The Oregon Aviation Board re-affirms that an air traffic control tower at Aurora State Airport is a critical aviation safety facility, as determined by the 2007 Tower study and by

FAA approvals of the tower and that, therefore the Aurora tower remains the Oregon Aviation Board's highest priority capital project. The Board further affirms that all federal, state and local regulatory processes will be followed in planning and developing the tower.

Presentation

The purpose of the PAC meeting was to review and discuss Draft Chapters 1 (*Introduction*), 2 (*Inventory*), and 3 (*Aeronautical Activity Forecasts*). The WHPacific planning team gave a presentation, which is outlined below. Comments from the PAC were taken during the presentation, while public comments were taken after the PAC working session had ended.

Schedule

Approximately 10 months are remaining. The process allocates review periods for ODA, FAA and PAC prior to each public meeting. To date, one public kick-off meeting and one PAC work session have been conducted. After tonight four PAC work sessions and four open houses remain. The next PAC meeting – with a public open house to follow – will be to discuss draft Chapter 4, *Facility Requirements*, and to identify possible airport development alternatives. It is tentatively scheduled for December 9, 2010.

Chapter 1

Chapter 1 covers the following topics: planning process goals, master plan goals, issues to be addressed within the plan, and airport role analysis.

Goals were discussed at kick-off meeting (November 2009) and the first PAC meeting (July 2010) and will guide the conduct of the ODA, ODA's consultants, and the PAC throughout the development of the master plan update. Planning process goals are:

- Be open-minded and proceed in good faith.
- Keep the focus more on the long-term future than the short-term future.
- Don't mix unrelated issues and don't be sidetracked by issues that don't relate to the master plan.
- Obtain high quality information for analysis.
- Seek consensus for solutions that are acceptable, helpful, and clear.
- Establish a clear vision statement that defines what the Airport will be like in the foreseeable future (30 to 50 years) and that is overwhelmingly embraced by all stakeholders. The vision statement should encompass safety, noise, and development scale and flavor.

Master plan goals should guide the future development of the Airport; when it is time to evaluate alternative layouts for airport development, the goals should be the evaluation criteria.

- Goal 1: Enhance safety.
- Goal 2: Meet the current and projected needs of airport users, as feasible.
- Goal 3: Consider all the off-airport impacts of Airport development; minimize negative impacts and maximize positive impacts.

Issues were a subject of the kick-off meeting and first PAC. Other sources for issue identification were ODA and an Airport user survey that was conducted in the fall of 2009. The issues are intended to be a method "checks and balances" throughout the planning process, to ensure the Plan addresses issues important to the airport users and community.

- Runway Extension
- Air Traffic Control Tower
- Impact of Airport Expansion on Surrounding Areas
- Calm Wind Runway Change
- Precision Instrument Approach
- Helicopter Operations
- Other Airport Improvements

In addition to goals and issues, Chapter 1 discusses the appropriate role of the Airport. It was determined the Aurora State Airport fits well the Oregon Aviation Plan (2007) description of an Urban General Aviation Airport.

The Airport's role in the future should not change from its current role—a busy airport handling a full range of general aviation, including helicopters and business jets. Mulino State could be utilized if personal use and recreational aircraft want to relocate to a less busy airport where the other aircraft are smaller and slower.

Aurora State Airport is not an FAA-designated reliever airport for Portland International. The Airport could be officially designated a reliever in the short-term future, if ODA decides to pursue the designation and the FAA agrees.

Aurora State Airport should continue to fulfill its role as an Urban General Aviation Airport. The advantages and disadvantages of becoming a reliever airport should be discussed with the ODA, Port of Portland, and FAA.

Chapter 2

The inventory chapter discusses existing facilities at the Airport, including: airfield facilities, landside facilities, support facilities, land use and zoning, and environmental.

Airside facilities include:

- Runway. Runway 17/35 is 5,004 feet by 100 feet.
- Taxiways and Taxilanes. Runway 17/35 full-length parallel taxiway (Taxiway A), 35 feet wide. Five taxiways connect Taxiway A to Runway 17-35.
- Aprons and Aircraft Parking.
    - State-owned property = 46 tiedown positions.
    - Private property = 37 tiedown positions with additional aprons for large aircraft parking.
- Airfield Lighting. Medium intensity lighting system.
- Visual Approach Aids. The Airport has three forms of visual approach aids.
- Two-box Visual Approach Slope Indicator (VASI) located at each runway end

- Runway 17 has both an Omnidirectional Approach Lighting System (ODAL) and Runway End Identification Lights (REILs).
- Instrument Approach Aids. Both Runway 17 and 35 have instrument approach procedures, which can be used when the visibility and cloud ceiling are below minimums for Visual Flight Rules (VFR) conditions.

Landside facilities include:

- Land. Airport Property vs. Airport Environs. Airport Property references property owned by the State of Oregon. The term Airport Environs is used to describe both public and private lands used for aviation-related uses.
- Hangars and Other Buildings. 89 buildings (Airport Environs)
- Aviation Services. Three fixed based operators (FBOs)
- Access and Vehicle Parking. Fencing surrounds the perimeter of the Airport Environs. All access points are gated - not all are automated. Private businesses at the Airport use a colored gate system to assist in emergency response and advertisement.
- Emergency Services. The Aurora Rural Fire Protection District provides fire protection, with a recently installed 500,000-gallon fire suppression system. Clackamas County Sheriff Department and Oregon State Police provide emergency services.
- Utilities. Utilities and public services provided at the Airport include:
- Water – Individual well system
- Sanitary Sewer – Individual drain field / septic tank systems
- Telephone – Local franchise companies
- Electricity – Portland General Electric

Land use and zoning. The existing land use and zoning at and surrounding the Airport was discussed (refer to Exhibit 2F).

Environmental Inventory. Environmental constraints for airports typically fall into two general categories: human environment and natural environment.

- Human factors include existing settlements and incompatible land use, noise, social or socioeconomic conditions, light and glare, and the general controversial nature of airports.
- Natural environmental elements include various aspects of air quality, water resources, fish and wildlife, hazardous materials, energy and other resource issues.

The FAA considers public controversy to be an environmental issue. Additional study regarding noise, threatened and endangered species, cultural resources, and possibly hazardous materials should be conducted once a project is defined.

Noise contours will be produced for the Master Plan study to assess the compatibility of land uses around the Airport with current and future levels of aircraft noise.

Chapter 3

Aeronautical Activity Forecasts are 20-year projections of activity (demand) to help plan the type and sizing of airport improvements. The Aurora State Airport forecasts are unconstrained by

current facilities. ODA may elect to constrain demand when facility needs and development alternatives are considered later in the planning process.

In the last 15 years, general aviation in the U.S., in Oregon, and at the Airport grew until 2008, when decline resulted from the economic recession and high fuel prices. From the turn of the century through 2007, the Airport's based aircraft grew due mainly to the growth at Southend Airpark, movement of aircraft from other "jet capable" airports, and strong economy. Declines in fuel flowage and instrument flight plans were recorded in 2008. In 2009, instrument flight plans declined, but fuel flowage grew. Instrument flight plans are growing in 2010.

About ¾ of Airport activity is associated with Clackamas and Washington Counties (based on population, pilots, instrument operations).

Historical records show 5.3% average annual growth in based aircraft at Aurora from 1998 (233 aircraft) to 2010 (432 aircraft).

Change in market share at "jet-capable" airports in the region, 1998 – 2007:

- Aurora - 21% to 32% (share of jets from 11% to 38%)
- Hillsboro - 35% to 27% (share of jets from 69% to 47%)
- Troutdale - 16% to 15% (share of jets from 6% to 3%)
- McMinnville - 10% to 10% (share of jets from 3% to 2%)
- Salem - 18% to 16% (share of jets from 11% to 10%)

Number of based aircraft at these five airports increased from 1,119 to 1,220 (jets from 35 to 88).

Based aircraft forecast models vary from 0.4% to 3.1% annual growth. Preferred forecast is 1.36% annual growth, resulting in 566 aircraft in 2030, an increase of 134 aircraft. Preferred forecast averages regional population and employment forecast growth rates and is consistent with growth projected by Airport businesses. Some change in fleet mix is forecast over 20 years: jets grow from 5% to 9%, helicopters grow from 8% to 10%, single engine airplanes decline from 72% to 66%.

Since 1998, total annual operations (operation = takeoff or landing) have varied between 66,821 and 90,180. Average historical ratio of based aircraft to operations is 232, consistent with Airport user survey conducted in fall 2009. Operations forecast models vary from 1.1% to 3.1% annual growth. Preferred forecast is based on 232 operations per based aircraft, which equates to 1.9% average annual growth. Operational fleet mix shows higher performance aircraft (jets and turboprops) are used more often than single engine aircraft, consistent with Airport user survey results. Over 20 years, jet operations are projected to grow from 13% to 18% of total operations, and single engine airplanes to decline from 33% to 29%.

Critical aircraft is the most demanding aircraft that regularly uses the airport (at least 500 annual itinerant operations) – can be a "family" of aircraft. The critical aircraft determines Airport Reference Code (ARC), which identifies appropriate FAA airport design standards. ARC is a letter

representing aircraft approach speed and a Roman numeral representing aircraft wingspan/tail height. ARC for current and future activity at Aurora is C-II (exemplified by Israel Aircraft Industries Astra 1125 now and by Cessna Citation X in the near future).

Summary of Aeronautical Activity Forecasts

Forecast Element	2010	2015	2020	2030
Based Aircraft	432	462	494	566
Aircraft Operations	100,224	107,227	114,720	131,312
Critical Aircraft	IAI Astra 1125	Cessna Citation X	Cessna Citation X	Cessna Citation X
ARC	C-II	C-II	C-II	C-II

PAC Comments

The following comments were provided by members of the PAC during the presentation.

- Susie Stevens – Cite the sources along with information, add language about physical constraints in regards to feasibility, change "evaluate" to "involve" on Goal 3. Also wanted more information on the user surveys and pointed out the difference between random and scientific surveys.
- Jim Hansen – Remove citation of 1,500' extension being desired by some users, as he's not heard that number before. (Note: several PAC members raised their hands when asked if anyone knows if 1,500' is needed by some operators.) Add extending the runway overruns. An air traffic control tower may decrease operations in the smaller planes.
- Bruce Bennett – The drainage ditch on state property needs to be filled and paved for safety. He also recommended the Airport not grow past Hwy 51, Airport Road, Keil Road, and Arndt Road; the zoning on the other side of the roads should be protected.
- John Henri – Added that adjacent lands should remain as EFU (exclusive farm use).
- Fred Netter – If adjacent lands are kept as EFU, owner must be compensated.
- Roger Kaye – The use of land, especially on through-the-fence land, should be established. Are through-the-fence areas sufficient?
- Steve Hurst – Gather information and cite the source more concretely. He also wondered how this information would be used in justifying a runway extension.
- John Henri – Also had questions on how this information would be used for justifying a runway extension.
- Fred Netter – Chapter 2 states that Aurora is within walking distance; however, the road is unsafe for walking as it has narrow shoulders. As for the calm-wind runway designation, he said more people want it kept as is. He also questioned why the Airport is designated as an "Urban General Aviation Airport" if SB 680 was designed for rural airports.
- Patti Milne – Clackamas County Sheriff provides service for emergencies of regional and statewide significance. Marion County Sheriff provides emergency services for typical emergency response, as well as Oregon State Police.

- A PAC member thought the pavement condition index was incorrect and that some taxilanes are closer to "poor" than what is designated.
- Statewide Resource Planning Goal 5 allows an entity to constrain growth to a boundary.
- UT-20 (as shown on the land use exhibit) is Urban Transitional, not Urban Transportation.
- Jim Hansen – Add discussion about new departure procedures. (Note: ODA reported they are working with FAA to finalize this and are hoping to have it completed within the next couple of months.)
- Bruce Bennett – Noise is important and bigger airplanes don't necessarily make more noise, because of advances in turbofan technology. There are published noise reduction procedures.
- Steve Hurst – Adjacent farmland is "Foundation" farmland according to the Oregon Department of Agriculture. He also questioned discrepancies in historical operations counts.
- Nick Kaiser – Airport is 1/3 mile from Aurora city limits. He also added another point of view that some people feel the airport needs to grow within certain constraints.
- Susie Stevens – Vehicular traffic will increase with bigger airplanes.
- Fred Netter – Vehicular traffic issues should be separated from the Airport aircraft operations issues.
- Nick Kaiser – Questioned the forecast numbers, especially the validity of the historical data.
- Bruce Bennett – There has been a lot of growth in the last ten years and there is no vacant land left.
- Tony Helbling – The recent increase at the Airport is artificially high, because many operators moved from Hillsboro, for example, since there was private property available to develop.
- Susie Stevens – Asked to have the Terminal Area Forecast link out on the website. She also questioned the reasoning behind selection of the Preferred Forecast.
- Steve Hurst – We need to have reliable numbers.
- Ray Phelps – We need Washington County vehicular traffic counts.

Public Attendees Comments

- Marlow Treit submitted written testimony, which is attached. The overall sentiment of the testimony states that an air traffic control tower is not needed at the Airport.
- Regarding the air traffic control tower, it must be justified by operations and is for the purpose of safety.
- Jets at the south end of the Airport are a cause of concern.
- A Charbonneau resident was told by her real estate agent that only small airplanes operate at the Airport, and the noise is much worse than they expected.
- Early morning operations and disturbances at Charbonneau are unacceptable.
- The recent accident near the Airport has neighbors concerned. How can we guarantee something like that won't happen again? These are adults and shouldn't need someone in an air traffic control tower telling them where to go – a tower wouldn't have avoided this accident.
- Touch and goes are scary for neighbors.

- Most neighbors knew about the Airport when they moved there, but growth has been greater than they expected.
- A pilot said he uses the Airport 3-4 times a year and he – like most pilots – wants to fly neighborly.

Meeting Adjournment

PAC members were asked to submit their comments on draft Chapters 1-3 within two weeks. The meeting adjourned at 7:15 pm. A public open house followed, and a summary of that event is attached. All information regarding the PAC meeting and open house – along with comment forms – is posted at www.aurorastateairport.org.

Aurora State Airport Master Plan

Open House Summary

September 30, 2010

Prepared by:
JLA Public Involvement
For WHPacific & Oregon Department of Aviation

Public Involvement and Outreach Overview

The Oregon Department of Aviation (ODA), with assistance from WHPacific, is conducting a master plan update for the Aurora State Airport. The purpose of this update to the 2000 Airport Master Plan is to assess the role of the Aurora State Airport, evaluate the Airport's capabilities, forecast future aeronautical activity for the next 20 years, and plan for the timely development of any new or expanded Airport facilities needed to accommodate future aviation activity.

ODA obtained and matched a grant from the Federal Aviation Administration (FAA) to fund this study. ODA has organized a Planning Advisory Committee (PAC) comprised of airport users and neighbors to participate in the planning process. In addition to six PAC meetings, other public outreach opportunities include regular project website updates to disseminate information and gather comments and questions, and five public open houses. The first open house was held in conjunction with the second PAC meeting on September 30, 2010 from 7:00 p.m. to 8:00 p.m. at the American Legion, located at 21510 Main Street in Aurora.

The drop-in style open house featured several display boards exhibiting information on the master plan update process and project schedule as well as information regarding the first three draft chapters of the Master Plan Update, including:

- Goals for the planning process;
- Goals for the future development of the Airport;
- Major issues the plan should address;
- The Airport's current and future role within the system of airports;
- The Airport's background, including existing airfield and landside facilities, airspace, land use and zoning, environmental issues, and historical aviation activity and financial data; and
- The types and levels of aviation activity expected at the Airport during a 20-year forecast period.

Staff from ODA and WHPacific were on-hand to answer questions and collect comments.

Public Information and Outreach

The public was invited to attend the open house and/or submit comments online through the following venues:

- Press release distributed to local media outlets.
- E-mail distributed to the "interested parties" list-serve.
- Announcement posted on the project website: www.AuroraStateAirport.org
- Flyers posted at a variety of locations around the community, including:
    - Columbia Helicopters
    - Willamette Aviation Office
    - Aurora Aviation, Inc.
    - Van's Aircraft
    - Sky Iron Café
    - White Rabbit Bakery
    - The Colony Pub
    - Lunch Room
    - Pheasant Run Wine Tasting Room
    - Old West Colony Kitchen
    - Antique shop
    - Two local market/grocery stores

Overview of Public Comments

Public comments were collected via comment forms and flip charts at the open house. Members of the public were invited to submit comments online in addition or in lieu of attending the open house.

Nearly 50 people attended the PAC meeting and open house. The overall response received from community members was pessimistic but constructive. Participants who provided written comments and who chatted with staff were concerned about noise impacts and recent accidents related to take offs and landings at Aurora State Airport. A few people provided input on the draft Master Plan Update chapters being considered. Many participants voiced their appreciation for having the opportunity to provide feedback.

Three people commented on the noise impacts and offered some solutions, including a noise reduction wall and regulations for helicopter traffic. Three people provided specific feedback regarding Draft Chapters 1 – 3. Some of these comments referred to physical constraints, transportation impacts, using proper references, and general clarification of terms. One person commented on the recent airplane crash in Piper Court and inquired about how the master plan might identify how this could be avoided. One person provided a written letter in opposition to the control tower being proposed by the ODA.

Open-Ended Comments from Comment Forms

Six written comments were collected from participants via comment forms. Two participants submitted letters (see attached).

- Lower noise. Put up a noise reduction wall.
- In Chapter 2, with regard to noise control, please include regulations and rules for helicopter traffic as it tends to overfly Aurora Historical area at low levels, creating excessive noise.
- Goals: Airplane crash at Piper Court (midfield)—how could this be avoided?
  Of the 400 planes based at Aurora, how many are at the 30,000 wt? Are any at 45,000 wt?
  Deer Creek is less than 1,000 feet from the south end of the airport – noise – livability – quality of life are very important to the 141 homes, approximately 425 people.
  Loud operation – take off – lands
- The second goal in Chapter 1 is to meet the needs of current and projected users, as feasible:
  - What is the current need?
  - Who are the projected users?
  - Isn't the notion of who projected users are a self fulfilling prophecy?

  Chapter 3 notes the intersections with Arndt Road north of the airport are already projected to fail in 2015.
  - Does the ODA plan to address surface transportation impacts in this master plan? If so, how? When?
  - Did any of the improvements identified in the Marion County Transportation System plan get built?

  How do the PAC members and the public get access to the surveys and other documents on which WHPacific bases the conclusion in the report?
  Chapter 3 says the Airport Reference Code will be changed from B-II to C-II and the reference jet is a citation X because a single airport user is buying one. Why? How will that affect the decision on runway length and strengthening?
  Chapter 2 – Emergency services should say who provides mutual aid for police and fire.
  91% of the population around the airport is in Clackamas County. How is it that Clackamas County is not part of the IGA?
- Thank you for keeping us posted on the progress!
- Page 1-3, change "evaluate" to "involve"
  Page 1-3, strike "1,500'" extension, not talked about by users, add recommendations for off-site improvements, i.e. roads. Troutdale Airport is in Multnomah County, not Washington,
  To have accurate forecasts, you must have forecasts of future growth of industry that may need airport! Also of population that may want airport services.
- Emergency services inventory should detail Mutual Aid agreements
- [Vehicular] traffic counts are not the same as a traffic study – need this
- Will there be an overhead noise study?
- Fill and pave drainage ditch on state property

Aurora State Airport Master Plan Update – Planning Advisory Committee (PAC) Meeting #2 & Open House

Sept 30 2010

Oregon Dept of Aviation
Master plan meeting

Subject- Air traffic control tower

For the sake of history, I was involved with the 1976 Master Plan that had the footprint for the tower included.
For the last 35 years I have been a user of the Aurora Airport, a fixed base operator, aircraft owner and land owner.
The basis for having a tower is simple. Improved safety. There must also be enough aircraft movements to justify it and have the funding to build it. Next the tower must be manned during the hours that the traffic would require management.
History shows us that the number of aircraft movements were at their height in the late 1970's early 80's.
The State Board of Aeronautics, at that time part of ODOT, had a device that they leased or rented the recorded the sound of aircraft using the runway. Those numbers were used for further development of the airport by the State. Since the downturn of aviation due to many aspects of the economy, the aircraft movements have never reached the level that was achieved in the "hey day" of aviation as we know it.
During the "hey day" we were told that somewhere between 150,000 and 175,000 movements were recorded per year. This was published information from the State Board of Aeronautics. A movement is a take off or a landing. The airport had a number of fixed base flight schools plus instructors who worked with students but not in a flight school. The VA was paying for students to become commercial, multi-engine, instrument rated, flight instructors. The operators could expect 90% of the cost to be paid for by the government in GI bill education funds. This created a tremendous customer base for the operators. That funding is gone and the cost of aviation training is now born by the student. And at this time, the number of students is minimal compared to that time period.
It was not uncommon for there to be as many as 12-20 aircraft in and out of the pattern all day on good flying days. No tower and no accidents.

This is where we are today. There has not been an accurate count of aircraft movements for years. The number of aircraft based here is up but the number of operations is no where near where it was in the past. The operations have changed dramatically with about 20% of the operations being piloted by professional pilots in business aircraft. These pilots have a much better safety record than a recreational pilot. The "see and be seen" method of governing the traffic with a common frequency to monitor has worked well and I feel will work into the future. To my knowledge there has not been an accident at this airport that a tower would or could have prevented. In the 35 years that I have been here, I have seen the results of a number of accidents, but not one of them would have been prevented by a tower operator. We have not had an air to air accident and the majority of the ground incidents are not within the towers control.

Having been a landlord here with over 50 rental units, I have seen many pilots move their aircraft out of the Port of Portland airports just to be away from the hassle of a tower. The 80% training and recreational pilots here do not need nor use the tower services.

So, just because the funds are available to install the tower and it is in the master plan should not justify its installation. The cost of manning it and maintaining it will be passed on directly to the user. This will be another tax and another level of government that this airport and its tenants should not be burdened with at this time. Our tax dollars should be spent on boosting the economy, not adding to the tax burden of any one group.

COMMENT FORM

Concerns of Concern with Chapters 1-3 of Draft Aurora State Airport Master Plan Update

By Tony Holt, Chair, Civic Affairs Committee, Charbonneau Country Club
September 27, 2010

General

Chapters 1-3 have been written prior to any discussion with the PAC. This is a clear attempt to lead the discussion in a predetermined direction.

There are obvious constraints to development and expansion of this airport (only one runway, bordered by roads on four sides, limited remaining areas for development within the footprint). Yet there is no discussion of constraints.

ODA has already picked a preferred activity level forecast prior to any discussion with the PAC.

Points under Chapter 1

Page 1-2 Goal 2 Heading says "where feasible" This section needs to recognize the physical constraints to airport expansion such as one runway, bordered by roads on four sides, limited areas remaining available for development within the footprint, etc.

Page 1-3 First bullet, change word "evaluate" to properly describe the meaning of this bullet---including assessing the effect of any proposed changes on the livability of airport neighbors. Add bullet-a proper noise study is required to measure potential impacts of proposed developments. Runway Extension paragraph-- Please provide proper attribution to the many statements loosely made in this paragraph. Air Traffic Control Tower paragraph—again, need proper attribution for statements made.

Page 1-4 2nd para "Airport neighbors are----" Add 'and their quality of life' to this sentence. Calm Wind Runway Change section. Need to explain this move has never lessened the noise over Charbonneau so to revert to 17 is not a major concern. Other Airport Improvements for complete transparency, need a list of individuals interviewed and an explanation of how they were chosen.

Page 1-5 2nd Section, first sentence. How has Aurora Airport suddenly changed from a **rural** GA airport to an **urban** GA airport? Note: the Oregon 'Through the Fence Bill only applies to rural airports.

Page 1-7 2nd para the 14,186 IFR operations does not seem to tie to the graph on page 3-10

Page 1-14 6th para-error-Troutdale is not in Washington County. Para 7-again refers to it as an urban airport.

Page 1-16 4th para- refers to 79,953 operations at Aurora on a 10 year average. This calculation needs to be carefully explained to the PAC.

Points under Chapter 2

Page 2-7 4th para, second last sentence-"complaints from neighboring Aurora have dropped---" should note that they have not dropped at Charbonneau which now suffers the wide spectrum of jet take-off noise.

Page 2-9 last para-the PAC needs to properly understand how the current annual operations number quoted of 87,345 was arrived at.

Page 2-11 3rd para should also quote the Oregon Department of Agriculture study classifying areas as either Foundation or Important or Conflicted farmland. The area around the Airport is classified as Foundation farmland.

Page 2-14 3rd para-"Other Issues" traffic impacts should be mentioned.

Page 2-15 Table 2D Operational Records. The PAC needs to know how this was developed.

Points under Chapter 3

Page 3-1 1st para, 3rd sentence-"These projections are unconstrained and assume ODA or others will be able to develop the various facilities necessary to accommodate based aircraft and future aircraft operations." This is a fatal flaw in the conclusions so far. Constraints to growth must be considered in producing an accurate operations forecast(s).

Page 3-5 last para, the statement that oil prices will not exceed $100 before 2025 is ridiculous given the limited supply of new sources of petroleum and increases in demand once the current worldwide recession is over. What is the source?

Page 3-9 Exhibit 3C Historical Aircraft Operations at Aurora State Airport. On the following page they admit this is an estimate, but how was it compiled?

Page 3-10 Exhibit 3D It is hard to believe that out of supposedly 90,000 total operations at Aurora in 2009 only 5,000 were IFR!!

Page 3-15 Based Aircraft Forecast-explain how various forecast models were developed and the preferred one selected.

Page 3-22 3rd para- the FAA's Terminal Forecast is mentioned frequently. What is it, how is it developed and explain how it is relevant.

Page 3-29 last para-"The airport has now passed the 500 operations threshold for Aircraft Approach Category C". How do we know??

The following sections were prepared earlier. There is some repetition.

Statements made without attribution

Chapter 1

--"PAC members who are airport users fear community concerns will unduly constrain growth."

--"Some airport users report there are times that they must lessen their airplanes weight in order to depart---"

--"Some Airport users and businesses favor a runway extension of up to 1,500 feet." (but not mentioned in the survey)

--"Airport neighbors are concerned that a runway extension would unduly disrupt the area and encourage more and louder aircraft."

--Re changing calm wind runway back to 17, "noise impact would move with traffic, a concern for Airport neighbors."

Chapter 2

Page 2-14, "There are some members of the community who are against airport growth and desire closure of the Airport and release of the land to other uses." Who are they??

Unclear statements

Chapter 1

One goal is "evaluate all communities and jurisdictions in the Airport's influence area." Meaning?

When did Aurora Airport go from being classified as a Rural General Aviation Airport to an Urban General Aviation Airport.

Chapter 2

"An accurate inventory helps produce an aviation demand forecast---"

Missing or misleading

Chapter 1

-They want to "determine" Airport's future role rather than predict it.

-No discussion of possible constraints to growth such as one runway, hemmed in by roads, current zoning, etc.

-No mention of livability of airport neighbors as goal.

-An MP goal should be to predict demand as accurately as possible.

-An MP goal should be to evaluate potential noise and traffic impacts for any new development.

-Should list which individuals/organizations responded to the survey?

-Should list which individuals/organizations were interviewed?

-How do the Oct 2007 to Oct 2009 IFR numbers on page 1-7 fit with Exhibit 3D, page 3-10?

-Page 1-16 says the average operations at Aurora from 1998-2008 were 79,953 operations; how calculated and isn't this meaningless?

Chapter 2

Page 2-7, "Complaints from neighboring Aurora have dropped since this designation (calm wind 35) was enacted." Maybe, but not from Charbonneau.

Page 2-9, Under 'Human Factors' and 'Noise' talks about noise sensitive land uses and says "the number of noise sensitive land uses is minimal' because the majority of the adjacent land is in agricultural use.

Page 2-11 under 'Farm Preservation' should also reference the Oregon Department of Agriculture study.

Page 2-14 'Conclusion' "Beyond controversy over noise and airport expansion, there do not appear to be any significant environmental issues on the Airport or in the airport vicinity." What about traffic??

Chapter 3

All activity forecasts presented are unconstrained; that is unrealistic.

Page 3-5 the oil price prediction needs references as to source/basis. As a former oilman, I would say, given the future supply demand equation, the prediction is totally unrealistic.

Page 3-10 Exhibits 3C and 3D indicate that of an estimated 88,000 operations at Aurora in 2008, only some 5,800, or 7% were IFR. That seems unrealistic.

Page 3-29 How do we know "the airport has now passed the 500 operations threshold for Aircraft Approach Category C, so the current ARC should be C-II"? What proof?

Tony Holt

September 27, 2010

Aurora State Airport Master Plan

Planning Advisory Committee (PAC) Meeting #3

December 9, 2010
Canby Adult Center, Canby, OR

MEETING SUMMARY

Attendees

Oregon Department of Aviation – Chris Cummings, Sandra Larsen, John Wilson, and Mitch Swecker (also a PAC member)

WHPacific – Rainse Anderson, Sara Funk, and Sarah Lucas

JLA Public Involvement – Adrienne DeDona and Sylvia Ciborowski

PAC – Bruce Bennett, Jim Bernard, Jim Hansen, Tony Helbling, John Henri, Tony Holt, Mark Ottenad (for Steve Hurst), Nick Kaiser, Rick Kosta, James Meirow, Ted Millar, Patti Milne, Fred Netter, Dan Riches, Roger Kaye, Ray Phelps, and Dave Waggoner

Public Attendees – See attached sign-in sheets

Welcome and Introductions

The meeting commenced at 5:15 pm, with welcoming comments from Chris Cummings. He introduced Oregon Department of Aviation (ODA) employees and the WHPacific consulting team.

Presentation

The purpose of the PAC meeting was to discuss the PAC comments received on Draft Chapters 1 – 3, as well as present information in Draft Chapter 4 (*Facility Requirements*). The WHPacific planning team gave a presentation, which is outlined below and posted to the project website (www.aurorastateairport.org). The PAC made comments during the presentation, and public comments were taken after the PAC working session had ended.

Schedule

Approximately eight months are remaining. The process allocates review periods for ODA, FAA and PAC prior to each public meeting. To date, one public kick-off meeting and two PAC work session have occurred. After tonight, three PAC work sessions and three open houses remain.

The next PAC meeting – with a public open house to follow – will be to discuss draft Chapter 5, *Airport Development Alternatives*.

Vehicular Traffic Counts

The Oregon Department of Transportation – Transportation Development Division placed traffic tubes at 11 access points at the Airport from 10/18 to 10/22. Additional data is being gathered and will be analyzed with data from ODOT. Data will be presented prior to the next PAC meeting.

PAC Comments – Draft Chapters 1 - 3

Time was allocated to discuss the comments received on Draft Chapters 1 – 3. Items discussed were:

Draft Chapter 1 Comments

- Roger Kaye – Is there a census of Airport occupants? Are all occupants airport-related? *An inventory of off-airport (through the fence) tenants will not be prepared as part of this project.*
- Tony Holt – How has Aurora State changed from a rural GA airport (SB 680) to an urban GA airport (Oregon Aviation Plan 2007)? *Aurora State Airport was listed as a "rural" airport in SB 680; however, the OAP also lists it as an urban airport.*
- Tony Helbling – Regarding 1.24. Do not add "some" – it is true that all PAC members who are airport users expressed this concern. *Sentence will be left as currently shown.*

Draft Chapter 2 Comments

- Fred Netter – Regarding comment 2.16 (see "Chapters" page on website), contact Jim Johnson with the Oregon Department of Agriculture. Foundation farmland is a term used in a metro study and not a legal term appropriate for Aurora. Tony Holt and Patti Milne joined this discussion. *WHPacific will research further, information gathered will be included Chapter Five,* Alternatives.
- Ted Millar – How will we see changes based on these comments? *The Final Draft, to be presented at the last PAC meeting, will incorporate changes.*

Draft Chapter 3 Comments

- Tony Holt – FAA planning advisory circular recommends both constrained and unconstrained forecasts. *The unconstrained forecasts, as prepared, were approved by FAA. The development alternatives will show options that do constrain the Airport's growth.*
- John Henri – Could you constrain the Airport in Chapter 5? *Yes.*
- Tony Holt – Why did you choose the Astra as the critical aircraft? It does not have 500 operations at the Airport. *The Astra has the most operations of C-II aircraft. The airport reference code (ARC) is developed by using families of aircraft. The Astra is most representative of C-II aircraft operating at the Airport.*

- Mark Ottenad – Why did you choose 2007 and 2009 data in determining the forecasts? *Those years represent recent peak and valley years, and an average represents a more normal year.*
- Bruce Bennett – How many operations does CSIM have in their Falcon 900? *The records were researched after the meeting. In FY 2007, documented operations for CSIM's Falcon 900 were 146 and in FY 2009, they were 123.*
- Nick Kaiser – Comment 3.23, the accuracy of operations is essential as it must have an impact on the forecasts. He would like the 62,900 operations numbers used. *No changes to will be made.*
- Bruce Bennett – Regarding a comment that the forecasts represent an operation occurring every 5 minutes, he noted this is an average and there are days when aircraft are lined up for take off.
- John Henri – Are you going to change the forecasts? *No, there are no compelling reasons to change the data presented at this time.*
- Ted Millar – People need to be aware of the impacts of the plan and we don't want to be on a camel looking backwards – we must look forward. The National Business Aviation Association guidelines must be taken into account.
- Tony Holt – What is the TAF (terminal area forecast) and does Aurora State have one? *Explanation to the TAF is given in the written comment responses. Yes, Aurora has a TAF and the airport has exceeded the TAF.*
- Bruce Bennett – Believes the forecasts are conservative.
- Mark Ottenad – Are helicopters broken out in the forecasts? *Yes, on pages 3-21 and 3-27.*
- Tony Holt – Please get the actual user surveys on the website. *WHPacific and JLA will gather the responses and post to website prior to the next scheduled PAC meeting.*
- Mitch Swecker – ODA is moving forward with finalizing departure procedures that direct traffic east and west of Charbonneau. They are planned to be published in spring of 2011.

Draft Chapter 4

The accompanying presentation outlines high points from Draft Chapter 4. The following comments were provided by members of the PAC during the presentation.

- Roger Kaye – You should defer zoning/planning discussion to Chapter 5. If were to remain in Chapter 4, there could be conflicting data. *The recommendations given would remain, regardless of alternatives presented in Chapter Five, as they are broad and conform with State guidance given in the Oregon Aviation Plan. No changes will be made.*
- Fred Netter – Zoning discussion should be able to remain, as it is only suggesting what may be needed.
- Tony Holt – Table 4B, the capacity shown isn't realistic.
- Fred Netter – Fire district need should be further explained, especially in regards to funding. The District owns the apparatus.
- Mark Ottenad – Regarding projected landside developments, how are the acreages developed? *Methodologies are explained within the chapter.*
- Jim Hansen – pg 4-25, utilities. Strike paragraph relating to development constraints. It is no longer a limiting factor, due to new technologies. *We will look into the issue by talking further with Jim and Marion County representatives.*
- James Meirow – There is a cost associated with the septic systems, so they are a constraint.

- Ted Millar – Maintenance of septic systems is expensive and you still must remove the gray water.
- Patti Milne – There should be some comment that modern technology could change the septic constraints.
- Tony Holt – Would like to request information on RPZs, RSAs, etc to the fence. *The information has been presented in Chapter 2 and will be graphically shown in Chapter 5.*
- Jim Hansen – Can an overrun area extend into a safety zone? (Overrun = RSA). *Yes, dimensions are based on runway end.*
- David Waggoner – Will the runup area to 17 be discussed in Chpt 5? *Yes.*
- Nick Kaiser – Regarding Tables 4A and 4B, why did you choose 84 degrees? *84 degrees is the mean maximum daily temperature of the hottest month, which adjust standard conditions with those at the Airport*. Page 4-14, what is ADG? *Airplane Design Group (ADG) has significance with regards to design standards. It is the Roman numeral in the Airport Reference Code.*
- Tony Helbling – Page4-26, title notices. Suggests extending area out to 5 miles (similar to tower notice). *There is no legislative authority to do so. ODA has promoted title notice statewide and will continue.*
- Nick Kaiser – 1 mile would go into Aurora (title notice), what happens today? Is there a title notice? *No, but ODA would like to see something like this occur.*
- Patti Milne – There are similar title notices for agricultural uses.
- Fred Netter – Notices could open ODA up for liability. It is a two-edged sword.
- Nick Kaiser – Relating to ATCT. How is the BCA developed? *The FAA develops it based on TAF data.*
- Bruce Bennett – Regarding Table 4A, one of the aircraft is based at the Airport. Many airports in Oregon have a longer runway than Aurora State.

Potential Development Alternatives

Chapter 5 will present four alternatives and with the assistance of the PAC, ODA will develop a "Preferred Alternative." The Preferred Alternative may be a combination of features from more than one alternative. A no build alternative will be presented, along with three development alternatives. The development alternatives will likely show different approach minimums, which will impact design standards, and at least one will show a runway extension. Discussions with the PAC yielded the following comments:

- John Henri – How will acreage be addressed in the alternatives?
- Bruce Bennett – Aren't precision approaches unattainable at Aurora?
- Fred Netter – Please do research as to where the fire station is most appropriate.
- Jim Hansen – LPV (localizer performance with vertical guidance) approaches are better than instrument landing systems. We should maximize their usage.
- Dave Waggoner – A run-up area to Runway 17 should be shown.
- Ted Millar – Can the helicopter landing areas be between the runway and taxiway (for approach and landing)?
- Tony Helbling – What Ted is talking about is referred to as "spots". Many airports have them and then helicopters can hover taxi to parking. There is a difference between a heliport and a helipad.
- Jim Hansen – Can the power lines be in the RPZ?

Public Attendees Comments

After the PAC comments were completed, the public had an opportunity to discuss the information presented. The comments given were:

- While doing the forecasts what job growth numbers were used? *Metro (2009) low to high range.*
- Airport disclosure must be detailed (*i.e.*, a neighbor with one cat is very different than a neighbor with 30 cats).
- Page 4-23. Add "life" to fuel tanks, third paragraph.

Meeting Adjournment

PAC members were asked to submit their comments on draft Chapter 4 by January 3, 2011. The meeting adjourned at 7:40 pm. A public open house followed until 8:00 pm. All information regarding the PAC meeting and open house – along with comment forms – is posted at www.aurorastateairport.org.

Public Open House

An open house was held from 7:40 to 8:00 pm. Members of the consulting team and ODA were available to discuss questions and concerns with attendees. One comment was submitted, which was "*Buying a home in proximity to an airport should be an informed decision. However, facing expansion of an airport can't be factored into a home purchase. Growth isn't necessarily good. Your approach is to provide for bigger and more. You know that building the tower will change the mix of planes in a manner that is detrimental to the surrounding property owners, but that doesn't seem to be an issue for ODA.*"

Aurora State Airport Master Plan

Planning Advisory Committee (PAC) Meeting #4

March 10, 2011
North Marion Intermediate School, Aurora, OR

MEETING SUMMARY

Attendees

Oregon Department of Aviation (ODA) – Chris Cummings, Sandra Larsen and Mitch Swecker (also a PAC member)

WHPacific – Rainse Anderson, Sara Funk, Sarah Lucas and Casey Storey

JLA Public Involvement – Vaughn Brown, Adrienne Dedona and Sylvia Ciborowski

Public Advisory Committee (PAC) – Bruce Bennett, Jim Bernard, Jim Hansen, Tony Holt, Steve Hurst, Nick Kaiser, Rick Kosta, James Meirow, Ted Millar, Fred Netter, Dan Riches, Ray Phelps, Charlotte Lehan (for Jim Bernard), Craig Wilmes and Dave Waggoner.

Public Attendees – see attached sign in sheets

Welcome and Introductions

Chris Cummings, ODA, introduced himself and welcomed everyone to the meeting. He noted this meeting had the best public turnout so far.

Chris reviewed the meeting agenda, explaining there would be a presentation from WHPacific prior to breaking out into a public workshop. After the workshop, the PAC will reconvene for a discussion of the alternatives. Chris instructed participants to ask as many questions as possible during the workshop and indicated that there is also the opportunity to provide written comments.

Rainse Anderson, WHPacific, introduced himself and provided an overview of the study to date. He noted that at previous meetings he had told members several times to hold their comments until we review Chapter 5. Rainse explained that Chapter 5 and the draft alternatives is what we've been building up to. He said reviewing and discussing the draft alternatives in order to develop a preferred alternative is the most exciting and important part of the study. Rainse asked the remainder of the consultant team to introduce themselves and reminded everyone to sign in. He drew attention to the comment form and let people know this would be a helpful guide when reviewing the draft alternatives.

Rainse reviewed the agenda further and explained there would be a review of the forecast updates, traffic analysis and the draft alternatives prior to the public workshop. He also said there would be a discussion of the alternatives with the PAC, and at the end of the meeting, there will be time for public comments.

Presentation

Project Overview: Rainse reviewed the project purpose and explained that there are seven (7) chapters total in the Master Plan Update. The first four draft chapters have been completed and draft chapter 5 will be reviewed tonight. Following completion of the document, the draft will be submitted to FAA for review. This process typically takes 90 days prior to final publication. After this meeting, the project team will take the feedback received and begin developing the preferred alternative. The draft preferred alternative will include a public review and comment period. Once that is completed, the Airport Layout Plan (ALP) and the Capital Improvement Plan (CIP) will be developed. The ALP and CIP will be the topics for review and discussion at the next PAC meeting; tentatively scheduled for the end of June.

Traffic Analysis: Rainse said that at the first PAC meeting there was a discussion about vehicular traffic and since that time, the project team has done some analysis to look at traffic coming from and around the airport. He explained that this data was gathered from various available sources. ODOT traffic specialists were enlisted to conduct counts around the airport. Data was gathered at 11 of the gates in during a 1 week period to determine the average annual daily traffic (AADT) and peak hour traffic volumes. The result was 2,400 AADT. Located at the NE corner, Columbia Helicopters generates 47% of the total traffic (1,130 AADT). Rainse explained that this is not a typical Fixed Base Operator (FBO) tenant since they don't use the runway. The traffic analysis included HTS (Helicopter Transport Services), under construction on the corner of Keil and Airport Road, and projected 211 AADT once developed. On Airport Road itself, 2007 data shows that approximately 2,600 vehicles travel along the road between Ehlen and Arndt Road. Rainse mentioned that this data is somewhat low; when it is updated in 2011, it's expected to increase. The data will be updated by studies completed by Marion County later this year. Rainse went on to explain that there is a lot of pass-through traffic going to and from I-5. He added that the impact from the airport on the Boone Bridge was also analyzed and it was determined that the airport generates about 1.5% of the total traffic on the bridge. Currently the employment numbers at the airport are approximately 750 employees, which equates to 3.2 trips per employee. Once a 1.19% annual employment growth rate is applied, the total employment for 2030 is 950 employees, equating to an airport generated AADT of 3,040. Rainse added that additional data and background information on the traffic analysis can be found in the report and could be discussed further during the workshop session.

Traffic Analysis Recommendations: Rainse said that ODA will continue to work with Marion County and the City of Aurora as improvements to Airport Road are considered and the appropriate considerations will have to be made with regard to airport businesses and entrances along Airport Road. He added that it is likely that there will be sharing of the costs in the system development, similar to what HTS did with their system development, but this will need to be worked out between the entities.

Forecast Updates: Chris explained that the previous meeting scheduled for February was postponed because of incorrect forecast information that needed to be corrected. There was an error with previous information related to the number of aircraft based at the airport. To remedy the problem, ODA checked with tenants, sent someone out to physically count aircraft in hangars (if able), and thoroughly reviewed their database of registered aircraft. Chris said there are now new numbers and those numbers have gone down from the original count. He said this information was used to go back and correct other information previously developed in the report. Chris said that he is very confident with the count and the new forecast.

Sara Funk said that while they were doing revisions based on the aircraft count, they completed other revisions, such as:

- Information from the FAA's Terminal Area Forecast (published in December 2010).
- Comments received from the PAC previously were addressed
- Additional research was done related to the Airport Reference Code (ARC). The project team looked up what kind of airplanes there were that were previously reported as unknown.

Sara reviewed the past and current numbers of aircraft based at Aurora, including the new projections for 2030 (based upon a 1.58% annual average growth rate).

Year	Aircraft Type	Revised Forecast	Previous Forecast
2010 Historical	Single Engine	261	312
	Jets	23	21
	Multi-engine	40	59
	Helicopter	25	35
	Other	5	5
	Total	*354*	*432*
2030 Projection	*Total*	*464*	*566*
	Jets	47	51

Operations: Sara explained the takeoffs and landings changed with the based number of aircraft. This number is now estimated at 90,909 for 2010. The number was previously somewhere around 100,000. Based upon the estimated annual growth rate, the revised forecast for 2030 operations is 124,386 as compared to the previous figure of 131,312.

Sara asked the PAC if there were any questions about the traffic or forecast analysis before moving on to Chapter 5. There were no questions from the PAC.

Draft Chapter 5

Sara said that the runway length surveys have been updated to reflect at least 500 constrained annual operations, which justifies a longer runway based on the FAA criteria. Besides the additional completed surveys sent to the PAC prior to the meeting, additional surveys have been received.

Tony Holt asked about the updated survey and requested to talk about it further later.

Bruce Bennett noted that Management West is still at Aurora, although the constrained jet aircraft owned by Management West is not.

Sara explained that three build alternatives have been proposed in order to meet the facility requirements.

Sarah Lucas explained that the preferred alternative would be developed based upon the elements included in the three build alternatives and the no-build alternative and the preferred alternative would be the basis for the ALP. She explained that the various elements outlined in the comment form could be mixed and matched to develop the preferred alternative.
Sarah explained the various comparative elements within the alternatives:

- Airport Reference Code (ARC)
- Runway length and strength
- Instrument approach capability
- Hangar/tiedown locations
- Cargo apron location
- Fuel tank location
- Air traffic control tower (ATCT)
- Aurora Rural Fire Protection District Facility

Approximately 40 developable acres are needed to meet the forecasted demand for the activity at Aurora. Currently ODA has about 9 acres of developable land. Development necessary for precision approach path indicators, a cargo apron, helicopter parking, vehicle parking and some additional hangars would be built on state-owned property. In all of the build alternatives, the adjacent church camp property (16 acres) is shown to be suitable for hangars and related development.

- *No-build Alternative:* The no-build alternative is ARC B-II. An air traffic control tower (ATCT) will still be constructed in this option, but a location has not yet been identified. The runway length would remain at its current length of (5,004 feet). Instrument approach capability does not change. The approach criteria minimums remain not lower than 1 statute mile. (The Runway Protection Zone (RPZ) at the end of each runway correlates to the approach minima). The pavement strength would remain the same (45,000 pounds dual-wheel gear).
  While the no-build alternative is essentially a do nothing option, it does not mean that there would be no financial impact to the airport. Most prominently, there would still be a cost associated with maintaining the current pavement and facilities.

- *Build Alternative 1:* – Alternative 1 is also ARC B-II and includes a 600 foot runway extension. The southern RPZ would extend south of Keil Road and an aviation easement would be sought. The northern RPZ would encroach into Columbia helicopters. The majority of state-owned property would be developed as hangars in this option. The state has identified three various alternatives for the location of the air traffic control tower. This alternative includes a fire station facility near the control tower. The air traffic control tower would be located midfield on the east side. Two helipads would also be built on public property. No cargo apron is included in this build alternative. Instrument approach capability does not change although the visual glide slope indicators would be upgraded to precision approach path indicators. The pavement would be strengthened to 60,000 pounds (dual-wheel gear). The fuelling tank would be relocated to the south of Aurora Aviation.

- *Build Alternative 2* – Alternative 2 increases design standards to ARC C-II. The approach minima are greater and extend RPZs further off of airport property; requiring additional easements or land acquisition. There are further impacts to Columbia Helicopters. This alternative has a fairly equal split between development of tiedown facilities and cargo aprons. The helicopter parking pads are same as in build alternative 1. The fuel facility is located near the cargo apron, northeast of Aurora Aviation. The fire station would be located near the current water suppression system, and the air traffic control tower is located near the center of the airport. The pavement would be strengthened to 60,000 pounds (dual-wheel gear). The runway and parallel taxiway would be extended to the south by 1,000 feet, which would require the closure of Keil Road (total runway length of 6,004 feet).

- *Build Alternative 3* – Alternative 3 also increases design standards to ARC C-II and shows a precision approach. The precision approach was something a lot of pilots requested during the goals and issues identification phase. There is no runway extension included in this alternative and RPZs increase significantly. The high voltage power lines would have to be relocated or put underground. The pavement strength remains the same. The helicopter operations areas are located north of the current cargo apron. The air traffic control tower is located closer to the north end and farther from the runway than in the other two build alternatives. The Fire District's building is located east of the fire suppression system. The fuel tanks would be located at the south end of state-owned property and the cargo aprons would be centrally located on state-owned property.

Steve Hurst asked if the no build option would include an air traffic control tower. Sarah clarified that the control tower is a committed project and would be built regardless, since it's already funded.

Noise: Casey Storey explained the type of noise model used and that it looked at saturated noise vs. point in time noise. He said the model accounts for more disturbances by night time noise vs. daytime noise. Casey went on to explain that they looked at the flight paths from this year and the aircraft type and mapped where those types of aircraft will fly. The flight tracks reflect the current noise abatement flight patterns and departure procedures. Casey noted that based upon the FAA criteria, residential land use is not considered compatible within the 65 dBA (average decibel) contour. Casey reviewed the noise projections for each of the proposed alternatives:

- All 2020 alternatives have the same type of and quantity of aircraft and show an increase in noise over time.
- Build Alternative 1 shows a slight bulge/increase in noise to the north due to the expanded runway.
- Build Alternative 2 contours shift south, due to the proposed southern extension to Runway 35.
- Build Alternative 3 contours remain the same as the 2020 No Build Alternative contours, since the runway configuration would not change.

Steve Hurst asked about the maps for the noise and confirmed whether or not alternative 2 was supposed show 2010 or 2020. Casey confirmed that it should have reflected 2020 and that this was a typo.

Tony Holt asked if this assumes the traffic control tower is built. Casey replied that it did not.

Mitch Swecker added that an instrument departure would be recommended for departures as well as certain flight patterns designed to keep the aircraft away from the Charbonneau area.

Tony said that he just wanted to understand what is currently in place.

Sarah explained that there are currently noise abatement procedures in place at the airport. Instrument procedures for northward departures are expected to be approved by the FAA in the fall. These procedures are in line with the current recommended noise abatement procedures for northward departures.

Tony said that he was aware of that but many operators don't pay attention to the noise abatement procedures and he asked if other flight paths were factored into the model. Casey responded that yes, they were taken into account.

Nick Kaiser said that the decibels don't change much between the alternatives and he asked if there were things that affected that. Casey explained that there is some shift based on the type of aircraft since there will be more jets in the future.

A member of the public asked what is happening to noise abatement around Aurora. Mitch replied that they've tried to change the flight pattern to avoid flights over Aurora and planes should depart to the south around Aurora.

Bruce Bennett said that he was involved with the FAA during the time they designed the airport departures/flight pattern and that they were designed to avoid Aurora.

Rainse explained that the preferred alternative would be presented to the Oregon Aviation Board later this month and then again in April for their concurrence. Chris said that he will send information out to the public about the meetings with the State.

Nick asked about the comment period for the draft alternatives. Chris said that there will be a two week comment period prior to the presentation to the Oregon Aviation Board.

Public Workshop

Vaughn reviewed the format for the public workshop and explained there would be 45 minutes for the public and the PAC to interact with staff to ask questions and review information about the draft alternatives. He recommended that participants take a comment form in order to review information and formulate their questions and comments. Vaughn suggested that participants think about the issues that need to be identified or considered when developing the preferred alternative. He said that the group will come back together after the workshop and the feedback heard will be discussed with the PAC for 30 minutes, then there will be time for public comment. If necessary, the public comment time would be extended and each person will be given a couple of minutes to provide testimony.

After the 45 minute public workshop, Vaughn reconvened the PAC session. He said he hoped that everyone had an opportunity to ask questions and obtain information from staff and PAC members. Vaughn explained that the PAC would now have the opportunity to discuss the draft alternatives and give input on the direction for the preferred alternative.

To start off the discussion on the preferred alternatives Sylvia Ciborowski and Adrienne DeDona reported out on the group discussion during the work session related to noise impacts and the draft alternatives. The following is a summary of the comments collected on flip charts at each of the information stations:

- If the runway object free area (ROFA) extends, what will happen to the highway?
- Have you considered what this project will do to the town of Aurora? Who needs this extension?
- I'm concerned about the impact of the RPZ on off-airport properties (alternatives 2 and 3)
- There needs to be consideration for the economic feasibility. There is no way this will pencil out economically. It will result in greater revenue from gas sales, but this will never cover the huge expenditure.
- I'm concerned about the impacts/development on the best farmland in the world. This farmland is more important for the future of food production than to pave over it.
- Currently the flight plan/pattern is not followed, especially at night. Planes fly right over houses and shake the windows. Concerned about the future safety and who disciplines pilots who fly in no flight zones.
- I'm concerned about the feasibility of Alternative 3.
- Can we use the additional capacity at Salem Airport rather than expand Aurora?
- The Run-up area is too close to hangars and private property (condo association) in Alternative 2. I'm concerned about the safety of this situation and the dust flying up in the area.
- What does it take to become a C-II Airport?
- I'm concerned about what will happen to the property values of nearby homes with the noise increase.
- I'm an airport user with five planes stationed in two hangars at Aurora. I prefer Alternative 1 with the 600 foot extension and ARC C-II.
- Can alternative 1 become a C-II with all other elements remaining the same?
- I have a concern about fumes from jets on people. The wind blows fumes into residential areas.
- The no-build option is no good because it does not have a fire facility. If we have a tower, we need a fire facility.
- Since we are already a volunteer fire station in Aurora, who will pay for a new fire facility?
- Can you request a modification to standards of the ROFA (on Highway 551) from the FAA?
- Why do you need more clearance for a more precise approach?
- Has ODOT gotten onboard with road improvements, especially Keil Road?
- Use displaced thresholds as a last resort. Sarah L. explained that a displaced threshold could be done to gain runway length for takeoff. The runway could be extended, but a displaced threshold, where aircraft land, would not be placed at the end of the extended runway pavement. The runway pavement behind the threshold could be used for takeoff, but not for landing. . .
- The Tower will enforce flight patterns (to reduce noise impacts to area neighborhoods) by keeping in contact with pilots by radio.
- Three to four days a week there are early morning airplane departures at approximately 3 a.m.

- Planes should not be allowed to take off before 7 a.m.
- If the current noise/flight pattern policy isn't being followed, why would a different policy be followed?
- Where is the money/funding for the project coming from? The Runway is already long enough. Enough money has already been spent on Aurora. Aurora doesn't have a lot of constraints as compared to the Orange County Airport (CA).
- The power lines at the north end of the airport should be removed or undergrounded for community safety reasons. The expense of doing so should be shared.
- An Educational Center for children should be built at the airport as well as a mechanic school in partnership with the local community colleges. A nearby playground is also a good idea so that kids could watch the airplanes take off and land.
- The area west of highway 551 will be severely impacted if the runway is extended. Farm equipment will be forced into the busy highway, creating safety concerns. Deer Creek Mobile Home Park will have limited access due to the closure Keil Road. Highway 551 will be the only point of access.
- Helicopters fly too low and are too noisy.
- The runway extension will increase the noise impacts to Deer Creek Estates. Residents already smell jet fuel. Airplanes take off as early as 4 a.m.
- Will there be any consideration for jet fumes in any of the future alternatives?
- The impervious surfaces drain to area farmlands since adequate drainage systems do not exist.
- Who enforces the noise abatement procedures? Orange County has a good noise abatement system.
- Will future zoning be amended due to the expanded noise footprint?
- The statement in the report that indicates that NW and Charbonneau residents will not be affected (related to Environmental Justice analysis) is inaccurate. There are 141 homes in the Deer Creek neighborhood. There will be quality of life impacts to residents.
- What will be done to mitigate noise from maintenance on jet engines?
- There seems to be a high number of planes flying over the Charbonneau area when there shouldn't be (based upon recommended flight patterns/noise abatement procedures).
- Mitigation efforts done simultaneously with airport improvements will help make things better for area residents.

PAC Discussion on Alternatives:

After the report out of public comments during the work session, the PAC reconvened for further discussion on the draft alternatives. The following is a summary of their comments and recommendations for consideration when developing the preferred alternative:

- Fred Netter said that his number one concern has consistently been regarding safety. He indicated that the no-build includes the tower, but not a fire station. He said that it would be his preference to have a Fire Station facility at the Airport near Airport Road and the water suppression system. He also indicated that closing Keil Road would a safety concern due to

emergency access and farming equipment access. Fred also requested that Airport Road be improved and called for Clackamas County to assist with funding for roadway improvements.

- Charlotte Lehan said that the traffic analysis doesn't recognize Clackamas County's role in surface transportation. She explained that Clackamas County's concerns are related to the surface transportation impacts and the impacts to area agriculture (industrial development pushes agriculture out). Charlotte added that Clackamas County has been excluded from some of the planning steps in this process.
- Dave Waggoner agreed that Clackamas County should be involved in funding the airport due to the positive impact the airport has on area economic development.
- Charlotte commented that the funding for the project hasn't been addressed.
- Steve Hurst asked if increased use of GPS and other technologies could be incorporated in lieu of a need for a runway extension.
- Bruce said that in order to make take off quieter, planes/pilots must use less power. To use less power, more runway is needed. This is a typical procedure for noise abatement elsewhere.
- Tony Holt said that the Aurora Airport is constrained by three major roads and only one runway. He indicated his support for the no-build alternative.
- Bruce agreed that the airport is constrained and should 'fill-in' for development. He added that agriculture and golf courses make good neighbors to airports and that no other building development should be allowed near airports.
- Charlotte requested that the financial impact to the public should be captured somehow and that Airport Road should be part of the financial analysis.
- Nick Kaiser stated that Airport Road gets 2,600 trips a day, but is listed as a collector street. It should be listed as an arterial street and should be designed as such. He added that in Alternative 2, the RPZ goes over the Deer Creek neighborhood and highway 551; this is a safety concern.
- Fred added that development in various communities impacts the airport too.
- Steve said that the Wilsonville City Council will discuss the Airport Alternatives at an upcoming meeting and will determine a formal position within the two week comment period.
- Ted Millar said that Aurora Airport is a category 2 airport and is an important part of the National Aviation System. He added that the Airport benefits Clackamas and Washington Counties (the cities of Wilsonville and Aurora). Ted commented that from a safety and an economic development standpoint, the runway should be expanded. There is an economic opportunity and that need should be filled. He called for an additional 1,000 feet of runway and increasing the pavement thickness of the runway.
- Rick Kosta stated that National retailers can land elsewhere in Oregon (Hillsboro, Portland, and Troutdale). He went on to say that the only alternative that doesn't impact Deer Creek neighborhood is the No-build. The noise impacts to Deer Creek residents in any of the build alternatives will be over 65 dB. What mitigation can be done for Deer Creek residents?
- Mitch Swecker said that before any mitigation were to occur, actual measuring of noise exposure would likely be conducted. If impacts are shown, they may be mitigated.

- Dave said that the current situation at the airport is dangerous for run-ups and that the run-up area in alternative 2 is impractical. It's too close to hangars and one of the hangars provides space for the Emergency Operations Center. There is no run-up space allocated in alternative 3. He called for alternative 2 to be modified to allow for a run-up area that doesn't crowd the hangars.
- Bruce said a greater than ¾ statute mile (sm) approach should be required; it's safer, quieter and saves fuel. He requested the minimums be lowered with a small extension to the south.
- Tony Holt asked how many of the user surveys were based at Aurora. He added that there should be a better, more rigorous way to collect/validate this type of data.
- Dan Riches said that Columbia Helicopters has reserved land for future development, so they cannot support any type of expansion to the north. He added that Columbia Helicopters supports safety improvements and improvements to Airport Road. Dan preferred the no-build or a hybrid of the no-build alternative.
- Nick said that the 2002 noise contour showed different planes, but there is not a huge difference. There has been a larger increase in the number of aircraft.
- Fred noted that expansion of the airport may impact other businesses' future plans and suggested that monetary compensation be offered to those businesses. Dan replied stating that Columbia Helicopters monetary compensation wouldn't work in their case because they are looking for a more long-term investment.

To wrap-up the discussion on the draft alternatives and to provide direction to the project team on the development of a preferred alternative, Vaughn directed the PAC to provide their individual recommendations/feedback on the draft alternatives in a round-robin fashion. The following summarizes their feedback:

- Dave Waggoner echoed his concerns about the run-up areas.
- Nick Kaiser said that there are a lot of variables within the four alternatives, especially with regard to noise.
- Dan Riches called for the no-build option or for an extension to the south.
- Steve Hurst said that he is looking forward to hearing the public comments.
- Fred Netter commented that safety is important and a Fire Station should be part of the plan.
- Ted Millar said that the Runway should be extended in addition to the thicker pavement surface. He suggested considering a possible hybrid alternative with a displaced threshold.
- Tony Holt said the no-build is the best option and that there are other airports in the area to operators to use. He feels the expansion of Aurora is not justified.
- Bruce Bennett said lengthening and strengthening the runway are important and that the overall safety of the airport should be increased. He added that the overall noise and environmental impacts should be decreased.
- Charlotte Lehan said that Clackamas County has not yet weighed in on the project and, at this time, she supports the Fire Station and the Airport Control Tower for safety reasons.
- Rick Kosta said he supports the no-build option since there are other airports in the area.

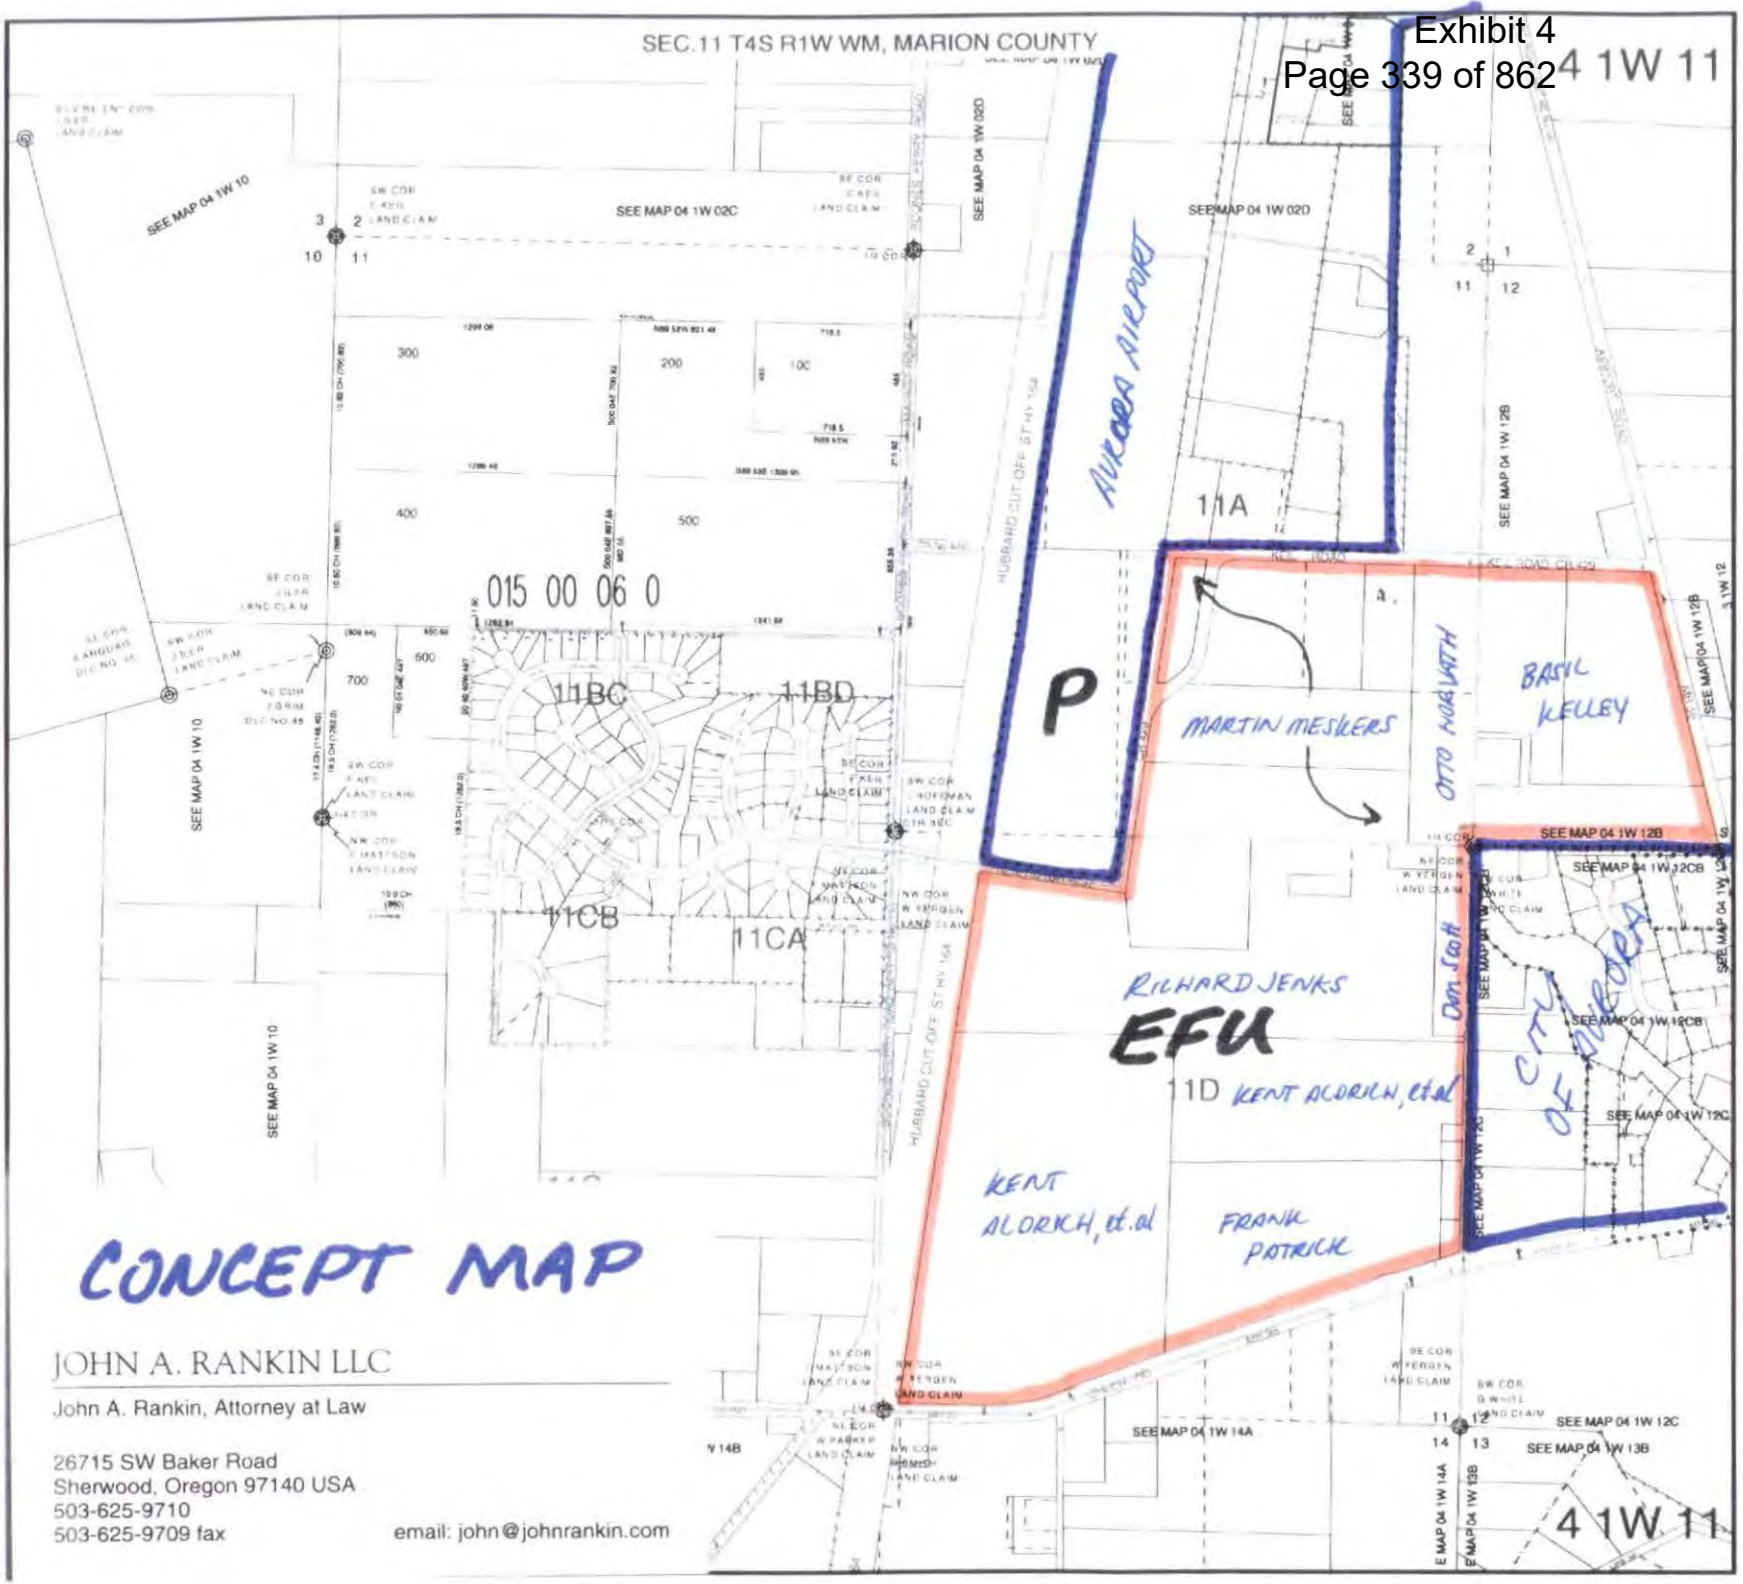
- James Meirow said that he would like to hear from the neighbors to the south of the airport.
- Craig Wilmes said he supports the run-up areas and displaced threshold.

Overall the PAC did not come to consensus on a preference for one single preferred alternative. However, there seemed to be somewhat shared support for safety improvements such as the Fire District's facility and the Air Traffic Control Tower. The consultant team and ODA will evaluate all comments and concerns received and consider them when developing the preferred alternative.

Public Comments:

Members of the public were each given two minutes to provide oral testimony regarding the draft alternatives. Several members provided written testimony in addition to or in lieu of oral testimony. Those statements are attached to this summary as separate documents.

- John Ranken, 26715 Baker Rd: He is an Attorney and consultant representing several property owners to the south. This area comprises 75 acres of properties in the EFU zone—from Airport Road to Hwy 551. Mr. Ranken was formerly the city attorney for the City of Aurora for 13 years and has been asked to help these property owners. The thanked PAC for its manner, and the public, and Chris C. for his efforts to help him get oriented to the project. He distributed information to the PAC showing the properties to the south that would be impacted. He said that at this point, their position is that they are interested in build alternative #1 since it seems to give everyone a little something. He added that this seemed to present a compromise.
- Mike Rite, NW Aircraft: Has been involved in aviation his whole life. He said he has been very involved in airport issues. Mr. Rite added that there have not been meetings in Mulino or McMinnville about expansion because no one wants to go there. He said that people are coming to Aurora because they want to be there. He said there is not as much going to Portland. Mr. Rite added that some complaints about noise will be addressed and that tower will help airplanes not go over neighborhoods as much. He indicated he supports extending the runway because it provides additional safety and will bring in other aircraft that aren't coming in currently.
- Larry Elschen, resident of Charbonneau: Mr. Elschen said he was representing Charbonneau neighbors. He presented a petition with 260 Charbonneau names on it, and indicated it should include more signatures. Mr. Elschen read from the petition (attached).
- Ken Ivey, representing a planning organization in Clackamas County. Mr. Ivey said he has heard a lot about safety and that airplanes are coming into a marginal airport, and they are choosing to create an unsafe condition. Mr. Ivey stated that these pilots have at least four alternatives within 30-40 miles that do have the infrastructure to safely handle those planes. He stated the group he represents would vote for the no-build alternative. He stated if you want to make the airport safer, direct those planes to those airports that have the infrastructure on the ground paid for, rather than asking us to shell out more money. I live near the airport, and I don't see a noisier airport and having to pay for the highway to get there.



- Ailin Ottinger: Mr. Ottinger said the main thing we are doing is making it possible for more commercial flights outside of Aurora. As a taxpayer, I wonder do the corporations have any part in funding all of this?
- Ben Williams, resident of Aurora and President of Friends of French Prairie: (submitted attached written comments). He said he was concerned about preservation of farmland and the impact on surface transportation. He said, we support addressing the safety requirements, but we have a 20-30 year history of the domino effect. With improvements, it will only get bigger and we'll need more improvements. The airport is surrounded by EFU farmland that needs to be preserved.
- Jack Kaley: He said he has a commercial pilot license and has been flying at Aurora 30 years. He is also the director of Positive Aurora Aviation Management Group. He attended the first PAC meeting, and noted that most placed aviation safety as their top concern. He said that is my top concern, especially safety issue for helicopter landing areas. He went on to say that Aurora has stated safety provisions for helicopters. We need to properly separate helicopter and fixed wing areas. Helicopters take off from tie down areas that are designated for fixed wing areas. There are no designated helicopter landing and parking areas on state owned property. Because of ground turbulence, it is essential that helicopters be separated from fixed wing tie down locations. Mr. Kaley distributed some diagrams explaining the problem. He said the FAA has established safety circles and helicopter standards. The safety circles have a range. In his drawing, he superimposed a helicopter pad between a fixed wing. The projected increase of helicopter traffic means we need safe operations. In the interest of overall safety, we must provide for proper separation. The master plan should plan for safe helicopter operation. The vacant state owned land east of the helicopter blade renovation building should be used for locating several helicopter pads.
- Manuel Martinez: chief pilot for JHRD investments: He said that his company moved from PDX to Aurora State due to his recommendations. His company has provided $2 million in local revenue. He has safety concerns in operating in and out of Aurora Airport. He felt a tower would enhance the safety margins, and runway length is a concern. In his 15 years as pilot, he has had 8 close encounters, mostly near Aurora Airport.
- Larry Brons: professional pilot, flying primarily out of Aurora, doing professional contract flying: He said he supports the Air Traffic Control Tower for safety. The additional 600 feet of runway would make operations safer and more economically viable. He said we are coming out of recession and we should try to stimulate the economy in the local area by making the airport more viable for business.
- Bryan Mobey, representative for Deer Creek Estates: He said they have concerns about their quality of life. He stated now with noise and the smell of fumes from jets, it affects us drastically. They cannot sit on their patios without being disturbed by aircraft. He supports the Air Traffic Control Tower to keep planes out of no fly zones and the Fire Response Facility. He felt an expansion at the airport will negatively affect their property values due to noise and jet fumes. He added that planes take off at 4 or 5 in the morning and that nobody has control of the

planes. Salem tells us to get the number of the aircraft, but we can't get their numbers at night. He said he is concerned about an accident in the future.

- Annie Kirk, Aurora resident: She said she is representing her family. She said regarding undue hardships and compensation, I have not heard anything about outside of the fence compensation for Aurora and Charbonneau residents. For impacts to Airport Road, who will bear the burden for those improvements? The road is grossly unimproved now. It needs to be taken care of, but we have more to come. I am comfortable with the tower and the fire services for safety. But I'm not convinced that any of the alternatives resolve the interest of the communities outside of the fence.
- Lolita Carl, full time farmer in Marion County: She said she is on Marion County Board of Directors for the Farm Bureau. Ms. Carl said that farming is the number one industry in Marion County. She said she is worried about encroachment on farmland and economic development. Agriculture is the second industry in Oregon, and all of us eat. All of the land surrounding Aurora Airport is the most fertile in the world. Once we start a little bit of development, it just encourages more. As a tax payer, she wonders where the money is coming from to support so few.
- Ron Sterba: He shared his concern with the power lines on north end of airport and asked what happens if a plane hits them? Where does the power grid go to? Hospitals or schools? They should be relocated. He said he would like to see an education center on the airport to share with high schools and local community colleges. Would like to see a realignment of runway so the approach is over I-5 on the north and to take the approach corridor off of Charbonneau and move the runway 75 feet to west to allow for an expansion of the taxi way without removing any buildings.

Meeting Adjournment

Rainse wrapped up the meeting and reviewed the next steps for the project. The next meeting will cover the Airport Layout Plan and the Capital Improvement Plan. This meeting is tentatively scheduled for the end of June. Rainse reminded everyone that there will be a public review and comment period for the preferred alternative and that an e-mail notification will be distributed with this information. The meeting was adjourned at approximately 8:30 p.m.

Aurora State Airport Alternatives Public Meeting
Comment Summary

30 comment forms were submitted at the March 10, 2011 Aurora State Airport meeting. 59 additional comment forms were faxed, mailed or e-mailed in after the meeting. 13 people submitted a comment form via the online survey.

Additionally, several people submitted other comments beyond the comment form at the public meeting and by email after the event. These comments are attached at the end of this summary.

	No Build Alternative	Alternative 1	Alternative 2	Alternative 3
Instrument Approach Capability	64 No change Approach minima to remain at visual and greater than 1 statute mile (sm)	12 No change Approach minima to remain at visual and greater than 1 statute mile (sm)	16 Improved instrument approach capability. Visibility greater than ¾ statute mile (sm)	8 Improved instrument approach capability. Visibility minima lower than ¾ statute mile (sm) (precision approaches). Parallel taxiway relocated 100 feet to the east and multiple buildings removed or altered.
Airport Reference Code	65 No change Remain at ARC B-II	16 No change Remain at ARC B-II	12 Upgrade to ARC C-II	1 Upgrade to ARC C-II
Runway Length	62 No change (total runway length: 5,004')	17 600' extension to north end of runway (total runway length: 5,604')	10 1,000' extension to south end of runway, closure of Keil Rd. (total runway length:	5 No change to length. However, relocation of the parallel taxiway is necessary for
Runway Strength	69 No change - 45,000 pounds DWG	18 Strengthen to 60,000 pounds DWG	9 Strengthen to 60,000 pounds DWG	4 No change - 45,000 pounds DWG
Air Traffic Control Tower (ATCT) Location	*Has not yet been determined.*	31 ATCT located midfield on the east side.	10 ATCT centrally located within State-owned property, but north of the location in Alternative 1.	5 ATCT located closer to the north end and farther from the runway than in the other two build alternatives.

	No Build Alternative	Alternative 1	Alternative 2	Alternative 3
Helicopter Parking Location	60 No change	18 Designation of helicopter operations area in the northwest section of State-owned property.	3 Designation of helicopter operations area, situated where the fuel tanks are currently located.	4 Designation of helicopter operations area, north of the current apron.
Fuel Station Location	64 No change	13 Fuel tank relocation south of Aurora Aviation.	6 Fuel tanks relocated northeast of Aurora Aviation.	9 Future fuel tanks located at the south end of State-owned property.
Aurora Rural Fire Protection District Location	34 No change	23 Fire District's response building located near the air traffic control tower (ATCT).	35 Fire District's response building located adjacent to the water suppression system.	3 The Fire District's response building located east of the fire suppression system.
Cargo Apron Location	66 No change	10 No change	4 Designation of a cargo apron facility, north of Aurora Aviation.	9 The cargo apron centrally located on State-owned property.

Additional comments provided on comment forms:

1) The number of air operations does not justify the lengthening of the runway. I support the no build alternative with the exception of the Aurora Rural Fire District facility. I am an elected board member of the Fire District. Aurora was never intended to be a "big jet" airport. It is too constrained both in length and width.
2) For the no build alternative, determination of the location for the ATCT is a critical addition.
3) Would like C-2, but don't think closing Keil Rd. is a good idea, increases traffic on Airport Rd. Prefer 600' extension to the north.
4) No additional growth.
5) 600' extension to begin with to the North. After a term of 5 years to help replenish funds extend an additional 600' on the South end (save Keil Rd.)
6) Roads are already over capacity!
7) Alternative 2 as depicted places a RWY 17 run-up area on Wiley Condo Association property very close to existing hangars with large operable doors. This property is not for sale and is not likely to be. Consideration should be given to an alternative that includes a 600' extension with run-up area at the North end and a 500' extension at the South end to create a 60000' runway with an upgrade to ARC C-11.

8) Representing property south of airport "P" zone south of Keil Rd. Totally approximately 75 acres.
9) Since you cut the trees down the noise is louder—trees are important to clean the air. I support the tower and fire station. NO expansion. I am very concerned about how the quality of my life will decrease because of the high noise along with the value of my property which will decrease. I live in Dear Creek Estates close to the end of the now runway and in 10 years the noise has increased greatly. Plus planes flying over our home taking a short cut to the airport.
10) The removal of the trees by the west opened up more noise. I support the no build plan, the tower and fire station.
11) I am a home owner in Aurora.
12) Why don't they do something at the airport to actually get pilots of jets to fly the pattern they are supposed to?
13) Property owner
14) Remove power lines on north end. If the power lines were hit by a plane how would the loss of power to our community. Hospitals, schools, fire police. Shared costs to relocate lines underground—Power Company, City, County, and Oregon Aviation Dept. Educational building for high school students interested in aviation, shared by community colleges and education districts; 2-story building. I have additional ideas. Email me please. (Ronald Sterba, saintesterba@msn.com)
15) Comment on Helicopter Parking Location for no build alternative: already done on whose approval?
16) Aurora is one of the most significant pieces of history in Oregon. Who benefits from a larger and busier airport? Could you consider doing something in the line of keeping the integrity of this small historic piece? It doesn't lend itself to this noisy alternative. Take an example from Vermont and keep this historic jewel as the treasure it should be.
17) Any/all proposed changes need to consider/mitigate the problems that will come outside "the fence" area. Such as east-west traffic and turn lanes, drainage issues, sewer and water supplies up to code, noise and vectoring of air traffic. If the above concerns are not met there will be many irate and vindictive neighbors to deal with going forward. Not a good situation! Given present and mean time future economic situation, we are better to not overbuild especially your way for the very few – the number of operations is still highly questionable! Use your new tower to get accurate numbers prior to any further changes. Runway lengthening and Build options 2 and 3 are not warranted.
18) What is tax payer liability for under improvements of Airport Rd? For the entire expansion?
    What are impacts of expansion on adjacent properties? Zoning? Usages?
    What is the number of regular operators that live in Clackamas or Marion County?
    What will be done prior to expansion mobilization to ensure City of Aurora's annexation of Airport?
    What are the wildlife and environmental impacts? When were studies completed?
19) We have hundreds of large geese in the Charbonneau area which could pose a serious threat to aircraft and civilians. I am not concerned about the lives of the geese—only the people. We have more than enough aircraft emanating from this airport now!

20) The noise level now is too high with low flying planes and helicopters who don't seem to care that people would very much appreciate a quiet neighborhood in which to find refuge. It is unfortunate that we in Clackamas County must suffer the consequences of Marion County decisions on this matter. More planes also mean more cars and trucks on our exits and entrances to the I-5 corridor which is awful right now as it is.
21) Some Charbonneau residents are curious when we see the map showing the sound pressure level (yellow line) following the exact southern boundary of Charbonneau. Also at the DOA meeting we heard SPL/Ob numbers for aircraft on this boundry to be 65 or 75 Db. Institutions such as MIT and HUD have said that the Db for flushing a toilet is 75 Db and a business office is 85 Db. I have a hard time believing that the planes going over as we dine on our patios are more quiet than a toilet or a business office.
    We have taken a straw poll of Charbonneau residents, at a recent social function and well over 95% of us are strongly opposed to the airport expansion!
22) No more noisy planes over Charbonneau!
23) It is hard for me to believe that fuel tax would pay for all the proposed changes. As a tax payer I don't want to have any part of paying for the ability to have more corporate jets landing at the Aurora Airport!
24) I have had enough as it is of planes flying over Charbonneau. I came here from Beaverton because of the rural atmosphere and less crowding. Why must it always be ruined?
25) To approve any changes is "letting the camel in the tent!" Good, bad, indifferent—the future cannot be controlled. Surely a tower and instrument approach would improve safety but that is the camel.
26) Rw 17 run-up area on Alternative 2 is not desirable to owners of Wylee property. It would add constant noise and blast to adjacent hangars. Better solution must be found, preferably adjacent to Willamette Aviation facility on runway extension to north.
27) It is my feeling that most Charbonneau residents have little sympathy for the needs and wishes of users of the Aurora Airport, because pilots presently flying in and out of the airport just don't give a shit about avoiding the airspace above Charbonneau. Improved facilities can only mean continued disregard for the neighborhood, on a larger scale.
28) Locate ATCT at mid-field west of the highway to Hubbard. This will require land acquisition but will reduce tower height with no loss of 2 acres of airport land.
    Locate the helicopter parking in the fire suppression system area. This will totally separate helicopter traffic from fixed wing, plus make room for helicopter business and hangars.
    A reasonable return on investment should always be a paramount consideration where major investment is required. I don't feel that has happened when consideration for runway strengthening or extension is being considered. To spend millions of dollars for the possibility of a very small return on investment makes no sense, especially when both the state and federal government is broke. Lets get realistic.
29) A tower and runway extension is not so good in this climate.
30) Who wrote this? Our biggest problem is people who don't have a clue about aviation write questionnaires like this. Get someone involved in aviation to help make airport programs! You are wasting our money.
31) Justify all projects by cost.

32) The noise over our house is BAD enough as it is. I certainly don't want any increase! I wish there were no Aurora Airport at all.
33) Any changes will only benefit a small handful of users of the airport, not the general public.
34) We hope that the airport is not enlarged! There is enough jet noise now over Charbonneau!
35) Larger jets = more noise
36) Runway extension – particularly north will result in heavier noisier aircraft taking off closer (& lower over) populated areas. Noise problem. Environmental problem. Safety problem. Please do not extend runways.
37) Planes are flying over Charbonneau even though they are required not to. Expansion would only increase the noise level in this area. Think of the noise level at our Portland International Airport. We don't need to push in that direction. Thanks.
38) Aircraft coming and going creates a worsening noise problem for those of us who live in Charbonneau. Making the changes sought will only make a bad problem worse!
39) I trust you will not move north. It would be too close to a population of a growing city (Wilsonville and Tualatin).
40) See submitted letter and petition from Friends of French Prairie.
41) We are concerned about the noise level from larger jets. The hundreds of geese that flock to the small lakes in Charbonneau are a hazard to the jet engines. Longer runways bring larger planes. Larger planes bring freight. Freight needs to be hauled away in big trucks. I-5 in the Wilsonville area and beyond is the most deadly in the State. We don't need more truck traffic and congestion.
42) We hate to see an increase in the airport. Already the noise and planes flying low is very unpleasant. Quality of living in a somewhat rural area is suffering from all of this. Homes to the south would really feel this with runway extensions.
43) In as much as the Charbonneau is a heavily populated area at the southern most edge of the city of Wilsonville, every effort should be taken to not degrade the environmental and living conditions of the residents while improving or, at the very least, mitigating the physical risk to person and property. To that end, I recommend the following: 1) any fuel storage should be located as far to the southern end of the airport as possible. That provides, by physical distance, the maximum protection to the populace in the case of explosion. 2) Approach capability should NOT be lowered below the current one statute mile minimum. North-to-south approaches typically pass over Charbonneau. Lowering the approach minimum directly increases the risk to the populace by reducing the vertical distance between the aircraft and the ground in case of an in-flight emergency such as mechanical failure, bird strikes, and/or wind shear. Further, the potential for increased air traffic coupled with lowering the approach minimum directly and dramatically degrades the quality of life around the airport by increasing the noise pollution associated the lower approaches. 3) Strengthening the runway only serves to allow larger, louder aircraft to access the airport. This change will result in further increasing noise pollution and dramatically increases the risk of damage to property and person in the case of an aircraft crash. 4) Helicopter operations should be located as far away from heavily populated areas as possible. This dislocation not only affords increased protection for the populace but also reduces the noise pollution associated with these aircraft types.

44) My husband and I would like our opinion on the Aurora Airport known. I have attached a copy of the survey for the airport. As you can see we have MARKED every box in the "NO Build Alternative" column. We DO NOT want and improvements done to the Aurora Airport. We would like to see the larger jets go to another airport. The noise from the jets is extremely annoying, especially when the come screaming over the house late at night. We have lived here since 1977. We know there will be change. But we DO NOT want the airport any larger or improved from how it is now. The current JETS are loud and at times too low during landing. The size of aircraft is getting too large for this location.
45) Helicopter parking location should be in south end only.
46) From 1/14/11 to present there have been 127 flights at the intersection of Miley Rd and Airport Rd that are totally out of FAA compliance, according to the flight directory rules. This intersection is 1.6 miles from the airport.
    1. Average flight inbound is 337 yards AGL (laser sighted)
    2. All aircraft are flying in an illegal pattern
    3. Noise abatement—some cases rattle windows
    4. Number of aircraft per month is 113 flights
    5. Most critical—who at the State Department did the bird counts for possible bird strikes?
    6. Four witnesses working on counting birds including AGL and direction of flight have been monitoring morning and night
    7. Flocks of over 1,000+ to as few as 25 or 30 generally fly pattern at 020 degrees to 219 degrees. These are the biggest migration pattern for these birds. These birds are directly in the fly pattern of aircraft flying over the intersection of Miley Rd and Airport Rd.
    8. The first engine out bird strike outbound is going to land in the middle of Wilsonville Shopping Center. It is a coincidence that average AGL for aircraft is 337 yards and geese are 215 to 480 yards AGL.

    With these documentations and witnesses to what may happen in the event of a major accident, who exactly are we going to sue? All flight in and out of this airport should use the FAA directory per its rules and you will find it is pretty safe flying conditions.

Comments from Online Survey

1) I have flown into and out of 3S2/ KUAO for 14 years. The demand for greater volume of aircraft is evident, and improved operational conditions would help Aurora, the local economy and the state of Oregon, whilst improving safety.
2) I have no opinion or inadequate information on other choices, what about both extensions? Why only 60,000 pounds; many business jets today push 100,000 pounds.
3) The city believes that the Airport should be allowed to grow, But it also believes that no growth should happen outside the existing boundaries of the airport until the airport is annexed into the City Of Aurora. In talking to adjacent property owners it seems they also agree with the City. Please consider our comments in your decision.
4) Before selecting the preferred alternative, comprehensive traffic and noise impact studies on surrounding communities need to be completed. The work done on these problems to date is cursory and insufficient for the size of the projects contemplated.

Additional Comments Submitted

Bernice -

Here are some of the questions that need to be addressed along with some additonal information that you will need at the meetings that you are going to attend.

1. FLOCKS OF GEESE

Since the meeting on the 12/12/10, my neighbor, Mike Farmer and I, have monitored the geese on the approach pattern from 7:30 am to 5:00 pm. In two days the average elevation was 1100'. The flocks range from 15 to more than 200 geese in the flock. We are going to keep monitoring the geese to prove how unsafe this is for the possibility of aircraft bird stikes.

2. DO THE PILOTS FLYING IN THE AIRSPACE AROUND THE AURORA AIRPORT HAVE TO ABIDE BY REGULATIONS FOR LANDING CONFIGERATIONS AND TAKE OFFS, INCLUDNG ANY ABATEMENTS OR RESTRICTIONS WHILE FLYING IN THESE PATTERNS?

3. ARE THERE ANY RESTICTIONS AROUND THE AURORA AIRPORT THAT CONCERNS SOUND ABATEMENT? WE WOULD LIKE YOU TO CLARIFY WHAT DECIBLE READING WOULD BE TOO HIGH FOR THE HOUSING AREA THAT SURROUNDS THE AURORA AIRPORT. IS THIS GOING TO BE A FAA READING OR ONE THAT YOU ARE GOING TO APPROVE ON YOUR OWN?

4. WHAT ARE THE RULES FOR ELEVATIONS FOR AIRCRAFTS AFTER CROSSING THE WILLAMETTE RIVER ON FINAL APPROACH TO AURORA AIRPORT?

5. DON'T JETS HAVE TO FOLLOW THE SAME RULES AND REGULATIONS, INCLUDING LANDING CONFIGERATIONS, AS PER THE FAA LAWS AND RULES THAT ARE
IN COMPLETE DETAIL IN THE AIRPORT DIRECTORY THAT IS USED BY ALL PILOTS?

6. WILL THERE BY ANY REGULATIONS THAT CONCERNS "CALM WIND DAYS" WITH WINDS 10 MPH OR LESS? ALL AIR TRAFFIC, IN BOUND AND OUT BOUND, SHOULD BE TAKING OFF FROM THE SOUTH ONLY. THIS WOULD EASE SOME OF THE TENSION FOR THE THOUSANDS OF PEOPLE INVOLVED TO THE NORTH.

All the questions above clearly indicate that no one is monitoring those pilots that are violating the FAA laws. When these laws are broken, will the pilots be fined or lose their license or will a new directory be written by the Aurora Airport to fit their needs?

As of 12/12/10, we have been monitoring incoming and out going aircraft, expecially their elevations (AGL). Just as a note, on 12/15/2010, Aurora Airport manager (FBO)
was notified that at 11:16 am, 11:21 am, 11:37 am and 11:46 am, the highest elevation for a DC3 was 301 yds and as low as 257 yds above Prairie View Estates. After the call, the DC3 stopped making its practice runs.

HARLAN REETZ

I do not believe citizens or local property owners benefit from the airport improvements that are going to be adopted by this master plan. I also don't believe it makes any difference if citizen's comment with disapproval, Marion County and the ODA will give the airport whatever they decide it needs or wants.

I've watched a film of a town hall meeting, concerning the master plan, from 10 years ago. Local citizens were very disapproving of all the improvements being offered. It made no difference. Marion County commissioners have allowed unrestrained growth. Now, 10 years later, the airport claims they need a tower because of safety issues, that were brought on by that unrestrained growth. In today's financial crisis, I am appalled that our federal and state governments are funding a tower. Millions of dollars could be put to much better use than to build a tower at Aurora.

I would encourage citizens to take a look at what has happened at the Hillsboro airport. The "improvements" being adopted here are designed to promote private aviation business interests such as flight training or aviation hobbyists whose comfortable lifestyle allows them to own or rent private aircraft.

I am against lengthening or strengthening the runway, the taking of farmland for hangers or the building of a tower. Attracting bigger jets or more aircraft only benefits a small minority and diminishes livability for those who live in the area. The no build option is best for the majority of citizens. The roads are already to busy and tax payers should not have to pay the cost of road and utility improvements, that only benefit a few private aviation businesses.

The Marion County Commissioners have demonstrated their support for aviation development over the environment, livable neighborhoods or protecting farmland. Clackamas County residents have not been given equal representation even though the airport expansion and development affects us as well as Marion County citizens.

The impact would be temp, but not for making large aircraft accessible. The environmental impact of a busier facility is a detriment to agriculture and to the livability of the entire area.

March 7, 2011

To: PAC of Aurora State Airport

I am concerned with increased noise and air pollution to nearby residents and potential disturbance to wildlife in the area if airport traffic is increased and more jets begin to use the airport. The small, local airport is already here, and we accept that once in a while a small jet flies in. But we are distressed that if it is opened to more and larger jets, our quality of life and property values will be diminished.

Perhaps the addition of a tower and/or runway extension would improve safety at the airport, but the increased noise levels of more jets using the airport are problematic. Jets that are really pounding to gain altitude would definitely affect noise levels. Plus, with the smaller planes that are currently using the airport there is almost no night-time traffic--I'm concerned that with more jets, we would have more noise and increased safety risk at night. I am also concerned about the possibility of more around the clock jet cargo traffic in the future.

The FAA performs extensive noise tests on hundreds of models that fly in the United States, making generalizations difficult. However, according to figures taken from FAA records, the median decibel level upon takeoff of all models of two common small jets, Learjet and Gulfstream, at 76 decibels, is somewhat higher than those of two common small propeller plane manufacturers, Piper and Cessna, at 69 decibels. Even a small increase in jet traffic would have an adverse noise impact. *(Longmont Ledger, April 23, 2010)*

Lorna Dove, who lives in Georgetown near Seattle, has devoted extensive hours toward researching and measuring chemicals like benzene and toluene, byproducts of jet fuel and plane exhaust. Dove's strongest ally has been the Agency for Toxic Substances and Disease Registry in Atlanta, which, after conducting a risk assessment of air quality in 1998, found that Georgetown residents had "a higher risk for leukemia and thyroid cancer" than the population at large. I would like to see studies of environmental impact of increased air traffic on our area. *(The Stranger, July 2, 2008)*

Our area is called French Prairie. Let's talk about the historical significance of this area and the importance of preserving it. A larger commercial airport will undermine the agricultural character and general livability of our community.

Look at CAAP (Citizens Against Airport Pollution), a community based organization that seeks to reduce pollution caused by airport operations.

July 20, 2010

Citizens Against Airport Pollution [CAAP] has filed a lawsuit against the City of San Jose because the City recently approved a major amendment to the Airport Master Plan without an Environmental Impact Report describing what adverse affect these amendments will have on the environment.

The suit alleges that the City failed to conduct the proper environmental investigation necessary prior to the approval of a major amendment to the Airport Master Plan, as required by CEQA. Air pollution impacts, noise pollution impacts and impacts on wildlife are unknown. In an effort to avoid litigation, CAAP previously requested the City to defer action approving the major amendment so that these issues could be evaluated and discussed without litigation. The City chose to ignore these concerns and approved the major amendment to the Airport Master Plan without a clear understanding of its impact on the environment.

For over 20 years, Citizens Against Airport Pollution has been the only watchdog organization committed to protecting the environment from pollution caused by Mineta San Jose International Airport. CAAP has always supported a first class airport to serve the needs of the Southbay. Protecting the quality of life for San Jose residents and maintaining a first class airport is doable. However, it requires thoughtful planning and a keen sensitivity to environmental protections. If Silicon Valley is to become the center of "green" technology, the City of San Jose must make every effort to make its airport environmentally sensitive and a good neighbor. CAAP believes that the protection of the quality of life in the neighborhoods should be the highest priority to the City of San Jose. http://www.caap.org/

I hope the ones who finally make the decision in this matter will take into consideration the appeals of their neighbors, and not jeopardize their ability to continue living comfortably in their homes. Please slow down the premature rush to expand this airport.

AOPA MAGAZINE - MAR. 2011

LOGBOOKENTRY | COMMENTARY

BY ROBERT E. BREILING
FOUNDER, ROBERT E. BREILING ASSOCIATES

Statistics that improve safety

Compiling business jet and turboprop accident statistics has been an objective of mine since the early 1960s. When I was a Navy carrier pilot and safety officer—and later a Pan Am pilot—I met an insurance executive who was concerned about insuring the new business jets and turboprops being bought by corporations. As I had some 3,000 hrs flight hours, I was retained as a consultant by the underwriter to visit and evaluate its operations. When Pan Am furloughed junior pilots, I went to work for the insurance underwriter to perform new-aircraft analyses, establish an engineering department, and supervise the company's fleet of 12 piston aircraft. There I began to compile business turbine aircraft statistics.

More than 50 percent of the bizjet accidents and incidents continue to occur in the landing phase year after year (for turboprops, it's 43 percent).

During this period I served on the NBAA board of directors, as head of its safety committee, and made numerous statistical presentations at Flight Safety Foundation's Corporate Aviation Safety Seminar, Bombardier's Safety Standdown, and others. I also worked with Donald Engen to establish the AOPA Air Safety Institute's light aircraft database.

I was then offered an opportunity to join the start-up team of SimuFlite, where one of my objectives was to secure an FAA exemption to use "advanced" simulators for training in lieu of aircraft. I showed the FAA that 52 business-jet accidents occurred during in-aircraft training from 1964 through 1980. We received the exemption, which benefitted both SimuFlite and FlightSafety International, the two training companies at the time. The accident rate began to fall (improve) so much that underwriters offered a reduced hull rate if companies trained in advanced simulators for both jets and turboprops. In 1985 we saw a need for this data by aviation insurance underwriters and corporate operators and began publishing our *Annual Business Turbine Aircraft Accident Review*, where we identified by specific aircraft the accident rates, phase of operation in which the accident occurred, causal factors, and other pertinent information.

In review of this data over the years, we found several dominant trends. For example, more than 50 percent of the bizjet accidents and incidents continue to occur in the landing phase year after year (for turboprops, it's 43 percent). Surprisingly, 76 percent of the jet accidents occur on 5,000-foot or longer runways, 10 percent on 4,000- to 5,000-foot-long runways, and 8 percent on runways shorter than 4,000 feet. Sixty-five percent were in VMC, and 24 percent were on contaminated runways. It is obvious that pilots are not adhering to positive landing techniques. They continue to land long, add a few knots to V_{REF}—which is already 30 percent above stall speed—"grease it on," delay reverser use, and use positive braking.

With respect to turboprops, accidents in the approach phase are higher with 17.6 percent occurring here, versus 7 percent in bizjets. My opinion is that many approach accidents involve single pilots, where it is apparent that the pilot gets to minimums and, being unfamiliar with the missed approach procedure, goes lower or performs an improper missed approach. I might add that single pilots have a 50-percent greater accident rate than aircraft flown by two pilots.

Single-engine turboprops, mostly flown by single pilots, are involved in a higher number of high-altitude upsets than other turboprops. It seems apparent that pilots are over-relying on the autopilot and when a malfunction occurs, loss of control follows. More instrument flight proficiency and upset training may be necessary.

Also noted over the years is that the number of reported incidents is increasing, and many result in serious damage. It is interesting to note that a turboprop can land gear up, and cause serious damage, yet this is classified as an incident—whereas a light jet can experience a gear collapse while taxiing, causing relatively light damage, and it is classified as an accident.

We believe that our annual reviews are invaluable to any bizjet or turboprop operator to aid in identifying specific aircraft problems, support the fact that short runways should not be used, and illustrate how business aviation safety compares to charter air taxi, fractionals, airline operations, single-pilot involvement, et cetera.

We publish the review annually and offer the complete study, including turbine helicopters, for $375; the jet section or turboprop section can be purchased separately for $175 each. For more see our website (www.breilinginc.com) or call us at 561-338-6900. AOPA

Subject: Comment: Aurora State Airport Master Plan

I attended the meeting earlier this month but unfortunately could not stay for the public comment portion that was begun at the end of the meeting.

One of the questions I have and I posed it to several people at the breakout session: Why is the Aurora Airport the subject of expansion when McNary Field is 20 miles away and has an existing longer runway than Aurora? Most of the responses to my questions were "convenience and closer to downtown Portland". I think that the overall public may be better served by exploring the options of McNary Field in Salem instead of embarking on this costly expansion.

If this expansion at Aurora proceeds the State of Oregon needs to impose stringent and enforced noise abatement procedures for the surrounding neighborhoods. This would mean monitoring by the control tower of violators and the imposition of fines and or license suspensions for pilots of aircraft that do not comply. To help with noise abatement the arrival/departure flight path from/to the north should be directed over the I-5 corridor and not Wilsonville.

Lastly, has an environmental impact study been conducted as to the affects of wildlife on airport operations. This area of the Willamette valley is a

large flyway for Canada geese. Wouldn't this be a safety issue?

I would appreciate your thoughts on my comments.

To: Adrienne DeDona
Subject: Aurora Airport

Dear Adrienne,

Thank you for taking the time to listen to the residents concern about the proposed expansions to the Aurora airport.

I live nearby in an area that is supposed to be a "no fly" zone. It is anything but. We have planes flying over frequently and sometimes very low.
Low enough on occasion that I am concerned they are in distress and are about to crash.

An expansion would only increase these problems with the addition of increased jets and larger planes in the area and the subsequent noise issues.

It seems there are enough larger airports in the vicinity already with PDX and Hillsboro, both with greater activity and facilities than here.
Please do not turn this area into another large airport and all the noise and safety issues that would go with it.

Keep us safe and quiet!

Thank you for taking our welfare into your consideration.

A local resident and neighbor of the Aurora Airport.

Lynell Cooper-Joslin
Charbonneau

I, Kenneth W. Hawken agree with the proposal noted below. Please add my name to the petition.

AURORA, OR 97002-9545
Phone 503-678-2280

Aurora Airport Master Planning Process
Petition to the Oregon Department of Aviation
from
Aurora Airport Neighbors in the Prairie View Community

Whereas, the Aurora State Airport lies less 1 1/2 miles south of the Prairie View residential community and over-flights of Prairie View are already frequent and noisy and

Whereas, the Oregon Department of Aviation is considering the possible inclusion of an extension of the existing runway and/or strengthening the runway to accommodate heavier aircraft in the current master planning process,

We, the undersigned residents of Prairie View support the petition from Charbonneau residents and express our grave concern about the number of larger jets that such an extension would bring, with the resultant increase in noise pollution for neighboring communities. We oppose such action for the following reasons:

1. At this airport, landings to the south require jets and others to fly low over dense residential areas of Wilsonville and surrounding communities. The proposed control tower, operating only during daylight hours, will not be able to fully mitigate this problem.

2. The environmental impact of a runway extension or strengthening, bringing additional and larger jet traffic, will be to reduce property values for many Wilsonville residents including those living in Charbonneau and Prairie View.

3. The extension proposed is sought by a very small number of operators, most of whom regularly use its current runway. At a time of extreme State and Federal budget difficulties it is unacceptable to consider spending large sums of taxpayer money on development to benefit so few special interests.

4. This Airport is constrained on all sides by roads and residences, by one runway, and by private infrastructure close to the taxiway and runway, all hampering long term expansion. For example, it is not practically possible, nor financially feasible, to reduce the approach minimums, something that would make the Airport a more reliable destination in bad weather. If a longer runway is required in the region this should be done at a rural area airport with many fewer constraints, such as Mulino.

For all the above reasons we request that consideration of a runway extension and/or strengthening the weight-bearing load of the runway at Aurora Airport be postponed to allow study of the most appropriate location and timing for such developments and any extension or strengthening be excluded from the current Master Plan update.

To who it may concern, we agree with the proposal below.

I agree with the proposal noted below and would like to add the following:

As a tax paying citizen, it is appalling to me that millions are going to be spent to build a tower at the Aurora Airport. It is obvious the ODA at the State of Oregon and the FAA will promote private aviation business interests over those of neighboring property owners. Marion County should not legally be allowed to expand the airport when it affects the residents of Clackamas County without equal representation. Sitting on an advisory committee outnumbered by airport business interests is not representation.

IT IS THE SPECIAL INTERESTS OF A SMALL MINORITY THAT BENEFITS BY DIMINISHING THE RIGHTS AND LIVIBILITY OF PROPERTY OWNERS.

Aurora Airport Master Planning Process
Petition to the Oregon Department of Aviation
from the
Residents of the Charbonneau Community in Wilsonville

Whereas, the Aurora State Airport lies less than 2 miles south of the Charbonneau residential community and over-flights of Charbonneau are already frequent and noisy and,

Whereas, the Oregon Department of Aviation is considering the possible inclusion of an extension of the existing runway and/or strengthening the runway to accommodate heavier aircraft in the current master planning process,

We, the undersigned residents of Charbonneau, express our grave concern about the number of larger jets that such an extension would bring, with the resultant increase in noise pollution for neighboring communities. We oppose such action for the following reasons:

1. At this airport, landings to the south require jets and others to fly low over dense residential areas of Wilsonville and surrounding communities. The proposed control tower, operating only during daylight hours, will not be able to fully mitigate this problem.

2. The environmental impact of a runway extension or strengthening, bringing additional and larger jet traffic, will likely have a negative effect on property values for many Wilsonville residents including those living in Charbonneau.

3. The extension proposed is sought by a very small number of operators, most of whom regularly use its current runway. At a time of extreme State and Federal budget difficulties it is unacceptable to consider spending large sums of taxpayer money on development to benefit so few special interests.

4. This Airport is constrained on all sides by roads and residences, by one runway, and by private infrastructure close to the taxiway and runway, all hampering long term expansion. For example, it is not practically possible, nor financially feasible, to reduce the approach minimums to less than ¾ mile, something that would make the Airport a more reliable destination in bad weather. If a longer runway is required in the region this should be done at a rural area airport with many fewer constraints, such as Mulino.

For all the above reasons we request that consideration of a runway extension and/or strengthening the weight-bearing load of the runway at Aurora Airport be postponed to allow study of the most appropriate location and timing for such developments and any extension or strengthening be excluded from the current Master Plan update.

Friends of
French Prairie

Friends of French Prairie
is an Oregon non-profit corporation

PO Box 403 | Donald, Oregon 97020 | www.friendsoffrenchprairie.org

March 10, 2011

Chris Cummings
Oregon Department of Aviation
3040 25th Street
Salem, OR 97302

Mr. Cummings;

As you know, Friends of French Prairie is a land use organization who's area of interest is French Prairie, the historic and agricultural center of Oregon. The Aurora Airport happens to sit in north east French Prairie, and is surrounded principally by farmland zoned EFU that are comprised of Class I and II soils. Our greatest concern is the preservation of farmland.

We are opposed to expansion of the Aurora Airport, because all such expansion occurs at the expense of farm land. The airport was expanded in the '90s (resulting in the reconfiguration of Kiel Road), which in turn allowed the airport to handle larger aircraft. This attracted not just aircraft owners with larger aircraft, but aviation industry, which in turn led to more traffic, etc. The result of which is the current "safety problem" that has to be resolved with an air traffic control tower. Marion County has abetted this process by approving zone changes that have increased aviation activity, in as much as they see the airport as a tax revenue source and appear not to be concerned that the consequence is loss of farm land. The most recent and egregious example is the rezoning of EFU land allowing Helicopter Transport Corp. to relocate to the southwest corner of the airport will greatly increase helicopter traffic, and removes 30 acres of farm land.

While we support improved air traffic safety, and thus the air traffic control tower, we support the No-Build Alternative found in Chapter 5 of the current Aurora Airport Master Plan document. The airport should continue as is, with necessary and required maintenance. All the other proposed alternatives either increase the runway length or accomodate precision approach which means more larger aircraft which means airport expansion. We note that Alternatives 1 proposes moderate runway lengthening within the current airport boundary, but Alternatives 3 and 4 are expansion of such scope as to be substantially expand the Runway Object Free Area and the 35' Building Restriction Line, and as such are intolerable.

The efforts of Oregon Department of Aviation, Marion County, and the local aviation industry over the past two decades have not only expanded the airport, but have created a domino effect of actions leading to contemplated and uncontemplated results which require another action--all characterized by expansion and loss of farm land.

The current master planning process will continue this outcome if the airport is expanded yet again. Agriculture is a major economic sector in the state and in Marion County. French Prairie has the best soils in the United States. Both need to be protected.

Please see attached petition signed by members of Friends of French Prairie, uniformly in opposition to expansion of the Aurora Airport.

Sincerely

Benjamin D Williams

President, Friends of French Prairie

PETITION CONCERNING THE MASTER PLANNING PROCESS FOR THE AURORA STATE AIRPORT

To be submitted to OREGON DEPARTMENT OF AVIATION

by FRIENDS OF FRENCH PRAIRIE

Whereas the Aurora State Airport is located in the French Prairie part of Marion County, the historic and agricultural heartland of Oregon, primarily comprised of agricultural land characterized by the finest soils in the United States.

Whereas Oregon Department of Aviation is currently conducting an update to the Aurora State Airport Master plan, we the undersigned hereby express our concern with the potential negative impacts of the Master planning process, and specifically oppose:

- The contemplated lengthening of the runway which has the potential to attract more aviation operations and **negatively impact nearby roads and traffic**;
- Expansion of the Aurora Airport beyond the current boundaries as a result of implementing "precision approach" and the consequent **loss of farm land.**

Aurora State Airport Master Plan

Planning Advisory Committee (PAC) Meeting #5

June 7, 2011
Maplewood Grange Hall, Aurora, OR

MEETING SUMMARY

Attendees

Oregon Department of Aviation (ODA) –Sandra Larsen, John Wilson and Mitch Swecker (also a PAC member)

WHPacific – Rainse Anderson and Sarah Lucas

JLA Public Involvement –Adrienne DeDona and Sylvia Ciborowski

Public Advisory Committee (PAC) – Patti Milne, Bruce Bennett, Jim Bernard, James Meirow, Tony Holt, Steve Hurst, Nick Kaiser, Rick Kosta, Ted Millar, Fred Netter, Dan Riches, Ray Phelps, Craig Wilmes, Randy Carson, Tony Helbling, Roger Kaye and Dave Waggoner. (PAC Member not in attendance: Jim Hansen)

Public Attendees – see attached sign in sheets

Welcome and Introductions

Rainse Anderson kicked off the meeting and thanked everyone for coming. He explained that this was the fifth PAC meeting. The meeting had been moved up to address the preferred alternative and the various add-on scenarios developed in March. Rainse introduced himself, Sarah Lucas from WHPacific and Mark Gardiner from the Oregon Aviation Board. Mark Gardiner introduced himself as the Chair of the Oregon Aviation Board and added that Joe Smith and Jack Loacker from the Oregon Aviation Board were also in attendance. Mark explained that this project has been through quite a process and a lot has gone on. He said that initially a preferred alternative and a couple of scenarios were developed and reviewed by the Aviation Board. The Board is interested in hearing what people think of each of the scenarios. Mark said that one scenario included an 800 foot displaced threshold to the north. He felt that this scenario balanced as many varying factors as possible. He added that many people feel this scenario is a viable alternative for the airport, while still meeting the community needs. However, he said that he is not confident that they will get cooperation from FAA related to this scenario. Because of this, they are still looking at an extension to the south. Mark said that they are still in process of balancing the needs of the airport and needs of the community.

Rainse asked for show of hands from the audience whether or not this was the first meeting they had attended. There were several people who raised their hands; approximately one quarter of the group.

Rainse reviewed the meeting agenda and explained there would be public comment at the end of the meeting. Each person would likely have about 2 minutes to speak. He said the meeting should be wrapped-up and adjourned around 7 p.m.

Presentation: Draft Preferred Alternative

Rainse explained that the master plan is a 20 year guide for airport development in order to obtain funding from the FAA. He said that so far in this process, they have completed Chapters 1 through 5 [Chapter 1: Introduction *(master plan issues and goals and airport role),* Chapter 2: Airport Inventory *(current airport facilities, zoning and aviation activity),* Chapter 3: Aeronautical Activity Forecast *(forecast for 20-year planning period),* Chapter 4: Facilities Requirements *(airport needs to meet future forecasted demand),* and Chapter 5: Airport Alternatives *(how to address the needs identified in Chapter 4)].* They are currently moving towards developing Chapters 6 and 7: the Airport Layout Plan (ALP) and Capital Improvement Plan (CIP). The ALP must be approved by the FAA, to enable funding from the FAA.

Rainse said that this meeting was moved up from the last meeting, which would have covered the Master Plan' final draft, so that the preferred alternative and the various add-on scenarios could be reviewed with the PAC and the public. The last meeting has been eliminated in order to provide for this meeting.

Rainse explained that the draft alternatives were presented to the PAC on March 10th. Following that meeting, public comments were collected until March 24th. A presentation was given to the Oregon Aviation Board on March 31st and again on April 28th. Due to the comments that were received related to the draft alternatives and the need for extended runway, a discussion took place regarding adding a displaced threshold.

Rainse reminded everyone that this meeting was intended as a work session for the PAC and requested that members of the public hold their comments until the public workshop session or during public comment.

Sarah Lucas reviewed the process since the last PAC meeting. She said that they had received 30 comment forms at the last meeting and 60 were sent in following the meeting. Over 100 people took the online survey. The results were fairly split between the no-build and alternative 2. Common themes throughout all of the comments were related to the airport reference code, runway length, runway strength.

PAC Discussion: Draft preferred Alternative

Tony Holt asked if the slide regarding public comments was presented to the Aviation Board. He said that he was not sure how many of the comments were recorded since he had submitted a petition with 260 signatures that were not included and supported no runway extension. He added that this seems to be cherry picking the comment data. Sarah responded that the comments were not 1 for 1 weighted and there were other communities that submitted petitions. Sarah clarified that this is a summary of the input received from the comment forms.

Tony asked how they came to the conclusion of developing the preferred alternative and the displaced threshold scenarios. Rainse responded that the comment forms are all available online. There were many comments received from airport users that requested a runway extension and that they are trying to balance the input received. Rainse stated that this has been an open process; trying to juggle all of the needs. Mitch explained that ODA values all of the input received and they consider all input equally; they don't put more weight on some input than others. He added that they've met with the FAA numerous times and the FAA believes they have justified constrained operations for a runway extension. Tony reiterated that his issue is with the decision that was made related to the preferred alternative. Rainse explained that based on the input collected, along with the input from the Board, they determined the preferred alternative.

Bruce Bennett said he would like to point out that there were various alternatives considered that made up the outcome of the preferred alternative.

Sarah reviewed the draft alternative that was presented to the Oregon Aviation Board:

- No runway extension
- Increased pavement strength (load capacity), which would match the parallel taxiway's pavement strength. This would allow for heavier aircraft to takeoff and land on the runway.
- To the south shows increased RPZ for a larger safety area with an approach greater than three quarter statute miles. Some impacts to residential and farm properties due to acquisition needed.

Sarah explained that at their last meeting, the Aviation Board requested further public comment on the preferred alternative and add-on scenarios. Since that time, they have received 42 e-mails. Most comments received were in support of the preferred alternative: increased runway length and increased runway strength. A few people made comments in support of or against improved instrument approach capability. A couple of people were against the upgraded airport reference code and the cargo apron. One person made a comment in support of the Rural Fire Protection District Facility. Sarah stated that all of the comments are listed online in Appendix K.

A PAC member commented on the strength and length of the runway. Sarah explained that comment summary is related to the comments received. Another PAC member asked if there was someone on the team that is an expert in statistical analysis. Sarah explained that this isn't a statistically valid survey.

Sarah said that the add-on scenarios were developed based upon the comments received following the last PAC meeting. She reviewed the concept of displaced thresholds, which are a very technical design for runway extensions/declared distances that typically only pilots understand. Sarah read the definition of displaced thresholds: *The purpose of declared distances in airport design is to provide an equivalent Runway Safety Area (RSA), Object Free Area (ROFA), or Runway Protection Zone (RPZ) in accordance with the design standards at existing constrained airports where it is otherwise impracticable to meet standards by other means. Declared distances are also employed when there are obstructions in the runway approaches and/or departure surface that are beyond the ability of the airport owner to remove.* Sarah said that what that means is that there are four proposed declared distances:

Add-on Scenario 1: Sarah explained that in this scenario, the threshold stays the same, but pavement would be extended 200 ft to the north and 600 ft to the south for a total of 800 feet.

	Runway 35	Runway 17
Takeoff Run Available (TORA)	5,604’	5,204’
Takeoff Distance Available (TODA)	5,604’	5,204’
Accelerate-Stop Distance Available (ASDA)	5,804’	5,804’
Landing Distance Available (LDA)	5,004’	5,004’

There was a question from a PAC member regarding relocating fuel tanks: If ODA can afford to move the fuel tank, why can’t we ask property owners to move their facilities to provide for a runway extension? Mitch explained that funding hasn’t been identified. Sarah explained that fuel tanks will be moved when they reach their life expectancy.

Add-on Scenario 2: Sarah explained that the distances will remain the same in this scenario, but with no additional added pavement to the north. Traffic departing to the south would have additional runway, but traffic departing to the north would not. Departing to the south is against the calm wind recommendations.

	Runway 35	Runway 17
Takeoff Run Available (TORA)	5,004’	5,804’
Takeoff Distance Available (TODA)	5,004’	5,804’
Accelerate-Stop Distance Available (ASDA)	5,804’	5,804’
Landing Distance Available (LDA)	5,004’	5,004’

Rainse explained that the scenarios were reviewed by the FAA and they were not thrilled with the idea of displaced threshold, and said that there is justification for a runway extension. ODA requested an official position from the FAA which was received today. Copies were provided to the PAC members. Rainse summarized the letter from the FAA. The FAA feels that displaced thresholds would only be used in a limited capacity and anything additional is a runway extension. To take the Runway Protection Zones (RPZ), object free areas and move them out impacts operators, particularly Columbia Helicopters on the north. The same thing would occur on the south side which would cross Keil Road. The benefit of the displaced threshold goes away with the FAA’s position. The FAA indicated they will not participate in funding partial or limited use of a runway extension.

A PAC member asked about the closure of Keil Road which is an important farming access road. He asked if the FAA plans to pay for relocation. Rainse replied that often times these types of road relocations are paid for by the FAA.

Add on Scenario 3: Sarah explained that this scenario includes a 1,000 ft extension to the south and takes pavement out to the current airport property RPZ another 1,000 ft. This option would require closure of Keil Road. Scenario 3 shows the declared distance of 6,004 ft.

	Runway 35	Runway 17
Takeoff Run Available (TORA)	6,004’	6,004’
Takeoff Distance Available (TODA)	6,004’	6,004’
Accelerate-Stop Distance Available (ASDA)	6,004’	6,004’
Landing Distance Available (LDA)	6,004’	6,004’

Rainse asked if there were further questions from the PAC.

Tony Holt stated that this was a planning process, not a funding process and his understanding was that the FAA does not have to approve the master plan. Rainse explained that they have to sign the ALP, but not the master plan. The State has to approve and update the capital improvement plan each year. Tony asked if we have to conform to the FAA through this process. Rainse replied there is a lot of demand driven items in this process such as hangars, tie-downs, etc. That is why the user survey was completed at the outset of this process in order to justify the process. The State doesn’t have money in the foreseeable future for this project. Mitch explained that this is a long-range plan based upon the needs of the aviation community. The FAA will not fund improvements without approval of the ALP. Tony said that part of his problem is how to get to the ultimate decision considering the feedback received. Mitch responded that the FAA thinks the extension is justified based up on the constrained operations.

Jim Bernard, Clackamas County Commissioner, said he understands that many PAC members feel that the needs analysis was cooked. He also supports economic development and job growth. There will be impacts on Clackamas County that they don’t know how to pay for. Will an extension increase the use at the airport? An analysis of the impact on public facilities needs to take place. Was there any analysis of closing Keil Road? Will Mulino be the next rural airport that needs to be expanded? There needs to be an analysis of farm land and farming practices. Has ODA analyzed the impact of the Salem Airport extension? Will ODA commit now to do the analysis later? Mitch responded that we have talked about a lot of these issues all along and a study would have to be done on the runway extension. It would not be fair for ODA to do all the traffic analysis study. Jim Bernard added that the Mayor of Canby has also said they do not have the money to accommodate the impacts of expansion. I-5 will be impacted. Communities to the north will be impacted. He added that he would greatly appreciate the analysis of these impacts. Mitch said ODA would consider cost sharing when the time comes and added that it is not reasonable for the airport to bear the cost when airport traffic is only a small percentage of the total traffic. Rainse said that prior to any runway extension there would have to be an environmental process that would have to take place, which would analyze traffic, endangered species, social impacts, etc. before construction was approved by the FAA.

Fred Netter commented that when this first came out the first concern was safety. Now looking at an extension, he's not sure if the safety impacts have been addressed. Rainse explained that on the last scenario there were three locations identified for the control tower. Fred said that the Fire District has talked about the Fire District facility, but he doesn't see a location for where that would be designated when funding is identified. He asked if a location will be guaranteed. Mitch said that they would like to have that space designated for a fire facility.

A PAC member commented that we were informed that a tower would be added to improve safety. He doesn't understand how lengthening the runway would improve safety whether there is a tower or not because there would be larger planes with more fuel. Rainse said the two aren't necessarily connected. Planes can come in and land, but are constrained when taking off. The additional runway will allow for better take off.

It was added that engine failure could occur at any time and additional runway allows more space and prevents emergency landing in fields or residential areas. Also, increased airport use takes cars off the road. The Keil Road closure could be relocated to Ehlen road.

Tony Holt stated that the issue of safety is obscured because there will be larger aircraft coming in. Larger aircraft will have the same safety problem as smaller airplanes. The logic is not there.

It was commented that the infrastructure doesn't meet the current demand of the airport. The PAC member added that he's not against growth, but he's concerned about how growth will be handled and how it affects the City of Aurora.

Another PAC member said this doesn't necessarily mean larger aircraft will come to Aurora unless it allows for it based upon the strength of runway.

A PAC member stated we are strengthening runway, so we would be allowing for larger planes. Rainse replied that if you look at the airport's current use, there are currently 60,000 pound aircraft. This change would be preserving the life of the pavement by strengthening it.

Bruce Bennett stated that most people wouldn't notice difference between 45,000 and 60,000 pound aircraft. The 60,000 pound aircraft are just larger business aircraft which tend to be quieter. These larger planes will allow for more jobs which will bring in revenue.

Public Workshop

Rainse reviewed the format for the public workshop and explained there would be 25 minutes for the public and the PAC to interact with staff to ask questions and review information about the preferred alternative.

After the 25 minute public workshop, Rainse reconvened the PAC session. Rainse explained that the PAC would now have the opportunity to discuss the preferred alternative and add-on scenarios and give input on the direction for the preferred alternative.

PAC Discussion

Mark Gardiner responded to some of the questions raised by the PAC earlier in the meeting. He said that related to the analysis of public facilities, traffic counts were done and airport traffic is a minor impact currently and is not a factor in any meaningful percentage between Canby and I-5. He added that at the last Aviation Board meeting, a person from Canby and a major employer in the area testified in favor of airport improvements. Airport users will not be forced to move anywhere, but may choose to move to Mulino due to the tower. Mark explained that intersections will be addressed through a planning process the airport will go through as part of the land use planning requirements. There has been consideration for prime farm land in the area and they have tried hard to limit any impacts to farmland. They are working hard to extend to the north vs. the south for that reason and will look at how to mitigate that. None of the recommendations will adversely impact farming. Keil Road is a minor facility and is not currently a source of traffic problems. The Salem Airport is outside of the Aurora airport market area, this would be the same thing as saying people would go to Portland although there are no hangars in Portland. Mark added that they will absolutely analyze the impacts, as required by the State's planning laws.

Steve Hurst, Wilsonville City Council, explained that during the breakout period he placed a copy of a letter on everyone's chair which states Wilsonville City Council's list of preferences related to the Master Plan:

- Improve management of aircraft approaching the airport that would result in the enhanced safety and reduced noise on Wilsonville.
- Eliminate the need to expand to the north.
- Preserve farmland
- Support concurrency by recognizing surface transportation improvements
- Recognize importance of preserving existing use of Keil Road for farm use

Patty Milne, Marion County Commissioner, stated that safety is most important to her. Farm and Agriculture in Marion County is extremely important to her and the Marion County Commissioners. Over the years, Marion County has made many specific statements about preserving farmland. Economic Development is extremely important to Marion County and the surrounding communities and they want to protect that. Everyone is well aware of the positive impact the businesses at the airport have on the City of Wilsonville, Clackamas County, and Marion County. Roads and transportation will need to be a joint effort with Clackamas County. When a master plan is determined, that will be the time to look at the conditions of the surrounding roads and identify the responsible parties. At that time, we will know how to identify the most important projects and prioritize them on the Marion County capital improvement plan and working with Wilsonville and Clackamas County. We will also look to federal and state government to help fund those projects.

Nick Kaiser said that since this project came out originally with preferred alternative, he has felt that it was a compromise and thought that it was a valid approach. He doesn't support a runway extension. He said they have the ability to deal with some of the safety issues without extending the runway and preserving the viability of the airport. Nick added that he had some other issues that he will address at a later time.

Randy Carson, Mayor of Canby, stated that he wears two hats. He works for Columbia Helicopters as well. He has watched the traffic increase over the years. He believes we need more transportation dollars on this side of the county. We should work to improve infrastructure to tie into I-5 and the airport. He believes there needs to be some build-out within the airport. Randy added that the big need is infrastructure and how we can work together to make that happen.

Roger Kaye said Keil Road is an important farm road and cannot be looked at primarily based on traffic counts. It's an important connector road as well. He previously wrote a letter to Mitch and ODA. He opposes lengthening the runway and disagrees that there is no noise difference between 45,000 and 60,000 pound planes.

Fred Netter of the Aurora Fire Protection District said he is happy to say that they have sited a facility at the truck stop which will improve response times to the airport. Keil Road is important for emergency access; without access though a gate or otherwise, emergency vehicles will have to go all the way around the airport. A gate could serve their purpose, but wouldn't help farmers. He wondered if Keil Road could be put below where there wouldn't be issues, or relocated further towards Ehlen Road. Fred said that he is adamantly opposed to any alternative that would remove access to Keil Road. If more traffic was added to Boones Ferry Road it would make it even more unsafe. There are currently numerous traffic incidents on Keil Road at Highway 551 which would be moved to Boones Ferry. He would like to make sure that the fire station has a dedicated spot on the airport property that cannot be taken away.

Tony Holt, representative of Charbonneau Country Club and residents, stated that he somewhat reluctantly supported the first preferred alternative because he felt it was a fair compromise and because that was put forward as a preferred alternative, he did not write numerous letters following the meeting. Tony stated that the summary of the comment forms does not stand up. He would like to know how ODA arrived at the decision for the preferred alternative.

Ted Millar, representative of airport users, said that they have held many public meetings for airport users at which they have come to understand the needs of the airport and the safety issues. A lot of pilots live in Charbonneau also. He believes there are two issues: safety first and jobs second. It has been well documented that there is a need for a runway extension. There have been noise studies that have been completed that prove that 60,000 pound airplanes are much quieter than the planes that currently land at Aurora Airport. Also with the longer runway, they are allowed to use noise abatement procedures. He has worked with the surrounding communities to establish instrument departures. On economic development, the job growth won't be at the airport. Big job growth will be within the surrounding communities that use aircraft at Aurora. He prefers scenario #2 because it fits within the needs of the surrounding community and it meets the needs of the airport users; a longer runway.

Bruce Bennett said he would like to point out that the Aurora airport has been there for 70 years. He has been involved with his family business that has been there over 40 years. He's also been involved in airport departure facilities that will abate noise and improve safety. The only way to do quieter takeoff is with more runway length. He believes we have worked hard to compromise with neighbors and

farmers and for that reason, he prefers scenario 2. Bruce added that additional runway is needed to takeoff safely for commercial aircraft. If FAA won't support scenario 2, then he would support scenario 3.

David Waggoner, business operator at the airport and resident of Clackamas County, said he appreciates the amount of revenue that Clackamas County generates for the airport, but he is frustrated that Clackamas County doesn't appreciate the amount of money that is generated at Aurora and gets funneled to Clackamas County. This is hugely beneficial to Clackamas County. He added that if managed correctly, there won't be an impact on Clackamas County. He supports scenario 2, but if the FAA doesn't, he would go back and support build alternative 1.

Tony Helbling, Wilson Construction, said he operates three fixed wing airplanes at Aurora. His company has various business locations in the United States and being able to get in and out of Aurora airport is critical to their business. When locating there, they looked at what is the best place, safest for employees, and allows growth that provides jobs for the people that live in the community. He added that money that comes in from out of state is brought to this community. He supports scenario #2 or a runway extension. He said that someone asked him if there are standard procedures for approach and he replied that pilots follow a highway in the sky. There are procedures that pilots are required to follow by the FAA. Not everyone follows these procedures, but this is comparable to automobile drivers who do not obey the speed limit. Most follow the regulations, but a few don't.

Jim Bernard said that Clackamas County does not oppose economic development or jobs. He just wants to be sure that the issue of traffic impacts is addressed. He said people can't deny that passenger planes and job growth won't increase cars on the road and he wants that addressed. Clackamas County does support economic development and growth. He feels their concerns were simply not addressed. They are concerned about the traffic impacts should the airport someday expand and want to see a study completed.

Mitch Swecker thanked everyone for providing their input from various viewpoints and said they are really trying to accommodate everyone and their feedback.

Rick Kosta, representative of Deer Creek Estates, said they are the closest community to the airport. If the runway is expanded to the south, they will be within 500 feet of the airport. The noise is currently an extreme factor. He does not support a runway extension, but does support runway strengthening. At previous meetings he has commented on the noise issues and has been told Deer Creek would be beyond the noise boundary. Rainse added that would be part of the social impacts study necessary for construction.

Craig Wilmes, area business representative, said he supports scenario #2 for increased safety and opportunities for business expansion.

Dan Riches, Columbia Helicopters, said he agrees with Craig. He explained that Columbia is a global company. They located at Aurora to be able to respond to their business needs. Columbia has spent a large amount of time ensuring they are a good neighbor. He believes the economic impacts on both

sides of the County line are significant. He supports expansion of the runway for safety reasons and prefers scenario #1. He added that he tempers his input with continuing to defend the use of their property.

Jim Meirow, City of Aurora, said he struggles with how we got from original alternative to where we are today, but has said in the past the City would support an extension within the airport property. Therefore, he supports scenario #2. He added that some adjustments could be made so that everybody can work with it.

Ray Phelps, Wilsonville Chamber, asked if there would be a later opportunity to comment. He explained the Chamber is not as nimble as this process is requiring. Their Board hasn't had a chance to take an official position and they want to do it correctly. He added that most people who work at the airport live in Clackamas County. Those are important people to us (600 of the 900 people). Rainse said that would be going to the Aviation board on the 23rd of June and requested that have comments in by then. Tom also said that many of the large businesses use the airport for airport traffic (Costco, State Farm, etc.).

Mitch Swecker again thanked everyone for input and said they had a tough act to complete.

Public Comments

Members of the public were each given two minutes to provide oral testimony regarding the draft alternatives.

Keith Amundson (Retired urban planner with state federal and local experience and a Charbonneau resident): The data and analysis only supports the no build alternative. Reluctantly, I would go along with idea of the preferred alternative, and reiterate the comments made by Tony Holt and the Clackamas County Commissioner.

Jeff Purr (Charbonneau resident): Against expansion of the runway. I have not heard a survey of residents of the area. There are 50,000 residents. How many of those people actually use the airport? Why are we expanding an airport for a small number of people? I hear jets in the middle of the night. There are other airport options, such as Hillsboro, Portland, and Salem. People can drive to those airports. There is no need to have residents hearing jets so close by. The airport is functioning as is, and there is no need to expand it. If companies want to grow, they can use other airports. I would rather use funds to build a second bridge across the Willamette than to use funds for this airport expansion.

Mike Iverson (French Prairie Board of Directors): French Prairie is opposed to expansion of airport, the closing of Keil Road and taking away farmland. The FAA and the Board seem to go against their statements in the preferred alternative, including stating that any expansion would not prove feasible. What has suddenly made expansion feasible? We should not use tax payer dollars to benefit a small number of people. I also farm land south of the runway and have holdings on the east and west side of the airport. I have 30 employees working for me and we cross Keil Road many times daily, so you can't say that it is not used. We have lots of farm equipment we need to move, and using Arndt Road would

be a disaster. Ehlen Rd would also be impossible. I am also an ex pilot. Surface transportation interruptions caused by the 1,000 ft expansion would be inconceivable to be compatible with farming.

Rob Callan (Charboneau resident): We are not using the best method of getting public comment. You need to talk to the people. There are a lot of pilots that don't follow the rules. 5:30 this Sunday morning there was a jet over Charbonneau—and that is the norm, not the exception. Whatever you do is going to increase the traffic at this airport. We don't understand why we need expansion when 25 miles down the road we have a very long runway. Aurora airport is a convenience to big companies. To have that convenience be to the detriment of homeowners and farms is unconscionable. Salem airport is a fine alternative. Tax payer money will be spent on Aurora, which functions now. Would like to count on Marion and Clackamas County to implement noise abatement ordinances if the expansion goes through.

Janet Olmstead (Wilsonville resident): My biggest concern is the traffic—the road traffic will be impacted terribly if we expand the airport. This whole thing seems to be a plan to enrich a few people and leave the rest of us in noise and traffic.

Glen Liffick: This seems to be airport creep. I have been involved with the evolution of a couple of local airports to regional airports. There is usually an incremental increase in runway length/strength justified by safety, which results in more traffic. Then there are increased taxiways and finally a crosswind of perpendicular runway to handle bigger airplanes. I believe this is the first step in evolution to Aurora regional airport. I encourage citizens to stay involved in this process if they are concerned. Citizens must continue to speak up.

Phil Swain (Chief pilot of Aurora Aviation): I also do safety management consulting in aviation. It is not true to say longer runways don't promote safety. Safety plans need to look at the capacity of the airport. Aurora is extremely limited with the approaches we have. That in and of itself means you can't get into Aurora. Also, we have a lot of mixed traffic—jet aircraft, reciprocating aircraft. Trying to forestall a tower and runway lengthening demonstrates a lack of foresight into what the future will bring in terms of economic growth, whether we like it or not. We need to look at this from a safety and usability perspective. This is not just about a few big businesses coming in. This is an area that needs the economic growth. We need to look down the road for future and economic viability.

Brian Oliver (Employee at Aurora Aviation and resident of Multnomah County): I am an employee that commutes to Aurora. I stop in the stores in Wilsonville and eat in restaurants. I shuttle visitors to the area. The economic growth is there. I have learned that growth is inevitable. We will all experience it. The airport will continue to grow. I am a student pilot. I have been fascinated to hear the armchair aviation that occurs in these kinds of public forums. A lengthened runway will increase safety. We need to listen to the experts and those who understand aviation. We can't look at an airplane on a ramp and make a judgment on it just because we are impacted by something tangential to the safety issue.

Ken Ivey (Chair of an unincorporated communities planning organization in Clackamas County): The noise plans are not being respected very much. In Charbonneau, I had a leer jet over my house, and that is common. People aren't following the noise abatement routes. If you want to justify expansion, you need to control your pilots and get noise abatement in place.

Annie Kirk (Aurora citizen and Marion County resident): I appreciate the comments made about mitigating noise. I would ask that when Charbonneau residents make noise comments, you would include the City of Aurora. I am against lengthening of the runway and agree with the Charbonneau representative that strengthening is okay. If any other alternatives come to pass, those on mailing list should understand they have an opportunity to comment. When the add-ons were made, I was unaware so did not comment.

Next steps

Rainse explained that the comment form would be online for the next two weeks. The next item of business will be a presentation to the Oregon Aviation Board looking for direction from them as to how to move forward with the ALP and the CIP on the 23rd of June. A PAC workshop will follow regarding the ALP and the CIP.

Joe Smith, Oregon Aviation Board said that he came to the meeting to listen and he listened very carefully. He has taken the time to read every comment on the website, and by June 23rd, will read everything on the website and that comes his way. He said there are a couple of things that people should be aware of: First, he is totally in favor of there being a tower for safety and for the best way to see that pilots are obeying flight patterns and noise abatement procedures. Second, he said he has to confess that he's very underwhelmed by the road/traffic arguments. The idea that there is going to be a significant increase in traffic is hard to believe. Before any extension happens, a number of studies would have to take place, and people would have to be compensated for their property. The thing to remember is that what goes into the ALP is not necessarily going to happen, but what doesn't won't happen. He said he really appreciates people attending, staying late and providing feedback.

Tony Holt asked what preferred alternative will be presented to the Aviation Board. Joe responded that he doesn't know where the idea of a preferred alternative came from. He said it's not the business of the consultant. It is the business of the consultant to look at all the possible options. He believes the word preferred has to go away. Rainse responded that they have to get to an ALP and to do so, they will get together with staff from ODA and Mark Gardiner from the Aviation Board to determine how they will present the material to the Aviation Board. Mitch added that it is a Board decision and they will make the call. They have postponed that decision twice. Mitch said that all feasible alternatives will be presented to the Board for consideration and decision.

The meeting adjourned at approximately 7:45 p.m.

Aurora State Airport Master Plan Update – Planning Advisory Committee (PAC) Meeting #5

Aurora State Airport Master Plan

Planning Advisory Committee (PAC) Meeting #6

September 15, 2011
North Marion School District, Intermediate School, Aurora, OR

MEETING SUMMARY

Attendees

Oregon Department of Aviation (ODA) – Mitch Swecker, Heather Peck , Sandra Larsen, and John Wilson

WHPacific – Rainse Anderson and Sarah Lucas

JLA Public Involvement –Adrienne DeDona and Sylvia Ciborowski

Public Advisory Committee (PAC) –Greg Taylor (new Aurora Mayor), Ray Phelps, Randy Carson, Patti Milne, Nick Kaiser, Jim Hansen, Tony Helbling, Bruce Bennett, Tony Holt, Mark Ottenad (alternate for Wilsonville), Fred Netter, David Waggoner, and Alternate for Dan Riches, Columbia Helicopters.

Public Attendees – see attached sign in sheets

Welcome and Introductions:

Mitch Swecker, Director of the Oregon Department of Aviation (ODA), welcomed the group and kicked-off the meeting. Mitch introduced Heather Peck, ODA's new construction project manager and Greg Taylor, the new mayor of Aurora.

Rainse Anderson introduced himself as the project manager for the Aurora Airport Master Plan update. Rainse introduced Sarah Lucas, project planner and John Wilson and Sandy Larsen from ODA. Rainse explained that there were comment forms and sign in sheets at the front for people to leave written comments at the meeting or send to staff later. Comments can also be made through the project website. Comments will be taken until Sept. 30th. Rainse added that this is the last meeting for the project and that he's enjoyed working with the community here in Aurora.

Rainse reviewed the meeting agenda which includes a project update and presentation on Chapters 6 and 7 (Airport Layout Plan and Capital Facilities Plan). Rainse reminded the public that this is a working session for the PAC and during the presentation, PAC members may have questions, but the public is asked to hold their comments until the end of the meeting. He explained there would be a break for a public workshop during which time the public and the PAC members could review project materials and interact with staff to ask detailed questions about Chapters 6 and 7. After the public workshop, the PAC will reconvene to discuss what was heard, then there will be time for public comment.

Rainse reviewed the project purpose, which is to update the 20 year plan that will guide the future development of the Airport. He went on to explain that at previous meetings, we have reviewed the first five chapters of the Master Plan document. We will now begin review of the Airport Layout Plan and the Capital Improvement Plan. Over the last five months, several alternatives were developed and public comment was generated related to these alternatives. Following public comment, project staff presented the outcomes to the ODA Board on April 28th, where they came up with the displaced threshold concept. The Board requested another public meeting to discuss the displaced threshold. Public comment was generated on the displaced threshold option until June 21st. At that time the ODA Board gave the direction to move forward with the 800-foot displaced threshold to the north, so that will be presented to the FAA within the draft Master Plan as the preferred option. If the FAA does not approve the displace threshold, a 1,000-foot extension to the South would be recommended for their review and opinion. Only one option will be carried forward.

Displaced threshold:

Rainse explained the displaced threshold option, which is recommended to mitigate the runway length deficiency at Aurora Airport. The following distances will be included in the displaced threshold option.

- Take-off run available (TORA): Runway 35, 5,004 feet and Runway 17, 5,804 feet
- Take-off distance available (TODA): Runway 35, 5,004 feet and Runway 17, 5,804 feet
- Accelerate-Stop distance (ASDA): Runway 35, 5,004 feet and Runway 17, 5,804 feet
- Landing Distance Available (LDA): Runway 35, 5,004 feet and Runway 17, 5,004 feet

Note: there is no change to the landing distance available.

Runway extension to the South:

Rainse explained the various concepts included in the proposed 1,000 foot runway extension to the South. The following distances will be included in the displaced threshold option.

- Take-off run available (TORA): Runway 35, 6,004 feet and Runway 17, 6,004 feet
- Take-off distance available (TODA): Runway 35, 6,004 feet and Runway 17, 6,004 feet
- Accelerate-Stop distance (ASDA): Runway 35, 6,004 feet and Runway 17, 6,004 feet
- Landing Distance Available (LDA): Runway 35, 6,004 feet and Runway 17, 6,004 feet

This option would require property acquisition, however pavement options are all on property owned by the Airport.

PAC Discussion:

Bruce Bennett asked why the landing distance wasn't extended in the displaced threshold. Rainse replied that this is how the displaced threshold is calculated since the pavement is only usable in one direction. Bruce asked if it can be considered as a stop-way. Sarah replied that you can only use the 5,000 feet to calculate the distance available. Bruce asked if the Runway 17 run-up pad was shown. Rainse replied that it was included in both alternatives, however it is shifted down to the very end of Runway 17 in the displaced threshold scenario. Rainse also added that easement acquisition is needed at Columbia Helicopters for the displaced threshold to the North.

Chapter 6 – Airport Layout Plan:

Rainse reviewed the Airport Layout Plan (Chapter 6). He explained that the Airport Layout Plans are a pictorial culmination of the master planning process. In order to be eligible to receive funding from the FAA, projects must be shown in the FAA-approved Airport Layout Plan. The drawings include:

- Cover sheet
- Airport Layout Plan
- Airport Airspace
- Airport Approach Surfaces
- Inner Portion of the Runway 17/35 Approach Surfaces
- Terminal Area Plan
- Land Use and Noise Contours
- Runway Departure Surfaces
- Airport Property Map

The Airport Layout Plan includes runway safety areas, displaced thresholds, location for the control tower (northern – CAA ramp area), fire station (centrally located), service road, relocation/closure of Keil Road, and modification of the runway object free area.

PAC Discussion:

Fred Netter said that at the last meeting, we talked about the tower and its proximity to the fire station and there being an issue with homeland security. He asked how close the tower is to the fire station in the Airport Layout Plan and whether that will be an issue. Mitch replied that ODA has appealed this to the FAA and the threat didn't justify the security clearance. Fred asked whether it is possible to connect the fire station facility to other buildings. Mitch replied that if there is some way of funding it from a grant or other source, then that would make it feasible. He added that if there is outside funding, they should talk. Fred replied that there might be other funding sources available. Mitch added that they would need to identify funding, etc. pretty quickly since an engineer has already been hired for the control tower.

Nick Kaiser asked if there are any changes in the previous chapters based on discussions with the ODA Board, such as the land use areas, etc. Rainse replied that in the alternatives chapters, we outlined all the issues relative to the alternatives discussed at that time, and the chapter content will remain the same since it provides the context for developing the preferred alternative shown in the ALP. Mitch added that if ODA gets approval for the displaced threshold distances to the north, you would probably see airplanes taking off to the south. Nick asked if there will be any changes in the noise levels.

Tony Holt suggested including the assumptions related to departures on the maps that show the conditions for 2010. Rainse replied these are listed in Chapter 5, but they can be summarized on the ALP noise drawings as well.

Chapter 7 – Capital Improvement Plan:

Sarah reviewed the Capital Improvement Plan Chapter and explained that this provides the basis for implementing the improvements in the Master Plan. She also explained that the Capital Improvements would be implemented within three separate phases:

- Short-term (Phase I): 2012-2016
- Intermediate-term (Phase II): 2017-2021
- Long-term (Phase III): 2022-2031

A Financial implementation analysis was also conducted to examine the various facets of the financial operating condition of the Airport. The Capital Improvement Plan is a living document and is updated as projects are completed or priorities change. As of right now, this is the prioritization of projects:

Phase I:

1. Construct Air Traffic Control Tower (ATCT) – 2012
2. Service Road – 2012
3. Pavement Maintenance – 2013
4. Helicopter Landing Pads – 2014
5. Ramp reconstruction – state leased – 2014
6. Taxi-lane Development (Hangar Access) - 2014
7. Hangar Development – 2015
8. Carryover Entitlements – 2015
9. Environmental Assessment for Runway Improvements – 2016
10. Pavement Maintenance – 2016

Total cost of Phase I Improvements - $8 million (ODA share = $583,000, FAA share = $2.5 million, Private share = $2.1 million, other funding = $2.7 million)

Phase II:

11. Aurora Fire Response Facility – 2017
12. Carryover Entitlements – 2017

Displaced Threshold Improvements Only:

13. Property Acquisition – 2018
14. Avigation Easement Acquisition – 2018
15. Carryover Entitlements – 2019
16. 800 foot Displaced Threshold to the north – 2020
17. Install Runway – 2020
18. Runway 17 Run-up Area – 2020

Runway Extension to the South Only:

19. Property Acquisition – 2018
20. Keil Road Relocation – 2019
21. Runway 35 1,000 Extension to the south – 2020
22. Install Runway 17 Precision Approach – 2020

Other improvements not related to above alternatives:

23. Pavement Maintenance – 2019
24. Taxi-lane development (hangar access) – 2019
25. Runway 17 & 35 Strengthening Overlay – 2020
26. Hangar Development – 2021
27. Master Plan Update – 2021

Total cost of Phase II Improvements - $7.6 million for Displaced Threshold (ODA share = $263,000, FAA share = $4.6 million, Private share = $2.7 million). $12 million for Runway Extension to the South (ODA share = $487,000, FAA share = $8.9 million, Private share = $2.7 million).

Phase III (2022 – 2031):

28. Pavement Maintenance
29. Apron Development/Run-up area
30. Taxi-lane development (Hangar Access)
31. Hangar Development
32. Cargo Apron
33. Relocate Fuel Tanks
34. Runway 17 run-up area

Total cost of Phase III improvements – $4.5 million (ODA share = $200,000, FAA share = $2.2 million, Private share = $2.1 million)

Sarah explained that ODA and the FAA share the cost of improvements. The Airport pays 5% and FAA pays the remainder for the majority of Airport Improvement Program (AIP)-eligible projects. One exception would be pavement maintenance through the Pavement Maintenance Program, where the Airport supplies 75% of the funding. Items related to hangar development were shown to be 100% private funding, as the FAA rarely funds revenue-generating projects.

Sarah explained that the financial analysis explored the feasibility of implementing these projects. This process entailed looking at the following conditions at the Airport:

- Financial operating condition
- Historical operating revenues and expenses
- Projected future revenues and expenses, with focus on Capital Improvement Plan development phases

The approach to the analysis was to:

- Review financial documents
- Evaluate rates and charges
- Review existing operating and financial environment
- Review Master Plan Capital Improvement Plan
- Analyze sources and timing of capital funding
- Analyze historic and projected operating revenues and expenses

Sarah said that the historical operating revenue and expenses at Aurora State are included in two funds – Public Transportation and Capital Projects. The following shows the revenues and expenses for both funds:

Public Transportation Fund	**FY2007**	**FY2008**	**FY2009**	**FY2010**
• Licenses and fees	$869.64	$116,748	$122,970	$128,358
• Rents and royalties	$149,206	$55,342	$44,461	$63,428
• Other misc. revenues	$11,833	$1,807	$11,649	$12,310
Revenues	*$161,909*	*$173,898*	*$179,081*	*$204,096*
• Salaries and wages	$19,288	$19,234	$19,263	$14,426
• Services, supplies, other	$65,793	$56,667	$38,435	$81,609
Expenses	*$85,081*	*$75,901*	*$57,698*	*$96,035*
Operating Income	*$76,827*	*$97,996*	*$122,382*	*$108,060*
Capital Projects Fund	**FY2007**	**FY2008**	**FY2009**	**FY2010**
• Revenues	$207,856	$2,905,882	$1,857,084	$13,198
• Expenses	$155,561	$3,524,431	$1,005,192	
Fund total	*$52,294*	*$(618,548)**	*$851,891*	*$13,198*

*Taxiway relocated

The projected Aurora State operating revenues and expenditures for the Public Transportation Fund are shown below.

- The Capital Project Fund is not shown as it is dependent upon eligibility and grant availability, which fluctuates.
- Does not include federal or other grant revenues or professional service expenses as they will vary and do not reflect true operating income.

Public Transportation Fund	**Current FY2011**	**FY2015**	**FY2020**	**FY2025**	**FY2030**
• Licenses and fees	$128,358	$145,000	$176,000	$224,000	$300,000
• Rents and Royalties	$63,428	$71,000	$87,000	$111,000	$148,000
• Other misc. revenues	$12,310	$14,000	$17,000	$22,000	$29,000
Revenues	*$204,096*	*$230,000*	*$280,000*	*$357,000*	*$477,000*
• Salaries and wages	$14,337	$16,000	$19,000	$24,000	$33,000
• Services, supplies, other	$96,035	$108,000	$128,000	$164,000	$219,000
Expenses	*$110,372*	*$124,000*	*$147,000*	*$188,000*	*$252,000*
Operating Income	*$93,723*	*$106,000*	*$133,000*	*$169,000*	*$225,000*

Sarah summarized the financial analysis by stating the following:

- Demand and the availability of financial resources for capital projects will dictate when facility improvements will be implemented.
- Continuation of the FAA's AIP entitlement program is essential for funding capital projects.

- The ODA does not allocate any indirect revenues or expenses to any of their 28 airports. Any additional ODA revenues would not be allocated to Aurora State Airport until the project costs are incurred and revenues are transferred.
- Based on ODA acceptance of the Capital Improvement Plan projects and the understanding that funding for the state's obligation will be met at the time of project implementation, the Capital Improvement Plan is financially feasible.

Sarah also noted that based on historic revenues, the ODA has funding to move forward with the first two phases of the Capital Improvement Plan.

PAC Discussion:

Tony commented that it was interesting that the cost to extend the runway to the South is two and half times the cost of the displaced threshold.

Bruce Bennett said he would like to point out that the revenues reported are 100% from aviation.

Public Workshop:

Sarah explained the format for the public workshop. Members of the public were then invited to review the display boards and ask project staff any questions during a 25-minute public workshop. Public comments were captured on flip charts by the facilitation team.

Adrienne and Sylvia recapped the comments heard from participants during the public workshop session:

- The sooner the better with improvements – especially the overlay because that will reduce maintenance costs and increase the life of the runway.
- Will there be any analysis of increased traffic at other airports by pilots who don't want to deal with the Aurora Air Traffic Control Tower after it is built?
- How do you prioritize the projects on the Capital Improvement Plan?
- What uses will be permitted on the service road?
- Are there caretaker facilities and can others be located on the airport?
- Run-up area is essential
- Why won't the run-up area be done sooner?
- Will the FAA buy off on the displaced threshold?
- Where/what are the required vertical clearances?
- What is the timing of the various improvements?
- Where will Keil Road be located to?
- Where will property acquisition/easement acquisition take place? What properties are impacted?
- What are the noise impacts/future flight patterns?
- Why are we doing the Master Plan Update?
- What is entailed in each alternative (Displaced Threshold and Runway Extension to the South)?
- Where are the developable properties?
- How will the Instrument Departure/noise mitigation process work?

Rainse explained that other than the Air Traffic Control Tower and the service road, there wouldn't be a lot of development over the next 5 years in order to save up entitlements for future improvements such as the runway extension or the displaced threshold. Mitch added that there are opportunities to re-prioritize projects based on need and available funding, such as the run-up area.

PAC Discussion:

Fred asked where Keil Road would be relocated to if relocation does occur. Rainse replied that is really up in the air at this time. He said they looked at the area and took a shot at it, but if and when that happens a variety of options will be reviewed if and when it comes up in the phasing plan. Mitch replied that it has to be coordinated with property owners and the County and there isn't a pre-determined outcome at this time.

Bruce recommended as a compromise, that the helicopter pads could be moved to make way for other projects even though it's a worthy project.

Jim asked if there was any way to move up the fire facility or co-locating it with another facility as opposed to duplicating utility needs, etc. He added that this would benefit the airport and the community. Fred replied that now that there is an engineer on board, he will arrange to talk with ODA to put something together. He asked whether or not the timeframe needed to conform with the phasing plan. Rainse said that the timing did not necessarily need to conform with the phasing plan since the funding is on the private side.

Mark asked if the service road was indicated on the Airport Layout Plan. Rainse replied that it was and indicated that it starts at the existing road and goes down to the existing taxilane (it is shown as a blue dashed line on the ALP). Fred asked if it started where you come off of Keil Road (near Metal Innovations). Rainse replied that it was.

Public Comment:

Karen Batte, lives on Ehlen Road. She stated that obviously with the tower coming in, you must be anticipating growth. What kind of growth are you anticipating and what are the impacts to Ehlen Road? At 5 p.m. it is blocked. How will you influence the state to get that road fixed? Mitch replied that this has been a discussion item at several meetings. He said that they will have to work with the County and the State when it comes to road improvements. Rainse said that as far as the tower is concerned, it is a safety related item, not to promote growth. The airport has been growing without the tower. It is a safety need to control aircraft movements in the air and on the ground. He said he could review the forecasts for future growth and type of aircraft with Ms. Batte after the meeting. Rainse added that staff are available for questions after the meeting for anyone who was interested.

Comment Forms- One public comment form was submitted with the following comments:
General comments regarding the Airport Layout Plan – Keil Road should not be closed or moved. The majority of local citizens and tax payers want the airport left as it is. No tower or Runway lengthening. I guess the local citizens have no say in this. These proceedings are dishonest and a waste of time.

Next Steps:

Rainse explained that there will be an opportunity for public comments on the two chapters until Sept. 30th. Comments may be submitted via comment forms at meeting or to staff or online.

The final draft will be prepared and submitted to the ODA Board and the FAA. It will also be available on the website for review. Notification will be sent to the PAC when available on the web.

Typically it takes 90 days for the FAA to review and approve an Airport Layout Plan. From there, the ODA will pursue adoption of the Master Plan as part of the Marion County Comprehensive Plan.

Mark Ottenad asked if the FAA's decision to adopt one of the two options would create some changes to the plan. Mitch replied that both options will be included in the Master Plan, but one will be indicated as the preferred alternative. He added that they are still going to present the 800-foot displaced threshold to the FAA and wait for them to say no before moving forward with any other option. Rainse said that after the decision is made, the document will be revised to show the chosen alternative. It will show the progression of the decision-making process. The other chapters will remain the same, but the Airport Layout Plan and the Capital Improvement Plan chapters will be updated. There will be a statement about what decision was made by the FAA.

Tony requested that when the final document is posted on the website, PAC members be notified where the significant changes are so they don't have to go through it page by page.

Jim asked whether the last time Master Plan update was adopted in the Marion County Comprehensive Plan. He said that we need to do it right this time and we need to answer questions about the impacts to roads and land use. He asked what the next step is for getting the plan adopted in the Marion County Comprehensive Plan. Nick replied that the County must agree to change the Comprehensive Plan, but it takes funds to do it because it's an extensive process. He said that doesn't mean you can't implement it, but the land use portions need to be brought on board. He added that the Master Plan does have land use impacts that need to be addressed. Patti said that the Comprehensive Plan adoption is another formal process with additional opportunity for public input, but we will have something to work from that will be presented and requested to be adopted. She added that doesn't eliminate anyone from coming forward and sharing any concerns that they might have. Jim said he really wants to make sure it gets adopted as part of the Comprehensive Plan because that could help developers as well as create a greater understanding of the Master Plan. He said that we should make sure we are able to produce a profit and make some money for the community.

Rainse thanked everyone on the PAC and the hard work they've done and thanked the public for coming out and asking questions.

Jim thanked Rainse and the consultant team for the work they've done.

Mitch thanked WHPacific, ODA staff and those that aren't here and have since moved on. He also thanked the PAC for spending their time studying the issues and making comments. He thanked the

public for their time and participation. He also stated the PAC and public comments had influenced and changed the course of the Master Planning process.

Meeting adjourned at approximately 6:45 p.m.

Appendix F:
OREGON AVIATION PLAN (OAP) INDIVIDUAL REPORT

Airport Master Plan Update

Aurora State Airport

WHPacific
OREGON DEPARTMENT OF AVIATION

Chapter 1 Introduction

The state of Oregon has an extensive aviation system spread throughout the state, providing valuable transportation options for the public, which range from small emergency use airports in remote regions to the extensive passenger enplanements at Portland International. Managing such a large and diverse system of airports can be a daunting task if a comprehensive plan is not in place to serve as a guide. In addition, with the ever-increasing demands for project funding, it is imperative that the Oregon Department of Aviation (ODA) have a solid inventory, understanding of need, and plan for development for the entire state aviation system to meet the needs of existing and future development.

This report is a combination of three studies, which will guide the development of the aviation system in Oregon for years to come. This document is organized into three distinct sections. *Chapter Two* summarizes the overall study goals, roles, and methodologies used to develop the study. *Chapter Three* is a summary of the various inventory efforts associated with the individual airport facilities. *Chapter Four* contains specific roles, recommendations, and funding options for the airport. This report will provide each community with information, which can guide the development of each facility in an orderly, economic, and environmentally friendly manner.

This Page Intentionally Left Blank

Chapter 2

The growing aviation demand in Oregon has prompted the Oregon Department of Aviation (ODA) to update the previous State Aviation System Plan published in 2000 and develop economic impact assessments that gauge the benefits of aviation to the state. Oregon is currently experiencing an unprecedented growth in population as well as aircraft operations. In order for the state to continue to provide a safe and efficient aviation system while accommodating growth, it is important to evaluate what facilities and capabilities are here today and what will be needed for tomorrow.

This chapter is organized into the following sections:

2.1 *Oregon Aviation Plan 2007* (*OAP 2007*) Study Components
2.2 Overall Study Goals & Objectives
2.3 Airport Functional Roles
2.4 Performance Measures
2.5 Summary

2.1 *Oregon Aviation Plan 2007 (OAP 2007)* Study Components

Three unique studies were originally undertaken which resulted in the development of the *OAP 2007*. This included a traditional state aviation system plan update which was developed to meet Federal Aviation Administration (FAA) requirements. An economic impact study was completed to assess the economic value of the aviation system at the state and local levels. The state aviation master plan component evaluated airports not included within the traditional state system plan criteria, as well as evaluating additional areas of interest or special consideration topics. The aforementioned goals were originally distributed over these three separate studies as outlined above, however, since there were numerous commonalities between the studies, they were combined into a single report for greater ease of use. Additional detail on each of these three studies is listed below. The information contained in the *OAP 2007* is the compilation of information, findings, and recommendations for all three studies.

2.1.a State Aviation System Plan

The *OAP 2007* addresses many different issues related to each individual airport and regional and state aviation system components. It is important to have a comprehensive understanding of the existing facilities, the need for future facilities, and the feasibility of reaching future goals. A state aviation system plan update is based upon sound evaluation of existing facilities, coupled with a clear understanding of the state and nation aviation interests, as well as the needs of the general public. The methodology used to evaluate the state system is consistent with that advocated for use by the FAA in Advisory Circular (AC) 150/5070-7 — *The Airport System*

Planning Process, issued November 10, 2004. All 97 public-use airports are listed in **Table 2.1** – **Public-Use Airports in Oregon**. Their associated city, FAA classification, and their type of ownership are noted within the table.

The *OAP 2007* includes 66 public-use airports, which are part of the National Plan of Integrated Airport Systems (NPIAS). The study group of airports was based upon extensive coordination with the ODA and the FAA. The study group includes the 57 airports currently listed on the NPIAS, eight state-owned airports which serve either a recreational/tourism base or have more than two based aircraft, and one privately owned airport, which serves a significant number of based aircraft.

2.1.b State Aviation Master Plan

The state aviation master plan element of the *OAP 2007* was included to ensure a comprehensive evaluation of all public-use airports within Oregon and was funded independently by the ODA. There are an additional 31 public-use airports in Oregon that were not included in the federally funded state aviation system plan component (NPIAS). These airports were evaluated using the same methodology of the state aviation system plan to provide the ODA a complete inventory of the state's aviation system resources. In addition to the evaluation of individual airports, the state aviation master plan was designed to evaluate broader, more conceptual issues related to the entire state aviation system. The evaluation of these issues will help the ODA better manage and improve the state system of airports.

2.1.c State Aviation Economic Impact Study

With the movement towards a global economy, it is now recognized that airports are no longer just another mode of transportation. Airports are vital components of the economic engine that drives the state, regional, and local economic climate and it is essential the state system of airports support these economies by providing adequate facilities and services. This study will provide the ODA, individual communities, airports and governmental agencies, and politicians the opportunity to assess the economic value of the aviation system as a whole as well as each individual airport. All 97 public-use airports, as shown in **Table 2.1**, are included in the analysis.

Table 2.1 Public-Use Airports in Oregon

Associated City	*Airport Name*	*NPIAS Status*	*Ownership*
Albany	Albany Municipal Airport	Yes	Publicly Owned
Alkali Lake	Alkali Lake State Airport	No	Publicly Owned
Arlington	Arlington Municipal Airport	No	Publicly Owned
Ashland	Ashland Municipal Airport - Sumner Parker Field	Yes	Publicly Owned
Astoria	Astoria Regional Airport	Yes	Publicly Owned
Aurora	Aurora State Airport	Yes	Publicly Owned
Baker City	Baker City Municipal Airport	Yes	Publicly Owned
Bandon	Bandon State Airport	Yes	Publicly Owned
Beaver Marsh	Beaver Marsh Airport	No	Privately Owned
Bend	Bend Municipal Airport	Yes	Publicly Owned
Boardman	Boardman Airport	Yes	Publicly Owned
Brookings	Brookings Airport	Yes	Publicly Owned
Burns	Burns Municipal Airport	Yes	Publicly Owned
Cascade Locks	Cascade Locks State Airport	No	Publicly Owned
Cave Junction	Illinois Valley Airport	Yes	Publicly Owned
Chiloquin	Chiloquin State Airport	Yes	Publicly Owned
Christmas Valley	Christmas Valley Airport	Yes	Publicly Owned
Clearwater	Toketee State Airport	No	Publicly Owned
Condon	Condon State Airport – Pauling Field	Yes	Publicly Owned
Cornelius	Skyport Airport	No	Privately Owned
Corvallis	Corvallis Municipal Airport	Yes	Publicly Owned
Cottage Grove	Cottage Grove State Airport – Jim Wright Field	Yes	Publicly Owned
Crescent Lake	Crescent Lake State Airport	No	Publicly Owned
Creswell	Creswell Hobby Field	Yes	Publicly Owned
Culver	Lake Billy Chinook Airport	No	Privately Owned
Denmark	Cape Blanco State Airport	No	Publicly Owned
Enterprise	Enterprise Municipal Airport	No	Publicly Owned
Estacada	Valley View Airport	No	Privately Owned
Eugene	Eugene Mahlon Sweet Field	Yes	Publicly Owned
Florence	Florence Municipal Airport	Yes	Publicly Owned
Florence	Lake Woahink Seaplane Base - *closed*	No	Privately Owned
Gates	Davis Field	No	Privately Owned

Table 2.1 Public-Use Airports in Oregon (Continued)

Associated City	*Airport Name*	*NPIAS Status*	*Ownership*
Gleneden Beach	Siletz Bay State Airport	Yes	Publicly Owned
Gold Beach	Gold Beach Municipal Airport	Yes	Publicly Owned
Grants Pass	Grants Pass Airport	Yes	Publicly Owned
Hermiston	Hermiston Municipal Airport	Yes	Publicly Owned
Hillsboro	Stark's Twin Oaks Airpark	No	Privately Owned
Hood River	Ken Jernstedt Airfield	Yes	Publicly Owned
Hubbard	Lenhardt Airpark	No	Privately Owned
Imnaha	Memaloose Airport (USFS)	No	Publicly Owned
Independence	Independence State Airport	Yes	Publicly Owned
John Day	Grant County Regional Airport – Ogilvie Field	Yes	Publicly Owned
Joseph	Joseph State Airport	Yes	Publicly Owned
Klamath Falls	Klamath Falls Airport	Yes	Publicly Owned
La Grande	La Grande / Union County Airport	Yes	Publicly Owned
Lakeside	Lakeside Municipal Airport	No	Publicly Owned
Lakeview	Lake County Airport	Yes	Publicly Owned
Lebanon	Lebanon State Airport	Yes	Publicly Owned
Lexington	Lexington Airport	Yes	Publicly Owned
Madras	Madras City - County Airport	Yes	Publicly Owned
Malin	Malin Airport	No	Publicly Owned
Manzanita	Nehalem Bay State Airport	No	Publicly Owned
McDermitt	McDermitt State Airport	Yes	Publicly Owned
McKenzie Bridge	McKenzie Bridge State Airport	No	Publicly Owned
McMinnville	McMinnville Municipal Airport	Yes	Publicly Owned
Medford	Rogue Valley International – Medford Airport	Yes	Publicly Owned
Monument	Monument Municipal Airport	No	Publicly Owned
Myrtle Creek	Myrtle Creek Municipal Airport	Yes	Publicly Owned
Newberg	Chehalem Airpark	No	Privately Owned
Newberg	Sportsman Airpark	Yes	Privately Owned
Newport	Newport Municipal Airport	Yes	Publicly Owned
North Bend	Southwest Oregon Regional Airport	Yes	Publicly Owned
Oakridge	Oakridge State Airport	No	Publicly Owned
Ontario	Ontario Municipal Airport	Yes	Publicly Owned
Owyhee	Owyhee Reservoir State Airport	No	Publicly Owned

Table 2.1 Public-Use Airports in Oregon (Continued)

Associated City	*Airport Name*	*NPIAS Status*	*Ownership*
Pacific City	Pacific City State Airport	No	Publicly Owned
Paisley	Paisley Airport	No	Publicly Owned
Pendleton	Eastern Oregon Regional Airport at Pendleton	Yes	Publicly Owned
Pinehurst	Pinehurst State Airport	No	Publicly Owned
Portland	Portland Downtown Heliport	Yes	Publicly Owned
Portland	Portland International Airport	Yes	Publicly Owned
Portland	Portland Hillsboro Airport	Yes	Publicly Owned
Portland	Portland Mulino Airport	Yes	Publicly Owned
Portland	Portland Troutdale Airport	Yes	Publicly Owned
Powers	Powers Hayes Field	No	Publicly Owned
Prineville	Prineville Airport	Yes	Publicly Owned
Prospect	Prospect State Airport	No	Publicly Owned
Redmond	Redmond Municipal Airport - Roberts Field	Yes	Publicly Owned
Rome	Rome State Airport	No	Publicly Owned
Roseburg	Roseburg Regional Airport	Yes	Publicly Owned
Roseburg	George Felt Airport	No	Privately Owned
Salem	Salem McNary Field	Yes	Publicly Owned
Sandy	Country Squire Airpark	No	Privately Owned
Sandy	Sandy River Airport	No	Privately Owned
Santiam Junction	Santiam Junction State Airport	No	Publicly Owned
Scappoose	Scappoose Industrial Airpark	Yes	Publicly Owned
Seaside	Seaside Municipal Airport	Yes	Publicly Owned
Silver Lake	Silver Lake Strip (USFS)	No	Publicly Owned
Sisters	Sisters Eagle Air Airport	No	Privately Owned
Sunriver	Sunriver Airport	Yes	Privately Owned
The Dalles	Columbia Gorge Regional Airport – The Dalles Municipal Airport	Yes	Publicly Owned
Tillamook	Tillamook Airport	Yes	Publicly Owned
Toledo	Toledo State Airport	No	Publicly Owned
Vale	Miller Memorial Airpark	No	Publicly Owned
Vernonia	Vernonia Municipal Airport	No	Publicly Owned
Waldport	Wakonda Beach State Airport	No	Publicly Owned
Wasco	Wasco State Airport	Yes	Publicly Owned

2.2 Overall Study Goals & Objectives

The primary goal of the three studies is to provide a comprehensive plan which addresses all public-use airports in the state of Oregon and which identifies how to improve individual airports as part of the larger state system, to meet the needs of tourism, economic development, and transportation services for each community and the state as a whole.

This information provides the framework that supports informed decisions related to planning and developing the Oregon aviation system. The objectives of these studies are to:

- Assess aviation facilities: including airside, landside, and ground facilities and services, and general aviation needs
- Assess the economic value of airport facilities to the host community as well as the overall importance to the state
- Provide guidance for the development of the Oregon system of airports to meet the state's future aviation needs to ensure the safety and efficiency of the state aviation system
- Enhance communication opportunities among ODA, airport sponsors, local government, other state and federal agencies, and airport users so that the future development of the state aviation system can be more readily accomplished
- Provide each airport the direction to develop their airport to meet the needs of the state aviation system and local community as well as promote the airport for the purposes of economic development and tourism

Each of these individual studies is a portion of the overall process necessary to create a systematic approach to meeting the improvements which are identified, as well as proposing development strategies. This report provides a summary of the results of three planning studies undertaken by ODA to assess the condition of the existing aviation infrastructure, the economic benefit of the aviation industry, and the passenger demands for air service.

2.3 Airport Functional Roles

Each airport in the state impacts the overall operational capacity and efficiency of the state aviation system by supporting different types and levels of aviation activity. The types of facilities and services that should be provided at each category of airport were determined throughout the development of this plan. Airport functional roles have been broken out into five categories and the following criteria were utilized to classify the airports:

- Current airport infrastructure, facilities, and services
- Aviation activity levels and type of aviation demand served
- Ability to accommodate future growth
- Accessibility and geographic service area

The five airport functional roles are defined on the following page.

Category I – Commercial Service Airports

These airports support some level of scheduled commercial airline service in addition to a full range of general aviation aircraft. This includes both domestic and international destinations.

Category II – Urban General Aviation Airports

These airports support all general aviation aircraft and accommodate corporate aviation activity, including business jets, helicopters, and other general aviation activity. These airports' primary users are business related and service a large geographic region or they experience high levels of general aviation activity.

Category III – Regional General Aviation Airports

These airports support most twin- and single-engine aircraft and may also accommodate occasional business jets. These airports support a regional transportation need.

Category IV – Local General Aviation Airports

These airports support primarily single-engine, general aviation aircraft, but are capable of accommodating smaller twin-engine general aviation aircraft. These airports support local air transportation needs and special use aviation activities.

Category V – RAES (Remote Access/Emergency Service) Airports

These airports support primarily single-engine, general aviation aircraft, special use aviation activities, and access to remote areas or provide emergency service access.

Volume I of the *OAP 2007* displays all airports within their various categories.

2.4 Performance Measures

Airport performance measures were developed for the functional roles. These objectives were developed in cooperation with ODA and the state aviation system plan and master plan Advisory Committee. The purpose of the performance measures is to compare existing airport facilities to the minimum and desired facility criteria for each functional role. The performance measures should not be considered a requirement for development standards and any development would require additional support and justification through the airport master planning process as well as environmental documentation.

The performance measures for each functional role are defined below. Many airports have multiple runways; therefore, the primary runway for each airport was used to evaluate the facility against the performance measures.

Category I – Commercial Service Airports

These airports support some level of scheduled commercial airline service in addition to a full range of general aviation aircraft. This includes both domestic and international destinations.

Performance criteria were evaluated by analyzing each airport's primary runway. A complete description of airport facilities is located below.

Airside Facilities	**Minimum Criteria**	**Desired Criteria**
FAA - ARC	C-II	Varies
NPIAS	Yes	Yes
Based Aircraft	Not an Objective	Not an Objective
Runway Orientation	Varies by Airport	Varies by Airport
Runway Length	6,000 feet	Varies by Aircraft
Runway Width	100 feet	Varies by Aircraft
Runway Pavement Type	Bituminous, Concrete	Bituminous, Concrete
Runway Pavement Strength	Varies by Airport	Varies by Airport
Runway Pavement PCI	Varies by Airport	Varies by Airport
Taxiways	Full Parallel	Full Parallel/High Speed Exits
Approach Type	Precision	Precision
Visual Approach Aids	Both Runway Ends	Both Runway Ends
Instrument Approach Aids	One Runway End	Both Runway Ends
Runway Lighting	MIRL/HIRL	MIRL/HIRL
Taxiway Lighting	MITL/HITL	MITL/HIT

General Facilities	**Minimum Criteria**	**Desired Criteria**
Rotating Beacon	Yes	Yes
Lighted Wind Indicator	Yes	Yes
Weather Reporting	AWOS/ASOS	AWOS/ASOS
Hangared Aircraft Storage	75% of Based Aircraft	100% of Based Aircraft
Apron Parking/Storage	75% of Daily Transient	100% of Daily Transient
Terminal Building	Yes	Yes, Gates and Covered Walkways
Auto Parking	Moderate	Adequate
Fencing	Perimeter	Perimeter
Cargo	Small Handling Facility w/ Apron	Handling Facility w/ Apron
Deicing Facility	Yes	Yes, 24 hour

Services	**Minimum Criteria**	**Desired Criteria**
Fuel	100 LL & Jet A	100 LL & Jet A, 24 hour service
FBO	Full Service, 24 hour service	Full Service, 24 hour service
Ground Transportation	Rental Car, Taxi, or Other	Rental Car, Taxi, or Other
Food Service	Coffee Shop/Deli & Cold Foods	Restaurant
Restrooms	Yes	Yes
Pilot Lounge	Yes w/ Weather Reporting Station	Yes w/ Weather Reporting Station
Snow Removal	Yes	Yes
Telephone	Yes	Yes

Category II – Urban General Aviation

These airports support all general aviation aircraft and accommodate corporate aviation activity, including business jets, helicopters, and other general aviation activity. These airports' primary users are business related and service a large geographic region or they experience high levels of general aviation activity.

Performance criteria were evaluated by analyzing each airport's primary runway. A complete description of airport facilities is located below.

Airside Facilities	**Minimum Criteria**	**Desired Criteria**
FAA - ARC	C-II	Varies
NPIAS	Yes	Yes
Based Aircraft	Not an Objective	Not an Objective
Runway Orientation	Varies by Airport	Varies by Airport
Runway Length	5,000 feet	Varies by Aircraft
Runway Width	100 feet	Varies by Aircraft
Runway Pavement Type	Bituminous, Concrete	Bituminous, Concrete
Runway Pavement Strength	Varies by Airport	Varies by Airport
Runway Pavement PCI	Varies by Airport	Varies by Airport
Taxiways	Full Parallel	Full Parallel/High Speed Exit
Approach Type	Precision	Precision
Visual Approach Aids	One Runway End	Both Runway Ends
Instrument Approach Aids	Not an Objective	One Runway End
Runway Lighting	MIRL/HIRL	MIRL/HIRL
Taxiway Lighting	MITL/HITL	MITL/HITL

General Facilities	**Minimum Criteria**	**Desired Criteria**
Rotating Beacon	Yes	Yes
Lighted Wind Indicator	Yes	Yes
Weather Reporting	AWOS/ASOS	AWOS/ASOS
Hangared Aircraft Storage	75% of Based Aircraft	100% of Based Aircraft
Apron Parking/Storage	75% of Daily Transient	100% of Daily Transient
Terminal Building	Yes	Yes
Auto Parking	Moderate	Adequate
Fencing	Perimeter	Perimeter
Cargo	Designated Apron Area	Small Handling Facility w/ Apron
Deicing Facility	Not an Objective	Yes

Services	**Minimum Criteria**	**Desired Criteria**
Fuel	100 LL & Jet A	100 LL & Jet A, 24 hour service
FBO	Full Service	Full Service, 24 hour service
Ground Transportation	Offsite Rental Car, Taxi, or Other	Rental Car, Taxi, or Other
Food Service	Vending	Coffee Shop/Deli & Cold Foods
Restrooms	Yes	Yes
Pilot Lounge	Yes w/ Weather Reporting Station	Yes w/ Weather Reporting Station
Snow Removal	Yes	Yes
Telephone	Yes	Yes

Category III – Regional General Aviation

These airports support most twin- and single-engine aircraft and may also accommodate occasional business jets. These airports support a regional transportation need.

Performance criteria were evaluated by analyzing each airport's primary runway. A complete description of airport facilities is located below.

Airside Facilities	**Minimum Criteria**	**Desired Criteria**
FAA - ARC	B-II	Varies
NPIAS	Not an Objective	Not an Objective
Based Aircraft	Not an Objective	Not an Objective
Runway Orientation	Varies by Airport	Varies by Airport
Runway Length	4,000 feet	Varies by Aircraft
Runway Width	75 feet	Varies by Aircraft

Hangared Aircraft Storage	75% of Based Aircraft	100% of Based Aircraft
Apron Parking/Storage	30% of Daily Transient	50% of Daily Transient
Terminal Building	Small Meeting Area	Yes
Auto Parking	Minimal	Moderate
Fencing	Terminal Area	Perimeter
Cargo	Space on Existing Apron	Designated Apron Area
Deicing Facility	Not an Objective	Not an Objective

Services	**Minimum Criteria**	**Desired Criteria**
Fuel	100 LL & Jet A	100 LL & Jet A, 24 hour service
FBO	Full Service	Full Service, 24 hour service
Ground Transportation	Courtesy Car / Offsite Rental Car	Rental Car, Taxi, or Other
Food Service	Vending	Vending
Restrooms	Yes	Yes
Pilot Lounge	Yes w/ Weather Reporting Station	Yes w/ Weather Reporting Station
Snow Removal	Yes	Yes
Telephone	Yes	Yes

Category IV – Local General Aviation Airport

These airports support primarily single-engine general aviation aircraft but are capable of accommodating smaller twin-engine general aviation aircraft. These airports support local air transportation needs and special use aviation activities.

Performance criteria were evaluated by analyzing each airport's primary runway. A complete description of airport facilities is located below.

Airside Facilities	**Minimum Criteria**	**Desired Criteria**
FAA - ARC	B-I	B-II
NPIAS	Not an Objective	Not an Objective
Based Aircraft	Not an Objective	Not an Objective
Runway Orientation	Varies by Airport	Varies by Airport
Runway Length	3,000 feet Paved; 2,500 feet Turf	Varies by Aircraft
Runway Width	60 feet Paved; 120 feet Turf	Varies by Aircraft
Runway Pavement Type	Bituminous, Concrete, Turf	Bituminous, Concrete
Runway Pavement Strength	Varies by Airport	Varies by Airport
Runway Pavement PCI	Varies by Airport	Varies by Airport
Taxiways	Exits Needed	Partial or Turnarounds
Approach Type	Visual	Non-Precision
Visual Approach Aids	Not an Objective	One Runway End
Instrument Approach Aids	Not an Objective	Not an Objective
Runway Lighting	LIRL	MIRL
Taxiway Lighting	LITL	MITL

General Facilities	**Minimum Criteria**	**Desired Criteria**
Rotating Beacon	Yes	Yes
Lighted Wind Indicator	Yes	Yes
Weather Reporting	Not an Objective	AWOS/ASOS
Hangared Aircraft Storage	75% of Based Aircraft	100% of Based Aircraft
Apron Parking/Storage	30% of Daily Transient	50% of Daily Transient
Terminal Building	Not an Objective	Small Meeting Area
Auto Parking	Minimal	Minimal
Fencing	Not an Objective	Terminal Area
Cargo	Not an Objective	Not an Objective
Deicing Facility	Not an Objective	Not an Objective

Services	**Minimum Criteria**	**Desired Criteria**
Fuel	100 LL	100 LL & Jet A
FBO	Not an Objective	Limited
Ground Transportation	Not an Objective	Courtesy Car/Offsite Rental Car
Food Service	Not an Objective	Vending
Restrooms	Yes	Yes
Pilot Lounge	Not an Objective	Yes w/ Weather Reporting Station
Snow Removal	Yes	Yes
Telephone	Not an Objective	Yes

Category V – RAES (Remote Access/Emergency Services)
These airports support primarily single-engine general aviation aircraft, special use aviation activities, access to remote areas, or provide emergency service access.

Performance criteria were evaluated by analyzing each airport's primary runway. A complete description of airport facilities is located below.

Airside Facilities	**Minimum Criteria**	**Desired Criteria**
FAA - ARC	A-I	B-I
NPIAS	Not an Objective	Not an Objective
Based Aircraft	Not an Objective	Not an Objective
Runway Orientation	Varies by Airport	Varies by Airport
Runway Length	2,500 feet Turf	3,000 feet Paved; 2,500 feet Turf
Runway Width	60 feet Turf	60 feet Paved; 120 feet Turf
Runway Pavement Type	Turf, Gravel	Bituminous, Concrete
Runway Pavement Strength	Varies by Airport	Varies by Airport
Runway Pavement PCI	Varies by Airport	Varies by Airport
Taxiways	Not an Objective	Exits Needed to an apron
Approach Type	Visual	NPIA
Visual Approach Aids	Not an Objective	One Runway End
Instrument Approach Aids	Not an Objective	One Runway End
Runway Lighting	Not an Objective	LIRL
Taxiway Lighting	Not an Objective	LITL

General Facilities	**Minimum Criteria**	**Desired Criteria**
Rotating Beacon	Not an Objective	Yes
Lighted Wind Indicator	Not an Objective	Yes
Weather Reporting	Not an Objective	AWOS/ASOS
Hangared Aircraft Storage	Not an Objective	75% of Based Aircraft
Apron Parking/Storage	Not an Objective	100 X 100 foot Apron
Terminal Building	Not an Objective	Small Meeting Area
Auto Parking	Not an Objective	Minimal
Fencing	Not an Objective	Limited
Cargo	Not an Objective	Not an Objective
Deicing Facility	Not an Objective	Not an Objective

Services	**Minimum Criteria**	**Desired Criteria**
Fuel	Not an Objective	100 LL
FBO	Not an Objective	Not an Objective
Ground Transportation	Not an Objective	On-Call Service
Food Service	Not an Objective	Not an Objective
Restrooms	Not an Objective	Yes
Pilot Lounge	Not an Objective	Yes
Snow Removal	Not an Objective	Yes
Telephone	Not an Objective	Yes

2.5 Summary

Each of these study efforts will provide valuable information to the state as well as the individual airports as stand-alone documents. Combined together, these studies provide a comprehensive resource for airport development throughout the entire state.

Chapter 3

As outlined in the Federal Aviation Administration (FAA) Advisory Circular 150/5070-7, *The Airport System Planning Process*, the process of system planning for aviation is based upon the collection and evaluation of information about each airport within the overall system and the area they serve. The inventory task is accomplished through physical inspection of the facilities, field interviews and surveys, telephone conversations, and review of previous studies.

The objective of the inventory task is to document existing conditions, thereby providing the background information essential to the development and recommendations for the *Oregon Aviation Plan 2007 (OAP 2007)*. The inventory information covers a broad spectrum and includes information on the following elements of the Airport:

- Airside and landside facilities and their uses
- Navigational aids
- Auxiliary support facilities and services
- Environmental observations
- Air traffic activity data
- Survey analyses

A large volume of data was collected, reviewed, and analyzed during the inventory effort. This chapter presents an overall summary of this information and is organized in the following sections:

3.1 General Airport Description and Location
3.2 Existing Airport Facilities
3.3 Current and Forecast Demand
3.4 Survey Responses

3.1 General Airport Description and Location

Aurora State Airport is located approximately one mile northwest of the city of Aurora, within Marion County (**Figure 3.1**). Regionally, the Airport is located approximately 25 miles south of Portland, 25 miles north of Salem, and 90 miles north of Eugene. The airport has easy access to Interstate Highway 5, which is the critical North/South ground transportation link through the Willamette Valley.

According to the State of Oregon Office of Economic Analysis, Marion County contained 305,265 residents in 2005, up 7.2 percent from 284,834 in 2000. Oregon has grown from 3,436,750 residents in 2000 to 3,618,200 residents in 2005, up 5.3 percent. This indicates that Marion County is growing at a faster pace than the state as a whole.

Figure 3.1
Marion County Location Map

The Airport is owned and operated by the Oregon Department of Aviation and is included in the National Plan of Integrated Airport Systems (NPIAS), making this airport eligible for federal funding. Aurora State Airport, designated by the airport code UAO, occupies approximately 144 acres of land.

Historical Development. The Aurora State Airport was constructed by the Oregon State Highway Department during wartime in 1943 as an emergency airfield for air carrier aircraft. The Airport has evolved into the busiest state-owned airport and the fifth overall busiest airport in the state.

3.2 Existing Airport Facilities

Existing airport facilities are presented in three categories: airside, landside, and support facilities. The airside facilities include such areas as the runways, taxiways, aprons, aircraft parking and storage areas, airfield lighting, and navigational aids. The landside facilities include items such as the airport terminal building, vehicular access, auto parking, and support facilities. The support facilities may include fuel facilities, aircraft rescue and firefighting (ARFF) facilities, airport maintenance, snow removal equipment (SRE) and facilities, and utilities. The existing airside, landside, and support facilities are detailed below.

3.2.a Airside Facilities

The airfield consists of many components that are required to accommodate safe aircraft operations. This consists of runways, taxiways, and an apron network; the visual and electronic navigational aids associated with runways; runway protection zones; and general aviation facilities.

Runways. Aurora State Airport has a single paved runway, Runway 17-35. The runway is 5,004 feet long and 100 feet wide with an asphalt surface. The Airport currently has an Airport Reference Code (ARC) of B-II. Additional runway information such as pavement strength and condition are located in **Section 4.2**, *Definition of Airport System Role*.

Taxiways. The existing taxiway system at the Airport consists of a full-length parallel taxiway and entrance/exit taxiways.

Aprons. There are three aprons used for aircraft parking. The north terminal apron has approximately 12 small aircraft tie down spaces. The central terminal apron has 38 small tie-down spaces and four large aircraft parking positions. The southern terminal apron has approximately 10 small aircraft tie-down spaces and five large aircraft parking positions. All three aprons are constructed of asphalt.

Lighting and Navigational Aids. The Airport's lighting and navigational systems extend the Airport's usefulness into night and/or poor visibility.

Pavement edge lighting consists of light fixtures located near the edge of the runway/taxiway to define the lateral limits of the pavement. This lighting is essential for the safe and efficient movement of aircraft during periods of darkness or poor visibility. Runway 17-35 is equipped with medium intensity runway lighting (MIRL). Taxiways at the Airport are equipped with reflectors.

A four-light visual approach slope indicator (VASI) is installed both ends of Runway 17-35. A VASI system provides the pilot with a red, red/white, or white signal that indicates if the pilot is below, above, or on the glide path to the runway.

The ominidirectional approach lighting system (ODALS) is the minimum approach lighting system necessary to achieve three-quarters of a mile non-precision approaches. It consists of seven omnidirectional flashing lights located in the approach area of a non-precision runway. ODALS are installed on the approach end of Runway 17.

A Localizer approach is an Instrument Landing System (ILS) approach without the glide slope. Because there is no glide slope information provided, the Localizer approach is considered a non-precision approach. The Localizer signal provides azimuth, or lateral, information to guide the aircraft to the centerline of the runway. It is similar to a VOR signal except that it provides radial information for only a single course, the runway heading. The Airport has a Localizer approach to Runway 17.

GPS uses satellites placed in orbit around the earth to transmit electronic signals, which properly equipped aircraft use to determine altitude, speed, and position information. GPS allows pilots to navigate to any airport in the country, and they are not required to navigate using a specific navigational facility. The Airport has GPS approaches to both runway ends.

In addition to lighting and navigational aids, the Airport is also equipped with an automated surface observation system (ASOS). The ASOS provides automated aviation weather observations 24-hours a day. The system updates weather observations every minute, continually reporting significant weather changes as they occur. The ASOS system reports cloud

ceiling, visibility, temperature, dew point, wind direction, wind speed, altimeter setting, and density altitude (airfield elevation corrected for temperature).

3.2.b Landside Facilities

General Aviation Facilities. General aviation services at the Airport are provided by three fixed based operators (FBO); Aurora Aviation, General Aviation Services, and Willamette Aviation LLC. They offer aviation fuel, aircraft parking (ramp or tie-down), flight training, aircraft rental, aircraft maintenance, pilot supplies, catering, off site rental cars, and courtesy transportation.

Hangar space at the Airport is comprised of both corporate and T-Hangars. There are approximately 275 hangar facilities at the Airport. Additionally, there is considerable adjacent private development activity that is enhancing hangar facilities and drawing more Aurora based aircraft.

The majority of the landside developments at Aurora State Airport are privately owned and operated and located off airport property. Through the fence operations at the airport are discussed in detail in *Section 4.1.b General Observations and Recommendations*.

3.2.c Support Facilities

Parking. Vehicle parking is located next to each of the FBO buildings. There are moderate parking facilities at the Airport.

Fuel Facilities. All aircraft fuel storage facilities at the Airport are privately owned and operated. The FBOs provide both 100 LL and Jet A fuel.

Aurora State Airport

3.3 Current and Forecast Demand

This element of the report provides projections of future aviation demand at the Airport. Projections of short-, intermediate-, and long-term activity at the Airport are based on 5-, 10-, and 20-year milestones, using 2005 as the base year of analysis as it is the most recent year for which a full year of activity data is currently available.

Projections of aviation demand are an important element of the system planning process as they provide the basis for several key analyses, including:

- Determining the role of the Airport with respect to the type of aircraft to be accommodated in the future
- Evaluating the capacity of existing airport facilities and their ability to accommodate projected aviation demand
- Estimating the extent of airside and landside improvements required in future years to accommodate projected demand

This analysis uses the most recent aircraft activity available to project future levels of aviation demand through the year 2025. The forecast analysis contained in this section includes methodologies based on historical aviation trends at the Airport, as well as other socioeconomic trends related to the state of Oregon. National projections of aviation activity developed by the FAA were also reviewed within the context of this forecast analysis, where available.

This section provides discussions of the methodologies and findings used for projecting passenger enplanements, aircraft operations, and based aircraft at the Airport. The projections of aviation demand are documented below in **Table 3.1**.

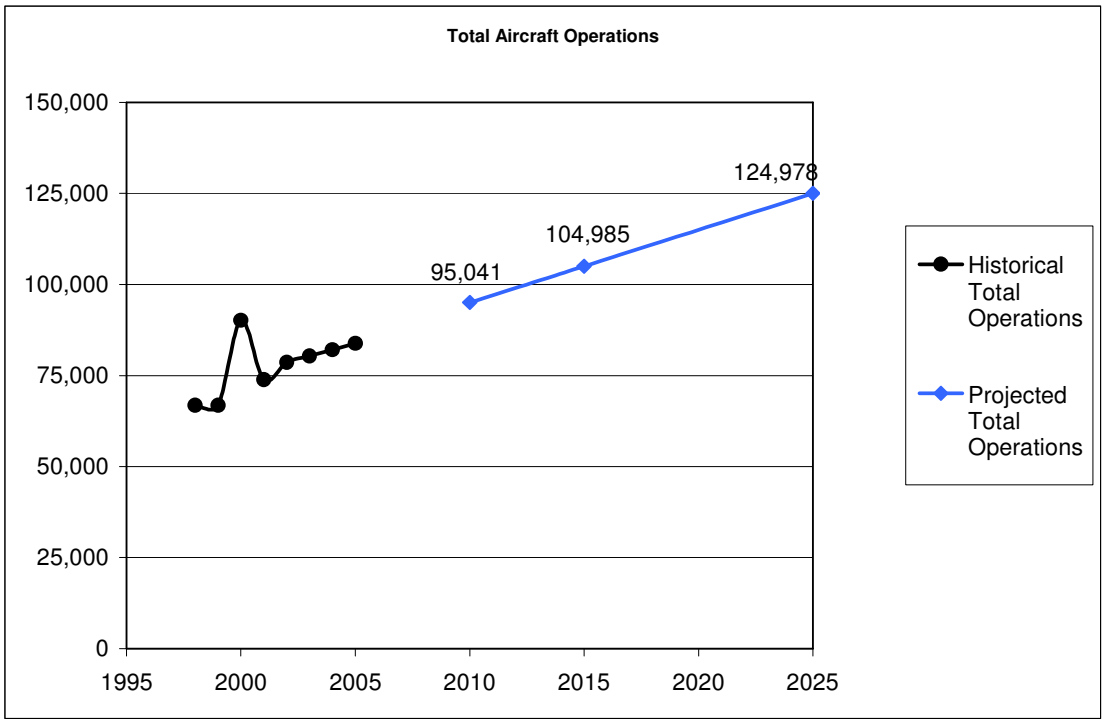
3.3.a Forecasting Approach

There are a number of different forecasting techniques available for use in the projection of aviation activity, ranging from subjective judgment to sophisticated mathematical modeling. Because a large number of variables affect a facility plan, it is important that each variable be considered in the context of its use in the plan. For variables that significantly affect the nature and extent of facilities, redundancy has been achieved through the utilization of several forecasting techniques to minimize the uncertainty associated with the range of the forecast variable.

The analysis includes the assessment of historical trends on aviation activity data at the local, regional, and national level. Aviation activity statistics on such items as passenger enplanements, aircraft operations, and based aircraft are collected, reviewed, and analyzed. Similarly, socioeconomic factors such as population and income are analyzed for the effect they may have on aviation growth. The comparison of relationships among these various indicators provides the initial step in the development of realistic forecasts of aviation demand.

The following general methodologies were used in projecting various components of aviation demand at the Airport.

Time Series Methodology. Historical trend lines and linear extrapolation are some of the most widely used methods for forecasting. These techniques utilize time-series types of data and are most useful for a pattern of demand that demonstrates a historical relationship with time. In utilizing this technique, an assumption is made that the same factors that have influenced demand will continue to affect future demand. While this is a rather broad assumption, it often provides a reliable benchmark for comparing the results of other analyses. Linear extrapolation established a linear trend by fitting a straight line using the least squares method to known historical data. Historic trend lines, as utilized in these analyses, examine historic compounded annual growth rates and extrapolate future data values by assuming a similar compounded annual growth rate in the future.



Market Share Methodology. Market share, ratio, or top-down models are utilized to scale large-scale aviation activity down to a local level. Inherent to the use of such a method is the demonstration that the proportion of the large-scale activity that can be assigned to the local level is a regular and predictable quantity. This method has been used extensively in the aviation industry for aviation demand forecasting at the local level. Its most common use is in the determination of the share of total national traffic activity that will be captured by a particular region or airport. Historical data is examined to determine the ration of local airport traffic to total national traffic. From outside data sources, in this case the FAA, projected levels of national activity are determined and then proportioned to the Airport based upon the observed and projected trends.

Socioeconomic Methodology. Socioeconomic or correlation analysis examines the direct relationship between two or more sets of historical data. In this case, socioeconomic analyses have been performed, relating historical aviation activity to historical population levels within the Airport region. Based upon the observed and projected correlation between historical aviation activity and the socioeconomic data sets, future aviation activity projections are developed based upon the projected socioeconomic data sets. In this case, projected population levels were obtained from Woods & Poole Economics, Inc. (W&P), an independent firm that specializes in long-term economic and demographic projections. This forecasting methodology is subject to how accurately an airport's activity reflects local demographic makeup.

Table 3.1 Summary of Aviation Projections

Aurora State Airport (UAO)

Year	Operations				Based Aircraft
	Commercial Air Carrier	General Aviation	Military	Total	
Historical:					
1995					
1996					
1997					
1998	8,791	57,850	180	66,821	233

3.4 Survey Responses

As previously discussed, surveys were a critical part of the data collection effort. Below is a summary of the surveys and staff interviews that provide the context that surrounds the *OAP 2007*. Surveys were sent to state, local, and county government officials, businesses, airport managers, pilots, chamber of commerce members, and host communities to solicit input of the state aviation system from diverse interests groups.

3.4.a Community Information

Currently, agriculture, timber, and manufacturing were noted as the primary industries in the Aurora area. Survey respondents indicate that the Airport is perceived to be a valuable economic asset to the community. The respondents also indicated that if there were no longer an airport available to the public, they would use the next closest airport. Survey results identified noise, security, safety, and expansion of the Airport as the main concerns regarding the future development of the Airport.

3.4.b Economic Development

The importance of aviation for growth from an economic perspective is ranked moderately high. The survey respondents noted that airport upgrades would increase economic growth for the surrounding communities. According to the survey results, the single most important item that the Airport could do to promote economic growth is to increase runway length. In addition, it was perceived that the impact to the economy would be negative if the Airport was no longer available. Businesses would depreciate in size, relocate, or use the next closest airport. Respondents were unsure if the city of Aurora and Marion County would be supportive of a funding mechanism to finance future airport developments.

3.4.c Airport Development and Use

Survey respondents indicate that the airport users of Aurora State Airport are local business, recreation, tourism, out-of-town business, and agriculture. Surrounding communities rely on the Airport for medical rescue flights and fire protection.

Survey respondents highlighted three areas of concern regarding the Airport. These concerns are outline below:

- There are perceived operational limitations of runway length, terminal amenities, navigational aids, taxiways, aircraft parking/storage, and availability of fuel
- Inclement weather significantly reduces the “usability” of the Airport
- Lack of infrastructure (sewer and water) was noted as a concern to the future of the Airport

3.4.d Air Shuttle

Upon the request of ODA, Mead & Hunt is investigating the feasibility of a state operated and subsidized air shuttle service. This air shuttle service would link various communities within the state. Traditionally, air shuttle services do not compete with regular commercial service, their intent is to commute between smaller local communities instead of large regional airports, therefore, they are viewed as a supplement to air service for airports.

Survey Respondents indicate that some form of an air shuttle service would be considered a convenience and would likely promote economic growth for communities. Survey results indicate that the primary users of the shuttle would be business, emergency services, and health services, transportation of cargo, higher education, and governmental services. Survey results provided the order of importance of issues for potential shuttle passengers. Most important to travelers was schedule, followed by cost, reliability, type of aircraft, and comfort. Survey results identified Bend, Eugene, and Portland as the destination cities for shuttle service originating in Aurora with service being provided daily. Survey results also indicate that the city of Aurora and Marion County would be willing to "guarantee" seats for their community on the air shuttle service; however, they would expect users to pay between $151 and $200 per seat, with a potential of over 20 users per flight.

3.5 Summary

Providing a comprehensive summary of the existing airport facility is an essential part of the planning process. The information contained in this chapter provides the foundation for the recommendations found in *Chapter Four*.

This Page Intentionally Left Blank

Chapter 4

As discussed, the inventory and forecasts provide a basis from which recommendations can be made for future development. The recommendations illustrated within the *Oregon Aviation Plan 2007 (OAP 2007)* reflect the Oregon Department of Aviation's (ODA) desire to create a comprehensive aviation system that adequately services the aviation needs of the state and the various interest groups associated with this resource. This chapter is organized in the following sections:

4.1 Airport Facility and Service Needs
4.2 Definition of Airport System Role
4.3 Economic Impact Analysis

4.1 Airport Facility and Service Needs

A primary focus of this report is to identify and evaluate airside, landside, and other general facility needs and deficiencies at the Airport utilizing information collected through the physical inspection of the facility, field interviews and surveys, telephone conversations, review of previous studies, and review of appropriate airport records. The following section presents the recommended airport facility and service needs identified during the study process.

4.1.a Recommendations Based on Performance Criteria

The Aurora State Airport has been classified as a *Category II – Urban General Aviation* airport and should provide appropriate facilities and services commensurate with its system role. The existing airport facilities were compared to the minimum and desired criteria for a *Category II* airport, which identified the following airport facility and service needs:

- Increase Airport Reference Code from B-II to C-II (associated safety area improvements)
- Correct parallel taxiway / runway centerline separation
- Install Medium Intensity Taxiway Lighting (MITL)
- Construct designated cargo apron

4.1.b General Observations and Recommendations

The Aurora State Airport is one of the busiest general aviation airports in the state. A vast majority of the traffic at the Airport is conducted by corporate jets and due to its prime location between the Portland Metropolitan area and Salem, the state capital; the Airport will continue to attract business/corporate aircraft. Therefore, it should be made a priority to increase the margin of safety by developing the Airport with C category aircraft design standards.

The majority of the landside developments at Aurora State Airport are privately owned and operated. However, some areas of the airfield are owned by the state of Oregon and leased to private business. The businesses that are located off airport property are entering the airfield from private property, more commonly known as a "through the fence" operations.

Through the fence agreements provide access onto the airfield for off-airport businesses or individuals who utilize the airport infrastructure but do not lease space at the airport or contribute financially to support the airport through ground leases or operational leases like those located on airport property.

General aviation airports often have difficulty generating revenue to offset the costs of operating, maintaining, and improving the airport. An important revenue generator at many airports is the lease of airport property for private or commercial use. Private property owners adjacent to an airport that are granted access to the airport infrastructure are typically not contributing to the airport fund through the normal lease process. This often results in an economically competitive advantage to off-airport businesses. They are allowed to access the airport without paying a lease rate which often reduces their overhead, allowing them to charge lower rates than their on-airport counterparts. This creates a situation which is first and foremost noncompliant with FAA policies but more importantly, often results in a weaker airport economy.

The FAA does not have a formal policy against "through the fence" operations; however they do strongly discourage their use. To maintain an economically viable business environment the airport sponsor should require all off field businesses or individuals to compensate the sponsor similarly to those being paid by on airport tenants. A yearly fee, percentage of gross profits, or access fees are common methods of collecting compensation from off airport businesses or individuals.

ODA is currently discussing Senate Bill 680 to address the "through the fence" operations at Aurora State Airport.

4.1.c Airport Capital Improvement Program

The Airport Capital Improvement Program (ACIP) is the primary planning tool the FAA utilizes to identify, prioritize, and assign funds to capital airport development and associated capital needs for all NPIAS airports. The 2006 ACIP for Aurora State Airport includes the following projects:

- Construct taxiway Phase 06 and 07
- Relocate taxiway including purchasing land
- Update Exhibit A Property Plan
- Update airport layout plan
- Implement Phase 2 – land purchase

4.1.d Other Potential Improvements for Consideration

No other airport improvement projects were being considered at the time of publication.

4.2 Definition of Airport System Role

Category II – Urban General Aviation
These airports support all general aviation aircraft and accommodate corporate aviation activity, including business jets, helicopters, and other general aviation activity. These airports' primary users are business related and service a large geographic region or they experience high levels of general aviation activity.

Performance criteria were evaluated by analyzing each airport's primary runway. A complete description of airport facilities is located in **Section 3.2**, *Existing Airport Facilities*.

Airside Facilities	**Existing Facilities**	**Minimum Criteria**	**Desired Criteria**
FAA - ARC	B-II	C-II	Varies
NPIAS	Yes	Yes	Yes
Based Aircraft	397	Not an Objective	Not an Objective
Runway Orientation	17/35	Not an Objective	Not an Objective
Runway Length	5,004 feet	5,000 feet	Varies by Aircraft
Runway Width	100 feet	100 feet	Varies by Aircraft
Runway Pavement Type	Bituminous	Bituminous, Concrete	Bituminous, Concrete
Runway Strength	30,000 (SW)	Not an Objective	Not an Objective
Runway Pavement PCI	84	Not an Objective	Not an Objective

Approach Type	Non - Precision	Precision	Precision
Visual Approach Aids	V4R (17) V4L (35)	One Runway End	Both Runway Ends
Instrument Approach Aids	ODALS, LOC (17) GPS (17/35)	Not an Objective	One Runway End
Runway Lighting	MIRL	MIRL/HIRL	MIRL/HIRL
Taxiway Lighting	Reflectors	MITL/HITL	MITL/HITL

General Facilities	**Existing Facilities**	**Minimum Criteria**	**Desired Criteria**
Rotating Beacon	Yes	Yes	Yes
Lighted Wind Indicator	Yes	Yes	Yes
Weather Reporting	ASOS	AWOS/ASOS	AWOS/ASOS
Hangared Aircraft Storage	275	75% of Based Aircraft	100% of Based Aircraft
Apron Parking/Storage	70	75% of Daily Transient	100% of Daily Transient
Terminal Building	Yes	Yes	Yes
Auto Parking	Moderate	Moderate	Adequate
Fencing	Perimeter	Perimeter	Perimeter
Cargo	Non-Designated Apron	Designated Apron Area	Small Handling Facility w/ Apron
Deicing Facility	No	Not an Objective	Yes

Services	**Existing Facilities**	**Minimum Criteria**	**Desired Criteria**
Fuel	100 LL & Jet A	100 LL & Jet A	100 LL & Jet A, 24-hour service
FBO	Full Service (3)	Full Service	Full Service, 24-hour service
Ground Transportation	Rental Car, Taxi	Offsite Rental Car, Taxi	Rental Car, Taxi, or Other
Food Service	Vending, Coffee Shop	Vending	Coffee Shop/Deli & Cold Foods
Restrooms	Yes	Yes	Yes
Pilot Lounge	Yes w/Weather Reporting	Yes w/ Weather Reporting	Yes w/ Weather Reporting
Snow Removal	Yes	Yes	Yes
Telephone	Yes	Yes	Yes

4.3 Economic Impact Analysis

The economic impact analysis of airports in Oregon was developed for each airport, measuring economic impacts of airport facilities, within regions and throughout the state. Airports that are part of the Port of Portland were not part of this study, except for the regional-based analysis of aviation dependent businesses. This study used the five regions of *ConnectOregon* to measure local/regional economic impacts of airports and for dependent non-aviation businesses. The regions are shown by the accompanying map.

Total economic impacts are the sum of on-airport economic activities, off-airport spending by visitors who arrive by air, and spin-off impacts (multiplier effect). Airport impacts are provided by region and state to show the contribution of each airport to the regional and state economies. In addition, aviation dependent impacts are provided by region to show the importance of airports in each region to non-aviation businesses. All impacts reported represent a base year of 2005. Each type of impact is defined in the following paragraphs.

On-Airport direct impacts represent economic activities that occur on airport grounds. By separating aviation related activities from non-aviation activities, The *OAP 2007* illustrates the regional economic contribution of aviation by airport in the regional and state economies, as well as the overall impact of each airport as a facility. Aviation related activities are those that would not occur without the airport, such as airlines, fixed base operators (FBO), government, and other tenants located at the airport or directly dependent on the airport. This category also includes airport management and other individuals employed directly by the airport, as well as retail and service operations for passengers, pilots, and other airport employees. In some cases, airports provide land or building space for companies that are not affiliated with aviation. These tenants are not related to the aviation mission of the airport, but are using the facility as a convenient and affordable business or industrial parks.

Off-Airport visitor spending (Direct Impacts) are expenditures made by air travelers who are visiting from outside the region, and occurs off the airport-in the regional economy. Visitor spending includes lodging, food, entertainment, retail purchases and ground transportation (retail purchases and on-airport car rentals are captured by on-airport impacts). Visitor spending is analyzed for commercial passengers as well as for general aviation pilots and passengers. Visitors flying into Oregon from another state or nation contribute to the airport's regional economy as well as to the state. However, passengers flying within Oregon, from one region to another, contribute to the region of their destination airport, but are not bringing additional money into Oregon. Therefore, in regions with air carrier airports, the direct impact of visitor spending for the region is higher than the impact of visitor spending for the state.

Airport dependent impacts represent area businesses that are dependent on an airport for incoming and outgoing, and for business travel. These businesses may relocate or suffer substantial loss if the airport were not available. This impact is not included in traditional economic impact methodology and is analyzed and reported by region for this study. Thus the

economic dependence of a region on aviation represents the cumulative impacts of all airports within a region. The analysis is provided as an indicator of the importance of airports to regional economies.

Spin-off impacts (Multiplier Affect) are calculated using impact multipliers, which are used to reflect the recycling of dollars through both the regional and state economy. A dollar spent in the economy does not disappear; rather, it continues to move through the local economy in successive rounds until it is incrementally exported from the community. As the expenditures described above are released into the economy, they circulate among other industry sectors, creating successive waves of additional economic benefit in the form of jobs, payroll, and output (expenditures). These successive rounds of spending are known as spin-off impacts, and help to represent the full impact of each dollar spent in a region. An example would be an airport employee spending his or her salary for housing, food, and other services. Spending occurring outside the area is considered economic leakage and is not reflected in the multiplier. Spin-off impacts are often reported as indirect and induced impacts. Indirect impacts reflect the purchase of goods and services by businesses. Induced impacts reflect worker making consumer purchases.

The project team analyzed the economic contributions of 91 airports under the jurisdiction of the Oregon Department of Aviation (ODA). In addition, the Port of Portland commissioned a separate economic impact studies of Portland International Airport, Portland Hillsboro Airport and Portland Troutdale Airport, which are administered by the Port. The sum of economic impacts derived from the OAP 2007 and the Port of Portland studies account for economic impacts generated by all public use airports in Oregon.

4.3.a Contribution of Airports to the Economy of Oregon

As shown in **Table 4.1**, Oregon public-use airports contributed a total economic impact of $8.3 billion to the state economy, including $3 billion from ODA airports and more than $5 billion from Port of Portland airports. Following Table 4.1 is a summary entitled *Airport Role in Economy*, which illustrates the individual airport economic impact.

Additional study highlights include:

- Oregon ODA public-use airports, including airport tenants, directly employ 7,000 people for aviation related activities and expend $259 million in wages
- Oregon ODA public-use airport employees and tenants earned an average annual salary of $36,000 per year for aviation activities and $35,000 per worker, when including non-aviation jobs
- Off-airport visitor industry employees earn an average annual salary of $15,000 per year

Table 4.1 Economic Contribution of Airports to the Oregon Economy

	Jobs	Wages	Business Sales
Direct Effects of ODA On-Airport Aviation Activities and Visitor Spending			
On-Airport, including FBO & air related tenants	7,273	$262,147,000	$827,475,000
Off-Airport: visitor spending	6,762	$101,641,000	$324,097,000
Subtotal of Direct Effects From ODA Airports	14,035	$363,788,000	$1,151,572,000
ODA Spin-off Effects of Supplier and Income Re-spending			
Due to On-Airport Aviation	12,029	$305,851,000	$883,988,000
Due to Visitor Spending	3,558	$94,459,000	$310,756,000
Subtotal of Spin-off Effects	15,587	$400,310,000	$1,194,744,000
Total ODA Airport Aviation Related Impacts	29,621	$764,098,000	$2,346,316,000
ODA Airport Generated Impacts of Non-Aviation Activities			
On Airport Non-Aviation Activities	2,177	$67,294,000	$320,530,000
Spin-offs due to Non-Aviation Activities	3,374	$96,239,000	$332,084,000
Total ODA Airport Non-Aviation Impacts	5,551	$163,533,000	$652,614,000
ODA Airports Total Aviation and Non-Aviation Related	35,172	$927,631,000	$2,998,930,000
Port of Portland Totals*			
Airport Generated	20,005	$941,244,000	$3,533,456,000
Visitor Generated	39,418	$907,718,000	$1,740,344,000
Total Impact Port of Portland Airports	59,423	$1,848,862,000	$5,273,800,000
Grand Total – All Airports	94,595	$2,776,493,000	$8,272,630,000

PAC COMMENTS COMPILATION

Airport Master Plan Update

Aurora State Airport

Aurora State Airport Master Plan Update - Comments Received on Miscellaneous Items

Comment #	Page #		WHPacific Response
Comments on Scope of Work		**Comments received from: Nick Kaiser**	
0.1	3-18, task 1.2	Significant growth doesn't mean that the runway should be extended. There is no mention of a tower.	A runway extension is not assumed, it is just one element to be studied in the Plan.
0.2	5-18, task 2D	Add proximity to Aurora's city limits.	No changes to Scope of Work will be made. Location of Airport, in relation to Aurora, is mentioned in the Plan.
0.3	6-18, task 2F	Need to collect actual data for airport operations and use ODA noise study.	All available data is used in the Plan, as well as information from the noise study.
0.4	6-18, task 2.4	Include city of Aurora land use data (vision for airport and off airport land use). Include Aurora comp plan and county UGB agreement (area of mutual concern).	Scope indicates land use documents from local government will be obtained. This comment is more applicable to Chapter Two, and this information will be supplemented in that chapter at the appropriate location(s).
0.5	7-18, task 3.2	Need to have firm data on projected critical aircraft. Why not have constraints on projected aircraft types? Current actual operations data should be used for airport demand/capacity not estimated operations.	See response to #3.1. All data available at the time of the study has been used to develop the forecasts.
0.6	9-18, task 4.2	Why not look at an airport design that fits within the current constraints of the airport?	The Facility Requirements only outlines infrastructure needed to meet the forecasted demand. The next task - Airport Alternatives - is where the Plan studies the No Build alternative, which would be a design that fits within the airport's current constraints, as well as other possible layouts.
0.7	13-18, task	(land use and noise contour drawing) Look at city zoning boundaries and noise study.	Noted, the City's zoning boundary will be evaluated, as appropriate. Traffic patterns, which at Aurora State are based on the noise study, are always a consideration in developing the noise contours.
0.8	14-18, task 7.2	Who will guarantee the bonds?	The issue of bonds, including if they are appropriate, will be discussed in Chapter Seven as stated in the Scope of Work.
Comments on Meeting Documents		**Comments received from: Nick Kaiser**	
0.9	4-6	Airport operations for 2002-2003 were 62,926 (actual count).	The RENS acoustical counting program reported 62,926 operations for that reporting cycle. However, that number is an estimate, based on seasonal samples. It is not an "actual" count.
0.10	5-6	The last master plan had a notation on the airport layout that evaluated adjacent property.	It stated the area would be acceptable for airport-related development under private ownership.

0.11	6-6	The last master plan was not adopted by the county but the CIP was completed anyway?	Elements of the CIP that were implemented went through the appropriate conditional use approvals with the County, since they were not approved outright through adoption of the Plan.
Meeting #1		**Comments received from: Nick Kaiser**	
0.12	2-7	(parameters) Will not do land use evaluations. If expansion occurs livability concerns from the local community needs to be considered.	If any deficiencies are noted the Plan will consider a variety of issues, including those that impact livability.
0.13	5-7	Aurora airport should not be a reliever airport for PDX.	As stated in Chapter 1, the Airport should continue to fulfill its role as an Urban General Aviation Airport.
General		**Comments received from: Tony Holt and City of Aurora**	
		Tony Holt	
0.14	-	Chapters 1-3 have been written prior to any discussion of a vision, goals and objectives or assumptions with the PAC. This leaves a clear impression that there is an attempt to lead the discussion in a predetermined direction.	There is no predetermined direction for this Plan. Goals and issues were a significant portion of the PAC #1 discussion, as well as the Kick-Off Meeting.
0.15	-	The process is being rushed and there is not sufficient time allocated, nor enthusiasm by the Consultant and ODA, to make sure all questions are answered at PAC meetings, that the PAC fully understands the assumptions being made and knows the sources of the data being used.	This planning process includes six PAC meetings, five open houses, and one kick-off meeting, which allows all interested parties an opportunity to review and comment on the Plan. ODA and WHPacific are attempting to address all questions and comments from the PAC; however, the meetings are designed to be working sessions and some questions must be answered off-line. These questions are being addressed in this spreadsheet and are available to the PAC and public.
0.16	-	There are obvious constraints to development and expansion of this airport (only one runway, bordered by roads on four sides, limited remaining areas for development within the footprint). Yet there is no discussion of constraints.	Chapter Five, *Airport Development Alternatives* , will address these constraints - as well as others.
0.17	-	ODA has already picked a preferred activity level forecast prior to any discussion with the PAC.	ODA's draft preferred forecast was submitted to the PAC and FAA in mid-September. Based on comments received, some changes will be made to the forecast chapter before final publication, but we do not see a need to substantially change the activity levels forecast.
0.18	-	Throughout the document many general statements mention that were collected from individuals or organizations but there is no proper attribution. There should be.	Sources will be added, as appropriate. However, some sources were given a promise of confidentiality, see response to #3.29.
		City of Aurora	
0.19	-	Has ODA hired a planning consultant for this update like in 2000 and if so, who is it?	Yes, ODA has retained WHPacific, Inc. to undertake the Master Plan Update.

0.20	-	Is there an Aviation System Plan adopted by ODA or Marion County as required by OAR 660?	Yes, the Oregon Aviation Plan was published in 2007. Please refer to ODA's website.
0.21	-	Text: Mutually beneficial to city and airport to have services provided by a utility and not under separate properties; the City of Aurora's future industrial and commercial lands will be impacted by expansion of the airport and they have mutually beneficial/reciprocal relationships; reference Aurora Comprehensive Plan goals and policies;	References will be made, as appropriate, within the plan.

Aurora State Airport Master Plan Update - Comments Received on Draft Chapter One

Comment #	Page #	Comments received from: Nick Kaiser, Susie Stevens, Tony Holt, Clackamas County, and City of Aurora	WHPacific Response	Will revisions to Chapter 1 be made based on comment?
		Nick Kaiser		
1.1	1-2	Enhance safety/noise - Need to complete VFR update of preferred traffic patterns.	Noted, this will be added to the paragraph.	Yes
1.2	1-2	Goal 2 - Livability of surrounding communities should also impact future growth of airport.	Livability of surrounding communities is a consideration for both environmental and political feasibility, which is why it wasn't mentioned outright.	No
1.3	1-3	Runway extension would disrupt the area's livability and encourage the growth of bigger and louder aircraft. Airport growth needs constraints so that the surrounding areas are not negatively impacted.	Impacts of any development will be discussed with the PAC when airport development alternatives are presented in Chapter Five.	No
1.4	1-4	Keep runway 35 as the calm wind runway for noise abatement. Instrument approach on 17 needs to have written training guidelines for calm wind use.	Noted. Chapter Four discusses this issue in more detail.	No
1.5	1-5	If the airport is changed from BII to CII will the runway have to be extended?	C-II is a classification for aircraft based on approach speed, tail height and wingspan. It does not relate directly to runway length.	No
1.6	1-6	Airport use from survey - inadequate runway length is an issue for only 8% of the respondents that don't keep their planes at Aurora.	The survey is only used anecdotally; it was not intended to be a representative sample of all airport users. Data on runway usage, in relation to runway length, was aquired by other sources in addition to this survey.	No
1.7	1-11	Chart error - II should be III	Noted, chart will be revised accordingly.	Yes
1.8	1-13	What is length of Salem airport? Troutdale is a reliever airport for PDX and has an ARC of BII. What is its runway length?	As noted in Table 1A, the length of Salem's runway is 5,811 and Troutdale's is 5,399.	No
1.9	1-14	Airport role - conclusions and recommendations. Need 3rd alternative - grow within the current (physical) constraints of the airport.	This alternative will be evaluated in Chapter Five. This recommendation states the airport should continue to fulfull its role as an Urban General Aviation Activity Airport; it makes no reference to expansion.	No
		Susie Stevens		
1.10	1-2	4th bullet - add "and cite sources."	Noted, text will be revised.	Yes
1.11	1-2	Goal 2 - Add physical constraints to feasibility.	Physical constraints are a component of the financial feasibility, environmental feasibility, and political feasibility.	No
1.12	1-2	Note: This paragraph should address physical constraints as well: one runway, adjacent roads, airport footprint, etc.	This will be discussed in Chapters Four and Five.	No
1.13	1-3	1st bullet - Remove "evaluate" and insert "involve."	Noted, text will be revised.	Yes
1.14	1-3	5th bullet - Conduct proper noise study.	A noise study was conducted in 2002 and noise contours will be prepared as part of this Plan. No other noise study will be conducted as part of this project.	No

1.15	1-3	Could the appendices please be included with the next draft chapters or posted to the website?	The appendices were mailed to all PAC members in hard copy form. For future mailings, they will also be posted on the website (note, they were later added). The appendices were not included in the initial PAC emailing, because of their filesize. However, if future appendices have smaller filseizes, they too will be included in the initial PAC emailing.	Yes
1.16	1-3	Please cite the sources for the statements made in this paragraph (runway extension). Include the survey in the appendices.	Copies of the user surveys will be included as an appendix.	Yes
1.17	1-3	Air traffic control tower section: Please cite sources for these comments.	Sources will be added, as appropriate.	Yes
1.18	1-4	1st full paragraph, revise to read "…rural character [, quality of life,] and natural…"	Noted, text will be revised.	Yes
1.19	1-4	Other Airport Improvements section: Most important to have the survey and interview data to make this paragraph credible.	See response to #1.16.	Yes
1.20	1-6	Survey paragraph: Please note that there was no random or other conventional method survey. Who received the survey? Who did not? What was the percent returned of those sent out?	We will clarify the survey was not intended to be a statistical representation of airport users, along with a list of where the survey was distributed. The rate of return is difficult to account for, since the survey was also available online and copies may have been made to those that we distributed; however, we will attempt to quantify a firm number.	Yes
1.21	1-7	2nd paragraph: This number does not appear to tied in with graph on 3-10.	We bought IFR data from 2 different providers. The 14,186 IFR ops for Oct. 2007-Oct. 2009 came from FlightAware. Addresses in that database were easy to sort, which helped to mail surveys & analyze service area. Later, the master plan was put on hold for several months. When the project started up again, we needed more up-to-date data for forecasting. We subscribed to GCR's less expensive Airport IQ Data Center to obtain IFR data used in Chapter 3. In comparing calendar year 2008, FlightAware shows 3,606 arrivals and 3,664 departures, or 7,270 operations. For the same period, GCR information shows 3,226 arrivals and 2,462 departures, or 5,688 operations. Perhaps FlightAware is capturing more of the flight plans filed after departure and those cancelled before landing. We will add a source (FlightAware) to the reference in Chapter 1 & change the estimate of IFR ops at the top of page 3-10 from "5% to 7% of total traffic" to "5% to 10% of total traffic." This does not affect the forecasts summarized on 3-32.	Yes
1.22	1-14	Troutdale airport is in Multnomah County.	Noted, text will be revised.	Yes
		Clackamas County		
1.23	1-2	Last bullet top of page. The PAC requested a vision at the beginning of the process.	Yes, however, the Plan initially did not include a vision statement at all (see PAC #1 summary: "The Plan will not: … develop a vision statement for the Airport.") This was a compromise.	No

1.24	1-2	Goal 2 - 1st sentence. This is not an accurate statement. Not all the PAC members stated this as a concern. Some PAC members share the community's concern.	It is our recollection the PAC members who are airport users expressed this opinion. However, text will be revised to state "Some PAC members who are airport users fear …"	Yes
1.25	1-3	Runway Extension - entire paragraph. This statement is based on 2009 survey? Survey responses should be available on webpage for review.	See response to #1.16.	Yes
1.26	1-3	Air Traffic Control Tower - last sentence. What is meant by "slowed down?"	The FAA and ODA have postponed some critical decision-making points in the ATCT process to include information from the Plan once it becomes available.	No
1.27	1-4	Other Airport Improvements. The survey responses should be available on wepage and to the PAC.	See response to #1.16.	Yes
1.28	1-5	Aurora State Airport's Regional Role. Is the reference to "spin-off" addressing off site businesses the airport serves?	From the 2007 OAP: "Spin-off impacts are calculated using impact multipliers, which are used to reflect the recycling of dollars through both the regional and state economy… Spin-off impacts are often reported as indirect and induced impacts."	No
1.29	1-6	5th paragraph. Implies that there is a possibility that Airport will become a reliever. Is that really the intent here, especially when it is concluded on page 1-15 that commercial service is not an appropriate future role for the Aurora Airport. Consultant clarified reliever airport during meeting - does not include commercial aircraft but does include business aircraft that meets the standards in chapter 1, page 11.	Correct, reliever airports do not provide commercial (airline) service.	No
1.30	1-15	Bullet at top of page. See comment for page 1-6.	See response to #1.29.	No
1.31	1-15 & 1-16	4th paragraph, last paragraph 1-16. What would be the "trigger" to designate the Aurora Airport as a reliever airport, and why Aurora when it was stated above the Salem [airport] is the better choice? What is the process?	The "trigger" points are generally those described in the bullets on pages 1-15 and 1-16. However, each airport is reviewed on a case-by-case basis. Most likely, at Aurora State, the trigger would be if any of the three entities (ODA, Port of Portland, or FAA) initiated an individual review.	No
		Tony Holt		
1.32	1-2	Goal 2 Heading says "as feasible" Several areas of feasibility are listed. However, this section needs to recognize the physical constraints to airport expansion such as one runway, bordered by roads on four sides, limited areas remaining available for development within the footprint, etc.	See responses to #1.11 and 1.12.	No

1.33	1-3	First bullet, change word "evaluate" to properly describe the meaning of this bullet (it is meaningless currently)---including assessing the effect of any proposed changes on the livability of airport neighbors. **Add bullet**-Perform noise study (to measure potential impacts of proposed developments). **Runway Extension paragraph**-- Please provide proper attribution to the many statements loosely made in this paragraph such as 'Some Airport users and businesses favor a runway extension of up to 1,500 feet'—which?. 'Airport neighbors are concerned that a runway extension would unduly disrupt the area and encourage more and louder aircraft' --who stated that? **Air Traffic Control Tower paragraph**—again, need proper attribution for statements made.	See responses to #1.13, 1.14, 1.16, and 1.17. Sources will be added for statements regarding airport neighbors and noise, as well.	Yes
1.34	1-4	2nd para "Airport neighbors are----". **Add to this sentence** 'and their quality of life'. **Calm Wind Runway Change section** Need to explain this move has never lessened the noise over Charbonneau so to revert to 17 is not a major concern. **Other Airport Improvements** for complete transparency, need a list of individuals interviewed and those given survey with an explanation of how they were chosen, either here or in a table.	See responses to #1.18, 1.27, and 3.29. The calm wind runway section will be supplemented.	Yes
1.35	1-5	2nd Section, first sentence. How has Aurora Airport suddenly changed from a **rural** GA airport to an **urban** GA airport? Note: the Oregon 'Through the Fence' Bill only applies to rural airports.	Aurora State has always been defined as an Urban GA Airport, as it lies on the southern extents of the Portland-Vancouver-Beaverton Metropolitan Statistical Area (MSA) and is within the Salem MSA. It was included in SB 680 explicitly as an exception to the rural airport requirement.	No
1.36	1-7	2nd para the **14,186 IFR operations** does not seem to tie to the graph on page 3-10	See response to #1.21.	Yes
1.37	1-14	Page 1-14 6th para-error-**Troutdale is not in Washington County**.	See response to #1.22.	Yes
1.38	14-Jan	Para 7-again refers to Aurora as an urban airport.	See response to #1.35.	No
1.39	1-16	4th para- refers to 79,953 operations at Aurora on a 10 year average. **This calculation needs to be carefully explained to the PAC.**	The footnote on p. 1-16 mistakenly says it is a ten-year average, when in fact 1998-2008 is 11 years. That footnote will be corrected to say 11 instead of ten. Using averages instead of individual years discredit year-to-year fluctuations. 79,953 is the average of the 1998-2008 total operations in Table 3K, p. 3-23.	Yes
1.40	-	--"PAC members who are airport users fear community concerns will unduly constrain growth."	See response to #1.33.	Yes
1.41	-	--"Some airport users report there are times that they must lessen their airplanes weight in order to depart---"	See response to #1.33.	Yes
1.42	-	--"Some Airport users and businesses favor a runway extension of up to 1,500 feet." (but not mentioned in the survey)	See response to #1.33.	Yes
1.43	-	--"Airport neighbors are concerned that a runway extension would unduly disrupt the area and encourage more and louder aircraft."	See response to #1.33.	Yes
1.44	-	--Re changing calm wind runway back to 17, "noise impact would move with traffic, a concern for Airport neighbors."	See response to #1.34.	Yes

1.45	-	One goal is “evaluate all communities and jurisdictions in the Airport’s influence area.” Meaning?	See response to #1.33.	Yes
1.46	-	When did Aurora Airport go from being classified as a Rural General Aviation Airport to an Urban General Aviation Airport.	See response to #1.35.	No
1.47	-	-You want to “determine” Airport’s future role rather than predict it.	There is no predetermined direction for this Plan.	No
1.48	-	-No discussion of possible constraints to growth such as one runway, hemmed in by roads, current zoning, etc.	See responses to #1.11 and 1.12.	No
1.49	-	-No mention of livability of airport neighbors as goal.	See response to #1.2	No
1.50	-	-An MP goal should be to predict demand as accurately as possible.	It is, see bullet #4 on page 1.2.	No
1.51	-	-An MP goal should be to evaluate potential noise and traffic impacts for any new development.	These are included as Goal #3, "Consider all the off-airport impacts of Airport development." Impacts to ground transportation are cited specifically, and noise contours will be developed as part of the Plan.	No
1.52	-	-Should show a list which individuals/organizations responded to the survey?	See response to #1.16.	Yes
1.53	-	-Should show a list of which individuals/organizations were interviewed?	Sources will be added, as appropriate. However, some sources were given a promise of confidentiality, see response to #3.29.	Yes
1.54	-	-How do the Oct 2007 to Oct 2009 IFR numbers on page 1-7 fit with Exhibit 3D, page 3-10?	See response to #1.21.	Yes
1.55	1-16	Says the average operations at Aurora from 1998-2008 were 79,953 operations; how calculated and isn’t this meaningless?	See response to #1.39. Average operations at both Aurora and PDX were used to perform the calculations associated with the reliever designation. Using averages instead of individual years discredit year-to-year fluctuations. The reliever calculations help assess the role of the Airport. In the past, reliever airports received set-aside funding in the Airport Improvement Program (AIP). This is not the case with the current (expired) legislation covering the AIP, although reliever airports receive higher priority than general aviation airports for some discretionary funding, according to the AIP Handbook. Because the authorizing legislation for the FAA has expired and the content of new legislation is unknown, we were hesitant to go into much detail. We will summarize this information and add it to the chapter so that it seems more meaningful.	Yes
		City of Aurora		
1.56	1-2	Goal 3 has good language that needs to be referred to often in other parts of the plan update, “Consider all the off-airport impacts of Airport development; minimize negative impacts and maximize positive impacts”	All goals are used to evaluate the proposed preferred alternative in Chapter 5, and are used in the decision-making process.	No

1.57	1-3	"For example, the lack of sewer service is a major constraint for having a restaurant at the Airport…" Add text: "While Oregon Department of Aviation recognizes the complexities of Oregon's land use system and potential need for upgrades to City of Aurora utilities prior to annexation, ODA is generally supportive of annexation of the Aurora Airport by the City of Aurora due to the economic growth potential for the airport if it were connected to city services".	Noted, text will be revised.	Yes
1.58	1-12	Page 1-12 under Aurora State Airport heading, add text: "Located less than a quarter mile from the City of Aurora"	See response to #2.1.	Yes

Aurora State Airport Master Plan Update - Comments Received on Draft Chapter Two

Comment #	Page #	Comments received from: Nick Kaiser, Susie Stevens, Tony Holt, Clackamas County, and City of Aurora	WHPacific Response	Will revisions to Chapter 2 be made based on comment?
		Nick Kaiser		
2.1	2-1	Airport location - correction - airport is 1/3 mile from the city limits.	Noted, text will be revised.	Yes
2.2	2-7	Airspace - Need written guidelines for IFR on 17 when calm wind runway 35 is used during VFR conditions.	Chapter Two reports existing conditions. ODA is working with FAA to create procedures to reduce the noise impact to surrounding communities.	No
2.3	2-8	Use noise study	A detailed discussion of the noise study is in Chapter Four.	No
2.4	2-8	Land use - Airport is public Zone - If airport becomes an airport zone what changes other than outright uses will be allowed?	No other changes would occur.	No
2.5	2-9	RPZ - How will this change with runway extension?	Chapter Five discusses alternative Airport Layouts, along with design standards.	No
2.6	2-9	Human factors - consultants indicate there are currently 87,000 operations and the plan projects there will be 100,000 by the end of 2010? Does no make sense? There continues to be noise sensitive issues because of flight over populated areas.	See response to #3.19. 87,345 is the number for 2008 from the Terminal Area Forecast. 100,224 is the number estimated by multiplying 2010 based aircraft (432) by average operations per based aircraft (232). Will revise p. 2-9 to be more clear.	Yes
2.7	2-10	Golf course is on Airport Road. (correct)	Noted, text will be revised.	Yes
2.8	2-10	Social impact - If the state has to acquire land and business and homes are relocated, that is beyond constraint.	This is a general statement, quantifying what would be considered a "social impact" per the National Environmental Policy Act definition. Any proposed land acquisition would undergo NEPA review and the impact would be further assessed.	No
2.9	2-11	Farmland - What happens during the process of coordinating with NRCS?	NRCS coordination is conducted by FAA per NEPA requirements, once a project is identified and if the project includes a taking of farmland. Through consultation, the NRCS would need to be shown there's no feasible and prudent alternative to taking farmland for the use.	Yes
2.10	2-13	Wetlands - Are they not jurisdictional?	A wetland delineation was not conducted, so this is unknown. A delineation would be prepared if any development action could affect the areas in question.	No
2.11	2-14	Controversy - Not correct - There are opinions that the airport should exist but growth should have some constraints to insure livability in the community.	Noted, text will be revised.	Yes
2.12	2-15	Terminal area forecast of operations at 87,345 is shown as "actual data." How is this measured?	See response to #3.13. We will change the word "actual" to "estimated."	Yes
2.13	2-16	Fuel fees - 2010 down 12% from 2009 and down 8% from 2008. This is indication that airport activity is going down.	See response to #3.3. Not all fees were paid on time.	No
		Susie Stevens		
2.14	2-7	Other Support Facilities: Please add Wilsonville to this paragraph.	Wilsonville will be added.	Yes

2.15	2-7	Airspace: Note - From the City of Aurora only, but not to the north. What is the source of this sentence?	Overall complaints have been reduced and source will be given. Text will clarify that overall complaints have reduced, but complaint levels from the north have remained at a consistent level.	Yes
2.16	2-11	Farmland: Please add information from the Oregon Department of Agriculture on the designation of Foundation farmland.	Information will be added.	Yes
2.17	2-14	Other Issues: Add a paragraph on (vehicular) traffic.	Issues relating to vehicular traffic will be added to the environmental conclusion section.	Yes
2.18	2-15	Regarding the Terminal Area Forecast: It would be more informative to have a couple sentences explaining how this forecast is determined.	See response to #3.45.	Yes
		Clackamas County		
2.19	2-2	Area Topography. Incorrect: Not part of Mt. Hood National Forest	Marion County reports the forest extends into Marion County, as does the Clackamas River Ranger District Office.	No
2.20	2-2	Community and Airport History. Why not include when tower was 1st put on ALP? This will provide clarification on all structures planned.	Noted, this will be included.	Yes
2.21	2-3	Airfield Facilities. How often is runway rated? What type of aircraft does runway support - commercial, business? Is there a limitation on runway strength and future strength?	The runway is rated every three years. The runway supports General Aviation, which includes private and business operators but does not include commercial (airline) operators. Discussions relating to runway limitations are provided in Chapters Four and Five.	Yes
2.22	2-8	3rd paragraph. Unclear sentence, please restate for clarity. Are you saying that allowed uses on adjacent lands must be compatible with the airport imaginary surface overlays?	Statement will be clarified. The FAA does require that airport sponsors - to the extent of their ability - restrict zoning on adjacent lands and lands within an airport's immediate vicinity to compatible land uses.	Yes
2.23	2-8	Surrounding Area Land Use. This statement gives the impression that adjacent lands are RRFF5 and the golf course. Restate as "… further north of the airport are RRFF-5 zoned lands and a golf course."	Statement will be clarified.	Yes
2.24	2-8	Surrounding Area Land Use. Did not address local, regional or state land use laws and regulations. As long as there is not a proposal to expand the airport runway or locate a facility off of the ALP boundaries the MP does not have to address these regulations, however any expansion will require addressing local, regional and state laws to include an exception process. Then again the FAA guidelines in accordance with the FPPA will prohibity the expansion of the airport boundary on high value farm lands.	This chapter presents the existing conditions. Any actions proposed in this Plan - in subsequent chapters - will address local, regional and state land use laws and regulations.	No
2.25	2-9	1st paragraph. Clackamas County's Capital Improvement Plan (CIP) 2006-2008 Update shelved the Arndt Rd/99E (#267) in 02-23-05.	Noted, text will be revised.	Yes

2.26	2-9	2nd to last sentence. Is this an FAA requirement in response to PAC and community's concerns relating to noise impacts?	No, this is a standard planning requirement for airports. Occasionally FAA will waive this requirement for smaller airports. It has always been in the Scope of Work for this project.	No
2.27	2-10	1st paragraph. In the 2002 noise mitigation study, where was the noise redirected with the implementation of use of Runway 35? Need to see this runway on a map to know where it is.	Please refer to the exhibits for a visual of Runway 17/35. Aircraft landing Runway 35 are approaching from the south.	No
2.28	2-11	4th paragraph. This implies that extension of the airport lands cannot be achieved. The surrounding farmlands are considered high value farmland according to the 1985 soil survey of Clackamas County Area, Oregon, that identifies surrounding soils as type #3 Amity silt loam and #88 Willamette silt loam. Other high value soils surrounding the airport property include #68 and #69 Newberg loam.	Any proposed improvement off airport would undergo NEPA review, in which this concern would be addressed. See response to #2.9.	No
2.29	2-14	Conclusion. The Master Plan goals stated in the beginning of this document also commit the MP to include"… evaluation and minimum impacts of airport growth to include transportation."	See response to #2.17.	Yes
		Tony Holt		
2.30	2-7	4th para, second last sentence-**"complaints from neighboring Aurora have dropped---"**should note that they have not dropped at Charbonneau which is now suffering the wide spectrum of take-off noise.	See response to #2.15.	Yes
2.31	2-9	last para-the PAC needs to properly understand how the current annual operations number quoted of 87,345 was arrived at. Also, the sentence 'Because the majority of the adjacent land is in agricultural use, the number of noise sensitive uses is minimal' is ludicrous given the adjacent residential areas of Aurora and Charbonneau	See response to #3.45. When compared to other urban airports, there are fewer noise sensitive land uses. However, that statement does not negate the impacts at Aurora State.	
2.32	2-11	3rd para should also quote the Oregon Department of Agriculture study classifying areas as either Foundation or Important or Conflicted farmland. The area around the Airport is classified as Foundation farmland the D of A's top rated classification.	See response to #2.16.	Yes
2.33	2-14	2nd para who are the community members who **'desire closure of the Airport'**? 3rd para- under "Other Issues" traffic impacts should be mentioned.	See response to #2.17. Source will be added.	Yes
2.34	2-15	**Table 2D Operational Records**. The PAC needs to know how this was developed. It is fundamental to the key forecasts.	See response to #3.45.	Yes
2.35	2-14	Page 2-14, "There are some members of the community who are against airport growth and desire closure of the Airport and release of the land to other uses." Who are they??	Source will be added.	Yes
2.36	-	"An accurate inventory helps produce an aviation demand forecast---"	--	--

2.37	2-7	"Complaints from neighboring Aurora have dropped since this designation (calm wind 35) was enacted." Maybe, but not from Charbonneau.	See response to #2.15.	Yes
2.38	2-9	Under 'Human Factors' and 'Noise' talks about noise sensitive land uses and says "the number of noise sensitive land uses is minimal' because the majority of the adjacent land is in agricultural use.	See response to #2.31.	No
2.39	2-11	Under 'Farm Preservation' should also reference the Oregon Department of Agriculture study.	See response to #2.16.	Yes
2.40	2-14	'Conclusion' "Beyond controversy over noise and airport expansion, there do not appear to be any significant environmental issues on the Airport or in the airport vicinity." What about traffic??	See response to #2.17.	Yes
		City of Aurora		
2.41	2-1	Page 2-1 under Airport Location and Access hearing: "The city of Aurora is located approximately ~~one~~ **one-quarter** mile southeast of the Airport".	See response to #2.1.	Yes
2.42	2-6	Page 2-6 under Airport Support Facilities heading: Add text: "Surrounding communities have expressed concerns that additional growth at the airport and the potential for airport expansion will have negative impacts upon their water supplies and/or water quality. Advanced planning and feasibility assessments regarding the airport's ability to meet water, sewer, and fire protection needs for development and expansion are of concerns. While not required as part of the Airport Master Plan Update and not included in this document, the ODA recognizes the importance of completion of this work in the future. ODA is supportive of pursuing funding options for such studies and supports surrounding communities in their pursuit of funding for such studies".	Noted, text will be added.	Yes
2.43	2-6	Page 2-6 under Airport Support Facilities heading and Utilities subheading, add text: "While Oregon Department of Aviation recognizes the complexities of Oregon's land use system and potential need for upgrades to the City of Aurora utilities prior to annexation, ODA is generally supportive of annexation of the Aurora Airport by the City of Aurora due to the economic growth potential for the airport if it were connected to city services."	A reiteration of this point will be made. See response to #1.57.	Yes
2.44	2-8	Page 2-8 under the Surrounding Area Zoning and Land Use heading, please make reference to the Urban Growth Boundary Coordination Agreement with Marion County that has a section on the Airport and surrounding lands as an Area of Mutual Concern, and the IGA signed between ODA, Marion County and the City of Aurora. I can provide copies of these documents if needed.	Noted, text will be supplemented.	Yes

2.45	-	Reference should be made to the following City of Aurora Comprehensive Plan Goals and Policies (I can make a copy of the Comp Plan available if needed):	Noted, text will be supplemented.	Yes
	-	Goal 14- Growth and Urbanization. Policy 4: The city will seek the funding to evaluate the impacts of development of the industrial and commercial properties at the Aurora Airport and on surrounding lands to determine the role of the Aurora Airport in relationship to the Overall Objectives of the Aurora Comprehensive Plan and to identify formal and informal relationships needed to achieve mutually beneficial goals.		
	-	Goal 9- Economic Policies. Policy 1: The City will work closely with Marion County, the Oregon Department of Aviation, and the Oregon Department of Economic and Community Development to evaluate and balance the net value (cost/benefit) of the industrial and commercial potential of the Aurora Airport and surrounding lands. The City will strive to minimize potential land use conflicts within the mutual planning area in an effort to maximize the livability of the community.		
	-	Goal 11-Public Facilities. Policy 2 and 8: The City shall consider extension of a sewer and water line to the Aurora Airport industrial district if it is determined by the City and county that: a. The City is the most logical service provider; and b. The extension benefits the City economically; and c. Precautions prevent hook-ups to the line by property owners in the rural area between the urban growth boundary and airport; and d. In full compliance with applicable laws.		

Aurora State Airport Master Plan Update - Comments Received on Draft Chapter Three

Comment #	Page #	Comments received from: Nick Kaiser, Susie Stevens, Tony Holt, and Clackamas County	WHPacific Response	Will revisions to Chapter 3 be made based on comment?
		Nick Kaiser		
3.1	General	Why are the projections unconstrained? There should be some parameters. The last master plan one of the constraints was an ARC of BII.	Airport master plan forecasts of aviation demand are usually unconstrained. ODA did not feel it necessary to constrain the forecasts, particularly since there is undeveloped land at the Airport (ODA and private) for hangars, etc. ODA may elect to constrain the forecasts later in the planning process, as happened in the 2000 master plan update. (During the last master plan, ODA decided to constrain the forecasts by not meeting design standards for Airport Reference Code C-II.) Identifying how to constrain the future is much easier when you have an idea what the unconstrained future might be. The FAA typically produces unconstrained forecasts. The FAA's annual Terminal Area Forecast (TAF) (http://www.faa.gov/data_research/aviation/taf_reports/media/TAF%20Summary%20Report%20FY%202009%20-%202030.pdf) contains forecasts for over 3,000 airports. Page 3 of the TAF report published December 2009 says, "The TAF assumes an unconstrained demand for aviation services based upon local and national economic conditions as well as conditions within the aviation industry. In other words, an airport's forecast is developed independent of the ability of the airport and the air traffic control system to furnish the capacity required to meet demand." This information will be added to Chapter Three to more clearly indicate why the forecasts are unconstrained.	Yes
3.2	3-2	"Critical Aircraft" current analysis is an unconstrained mix. Where do you draw the line on size of plan?	Decisions about the size of the plan will be made later.	No
3.3	3-3	2010 trend is still down so how can operations go up?	Nationwide aircraft shipments were down the first quarter of 2010, although billings were up (p. 3-3). At Aurora, IFR traffic was up 22% for partial year 2010 (p. 3-10) and fuel flowage resumed growth in 2009 (p. 3-8).	No
3.4	3-5	Need to label the charts 3A and 3B.	Exhibits 3A and 3B have titles and sources, so the comment intent is not clear.	No
3.5	3-7	With the slight increase in US active aircraft and Oregon trending below that how can we show such a large increase in base aircraft? How can you conclude that operations will increase at the same rate as based aircraft?	Aurora's historical 2000-2009 growth is 7.0% annually (233 based aircraft in 2000 growing to 427 in 2009), while the national increase for 2000-2009 is 0.6% annual (Table 3A on p. 3-5). So, it is reasonable that Aurora's future growth is higher than the national forecast (1.36% compared to 0.9%). Using a constant OPBA for forecasting future general aviation operations is common in airport master plans. Historical info at Aurora shows operations sometimes go down when based aircraft go up and vice versa.	No
3.6	3-8	Aviation gas dropped 47% in 2008 and the increase in 2009 and 2010 is mainly jet fuel. Jets are a small portion of based aircraft so operations should have not increased at levels indicated.	Fuel is sold to transient as well as based aircraft. Jets have larger fuel tanks and on average are flown more hours than other fixed wing aircraft. This explanation will be added.	Yes
3.7	3-9	2002 & 2003 operaions were measured at 62,926. Chart 3C shows approximately 78,000?	See Table on p. 3-23 for the numbers in Exhibit 3C and see response to #3.13.	No
3.8	3-10	IFR operations in 2009 is approximately the same as 2002-2003. 2010 continues to be a bad year.	See response to #3.3. IFR is growing in 2010.	No
3.9	3-13	I don't see the correlation between the population growth in the core area and licensed pilots.	We did not specifically correlate population growth with pilot growth.	No
3.10	3-16	Based Jet aircraft went from 33 in 2007 to 21 today.	Noted. However, the number in 2006 was only 6. We tried to look at trends over time.	No

3.11	3-18	Based aircraft increase is not following the socioeconomic trends.	Based aircraft forecast is 1.36% annual growth. Average annual population growth in service area is 1.53% (p. 2-13). Metro forecasts for nonfarm employment are between 0.7% and 1.8% annual (p. 3-14).	No
3.12	3-21	Using preferred forecast 1.36% the based aircraft is too optimistic. It will not follow population growth or other socioeconomic trends. For based aircraft to increase at the forecasted rate there will need to be a lot more hangar space. (constraint?)	See response to #3.11. Hangar space needed for forecasts will be in Chapter Four.	No
3.13	3-22	The last actual operations recorded was 2002/2003 at 62,900. No actual data was taken in 2008.	Acoustical counts in 2002/2003 were estimates based on samples (as reported on ODA's website). We have not been able to account for the difference in operations reported from acoustical sampling on ODA's website and the operations reported in the Terminal Area Forecast, which the FAA says come from ODA. We will change the word "actual" to "estimated".	Yes
3.14	3-23	OPBA of 232 means there is little itinerant traffic (according to FAA guidelines). Table shows heavy itinerant traffic? The OPBA from the survey doesn't make sense?	We noted that FAA's OPBA guidance does not relate well with Aurora having considerable itinerant traffic, hence the discussion on p. 3-23 and 3-24. The survey was a random sample, but it did cover a wide range of aircraft types and convey average OPBA per fixed wing aircraft similar to FAA's historical records of aircraft and operations.	No
3.15	3-25	Preferred forecast 1.9% - At 232 OPBA the itinerant will be lower so how do you get to 1.9%/year?	In 2008, operations were 87,345 and the number of based aircraft was 422. The OPBA was 207, below the average of 232. 1.9% average annual growth is from 87,345 in 2008 to 131,312 in 2030.	No
3.16	3-26	Why large growth in itinerant from 51,000 to 85,000?	Itinerant operations are those that are not local (touch and go training, primarily) and are performed by both based and transient aircraft. The assumption is that training operations will comprise a slightly lower portion of total operations in the future, which often happens when airports grow busier. However, the growth in itinerant operations (2.1% per year) is not much different than the growth rate for total operations.	No
3.17	3-27	With 21 jets in 2010 what is the correct % of the jet capable airports.	We do not have 2010 information about the other airports, so cannot calculate that.	No
3.18	3-27	With 21 based jets and 432 total based aircraft (5%) how do you get to 13% of operations growing to 18%?	Business jet aircraft are used more often than piston aircraft. From Tables 3A and 3B, compare national averages by aircraft type. Piston aircraft are flown 83 hours per year and jet aircraft are flown 252 hours per year on average. Also, since it is jet capable, and most of the 46 other airports in the service area are not, Aurora will be used more by transient jet aircraft than most of the other airports. This explanation will be added.	Yes

3.19	3-28	There is a sensitivity to using an inflated operations per year number. Just going from 100,000 to 87,000 the peak hour operations goes from 40 to 34 and 80,000 gets you 32.	This comment is one of several concerned with inaccurate or inflated numbers of aircraft operations. The FAA uses aircraft operations estimates from airport owners to determine the number of aircraft operations at non-towered facilities, and assesses them for their reasonableness before publishing them in the Terminal Area Forecasts. See p. 3-22 through 3-24 for a discussion of different ways to measure operations at non-towered airports, FAA guidance for ratios of operations per based aircraft, and analysis of Aurora's operations per based aircraft compared to other airports in the region. The FAA's records of aircraft operations at over 2,000 airports across the nation are estimates, so reliance on estimates for planning is not unique to Aurora State. Here is how the number of aircraft operations could affect the requirements in Chapter Four: . The capacity analysis uses operations numbers. (However, the analysis will show that the runway has the capacity for many more operations than are estimated to occur at the Airport now or in the 20-year future.) Also, peak operations are used to project the amount of transient aircraft parking apron needed in the future. These projections help in planning the future layout of the Airport. However, neither ODA nor private entities will build more apron until actual need is demonstrated.	No
3.20	3-29	What % of the Aurora based jets is the runway design for?	Airports are designed for transient airplanes as well as based airplanes; this is not something a master plan would normally calculate.	No
3.21	3-29	Do we want to go to ARC C and open the door to much larger jets? What is max weight of jets in C category?	The standards for ARC C-II will be spelled out in Chapter Four, along with weight information about jets in C category that use the Airport. The decision about meeting those standards will be made later.	No
3.22	3-29	How many planes listed in the II category fit the weight restrictions (45,000 dual) currently at the airport? What increase would the runway weight capability have to be to fit the critical aircraft?	All or nearly all the current based aircraft have maximum takeoff weights below 45,000 pounds. The current and forecast critical aircraft mentioned on pages 3-30 and 3-31 weigh 23,500 and 36,100.	No
3.23	3-30	I thought that the current ARC was BII?	The Airport is now designed to meet ARC B-II standards. Operations at the Airport now meet the threshold for the ARC to be C-II.	No
3.24	3-30	What are the weight design specs fro ARC CII? What are the weight design specs for the Astra 1125 and Cessna Citation (X)? Is it 36,000# for both? Are the dual wheel? Footnote shows that ARC CI and CII have the same max takeoff weight?	ARC is based on approach speed, wingspan, and tail height, not weight. Aircraft in one ARC can and do have different weights. More information about different weights of business jets will be in Chapter Four.	No
3.25	3-30	Since 2009 C category jet operations are low and if you used 2009 and 2010 you would probably be below the 500 critical operations.	See p. 3-10. IFR Traffic is up 22% in 2010 compared to 2009, so that is probably not the case.	No
3.26	3-30	What are the runway design specifications for ARC CII? What is the Runway length specs for the Critical aircraft?	This will be in Chapter Four.	No
		Susie Stevens		
3.27	3-1	1st paragraph: Constrained projections should be part of the Master Plan if there is the possibility that ODA may choose to not meet the unconstrained projections.	See response to #3.19.	-
3.28	3-5	Oil prices: This seems unrealistic; perhaps a couple of other sources will provide credibility.	The oil price assumption is in the FAA's forecast for aviation activity nationwide (*FAA Aerospace Forecasts Fiscal Years 2010-2030* , March 2010) and is based on Global Insight's October 2009 oil price forecast. This is simply part of the description of the FAA's latest national forecasts. We don't have sufficient data about Aurora activity to distinguish the effect of high fuel prices in 2008 from effects of the recession or other factors in 2008. High fuel costs usually influence discretionary/recreational flying more than business travel.	No

3.29	3-10	Regarding business interviews: It would be helpful to know which businesses provided this information.	We promised those businesses confidentiality because they compete with each other. If there are any businesses at the Airport that believe this paragraph misrepresents their activity or projections for the future, we will delete the paragraph.	No/Yes
3.30	3-12	I suggest a paragraph that notes that Marion County is the entity that approves zoning and land use changes.	See Chapter Two, page 2-9: "The entire Airport is zoned ... in the Marion County Zoning Code. Marion County is the planning and building permit authority for the Airport."	No
3.31	3-16	Last paragraph: It would be interesting to see, maybe in the appendix, the Table 3I recalculated without Southend Airpark's growth. Sort of like eliminating high and low numbers to get a better average.	We may have mistakenly implied that the Southend Airpark was the only cause of the market shift and will revise the text to mention that the development and removal of hangars at other airports in the region may have contributed to the shift in market share. For example, the privately owned Evergreen Field in Vancouver with up to 165 aircraft closed in 2006 (http://www.airfields-freeman.com/WA/Airfields_WA_SW.html#evergreen). Several other private airports in the region closed between 1998 and 2007. In 2008, Portland International Airport removed 18 hangars for a road improvement project.	Yes
3.32	3-21	Preferred Based Aircraft Forecast: I realize PAC members may feel like we are going backwards, but this is such a critical paragraph. I suggest we discuss the assumptions made in choosing the Preferred Forecasts.	Noted for Dec. 9 meeting.	-
3.33	3-22	It's frustrating that we can't get an accurate count. Using the estimated forecast results in an operation every 6 minutes, 24 hours a day, 365 days per year. This seems too high.	See response to #3.19.	-
3.34	3-23	It would be good to note how the survey was done; how many sent, how many returned, etc.	See Appendix C. It is difficult to estimate how many questionnaires were distributed, but we'll try to quantify this more. See response to #1.20.	Yes
3.35	3-29	Last paragraph: It would be helpful to have a table showing the numbers of piston and turboprop aircraft operations, even if they are estimates. This relates to the ideas expressed at the first PAC meeting of a "vision" for the airport - what do the majority of users want. In 2000, ODA decided to constrain the forecast by keeping the ARC BII (pg 3-28). We should discuss this idea.	See Table 3M, p. 3-27. For a response to the comment about vision, see the response to comment #1.23.	No
3.36	3-32	With over 70% of the projected operations by piston or helicopter for the next 20 years, improvements should be geared to serve the majority of users.	Chapter Four will address the needs of piston and helicopter users. Following FAA guidance, airfield design is for the most demanding aircraft in regular use and then the airfield is adequate for all the less demanding aircraft.	No

3.37	-	In reference to the data and text on pages 3-28 through 3-31, is a designation of ARC C-II mandatory?	Probably not. The obligation to improve the Airport to meet demand is not in the 39 assurances that ODA makes when accepting Federal Airport Improvement Program grants. However, it is possible that the FAA will not fund a future airfield project if does not meet the design standards for the ARC. The FAA's guiding principles for investing in airports include: "Airports should be safe and efficient, located at optimum sites, and developed and maintained to appropriate standards," and "Airports should be flexible and expandable, and able to meet increased demand and to accommodate new aircraft types." On the other hand, cost beneficial investing is another guiding principle for the FAA, along with "Airports should be compatible with surrounding communities, maintaining a balance between the needs of aviation and the requirements of residents in neighboring areas." We believe the best time for deciding whether or not it is feasible to meet ARC C-II standards is after we know the impact of meeting those standards, later in the process. (The guiding principles are in the National Plan of Integrated Airport Systems (NPIAS) 2011-2015, p. 3, http://www.faa.gov/airports/planning_capacity/npias/.)	No
		Clackamas County		
3.38	-	Forecast Growth Rate for Jets. … It would seem that the linear trend would not be a valid predictor of future growth. Is there any factual basis for predicting that the rapid growth that resulted from the opening of the Southend Airpark will or can continue? Is there room within the existing airport boundaries or sufficient land available outside the airport? Zoning maps indicate that there is not. Is the ODA aware of any plans to change the surrounding zoning?	We agree that growth in based jet aircraft will not continue at the 5.9% historical growth rate. The 4.5% growth rate for based jets is substantially less than the historical rate, but comparable to the 4.3% annual growth from 2010 to 2030 that the FAA projects for jets nationwide (Table 3A). The forecasts are unconstrained. Evaluating the amount of land available will be in Chapter Four. If any change in zoning is contemplated, it will be later in the planning process.	No
3.39	-	Critical Aircraft. Is there any reason why the "critical aircraft" is different than the predominant aircraft of last year? How does this meet the "regularly" or "substantially" standards set forth on page 3-28?	The prevalent or predominant jet aircraft is the model that uses the Airport the most. This discussion just expands on what Table 3P shows. The most used aircraft is not the critical aircraft. The critical aircraft is the most demanding that regularly uses the Airport. The predominant jets in 2007 and 2009 were Airport Reference Code (ARC) B-I and B-II. ARC C-II has more demanding design standards (generally larger safety clearances) than ARC B-I or B-II, as Chapter Four will show. We will try to explain the distinction between predominant and critical for better clarity.	Yes
		Tony Holt		
3.40	3-1	1st para, 3rd sentence-**"These projections are unconstrained and assume ODA or others will be able to develop the various facilities necessary to accommodate based aircraft and future aircraft operations."** This is a fatal flaw in the conclusions so far. Constraints to growth must be considered in producing any accurate operations forecast(s).	See response to #3.1.	-
3.41	3-5	last para, the statement that **oil prices will not exceed $100 before 2025** is ridiculous given the limited supply of new sources of petroleum and increases in demand once the current worldwide recession is over. What is the source?	See response to #3.28.	-
3.42	3-9	**Exhibit 3C Historical Aircraft Operations at Aurora State Airport**. On the following page it is admitted that this is an estimate so Exhibit 3C should show that. How were these data it compiled? Sentence above Exhibit 3C says' The FAA keeps records of airport operations reported by airport owners'. Please explain this.	We will add that the airport owners estimate the operations they report to the FAA. Airport operators report estimated operations on periodically updated http://www.gcr1.com/5010web/airport.cfm?Site=UAO) and the FAA Airport District Office in Seattle reports numbers to Headquarters annually.	Yes

3.43	3-10	Exhibit 3D It is hard to believe that out of supposedly **90,000 total operations at Aurora in 2009 only 5,000 were IFR!!** Please confirm and supply source	We realize from our line-by-line analysis of jet IFR operations that quite a few IFR operations are not documented in the IFR records from GCR (http://www.airportiq.com/) because flight plans are filed after takeoff or cancelled before landing. We documented those unrecorded jet operations to identify the appropriate airport reference code, but jets account for less than half of the IFR records. When charting the IFR operations trend in Exhibit 3D, we felt using the data exactly as provided by GCR would be the best course of action. We are increasing the estimate of IFR operations to up to 10% of total operations to account for unrecorded operations. 36% of operations are classified local (touch-and-go) operations that are nearly all VFR. Underestimating or overestimating the IFR operations proportion of total operations has no impact on the facility requirements in Chapter Four, although the FAA might consider IFR operations numbers when contemplating new or different instrument approaches in the future. The consequences of underestimating or overestimating total operations is described in the response to #3.19.	Yes
3.44	3-15	**Based Aircraft Forecast**-explain how various forecast models were developed and the preferred one selected.	The explanation is in the chapter and can be discussed more at the meeting Dec. 9.	-
3.45	3-22	3rd para- the **FAA's Terminal Forecast** is mentioned frequently. What is it, how is it developed and explain how it is relevant.	The Terminal Area Forecast (TAF) is the FAA's annual forecasting for terminal control centers and for the approximately 3,300 individual airports that are in the National Plan of Integrated Airport Systems (NPIAS). According to the Terminal Area Forecast Summary, Fiscal Years 2009 – 2030, p. 3, "The TAF is prepared to assist the FAA in meeting its planning, budgeting, and staffing requirements. In addition, state aviation authorities and other aviation planners use the TAF as a basis for planning airport improvements." The TAF provides a benchmark for individual master plan forecasts. The FAA may modify or update the TAF based on an approved master plan forecasts. If an airport master plan forecast for operations exceeds the TAF by more than 10% in the first five years, they are sent to FAA Headquarters for review. According to Par. 428.a, FAA Order 5100.38C, AIP Handbook, the lack of FAA acceptance of forecasts may delay any further planning or capital improvements depending on them. See Appendix H for the comparison of Aurora's master plan forecasts and the TAF. We will add this explanation to the chapter. For more information about the TAF, see http://www.faa.gov/data_research/aviation/taf_reports/media/TAF%20Summary%20Report%20FY%202009%20-%202030.pdf.	Yes
3.46	3-29	last para-**"The airport has now passed the 500 operations threshold for Aircraft Approach Category C"**. How do we know? Where is it documented and by whom? **But there are not 500 operations for ARC C II.**	There are at least 500 operations for Aircraft Approach Category C and at least 500 operations for Airplane Design Group II, hence the ARC is C-II. Table 3P shows the number of Aircraft Approach Category C operations in FY 2007 and FY 2009 (665 and 377)—these include Airport Reference Code (ARC) C-I, C-II, and C-III. The average of these two years is 521. We consider this average a fair representation of activity because within the last ten years, 2007 was the peak year and 2009 was the valley year. To get these numbers, we counted individual jet operations in IFR records, adding VFR arrivals and departures as required. Here's an example of the backup for Table 3P. The table lists 293 ARC C-I operations in FY2007. These ops are: BAE 125-122, Israel 1124-15, Learjet 36-2, Learjet 45-4, Learjet 55-2, Learjet 31/31A-12, Learjet 35A-14, and Hawker 400/400A-122. A sample from the IFR data is copied below these comment responses.	No
3.47	-	All activity forecasts presented are unconstrained; that is unrealistic.	See response to #3.1.	-

3.48	3-5	The oil price prediction needs references as to source/basis. The prediction is totally unrealistic.	See response to #3.28.	-
3.49	3-10	Exhibits 3C and 3D indicate that of an estimated 88,000 operations at Aurora in 2008, only some 5,800, or 7% were IFR. That seems unrealistic.	See response to #3.10.	-
3.50	3-29	How do we know "the airport has now passed the 500 operations threshold for Aircraft Approach Category C, so the current ARC should be C-II"? What proof? Why C II ?	See response to #3.46.	-

ADDITIONAL INFO FOR DOCUMENTATION OF ARC

Exhibit 3D on page 3-10 lists IFR operations for all types of aircraft, piston and turboprop as well as jet aircraft. Table 3P is only jet aircraft.
The jet operations in Table 3P result from reviewing IFR records line-by-line and adding additional arrivals and departures as needed.
See the footnote on p. 3-29. Here is an example of an IFR record:

Aircraft - **N600ST** Make and Model **CESSNA 550** Class **JET**
ROBERTS FIELD to AURORA STATE - 02/13/2007 at 08:01 AM
REDDING MUNI to **AURORA STATE** - 02/13/2007 at 03:55 PM
ROBERTS FIELD to **AURORA STATE** - 03/07/2007 at 07:44 AM
AURORA STATE to **ROBERTS FIELD** - 03/07/2007 at 08:19 AM
ROBERTS FIELD to **AURORA STATE** - 03/07/2007 at 02:45 PM
AURORA STATE to **ROBERTS FIELD** - 03/07/2007 at 03:12 PM
ROBERTS FIELD to **AURORA STATE** - 06/11/2007 at 09:25 AM
AURORA STATE to **REDDING MUNI** - 06/11/2007 at 10:28 AM
SACRAMENTO MATHER to **AURORA STATE** - 06/11/2007 at 06:59 PM
BOEING FIELD/KING COUNTY INTL to **AURORA STATE** - 07/18/2007 at 12:19 PM
AURORA STATE to **ROBERTS FIELD** - 07/18/2007 at 04:18 PM
Total Operations 11

Operations need to be added to get the airplane from Aurora to Redding Muni on 2/13, from Aurora to Roberts Field between 2/13 and 3/7, and from Aurora to Boeing Field between 6/11 and 7/18.

Nick Kaiser (submitted March 24, 2011)

3.51	3-22	1.36% growth in based aircraft will be dependent on what facilities are available at Aurora vs. other airports. What data other than population and Employment shows that Aurora will get this kind of growth?	It is an unconstrained forecast that assumes capacity will be built to meet demand. Chapter Three discusses historical growth at the airport, national and state aviation trends, other forecasts for the airport, and anecdotal projections by some businesses at the Airport.	No
3.52	3-24	According to the FAA guidelines having 240 OPBA indicates little itinerant traffic but according to the Aurora airport operations chart over half of the operations are itinerant?	The FAA uses two different meanings for the word "itinerant". Itinerant operations are those travelling more than 20 miles to/from the airport, and are performed by aircraft based at the airport and by aircraft based at other airports. Operations that are not "itinerant" are "local". Local operations are mostly touch-and-go and other training operations that stay within 20 miles of the airport. Local operations are also performed by both based and visiting aircraft. By saying that 250 OPBA is typical at a rural GA airport with little itinerant traffic, the FAA means little activity by aircraft based at another airport. Aurora State Airport's activity is not consistent with this guidance regarding OPBA, as discussed on pages 3-24 and 3-25 of Chapter Three.	No

Aurora State Airport Master Plan Update - Comments Received on Draft Chapter Four

Comment #	Page #	Comments received from: Tony Holt, Nick Kaiser, Bruce Bennett, Roger Kaye, and City of Aurora	WHPacific Response	Will revisions to Chapter 4 be made based on comment?
		Tony Holt		
4.1	General	Repeating a question I asked at the last meeting, to ensure a response: Current runway length is 5004ft. What is the current length of the required 'safety zones' (sz) at the north end and the south end? What is the distance from the ends of the current safety zones to the airport fence (F) at the north end and the south end? For example, what are the following distances: F---------I---sz----I---------- runway----------I----sz----I----------F	Safety zones are referred to as Runway Protection Zones (RPZs) per FAA Advisory Circular 150/15300-13. Table 4C (page 4-8) shows the RPZ dimensions for the existing condition (ARC B-II with approach minima greater than 1 statute mile), as well as for ARC C-II (all approach minimums). The dimensions you requested are shown below, along with the Runway Safety Area (RSA) lengths (Runway 17 end is to the north, and Runway 35 end is to the south): RPZ length beyond Runway 17: 1,200' RPZ length beyond Runway 35: 1,200' Runway 17 RPZ end to fence: 847' Runway 35 RPZ end to fence: -154 (RPZ extends south of Keil Rd) RSA length beyond Runway 17: 300' RSA length beyond Runway 35: 300' Runway 17 RSA end to fence: 1,747 Runway 35 RSA end to fence: 746'	No. Chapter 5 addresses these issues.
4.2	General	If the runway was lengthened as much as possible without expanding outside the current airport fence, what would be the new runway length and how long would the new 'safety zones' be?	Draft Chapter 5 shows an alternative that extends the runway, while keeping within the current Airport footprint. The appropriate RPZs and RSAs are shown in each alternative.	No. Chapter 5 addresses these issues.
4.3	General	Chapter 5 of the FAA Advisory Circular on Airport Master Plans talks about 'Environmental Considerations' and spends considerable time talking about noise pollution. It mentions noise levels as one of the three most common environmental concerns, talks about a noise compatibility planning program and noise overlay zones. When will this master planning exercise talk about noise? Hopefully it will be before a choice of "possible development alternatives" is made since that must surely be a factor in basing a decision.	Per the Scope of Work, noise contours are developed for Draft Chapter 5. Within Chapter 5 each alternative, including the no build alternative, will be shown with the noise contours. The FAA's Integrated Noise Modeling (INM) program is used to develop the contours. Additionally, an environmental overview for each alternative is given in Draft Chapter 5, wherein noise is an important component for analysis. The noise contours and subsequent analysis will assist decision-making for the "Preferred Alternative."	No. Chapter 5 addresses these issues.
4.4	General	Regarding the survey, it is interesting that of the 61 respondents only 10, or 16%, would publicly say that they have constrained operations. It is interesting also that these 10 operators are content to use KUAO, rather than move to Hillsboro or elsewhere, even though they claim to be constrained. It is also interesting that one operator claims to be about to purchase a new Citation X even though he knows that aircraft may be constrained. It makes one wonder why considerable taxpayer money may be expended to make these already happy operators even happier.	Two surveys were distributed for this planning project: Airport User Survey and Runway Length Survey. The responses you reference are from the Airport User Survey. This survey was distributed at FBOs on Airport and at nearby airports, and on the project website. Many of the respondents were operators of single engine, piston-driven aircraft that have vastly different needs than business jet users. The Runway Length Survey (Appendix I) was distributed to a targeted group identified by IFR flight records that would likely be constrained due to runway length. The runway length analysis identified 358 constrained annual operations based on those survey returns (this number will likely change, as more surveys continue to be returned), see page 4-13. Many factors are used by operators to determine where they base their aircraft - or operate in and out of - in addition to runway length (*i.e.* , location, hangar availability, etc.).	No

4.5	4-2	1st paragraph, talks again about the ARC being C-II. This claim is based on arbitrarily picking two years (2007 and 2009) and averaging them with the defense that one is the decade's highest activity year and 2009 is apparently the decade's lowest year. That is not a robust enough analysis to justify big changes in airport facilities at KUAO. And while we're on that topic, the fact that one operator talks about buying a Citation X surely cannot justify announcing it as the new, official, 'critical aircraft'.	The averaging of two years was a reasonable way to account for the extraordinary impact of the recession. We did not examine more than two years because tallying this information is very labor intensive. There are airports that upgrade their ARC based on forecasts only, without having already surpassed the 500 operations threshold as Aurora has. The ARC represents a family of aircraft and the representative aircraft chosen as the critical aircraft is the one in that ARC that uses Aurora the most. Since the forecast chapter was prepared, an Astra aircraft (ARC C-II) has based at Aurora. (The Astra was listed as the current critical aircraft in the forecast chapter, due to operations by transient aircraft.) Astras were introduced in the mid-1980s. The Citation X is a newer business jet model in ARC C-II and so is likely to remain in the business jet fleet longer than the Astra. If the Aurora tenant purchases a Citation X, the number of Citation X operations will increase considerably in the future from the number occurring now. The Citation X is neither the heaviest airplane using the airport nor the one needing the longest runway, as shown in Table 4E. Consequently, there is no need to fear that future airport design will be focused on that one aircraft. ODA has not yet decided to upgrade the airport from ARC B-II to ARC C-II and will not before considering the development alternatives that show both ARCs.	No
4.6	4-5	The table at the bottom of the page, I presume the hourly capacities mentioned for VFR and IFR are either /or, not additive? It is interesting that one respondent to your questionnaire says "---we have only a single runway which under normal economic conditions is close to the maximum traffic possible now."	Yes, the capacities are not additive, because weather is either visual or instrument. One user may feel the runway is close to maximum traffic, but examples of busier airports with one runway include McClellan-Palomar (Carlsbad, CA) with over 170,000 annual ops and Scottsdale with over 190,000 annual ops.	No
4.7	4-14	Runway Pavement Strength---currently 45,000lbs for dual wheel and taxiway currently 60,000lbs, so if mtow of ARC CII aircraft is more than 45,000lbs and they are using the runway, why is "the current strength rating adequate for the current runway length and using aircraft"?	As shown in Table 4E, not all ARC C-II aircraft have a maximum takeoff weight (MTOW) greater than 45,000 lbs (seven aircraft are shown to have MTOW's greater than 45,000 lbs, regardless of ARC). While this list is not all inclusive of business jets, it is representative of the common business jet fleet, which shows MTOWs can vary greatly. Rarely do aircraft operate at MTOW, due to constraints such as runway length or high ambient temperatures, nor do operators fill the fuel tanks completely if the flight does not require it for safe operations. As such, it is our analysis that because of constraints, such as runway length limitations, few operators will be able to take off with weights greater than 45,000 lbs. ODA, in some instances, has issued waivers for heavier aircraft to operate at the Airport. If the runway were extended, however, operators would be less constrained and more likely to put on more fuel, for instance, thus increasing the aircraft's weight and the need for the pavement strength to be increased. Even with increased pavement strength, operators are not likely to operate at MTOW.	Yes, clarification will be added as to why the current strength rating is adequate for the existing runway length and aircraft fleet.

4.8	4-17	1st bullet, if FAA approves this additional departure procedure will it (and a 90-degree left turn) become mandatory, even without a tower?	Departure procedures, unless flying under instrument flight rules (IFR), are not mandatory for aircraft operators. An air traffic control tower (ATCT) would be able to direct both IFR and visual flight rules (VFR) traffic on the departure procedures. The purpose of an ATCT is to provide aircraft separation and sequencing. Without an ATCT it is solely the pilot's discretion on how to operate safely.	Yes, clarification will be given.
4.9	4-17	3rd bullet, please explain “allow a back course approach”.	Runway 17 has a localizer approach. A "back course" approach would utilize the Runway 17 localizer to give approach guidance for Runway 35. See the drawing below. The hatched chevrons show the localizer, while the solid chevron represents the back course approach. Tracking the back course approach inbound gives reverse sensing unless the aircraft has an HSI (horizontal situation indicator) installed; meaning if the indicator shows course deflection to the left, the pilot would actually correct to the right to get back on the localizer course. For this to work at Aurora State, the distance measuring equipment (DME) associated with the localizer would require an upgrade. Utilizing a back course approach to Runway 35 would reduce the conflict of flight students practicing the Runway 17 localizer approach during calm wind conditions (Runway 35 is the preferred calm wind runway). 	Yes, clarification will be given.
		Nick Kaiser		
4.10	General	In the 2000 master plan update it was noted that the operations acoustical counts for 1997 were not totally accurate but the procedures would be improved for 1998. Were there acoustical counts taken in 1998 or beyond?	According to ODA records (http://www.aviation.state.or.us/Aviation/docs/RENSSummary94-02.pdf), four counts have occurred since the 1997 cycle. The results were: 1998-99 = 74,056 ops; 1999-2000 = 57,823 ops; 2001-02 = 58,479 ops; and 2002-03 = 62,926 ops. The RENS counts are estimates, based on seasonal acoustical samples. While procedures were improved, flaws with the RENS program are inherent (*i.e.* , aircraft noise not "triggering" the system, false-positives, etc).	No
4.11	4-7	How does the C II design standards affect land use outside the airport boundary if the RSA requirements goes from 300’ to 1000’ and the RPZ goes from 1000’ to 1700’? What can be built in the RSA and RPZ? Where do you start the measurement for the increased RSA and RPZ requirements?	If the RPZ extends off airport, the FAA recommends ODA acquire the property; however, in some cases avigation easements would be allowed. Regardless of ARC, the RPZ begins 200' beyond the runway end. While it is desirable to clear all objects from the RPZ some uses are permitted, provided they do not attract wildlife, are outside of the Runway object free area (OFA), do not allow assembly of people, do not allow bulk fuel storage, and do not interfere with navigational aids. If the RSA extends off airport, ODA would acquire the property. Table 4C shows the RSA length beyond runway end for ARCs B-II and C-II. The RSA must remain free of objects, except for objects that need to be located in the RSA because of their function (those objects higher than 3 inches above runway grade should be constructed on frangible mounted structures).	No. Chapter 5 addresses these issues.
4.12	4-10	Is there a category of mid size airplanes that could be applied to table 4D?	No. These are the categories included in FAA's design program.	No

4.13	4-18	Will wastewater land requirements be considered when the final land needs are identified for the various airport designs?	Wastewater land requirements for development needs on state-owned property will be identified in Chapter 5.	No. Chapter 5 addresses these issues.
4.14	4-26	(land use planning) The city of Aurora's comprehensive plan and vision plan have references to current and future airport opportunities and issues and should be reviewed in the master planning process. Also the City has an Urban Growth Boundary Coordination Agreement with Marion County that has a section on the Airport and surrounding lands as an Area of Mutual Concern.	These planning documents will be reviewed and included, as appropriate.	Yes. Documents cited in Chapter 2.
		Bruce Bennett		
4.15	General	Should the current weight restrictions of both based and visiting aircraft be mentioned in the length sections?	See response to 4.7.	No
4.16	General	Please be advised a 27,400 pound Hawker 800A s/n 2580055 (federal registration N855BC pending) has flown into Aurora and is based here until eventual sale, it is not now flyable but will be when registration is complete and US Airworthiness established and issued.	Noted.	No
4.17	General	I request the addition of the attachment to the master plan; this follows up on my comments at the last meeting and on my attempt to keep things in perspective. (attachment shown below)	The information will be included in an appendix of the Final Draft Master Plan Update.	No
4.18	4-11	Table 4E. JHRD does base their Citation CJ3 at UAO.	Noted, table will be corrected.	Yes
4.19	4-16	We do have precision instrument approaches (GPS 17 & 35) although with high (1 mile) visibility.	The Airport has LPV (localizer performance with vertical guidance) approaches, which are considered nonprecision.	No

Aurora Airport Relative Runway Length & Strength Comparison

Based on FAA Airport Facility Directory dated 18 NOV 2010
Compiled by Aurora Aviation December 13, 2010

Airport	MAX Strength	Runway Length
UAO- Aurora State	45K	5004
AST- Astoria	119K	5796
Baker	82K	5095
Bend		5200
Burns	90K	5100
Christmas Valley		5200
Toketee		5350
Corvallis	100K	5900
Cape Blanco	340K	5100
John Day		5220
Joseph		5200
K-Falls	230K	10301
LaGrande	130K	5600
Lakeview	109K	5306
Madras	180K	5089
McDermitt		5900
McMinnville	80K	5420
Newport	170K	5398
OTH- N. Bend	190K	5980
Ontario	50K	5011
PDT- Pendleton	210K	6301
TTD- Troutdale		5399
RDM- Redmond	200K	7038
RBG- Roseburg	88K	4602
Scappoose	90K	5100
Sunriver		5455
The Dalles		5097
Tillamook	125K	5001

		Roger Kaye (asked at the PAC #3 meeting)		
4.20	4-26	The zoning/planning discussion should be deferred to Chapter 5. If were to remain in Chapter 4, there could be conflicting data.	The recommendations given would remain, regardless of alternatives presented in Chapter Five, as they are broad and conform with State guidance given in the Oregon Aviation Plan.	No
		Nick Kaiser (submitted March 24, 2011)		
4.21	4-13	Constraints have increased from 358 to 473 and at the last PAC meeting it was said that it was now even higher. Does ODA have a way to verify these constraints?	Names, phone numbers, addresses, N numbers, and aircraft types can be verified through public records.	No
		City of Aurora		
4.22	4-24	Add text to the effect that public services/facilities should be planned in accordance with needs and capacities rather than be forced to respond to development as it occurs.	Chapter Four identifies facilities that would be required to meet the forecasted demand. Planning and the phasing of specific projects, including utilities, is more appropriate in later chapters of the Plan.	No
4.23	4-25	Under Utilities subheading, add text, "The City of Aurora has express concerns that additional groundwater wells or expansion of water facilities at the Aurora State Airport will have negative impacts upon the City's current water supply. Drinking water quality is also a concern for the City. Continued development and/or potential expansion of airport facilities without proper advanced planning and feasibility assessments regarding the airport's ability to meet water, sewer, and fire protection needs concerns the City.	Noted, text will be supplemented.	Yes
4.24	4-25	Under Utilities subheading, add text, "While it is not within the scope of the Airport Master Plan Update to collect data on surrounding properties and potential expansion of the airport boundary and whether expansion of the airport boundary would be able to provide adequate water or sanitary sewer service (septic or otherwise), the City has requested that the Master Plan Update provide additional documentation as to the adequacy of water, sewer, and other proposed utilities of existing facilities and within the existing airport boundary prior to adoption of the plan document. It is the City's position that adequate consideration of impacts to public facilities and services such as water, sanitary sewer, storm water, and traffic should be given as part of the Plan Update".	This request is outside of the Plan's Scope of Work. Issues relating to utilities will be addressed, as specific projects are identified.	No
4.25	4-5	Under Airfield Capacity: Reference should be made to the Airport Planning Rule here and the requirement that land use applicants should *show* that the proposed increased capacity and projections for flight growth/need *cannot* be reasonably accommodated in the existing airport boundary.	This section is relating to runway capacity; therefore, this addition would not be appropriate.	No

Aurora State Airport Master Plan Update - Comments Received on Draft Chapter Five

Comment #	Page #	Comments received from: Fred Netter, Dan Riches, Nick Kaiser, Tony Holt, City of Wilsonville, City of Aurora, Marion County, and Dave Waggoner	WHPacific Response	Will revisions to Chapter 5 be made based on comment?
		Fred Netter		
5.1	General	Since our role is safety and we strive to be "the safety experts", we place this as our number one concern. We support any proposals that enhance safety as well as protecting the other patrons of our district from economic hardship or undo inconvenience.	Noted.	No
5.2	General	After evaluating all of the proposals, we concluded that a fire facility consisting of two apparatus bays should be included in any plan, even the "no build". We believe this facility should be located by the airport water supply facility along Airport Rd. This location best serves ARFPD for accessibility and eliminates the problem of security. Since this facility is necessitated by airport use and business, it should be paid for by airport generated funding.	Noted, the Preferred Alternative will reserve land for a facility in the location supported by the ARFPD. Funding sources will be identified at a later time. As an Airport Rescue and Fire Fighting facility is not required at the Airport, funding from FAA or ODA is unlikely.	No
5.3	General	We would support the expansion of the runway both north and south as long it does not impinge on the use of private property, both farm and non farm, or result in increased response times or call volume for ARFPD without funding increases.	A runway extension has been shown to be infeasible at this time.	No
5.4	General	Necessary changes in area intersections and roadways must be part of any plan with a focus on safety.	Traffic impacts of proposed development will be evaluated as projects are defined.	No
		Dan Riches		
5.5	General	Columbia Helicopters supports modernization and possible extension of the … Airport runway to provide for a safer operating environment … however, it cannot support any proposal that would restrict business development of our property.	See response to #5.3.	No
		Nick Kaiser		
5.6	General	Need to correct the calm wind runway in chapter 5 pages 9 , 15 , 20.	Yes, these errors will be corrected.	Yes
5.7	5-2	ODA and FAA will establish departure procedures for both runway 35 and 17 to avoid flight over noise sensitive areas.	Runway 17 will be included in the text.	Yes
5.8	General	I still feel that the number of actual operations used, as base data in this study is too high. There should be an actual count made over the various seasons of the year to validate the number and type of operations.	See response to #3.19.	No
5.9	General	The number of operations for critical aircraft that exceeded 500 is still borderline.	See response to #3.25.	No
5.10	General	Constrained operations need to be further validated. The timing of implementing any alternative that is based on constrained operations should be looked at again after further study.	See response to #4.21.	No
5.11	General	There should be a category of airplanes that is used in the study that is medium size not just small and large. The study mix that includes medium size might show a better fit.	The aircraft called "large jets" in the noise input are actually medium-sized according to the industry (see Table 4A in Chapter Four).	No
5.12	General	The preferred alternative should not extend past the current airport boundary, including the RPZ.	Noted.	No
5.13	General	The weather is below 1 mile visibility a small % of the time so having an approach that is usable in lower visibility minimums might not be necessary.	Noted.	No

5.14	General	Calm Wind runway 35 has worked to help abate noise over populated areas and should be continued.	Agreed. See response to #5.6.	No
5.15	General	Having a control tower will help with Safety and Noise.	Noted.	No
5.16	General	In the short term no change in the airport (except for a run-up area for runway 17) is needed and should be adequate to accommodate planned business growth.	Noted.	No
5.17	General	A longer-term look could accommodate a build alternative like number 1 and still stay within the boundaries of the airport.	Noted.	No
5.18	General	All livability issues from the surrounding communities need to be considered when Airport development changes are planned and all long-term impacts are not thoroughly understood.	The planning team has tried to consider these needs, as outlined in the Goals and Issues section of the Master Plan.	No
5.19	General	How did you use the noise data from the 2002 noise study to help develop the noise contours for each alternative?	The 2002 noise data was utilized to determine the model aircraft type and the percentage of operations in a given group (i.e. turboprop, small prop, large prop, jets, and heli). The operations data from this older study was not used to determine the number of operations – just the group makeup. The same group composition (percents and aircraft) was used for each alternative, with the only change the operation numbers between existing conditions and the future conditions.	Yes
		Tony Holt		
5.20	General	Constrained Operations: Given the proviso that the FAA requires airport sponsors to document at least 500 annual itinerant aircraft operations before considering funding of a runway extension (Chapter 4, page 4-11), it is vitally important that proper and accurate documentation be provided by operators demonstrating past constrained operations. Simply sending surveys to based aircraft operators and a wide selection of non-based operators, including some aircraft brokers in California, and asking them how many constrained operations they estimate they have had (or even would have) at Aurora Airport, is insufficient and can lead to possible manipulation of the data. There needs to be a more rigorous attempt at accurate documentation from logbooks or other records. Given that more surveys were returned and mentioned at the last PAC meeting I believe this is a valid topic for Chapter 5.	See response to #4.21. The mailing list for the questionnaire was compiled from IFR records of aircraft that operated frequently at the Airport.	No
5.21	General	Predicted Noise Contours: It is notable that the maps shown as Exhibits 5E-5H have predicted (after a tower is installed and new departure rules are approved by the FAA) noise contours that stop short of Wilsonville City Limits. Clearly, the noise does not stop at the 55 dBA contour. The contours should continue northward to show what noise level is experienced over the City of Wilsonville, including that caused by landings on runway 17. The noise analysis was poorly explained at the last PAC meeting, in my view, and more time should be spent discussing the basis for the conclusions.	The FAA requires noise contours to the 65 dBA line be shown, we have shown contours to the 55 dBA line. The contours show an averaging of noise exposure and we acknowledge there may be noise events of the City of Wilsonville that exceed the average contour line.	No
		City of Wilsonville		
5.22	General	The Wilsonville City Council recognizes the Oregon Department of Aviation master planning obligations, and supports an Aurora State Airport Master Plan alternative that achieves the following outcomes:		
5.23	General	Improves management of aircraft approaching and departing Aurora State Airport that results in minimized noise and enhanced safety to the City of Wilsonville;	Noted.	No
5.24	General	Eliminates the need to expand the runway to the North in a way that impacts current facilities;	Noted.	No

5.25	General	Preserves foundation farmland by restricting future airport development to the property suitable for airport use and bounded by the Hubbard Cutoff to the West, Airport Road to the East, and Arndt Road to the North;	Noted.	No
5.26	General	Supports concurrency by recognizing surface transportation impacts on Airport Road resulting from future development and allowing for cooperation with Clackamas and Marion Counties on the scope and funding of any future improvements that may be required;	Noted.	No
5.27	General	Recognizes a preference for preserving the existing use of Keil Road.	Noted.	No
		City of Aurora		
5.28	5-2	When addressing demand, please specify whether land is public or private or a combination of both to meet hangar demand, aprons and aircraft parking, cargo apron, fuel tanks, etc. (bullets under "Landside Requirements")	As shown in the alternatives, the allocation of these items vary by alternative. Therefore, it would be inappropriate to allocate specific acreages.	No
5.29	5-3	It is my understanding that the Aurora Rural Fire Protection District has not yet identified the site for their new facilities and this was confirmed with the fire chief. While the fire district may have identified the need to park a vehicle at the airport, this distinction needs to be made. Also, please specify how much land is being dedicated/set aside for the fire district under Landside Requirements.	The acreage allocation will be added. ODA and the District acknowledge a specific site has yet to be determined. The alternative merely show areas that would be suitable.	No
5.3	5-3	3rd bullet from the top re: Airport Road. Improvements to Airport Road will occur as improvements occur and will require Traffic Impact Analysis (TIA) from Marion County. This bullet should be completely removed as it is not a statement of fact. ODA and private owners WILL BE required to work with Marion County and City of Aurora as improvements to Airport Road are REQUIRED as a result of development. Funding for improvements are based upon traffic impacts of development. I can provide suggested language from Marion County if requested.	Noted, section will be revised as appropriate.	Yes
5.31	5-3	2nd to last paragraph, please clarify whether the needs for 40 developable acres to meet demand includes: ODA land, private land, or a combination or both. This is clarified later in the text (pages 5-4) but it should be made clear from the beginning. Also include information regarding whether the 40 acres includes needs for water and sewer to accommodate this growth (i.e. Septic fields)	This paragraph states ODA only has nine developable acres, implying development will be a combination of private and public lands. The 40 acres includes allowances of 3 to 4 times the building floor or individual vehicle/aircraft parking area, to account for circulation, fire separation, inefficiency in layout, etc. Depending on how many facilities have plumbing, the land allowance may not be enough for septic fields.	Yes
5.32	5-3	2nd to last paragraph- Again, the Aurora Fire District has not identified a site for their new facility. Please remove reference to the Fire District facility.	See response to #5.29.	No
5.33	5-4	Includes the following statement, "Combining 9 acres of undeveloped State-owned property and 26 acres of undeveloped private property currently zoned for airport use this is a shortfall of approx. 5 acres… over the next 20 years…adjacent property is shown to be suitable for airport-related development. This area incorporates approximately 16 acres. This land, now used as a church camp…" Please explain how the adjacent lands cannot meet the need for 5 additional acres over the next 20 years.	We project a need for 40 acres of landside development over the next 20 years and 35 acres are available for development on either state-owned land or privately owned land that is zoned appropriately for airport use. To provide for the 5-acre shortfall, the church camp is the most suitable for converting to airport development, given its location. The explanation of our 40-acre projection begins on p. 4-18 of Chapter Four.	
5.34	5-4	"Development of private property, adjacent to the Airport, would be permitted-consistent with local and State regulations". This sentence does not provide an appropriate explanation of the land use constraints associated with rezoning EFU land to Public including application to Marion County for Oregon Planning Goal 3 exception. Language from Marion County should be requested and submitted here.	This statement is referring to the adjacent private property on-airport currently zoned as Public, which would be consistent with zoning. Clarification will be given that the No Build Alternative is only a no build for the state, private property (*i.e.* , Southend Airpark, Columbia Helicopter, etc) could still be developed. For the church camp property, a statement will be included to detail the Planning Goal exception.	Yes

5.35	5-5	"The runway extension would accommodate… Keil Road would be dead-ended". Please specify whether this Alternative would result in the loss of road access/frontage for any property owners along Keil Road.	Information will be added to text.	Yes
5.36	5-9	Alternative 2 Noise Contours should acknowledge that by moving closer to the City of Aurora and its surrounding communities would result in a significantly higher impact as the number of residential impacts is much higher than any other alternative since the City of Aurora is primarily residential in nature in the NW end of the city limits and UGB.	Text will include a statement that the 65 dBA contour line would incorporate more residential properties than the other build alternatives.	Yes
5.37	5-15	1st paragraph: Remove reference to the No Build Alternative not presenting noise concerns. The document has acknowledged that the No Build Alternative would still result in growth at the Airport, simply within the current land use boundary. As such, growth at the Airport will continue to have noise concerns/impacts of growth upon surrounding communities.	This statement relates to FAA thresholds of noise impact. A statement will be added that surrounding communities are concerned of the increased noise expected at the airport due to the increase in operations.	Yes
5.38	5-16	Please provide clarification on why avigation easements will be sought on residential lands but agricultural use lands will require acquisition. All lands south of the airport are EFU, some of which include residential uses along with their EFU zone. If the ODA is to pursue acquisition of some lands and only avigation easements over others, this needs to be explained in more detail. In addition, the document later references (on page 5-17) that the FAA may allow continuation of agricultural practices in the RPZ based upon the commodity produced. Whether or not property owners with EFU lands can pursue avigation easements rather than acquisition needs to be explained.	Please refer to the Preferred Alternative and the proposed plan for acquisition/easement within the RPZ.	No
		Marion County - Patti Milne		
5.39	General	An air traffic control tower at the airport can improve safety and reduce the impact of air traffic over residential properties in the area.	Noted.	No
5.40	General	A fire facility at the airport is necessary…	Noted.	No
5.41	General	Based on information provided throught the planning process, we favor an extension of the length of the runway and an increase in it's weight-dearing capacity to support safe and economically efficient airport operations.	Noted.	No
5.42	General	Marion County would support instrument upgrades that improve safety through improved technology.	Noted.	No
5.43	General	Marion County supports ODA's efforts to design departure procedures and designate a calm-wind runway…	Noted.	No
5.44	General	Marion County recognizes that Aurora State Airport is different from many airports in the state… Marion County encourages ODA as well as property owners in the Public Zone at the airport to continue working collaboratively with Marion County on landside development, zoning issues, and traffic impacts in the area outside the airport property.	Noted.	No
		Dave Waggoner		
5.45	General	Modify Build Alternative 1 (600' runway extension to the north) by adding a 400' Displaced Threshold.	Displaced thresholds and the use of "declared distances" (different runway lengths for different components of takeoff/landing) are not recommended at this Airport and they are not supported by the FAA for Aurora. Declared distances must be approved by the FAA. The FAA would rather invest in pavement that can be used for both landing and taking off, otherwise they are only getting half of the utility from their investment.	No

Aurora State Airport Master Plan Update - Comments Received at the Planning Advisory Committee (PAC) #4 Meeting

Comments received from PAC Members and the Audience that warrant further response/clarification	WHPacific Response
If the runway object free area (ROFA) extends, what will happen to the highway?	The highway would not be relocated. ODA would request the FAA to approve modifying the ROFA standard to allow the highway to remain. Recent conversations with the FAA indicate the request would likely be approved.
Have you considered what this project will do to the town of Aurora? Who needs this extension?	Yes, surrounding communities have been considered, including Aurora. The City of Aurora also has a seat on the PAC. As for the extension question, please refer to Appendix I.
Currently the flight plan/pattern is not followed, especially at night. Planes fly right over houses and shake the windows. Concerned about the future safety and who disciplines pilots who fly in no flight zones.	The flight pattern and noise abatement procedures are recommended, not required in most situations. The air traffic control tower will allow for better oversight of operations and sequencing of traffic.
Can we use the additional capacity at Salem Airport rather than expand Aurora?	While there may be unused capacity at Salem, users prefer to operate at Aurora.
What does it take to become a C-II Airport?	For the most part, the Airport already meets C-II design standards. Notable changes would be the increased runway object free area (ROFA) width and increased runway protection zone (RPZ) size.
Can alternative 1 become a C-II with all other elements remaining the same?	Yes, however, the ROFA, RPZ, and runway safety area (RSA) would have to increase in size.
Since we are already a volunteer fire station in Aurora, who will pay for a new fire facility?	We do not know. ODA could not obtain a grant from the FAA to pay for such a facility, since the Airport does not have airline service (therefore a fire facility is not required). Consequently, ODA would not be able to fund construction of the facility. ODA could lease land for the facility, however.
Can you request a modification to standards of the ROFA (on Highway 551) from the FAA?	Yes, see first response above.
Why do you need more clearance for a more precise approach?	A more precise approach allows landing in lower visibility conditions. Larger safety clearances increase the margin of safety - they account for the fact a pilot cannot see as far as in clear weather.
Has ODOT gotten onboard with road improvements, especially Keil Road?	ODOT has reviewed the alternatives, and has expressed concern over the possiblity of closing Keil Road.
If the current noise/flight pattern policy isn't being followed, why would a different policy be followed?	Efforts to educate pilots would continue and the air traffic control tower could provide oversight of operations.

Where is the money/funding for the project coming from?	No specific projects have been defined yet. For those projects eligible for FAA funding, the FAA could fund up to 95% of the project costs. The remaining responsibility would fall on the state or private developers (depending on the project).
Will there be any consideration for jet fumes in any of the future alternatives?	We see no appreciable difference in the alternatives regarding jet fumes. An environmental assessment for a runway improvement would look at air quality in more detail.
Who enforces the noise abatement procedures?	There is no enforcement; they are recommendations.
Will future zoning be amended due to the expanded noise footprint?	We do not know. The FAA and airport owners encourage local governments to make zoning around airports consistent with the FAA's aircraft noise/land use compatibility guidance. According to FAA guidance, any land use is normally compatible outside the 65 DNL noise contour. Guidance for land use compatibility inside the 65 DNL contour is in FAA Advisory Circular 150/5020-1, Noise Control and Compatibility Planning for Airports, Appendix 1.
What will be done to mitigate noise from maintenance on jet engines?	No mitigation is proposed at this time.

Fax : (503) 373-1688

Aurora State Airport Runway Length Questionnaire

1. Please list the aircraft currently operated by your company into the Aurora State Airport, along with the aircraft's tail number:
   PC-12NG N811DD
   LR-45 N75XP
2. What is the typical stage length for each of the aircraft listed above?
   PC-12 - 800 nm
   LR-45 - 1600 nm
3. What is the maximum stage length for each of the aircraft listed above?
   PC-12 1200 nm
   LR45 - 2100 nm
4. If aircraft operations at the Aurora State Airport are constrained (i.e., reduced payload for takeoff), identify those constraints:
   runway not long enough on hot days
   traffic congestion - safety issues
5. Identify the number of annual operations at the Aurora State Airport that require a runway extension (this can be a cumulative number based on constrained operations of multiple aircraft, if you have a fleet of various aircraft): 30-40
6. Does your insurance company require a minimum runway length for operations? ___ Yes X No
   a. If you responded Yes to #6, please provide a letter from your insurance company stating the minimum runway length requirement.
7. Do you currently operate at the Aurora State Airport? X Yes ___ No
   a. If you responded No to #7, can you assure that your company intends on operating at the Aurora State Airport, if a runway extension that meets your criteria is constructed?
   ___ Yes ___ No
8. Are there any other comments/suggestions you have for improving the Aurora State Airport?
   Control tower

Optional - Please provide your contact information, in the event we have follow-up questions for you:
Name: Bill Grabewich Company: Premier - Air

Fax: (503) 373-1688

Aurora State Airport Runway Length Questionnaire

1. Please list the aircraft currently operated by your company into the Aurora State Airport, along with the aircraft's tail number:
   CE-560 XL N567MC , PC-12/47E N52MW
   C-172 N943SP

2. What is the typical stage length for each of the aircraft listed above? NM = Nautical Miles SM = Statute Miles
   CE560 XL - 1800 NM (2071 SM)
   PC-12 800 NM (920 SM)

3. What is the maximum stage length for each of the aircraft listed above?
   CE 560 XL 1900 NM
   PC-12 1500 NM

4. If aircraft operations at the Aurora State Airport are constrained (i.e., reduced payload for takeoff), identify those constraints:
   During the summer on Hot days we are limited to less than a full gross weight take off because of too short of a runway. Also, Winter months cause us to operate out of Portland, OR because of runway too short.

5. Identify the number of annual operations at the Aurora State Airport that require a runway extension (this can be a cumulative number based on constrained operations of multiple aircraft, if you have a fleet of various aircraft):
   40 operations combined

6. Does your insurance company require a minimum runway length for operations? ____ Yes X No

   a. If you responded Yes to #6, please provide a letter from your insurance company stating the minimum runway length requirement.

7. Do you currently operate at the Aurora State Airport? X Yes ____ No

   a. If you responded No to #7, can you assure that your company intends on operating at the Aurora State Airport, if a runway extension that meets your criteria is constructed?
   ____ Yes ____ No

8. Are there any other comments/suggestions you have for improving the Aurora State Airport?
   #1, install a control tower, #2 lengthen runway to 6500 ft. #3, install an ILS precision approach.

   Please don't hesitate to contact me with any questions.

Optional - Please provide your contact information, in the event we have follow-up questions for you:

Aurora State Airport Runway Length Questionnaire

1. Please list the aircraft currently operated by your company into the Aurora State Airport, along with the aircraft's tail number:
   CJ3 N149WW

2. What is the typical stage length for each of the aircraft listed above?
   400 NM

3. What is the maximum stage length for each of the aircraft listed above?
   1,800 NM

4. If aircraft operations at the Aurora State Airport are constrained (i.e., reduced payload for takeoff), identify those constraints:
   During hot summer days we have to take less fuel and at times incurre a fuel stop.

5. Identify the number of annual operations at the Aurora State Airport that require a runway extension (this can be a cumulative number based on constrained operations of multiple aircraft, if you have a fleet of various aircraft): 7

6. Does your insurance company require a minimum runway length for operations? ____ Yes X No

   a. If you responded Yes to #6, please provide a letter from your insurance company stating the minimum runway length requirement.

7. Do you currently operate at the Aurora State Airport? X Yes ____ No

   a. If you responded No to #7, can you assure that your company intends on operating at the Aurora State Airport, if a runway extension that meets your criteria is constructed?
   ____ Yes ____ No

8. Are there any other comments/suggestions you have for improving the Aurora State Airport?
   My company is considering buying a larger aircraft that would benefit significantly from having a longer runway

Optional - Please provide your contact information, in the event we have follow-up questions for you:

Fax: (503) 373-1688

Aurora State Airport Runway Length Questionnaire

1. Please list the aircraft currently operated by your company into the Aurora State Airport, along with the aircraft's tail number:
   Cessna Citation CE-650 N896RJ

2. What is the typical stage length for each of the aircraft listed above?
   900 + miles

3. What is the maximum stage length for each of the aircraft listed above?
   1500 N.M. if conditions are perfect at Aurora. In summer we cannot takeoff full fuel & Pax.

4. If aircraft operations at the Aurora State Airport are constrained (i.e., reduced payload for takeoff), identify those constraints:
   We are currently limited on take off weight due to runway length. This is especially critical in summer.

5. Identify the number of annual operations at the Aurora State Airport that require a runway extension (this can be a cumulative number based on constrained operations of multiple aircraft, if you have a fleet of various aircraft):
   30 +

6. Does your insurance company require a minimum runway length for operations? ____ Yes __X__ No

   a. If you responded Yes to #6, please provide a letter from your insurance company stating the minimum runway length requirement.

7. Do you currently operate at the Aurora State Airport? __X__ Yes ____ No

   a. If you responded No to #7, can you assure that your company intends on operating at the Aurora State Airport, if a runway extension that meets your criteria is constructed?
   ____ Yes ____ No

8. Are there any other comments/suggestions you have for improving the Aurora State Airport?
   Our current aircraft is limited due to current runway length. We are changing aircraft to a larger model. The new model will be restricted more than the current aircraft. We would be able to operate safely with full fuel at a 7000' runway.

Optional - Please provide your contact information, in the event we have follow-up questions for you:

Subject: Re: Aurora State Airport

Follow Up Flag: Follow up
Flag Status: Flagged

Hi Sarah,

We are looking at a Citation X. We need to go non-stop to the east coast and Bahamas.
We are currently restricted with our current aircraft due to runway length requirements being to short for fuel loads required for the long trips.
When we get the Citation X, we will be more restricted. This of course means wasted time for fuel stops and extra costs involved.
During the summer months we cannot take off from Aurora without making a fuel stop for any trip over two hours.
We conduct on average 12-15 operations per month. Figure about 150-175 operation as a minimum per year.
I hope this information helps. If you need anything else from me, just let me know.
Thank-you,
Tod Coombs

Subject: Aurora State Airport

Mr. Coombs,

I am writing this email as a follow-up to a survey you completed for the Aurora State Airport Master Plan Update last winter regarding runway length. Due to financial constraints the project was put on hold, but now we are proceeding once again.

In the survey response you mention that you are currently constrained in your operations at UAO, but that constrained operations would be increasing as the company intends to purchase a more demanding aircraft. What type of aircraft is it that you are looking to purchase? What is your estimate for future constraints with this new aircraft? Also, you mention that current constrained operations are 30+: how many total operations per year do you conduct at UAO?

If you could assist me with these follow-up questions I would be greatly appreciative.

If you have any questions, please do not hesitate to contact me.

Oregon

Aurora State Airport Runway Length Questionnaire

1. Please list the aircraft currently operated by your company into the Aurora State Airport, along with the aircraft's tail number: ASTRA JET | N41AL

2. What is the typical stage length for each of the aircraft listed above? 6000 feet of Runway, TRIPS OF 500-2000 N.M.

3. What is the maximum stage length for each of the aircraft listed above? 2500 N.M.

4. If aircraft operations at the Aurora State Airport are constrained (i.e., reduced payload for takeoff), identify those constraints: ON OCCASION I would need to take more fuel to Be able to Fly nonstop, however, the Runway is too short for Full Fuel & payload.

5. Identify the number of annual operations at the Aurora State Airport that require a runway extension (this can be a cumulative number based on constrained operations of multiple aircraft, if you have a fleet of various aircraft): 50 Take OFFS & Landings

6. Does your insurance company require a minimum runway length for operations? ____ Yes X No

   a. If you responded Yes to #6, please provide a letter from your insurance company stating the minimum runway length requirement.

7. Do you currently operate at the Aurora State Airport? X Yes ____ No

   a. If you responded No to #7, can you assure that your company intends on operating at the Aurora State Airport, if a runway extension that meets your criteria is constructed?
   X Yes ____ No

8. Are there any other comments/suggestions you have for improving the Aurora State Airport? LONGER RUNWAY By at least 1000 feet. 1500 feet would Be ideal.

   With increasing traffic a control tower would be a great addition!

Aurora State Airport Runway Length Questionnaire

1. Please list the aircraft currently operated by your company into the Aurora State Airport, along with the aircraft's tail number:
   __N900TG___Falcon900B_____

2. What is the typical stage length for each of the aircraft listed above? _____Average 1500miles._____

3. What is the maximum stage length for each of the aircraft listed above? _____3400 miles_____

4. If aircraft operations at the Aurora State Airport are constrained (i.e., reduced payload for takeoff), identify those constraints: ____Reduced payload for longer flights. We have a 46,500 lb max takeoff weight. Limited to 45,000 dual wheel weight restriction for runway. We also run into performance issues at the higher weights with runway length. An extra 1000 ft would help our operation. _____

5. Identify the number of annual operations at the Aurora State Airport that require a runway extension (this can be a cumulative number based on constrained operations of multiple aircraft, if you have a fleet of various aircraft):
   _____5_____

6. Does your insurance company require a minimum runway length for operations? ____ Yes __x__ No

   a. If you responded Yes to #6, please provide a letter from your insurance company stating the minimum runway length requirement.

7. Do you currently operate at the Aurora State Airport? _x___ Yes ____ No

   a. If you responded No to #7, can you assure that your company intends on operating at the Aurora State Airport, if a runway extension that meets your criteria is constructed?
      ____ Yes ____ No

8. Are there any other comments/suggestions you have for improving the Aurora State Airport?
   _____We are for the Control Tower for safety management with the increase in operations particularly with the growing number of larger jet aircraft.
   _____
   _____

Aurora State Airport Runway Length Questionnaire

1. Please list the aircraft currently operated by your company into the Aurora State Airport, along with the aircraft's tail number:
   IAI ASTRA N777AM, CIRRUS N769PC

2. What is the typical stage length for each of the aircraft listed above?
   1.0 HOUR, 0.7 HOURS

3. What is the maximum stage length for each of the aircraft listed above?
   4.5 HOURS, 2.5 HOURS

4. If aircraft operations at the Aurora State Airport are constrained (i.e., reduced payload for takeoff), identify those constraints:
   REDUCED PAYLOAD FOR T/O AND LDG

5. Identify the number of annual operations at the Aurora State Airport that require a runway extension (this can be a cumulative number based on constrained operations of multiple aircraft, if you have a fleet of various aircraft):
   15-20 DEPARTURES ANNUALLY

6. Does your insurance company require a minimum runway length for operations? ___ Yes [X] No

   a. If you responded Yes to #6, please provide a letter from your insurance company stating the minimum runway length requirement.

7. Do you currently operate at the Aurora State Airport? [X] Yes ___ No

   a. If you responded No to #7, can you assure that your company intends on operating at the Aurora State Airport, if a runway extension that meets your criteria is constructed?
   ___ Yes ___ No

8. Are there any other comments/suggestions you have for improving the Aurora State Airport?
   OUR COMPANY HEADQUARTERS ARE IN WILSONVILLE. WE ROUTINELY DEPART WITH 6-8 PASSENGERS, ESPECIALLY IN SUMMER. WE PURCHASE ALOT OF FUEL @ AURORA AND ARE LIMITED BY RUNWAY LENGTH FOR MANY DEPARTURES - ESPECIALLY IN SUMMER MONTHS.

Aurora State Airport Runway Length Questionnaire

1. Please list the aircraft currently operated by your company into the Aurora State Airport, along with the aircraft's tail number:
   EMB-135BJ AC90, AC95 LR-35A, CL-601-3A/R
   N53NA, N543LG, N544LG, N115WF, N71AR, N83WA

2. What is the typical stage length for each of the aircraft listed above?
   EMB - 3400, AC90 = N/A, AC95 = N/A, LR-35A = 3300, CL601 = 4000
   (ALL NUMBERS ARE ESTIMATES)

3. What is the maximum stage length for each of the aircraft listed above?
   EMB = 7600 AC90 = N/A AC95 = N/A, LR-35A = 8300, CL601 = 9000
   (ALL NUMBERS ARE ESTIMATES)

4. If aircraft operations at the Aurora State Airport are constrained (i.e., reduced payload for takeoff), identify those constraints:
   ~~N/A~~ DURING SUMMER MONTHS NO JET CAN TAKE OFF UNDER 135 REQUIREMENTS WITH FULL PAYLOAD / FUEL

5. Identify the number of annual operations at the Aurora State Airport that require a runway extension (this can be a cumulative number based on constrained operations of multiple aircraft, if you have a fleet of various aircraft):
   BEST GUESS: ≈ 50 / YEAR

6. Does your insurance company require a minimum runway length for operations? ____ Yes ✓ No

   a. If you responded Yes to #6, please provide a letter from your insurance company stating the minimum runway length requirement.

7. Do you currently operate at the Aurora State Airport? ✓ Yes ____ No

   a. If you responded No to #7, can you assure that your company intends on operating at the Aurora State Airport, if a runway extension that meets your criteria is constructed?
   ____ Yes ____ No

8. Are there any other comments/suggestions you have for improving the Aurora State Airport?
   UPDATED TAXIWAY MARKINGS.

Aurora State Airport Runway Length Questionnaire

1. Please list the aircraft currently operated by your company into the Aurora State Airport, along with the aircraft's tail number: ___CL-604, CL-601, G200

2. What is the typical stage length for each of the aircraft listed above? __2 to 4 hours_____

3. What is the maximum stage length for each of the aircraft listed above? _____6 – 8 hours_____

4. If aircraft operations at the Aurora State Airport are constrained (i.e., reduced payload for takeoff), identify those constraints: __reduced passenger load due to runway length, possible diversion upon arrival if rain due to runway lenght_____

5. Identify the number of annual operations at the Aurora State Airport that require a runway extension (this can be a cumulative number based on constrained operations of multiple aircraft, if you have a fleet of various aircraft):
___once a month_____

6. Does your insurance company require a minimum runway length for operations? ____ Yes _X___ No

    a. If you responded Yes to #6, please provide a letter from your insurance company stating the minimum runway length requirement.

7. Do you currently operate at the Aurora State Airport? _X___ Yes ____ No

    a. If you responded No to #7, can you assure that your company intends on operating at the Aurora State Airport, if a runway extension that meets your criteria is constructed?
    ____ Yes ____ No

8. Are there any other comments/suggestions you have for improving the Aurora State Airport?
___Our policy manual and me the director of operations make restrictions that apply to this shorter type runway. It also is very hard to plan for our executives since we never know if we can land in UAO since the possibility of rain is high in Oregon. If we arrive into that area and the runway is wet we would have to divert to PDX costing our passenegr a major delay and possible missing the meetings they are flying out there for. One event like that and my orders will be never to fly into there again. I know it sounds odd, but if I plan the drive from PDX then the passneger will not miss the meeting. Don't forget, the type passneger that is on this airplane "IS" the reason for the meeting and many people are awaiting her arrival.__DON'T FORGET THE MAIN REASON YOU SHOULD DO THIS IS FOR INCREASED SAFETY MARGIN FOR ALL!

Oregon

Aurora State Airport Runway Length Questionnaire

1. Please list the aircraft currently operated by your company into the Aurora State Airport, along with the aircraft's tail number:
   Our company currently does not operate from KUAO.
   We do however occassionly operate from KHIO, KADX and KMFR
   GLOBAL EXPRESS, N881WT and GULFSTREAM 550, N885WT
2. What is the typical stage length for each of the aircraft listed above?
   4500 NM
3. What is the maximum stage length for each of the aircraft listed above?
   N881WT 5700 NM
   N885WT 6100 NM
4. If aircraft operations at the Aurora State Airport are constrained (i.e., reduced payload for takeoff), identify those constraints:
   Fuel limited by maximum Takeoff weight allowable at KUAO
5. Identify the number of annual operations at the Aurora State Airport that require a runway extension (this can be a cumulative number based on constrained operations of multiple aircraft, if you have a fleet of various aircraft):
   We currently do not operate from KUAO due to location and runway length.
6. Does your insurance company require a minimum runway length for operations? ____ Yes X No
   a. If you responded Yes to #6, please provide a letter from your insurance company stating the minimum runway length requirement.
7. Do you currently operate at the Aurora State Airport? ____ Yes X No
   a. If you responded No to #7, can you assure that your company intends on operating at the Aurora State Airport, if a runway extension that meets your criteria is constructed?
   ____ Yes ____ No Not yet considered. Would have to evaluate.
8. Are there any other comments/suggestions you have for improving the Aurora State Airport?
   Our flight department has never operated from Aurora State Arpt.
   If the runway extension were to equal or exceed the KHIO runway 12/30
   facility, we would possibly consider operations from KUAO
   occassionally.

Fax (503) 373-1688

Aurora State Airport Runway Length Questionnaire

1. Please list the aircraft currently operated by your company into the Aurora State Airport, along with the aircraft's tail number:
Currently N/A due to runway length. We operate two Challengers - N601RC and 605RC as well as one Hawker 800XP - N800RC

2. What is the typical stage length for each of the aircraft listed above?
6000 NM each

3. What is the maximum stage length for each of the aircraft listed above?
N601RC - 3000 NM, N605RC - 4000 NM,
N800RC 2700 NM

4. If aircraft operations at the Aurora State Airport are constrained (i.e., reduced payload for takeoff), identify those constraints:
Reduced max T.O. weight resulting in additional fuel stop to return to destination (Essex). Unable to use when runway contaminated

5. Identify the number of annual operations at the Aurora State Airport that require a runway extension (this can be a cumulative number based on constrained operations of multiple aircraft, if you have a fleet of various aircraft):
If runway extended - would use 12-15 Times/year

6. Does your insurance company require a minimum runway length for operations? ____ Yes X No

   a. If you responded Yes to #6, please provide a letter from your insurance company stating the minimum runway length requirement.

7. Do you currently operate at the Aurora State Airport? ____ Yes X No

   a. If you responded No to #7, can you assure that your company intends on operating at the Aurora State Airport, if a runway extension that meets your criteria is constructed?
   X Yes ____ No

8. Are there any other comments/suggestions you have for improving the Aurora State Airport?

Optional - Please provide your contact information, in the event we have follow-up questions for you:

Name: Evan McBride Company: Rockwell Collins

Aurora State Airport Runway Length Questionnaire

1. Please list the aircraft currently operated by your company into the Aurora State Airport, along with the aircraft's tail number:
   A300F5 CL-30

2. What is the typical stage length for each of the aircraft listed above?
   600 nm

3. What is the maximum stage length for each of the aircraft listed above?
   2,200 nm

4. If aircraft operations at the Aurora State Airport are constrained (i.e., reduced payload for takeoff), identify those constraints:
   restricted operations on West Runway for departures

5. Identify the number of annual operations at the Aurora State Airport that require a runway extension (this can be a cumulative number based on constrained operations of multiple aircraft, if you have a fleet of various aircraft):
   6

6. Does your insurance company require a minimum runway length for operations? ✓ Yes ____ No

   a. If you responded Yes to #6, please provide a letter from your insurance company stating the minimum runway length requirement. Variable based on 90% scenario

7. Do you currently operate at the Aurora State Airport? ✓ Yes ____ No

   a. If you responded No to #7, can you assure that your company intends on operating at the Aurora State Airport, if a runway extension that meets your criteria is constructed?
   ✓ Yes ____ No

8. Are there any other comments/suggestions you have for improving the Aurora State Airport?
   We are unable to use 100 about 30% of the time due to runway restrictions

Optional - Please provide your contact information, in the event we have follow-up questions for you:

Name: Ken Doubet
Company: Kap Air
Phone: 206-913-1063
E-Mail: [illegible]

Aurora State Airport Runway Length Questionnaire

1. Please list the aircraft currently operated by your company into the Aurora State Airport, along with the aircraft's tail number: ASTRAJET 1125 / N41AU

2. What is the typical stage length for each of the aircraft listed above?
800 N.M.

3. What is the maximum stage length for each of the aircraft listed above?
2200 N.M.

4. If aircraft operations at the Aurora State Airport are constrained (i.e., reduced payload for takeoff), identify those constraints:
Not able to top off Fuel & passengers for some mission Because we are Restricted for weight for Runway length!

5. Identify the number of annual operations at the Aurora State Airport that require a runway extension (this can be a cumulative number based on constrained operations of multiple aircraft, if you have a fleet of various aircraft).
48 take off / year average.

6. Does your insurance company require a minimum runway length for operations? ___ Yes X No

   a. If you responded Yes to #6, please provide a letter from your insurance company stating the minimum runway length requirement.

7. Do you currently operate at the Aurora State Airport? X Yes ___ No

   a. If you responded No to #7, can you assure that your company intends on operating at the Aurora State Airport, if a runway extension that meets your criteria is constructed?
   ___ Yes ___ No

8. Are there any other comments/suggestions you have for improving the Aurora State Airport?
LONGER RUNWAY WOULD BE MUCH APPRECIATED!

Aurora State Airport Runway Length Questionnaire

1. Please list the aircraft currently operated by your company into the Aurora State Airport, along with the aircraft's tail number: None because the runway is too short. We operate a Citation Encore. Jet N550PF

2. What is the typical stage length for each of the aircraft listed above? Hour and 30 min.

3. What is the maximum stage length for each of the aircraft listed above? Six hours

4. If aircraft operations at the Aurora State Airport are constrained (i.e., reduced payload for takeoff), identify those constraints. The runway is to short to even consider

5. Identify the number of annual operations at the Aurora State Airport that require a runway extension (this can be a cumulative number based on constrained operations of multiple aircraft, if you have a fleet of various aircraft): We would consider using it 10 times a year

6. Does your insurance company require a minimum runway length for operations? ____ Yes __X__ No

   a. If you responded Yes to #6, please provide a letter from your insurance company stating the minimum runway length requirement

7. Do you currently operate at the Aurora State Airport? ____ Yes __X__ No

   a. If you responded No to #7, can you assure that your company intends on operating at the Aurora State Airport, if a runway extension that meets your criteria is constructed?
   __X__ Yes ____ No

8. Are there any other comments/suggestions you have for improving the Aurora State Airport?
   Just make the runway longer

Optional - Please provide your contact information, in the event we have follow-up questions for you.

From: CROWNOVER Don R [Don.R.CROWNOVER@odot.state.or.us]
Sent: Wednesday, November 03, 2010 4:31 PM
To: Anderson, Rainse; CUMMINGS Christopher * ODA; WILSON John P * ODA
Subject: RE: Aurora airport counts [auto-ip][senderbase]

All; I applied factors to the counts to estimate a annual average daily traffic (AADT) at the sites. These should be taken with a great plus or minus. The AADT is derived by multiplying the count ADT by a seasonal factor by an axle factor. The count ADT is just the average from the seven days it was counted. The seasonal factor is just an adjustment based on our nearby Hubbard automatic traffic recorder (ATR) that is a ratio of that count week to the year (in this case a rolling year from Nov 2009 to Oct 2010, because 2010 is not yet complete. That factor was 0.97. The axle factor adjusts for the fact that the counter just sees every two axles as a vehicle. Since there were few trailers that we saw, I just applied an axle factor of 0.99. Since all that is such a long shot, I also rounded as much as I could get away with. The chart below presents the sites in clockwise order around the airport. If you have any questions, please let me know. Don

Site ID	Description	Count ADT	Estimated Annual ADT	Peak Hour
21127	Columbia North Exit	106	100	37

Subject: RE: Aurora airport counts

Don,

Thanks for the data. Could you let me know what other reports you can provide....also I assume that these number are total axle counts so at a minimum they are one half of the total correct?

Thanks

Rainse

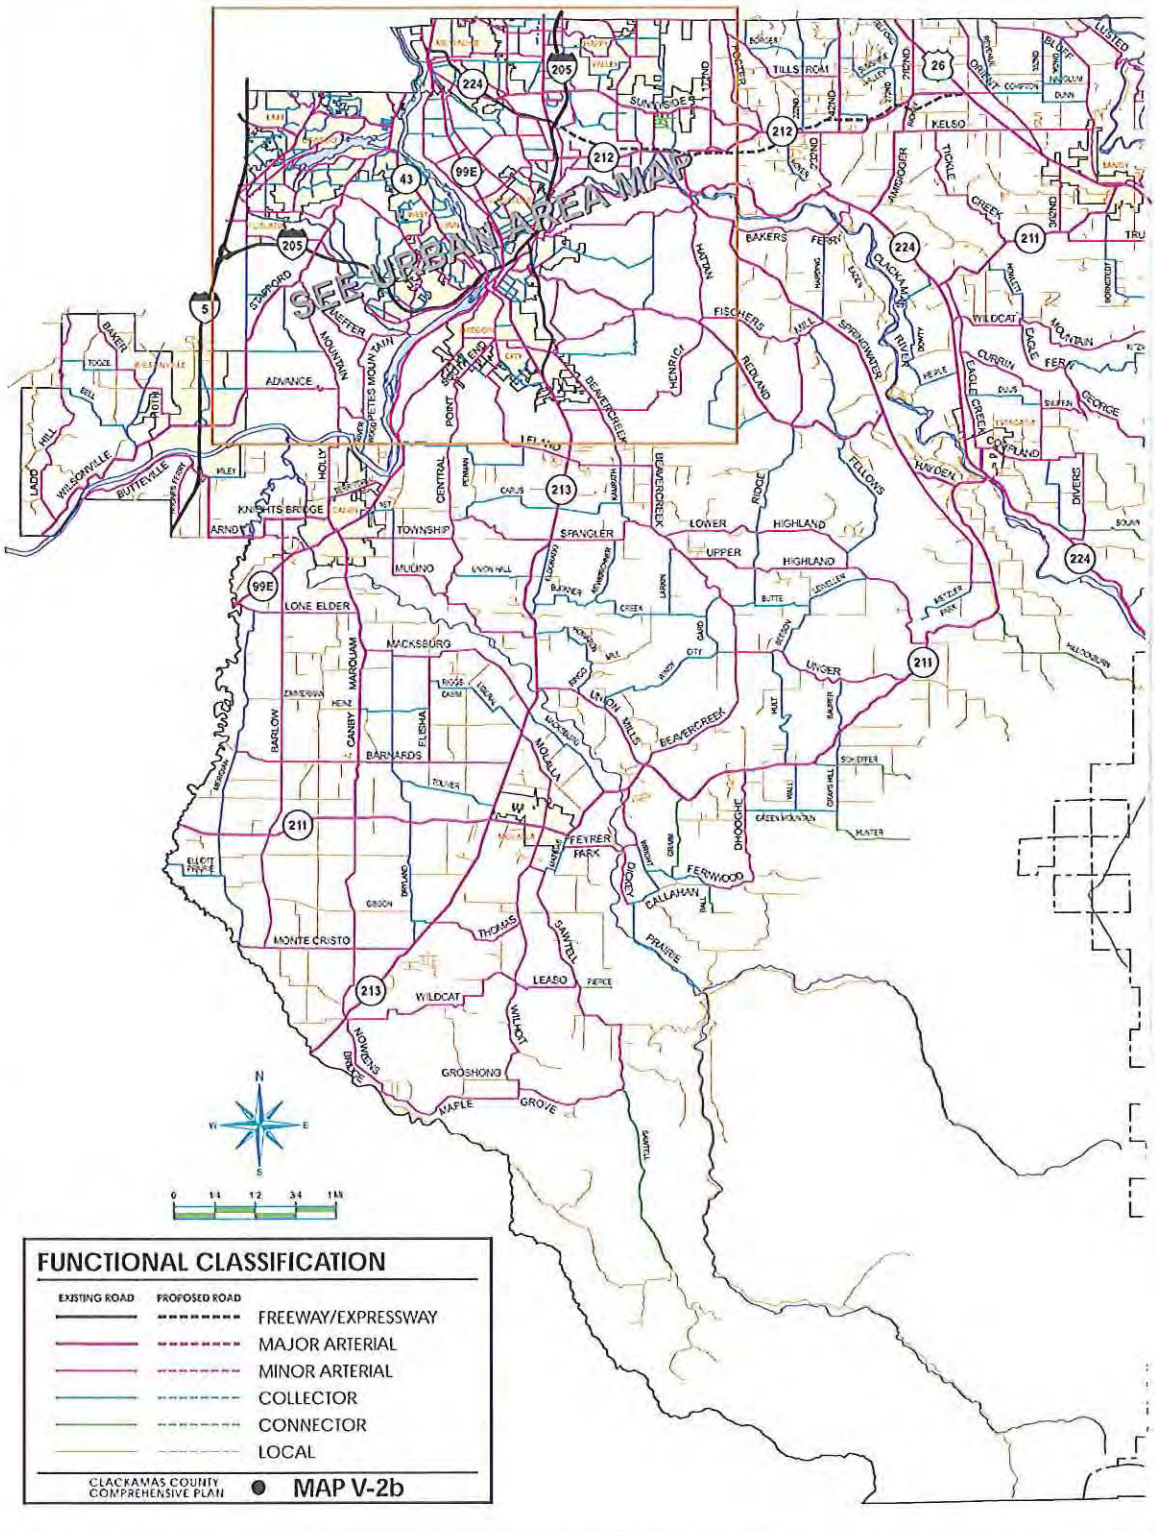
Rural Road Functional Classification Characteristics

Principal Arterial
- Continuous segments with trip length and travel density indicative of statewide or interstate travel; and
- Serve all of the large urban areas and most of the moderate sized cities.

Arterial
- Link cities, larger towns, and other major traffic generators; and provide interstate and inter-county service: and
- Spaced such that all developed areas of the region are within reasonable distance of an arterial; and
- Serve a higher travel density, trip length, and overall travel speed than collector and local systems.

Major Collector
- Provide service to larger towns not directly served by higher classed roads and to other traffic generators of equivalent intra-county importance (including parks, tourist attractions, significant resource areas, etc.); and
- Link these places with nearby towns and cities, or routes of higher classification; and
- Serve the more important intra-county travel corridors.



Minor Collector
- Spaced at intervals to collect traffic from local roads and bring all developed areas within a reasonable distance of a collector road; and
- Provide service to any remaining smaller communities and traffic generators; and
- Link locally important traffic generators with their local constituents.

Local
- Primarily provide access to adjacent lands; and
- Provide relatively short travel distances compared to higher classed facilities.

The original (1998) RTSP included a list of roadways and their functional classification. As part of this 2005 Update, some changes are being made as shown in **Table 5-2**, which better reflect the current and future function of each roadway.

FUNCTIONAL CLASSIFICATION GUIDELINES

Classification	Number of Traffic Lanes	Purpose	Access Impacts	Examples
Freeway Expressway	4-8	Serves Interregional and Intrareginal Trips. Carries heavy volume at high speed.	Freeways and expressways are intended to move traffic and not provide direct access to land use activities. Access to these facilities will be from other arterials.	I-205 Milwaukie Expressway
Major Arterial	3-7 Urban 2-4 Rural	Carries local and through traffic to and from destinations outside local community, connects cities and rural centers. Moderate to heavy volume, moderate to high speed.	Direct Access to major arterials will be limited. Access should be restricted to major generators.	Sunnyside Road Boones Ferry Road Highway 26
Minor Arterial	2-5	Connects collectors to higher order roadways. Carries moderate volume at moderate speed.	Direct access will be limited, however to a lesser degree than major arterials. The number and location of driveways should be controlled.	Oatfield Road Beavercreek Road Borland Road

Classification	Number of Traffic Lanes	Purpose	Access Impacts	Examples
Collector	2	Principle carrier within neighborhoods or single land use areas. Links neighbor-hoods with major activity centers and arterials. Generally not for through traffic. Low to moderate volume; low to moderate speed. New collectors should intersect minor arterials rather than major arterials.	Collectors provide access to abutting land and to the arterial system. Access to individual parcels is usually allowed.	Roethe Road Welches Road Pilkington Road
Connector	2	Collects traffic from and distribute traffic to local streets within neighborhoods or industrial districts. Usually longer than local streets. Low traffic volumes and speeds. Primarily serves access and local circulation functions. Not for through traffic	Connectors provide direct access to abutting properties	Risley Ave Harold Ave Pleasant Ct
Local	2	Provides access to abutting property and connects to higher order roads. New local roads should intersect collectors or, if necessary, minor arterials.	Local streets provide direct access to abutting properties. Adjacent land is normally residential.	Blanton Street Windy City Road La Bonita Way

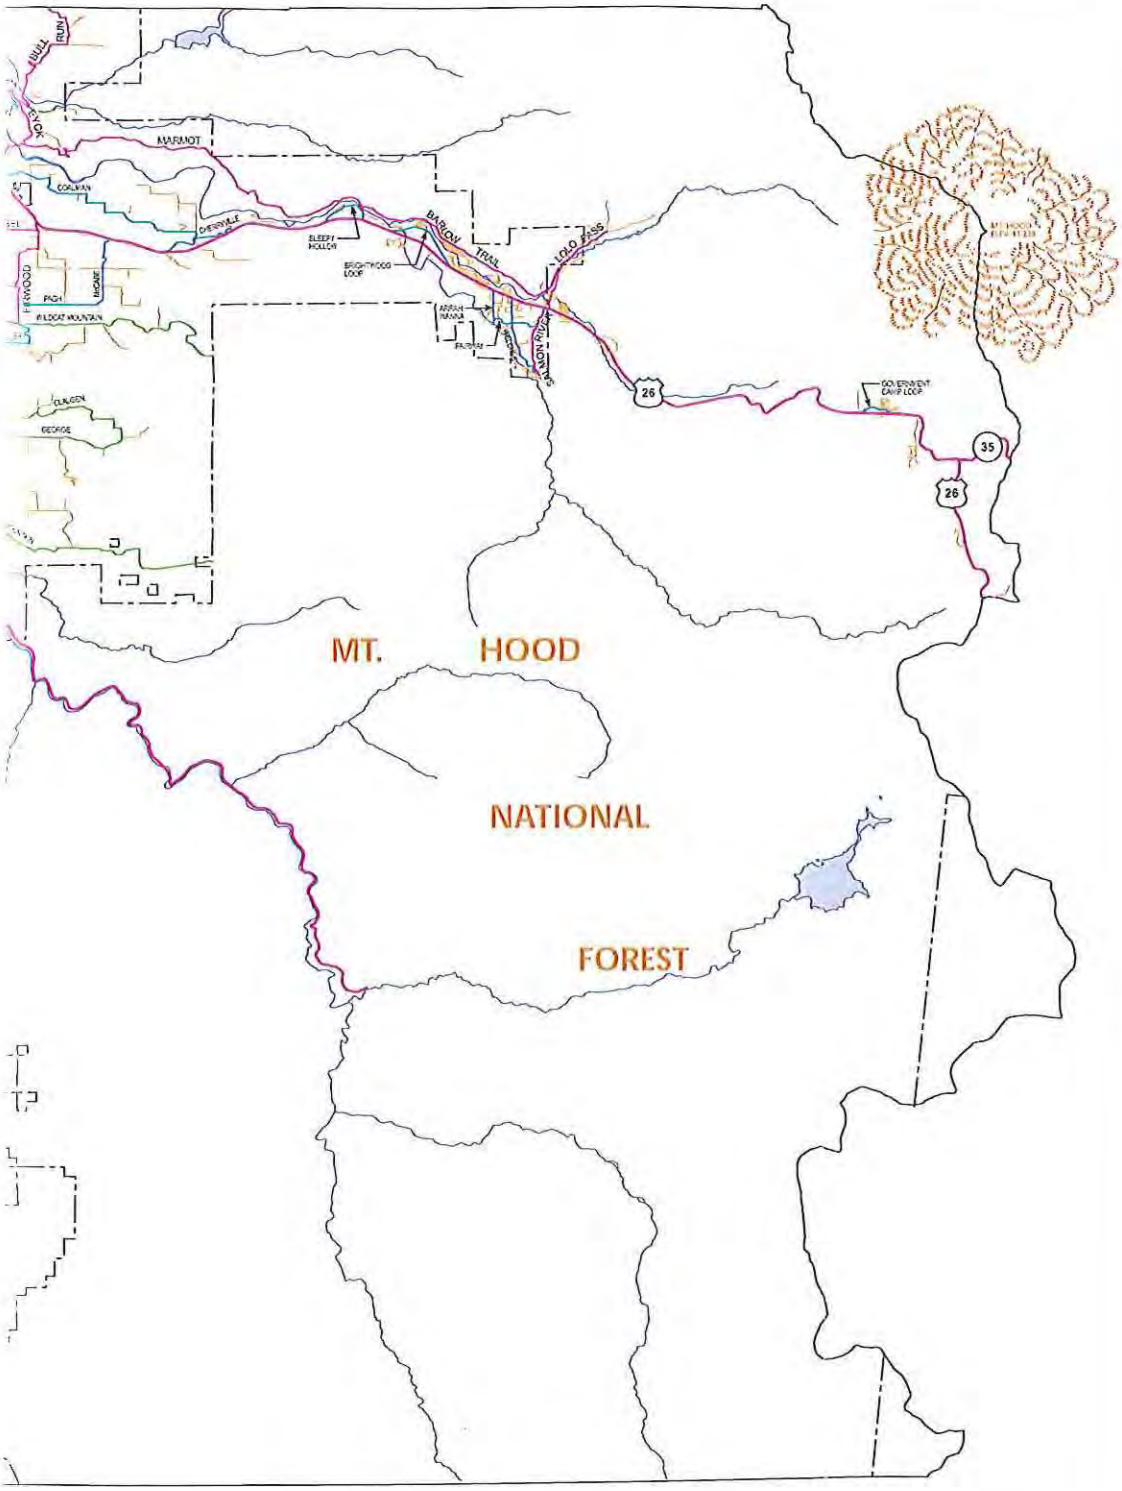


Table V-3
Clackamas County
Roadway Classifications and Guidelines (Continued)

Roadway Classifications and Guidelines (continued)						
FUNCTIONAL CLASSIFICATION	NUMBER OF TRAFFIC LANES	MINIMUM RIGHT-OF-WAY WIDTH*	PAVED WIDTH	SIDEWALK/ PATHWAY (1/17/08)	BIKWAYS	LANDSCAPE STRIP**
Freeway/ Expressway	4 to 8	Defer to Federal and State Standards	Defer to Federal and State	No	No	Defer to Federal and State
Major Arterial	3 to 7 Urban 2 to 4 Rural	60'-125' More if needed for terrain, turn lanes or heavy volume	36'-98'	Yes In urban areas only	Yes	Yes In urban areas
Minor Arterial	2 to 5	60' – 115'	36' – 90'	Yes In urban areas only	Yes	Yes In urban areas
Collector	2 to 3	60' – 85' Less if volume and land use density are low and terrain allows	32' – 61'	Yes In urban areas only	Yes	Yes In urban areas
Connector	2	55'	28' – 34' Residential 28' – 40' Industrial	Yes In urban areas only	If ROW allows	Yes In urban areas
Local	2	40' – 50'	28'	Yes***	No	Yes In urban areas
Alley	2	16'	16'	No	No	No

* - Preferred dimensions are not adjusted for adjacent land uses; additional right-of-way may be required for slope, sign, sidewalk and utility easements.

** - Required unless acquiring right-of-way is impractical due to wetlands, topographic conditions, resource protection, or preexisting development patterns.

*** - Sidewalks are required on all new streets within the Urban Growth Boundary and when development or redevelopment occurs on existing streets. (1/17/08)

I. EXECUTIVE SUMMARY

DEVELOPMENT DESCRIPTION

A zone change and conditions use application are required for development of the proposed Helicopter Transport Services facility. The site is currently zoned Exclusive Farm Use (EFU) and the proposed zone is Public (P). An airport use is a conditional use in the Public zone. It has been determined the zone change from EFU to P does not result in an increase in trip potential, so only the condition use application is addressed for conditions at buildout of the site.

The Helicopter Transport Services facility is a repair station for the company's helicopters. The company's helicopters are located around the world at different sites, and generally are brought back to this maintenance facility once a year in the late fall for major overhaul and repair during the winter months. After a several month overhaul and repair, the helicopters, pilot crews, mechanics, and fuel tank drivers, then return to service in the spring to specific locations based on contract needs for firefighting services with the company's clients. Thus, the activities within the facility are all related to helicopter maintenance. In addition, there is supporting administrative and management activities for the helicopter maintenance operation.

During the fire season, which runs from May through October/November, only support staff remain in the building, with an estimate of up to 30 employees working an 8:00 am - 5:00 pm shift. During the off-season, running from November through April, employment at the building will increase to up to 70 employees.

The site plan and access locations are still in development. Access will be provided to Keil Road, and will comply with Marion County access and spacing standards.

MAJOR FINDINGS

Trip generation estimates for the Helicopter Transport Services facility were prepared using the Institute of Transportation Engineers *Trip Generation*, Land Use – 110 (General Light Industrial) based on the anticipated peak seasonal 70 employees. A total of 211 daily, 34 AM peak hour and 36 PM peak hour trips are anticipated. Truck trips are expected to be less than 30 per day.

The intersection of OR 551 with Ehlen Road does not currently meet ODOT standards of v/c 0.70. The addition of site trips does not decrease the v/c in the critical PM peak hour. Improvements are planned, as noted in the Draft 2010-2013 STIP (key number 16121), to include building left turn lanes on Ehlen Road and a traffic separator to limit Boones Ferry to right turns. The Marion County 2005 Rural Transportation Plan, Table 8-5 also identifies improvements that are needed at the OR intersection.

- The Airport Road/Ehlen Road intersection is expected to operate at a level of service "F" in 2010 PM peak hour conditions regardless of site development, which is below Marion County standards. AM peak hour operation would remain at level of service "C". The City of Aurora is considering adding a traffic signal at this intersection in their TSP.

Queuing calculations were prepared for the OR 551 intersections in accordance with ODOT standards using SimTraffic software. The addition of trips from the proposed Helicopter Transport Services facility has little impact on the anticipated queue lengths at the study intersections. Long queues are currently experienced on the Ehlen Road eastbound approach to OR 551, cansed by the lack of a dedicated left turn lane. Both ODOT and Marion County have identified the need for dedicated left turn lanes, which would address the long queues currently occurring.

- Traffic signal warrants presented in the Manual on Uniform Traffic Control Devises were reviewed for the intersection of Ehlen Road with Airport Road, specifically Warrants 1 – Eight Hour Vehicular Volume, 2 – Four Hour Vehicular Volume, and 3 – Peak Hour. ODOT's sixteen hour volumes were used as a basis for review of the eight and four hour warrants. With the addition of site trips, Warrants 1 and 2 not met, and Warrant 3 is just met. Based on this analysis, a traffic signal is not recommended at this time.

  The need for right and left turn lanes at the study area intersections was reviewed using ODOT's turn-lane criterion. Right turn volumes on OR 551 at Keil Road will not meet ODOT's Right Turn Lane Criterion for either AM or PM peak hours.

  No left turn lanes are provided on OR 551 at the intersection with Keil Road. Given the high through volume on the highway, the left turn lane criterion is met with only 10 left turns in an hour. The criterion is met with existing AM peak hour volumes, but not with the PM peak hour volumes for the southbound left turn movement.

- The need for a left tnrn lane was also reviewed on Ehlen Road at the intersection with Airport Road, where no turn lanes are currently provided. The ODOT left turn criterion is met for both the Pre-Development AM and PM peak hour conditions.

MITIGATION MEASURES PROPOSED

With improvements already identified for the intersections of Ehlen Road with OR 551 and Airport Road, and costs that would exceed the proportionate impacts of the Helicopter Transport Services facility, it is recommended the project contribute a proportionate share of planned improvements.

II. INTRODUCTION

This transportation impact analysis has been prepared to support the proposed zone change and Conditional Use Permit for the 126,000 square foot Helicopter Transport Services facility in Aurora, Oregon. The site is currently zoned Exclusive Farm Use (EFU) and the proposed zone is Public (P). An airport use is a conditional use in the Public zone. The subject area is bound by the Aurora Airport to the west, vacant land to the north, Keil Road to the south, and Airport Road to the east. Figure 1 is a vicinity map indicating the property location.

PROJECT DESCRIPTION

The site is approximately 27.48 acres and is identified by Assessor's Map Township 4 Range 1W Section 11 Tax Lot 100 and Township 4 Range 1W Section 12b Tax Lot 400. There are currently two dwelling units on the property.

The Helicopter Transport Services facility is a repair station for the company's helicopters. The company's helicopters are located around the world at different sites, and generally are brought back to this maintenance facility once a year in the late fall (November) for major overhaul and repair during the winter months. After a several month overhaul and repair, the helicopters, pilot crews, mechanics, and fuel tank drivers, then return to service in the spring (April/May) to specific locations based on contract needs for firefighting services with the company's clients. Thus, the activities within the facility are all related to helicopter maintenance. Such use generally includes airframe, rotor, engine, electronics, and radio repair items. In addition, there is supporting administrative and management activities for the helicopter maintenance operation.

During the fire season, which runs from May through October/November, only support staff remain in the building, with an estimate of up to 30 employees working an 8:00 am - 5:00 pm shift. During the off-season, running from November through April, employment at the building will increase to up to 70 employees.

Site access is proposed to Keil Road at several locations. The number and location of access points will be refined based on site conditions and will comply with Marion County access and spacing standards. Figure 2 attached is the preliminary site plan.

SCOPE OF REPORT

As identified in our March 17, 2009 scope letter to Marion County, the zone change from EFU to P does not result in an increase in trip potential. For this reason, only the condition use application is addressed for conditions at buildout of the site.

Due to the project location, both the Marion County and the Oregon Department of Transportation (ODOT) have jurisdiction over certain study area intersections. Based on the March 17, 2009 scope letter, May 14, 2009 trip generation letter and conversations with County staff, the analysis study area includes the following intersections as well as the site access to Keil Road:

MACKENZIE

ODOT
- OR 551/Keil Road
- OR 551/Ehlen Road

Marion County
- Airport Road/Keil Road
- Airport Road/Ehlen Road

Analysis was conducted for the AM and PM peak hour for the following scenarios:

- 2009 Existing
- 2010 Pre-Development
- 2010 Post-Development

All correspondence is included in the appendix.

III. EXISTING CONDITIONS

TRANSPORTATION FACILITIES

The following summarizes the study area roadway classifications and descriptions:

TABLE 1 – ROADWAY CHARACTERISTICS						
Roadway	ODOT/City Classification	Posted Speed	Travel Lanes	Bike Lanes	On-Street Parking	Sidewalks
OR 551	Rural Arterial – Regional Hwy	50	2	No	No	No
Ehlen Road	Arterial	35/55	2	No	No	No
Airport Road	Major Collector	35/55	2	No	No	No
Keil Road	Local Road	25	2	No	No	No

Currently, the OR 551/Ehlen Road intersection is signalized. The other intersections are stop controlled for the minor street approach.

Figure 3 illustrates study area intersection existing lane configurations and traffic controls.

EXISTING TRAFFIC COUNTS

Traffic volume data was either collected at the study intersections between 7 AM – 9 AM and 4 AM – 6 PM in April, 2009 or agency supplied. Sixteen hour counts for the intersection of Ehlen Road/Airport Road were conducted by ODOT in 2008 and were used in review of signal warrants for that intersection.

Turning movement counts for OR 551 were not conducted in the peak month (August); therefore, a 3.2% seasonal volume adjustment was made using the 2008 Seasonal Trend Table, in accordance with ODOT standards. Calculations and raw count data are included in the appendix.

Figures 4A and 4B present 2009 intersection traffic volumes including the seasonally adjusted volumes on OR 551.

PLANNED PUBLIC IMPROVEMENTS

ODOT

The Draft 2010-2013 STIP (key number 16121) indicates improvements are scheduled to begin in 2012 at the OR 551/Ehlen Road intersection. Identified improvements include building left turn lanes on Ehlen Road and a traffic separator to limit Boones Ferry to right turns.

Marion County

The Marion County 2005 Rural Transportation Plan, Table 8-5 also identifies improvements are needed at the OR 551/Ehlen Road intersection. Potential improvements may include "*Left Turn Lane on Ehlen; possible realignment; possible traffic signal at Boones Ferry coordinated with State Highway signal*".

City of Aurora
The City of Aurora is currently in the process of a TSP update with public hearings scheduled for July 2009. According to City and County staff, a recommendation for a signal at the Ehlen Road/Airport Road intersection is expected to be included in the TSP.

CRASH ANALYSIS

When evaluating relative intersection safety, consideration is given to the total number and types of crashes occurring and the number of vehicles entering the intersection. This leads to the concept known as "crash rate", usually expressed in terms of the number of crashes occurring per one million vehicles entering the intersection (mev). Intersections having a crash rate less than 1.0/mev are generally considered relatively safe and with crash rates higher than 1.0/mev, consideration may be given to correcting operational problems.

Crash data for the study area intersections were provided by the ODOT Crash Analysis and Reporting Unit (CARU) for January 2003 through December 2007. The following table represents calculated crash rates at the study intersections for the five-year data period. Annual traffic entering the intersections was estimated by multiplying the average daily traffic (ADT) entering the intersection by 365. ADT was estimated by multiplying the intersection PM peak hour volumes by a factor of 10, which coincides with volumes found in the 2007 Oregon State Flow Map.

TABLE 2 – CRASH DATA

Intersection	2004	2005	2006	2007	2008	Total	Crash Rate
OR 551/Keil Road	2	5	1	4	1	13	0.72
OR 551/Ehlen Road	4	2	10	8	7	31	1.09
Airport Road/Keil Road	0	0	0	0	0	0	0.00
Airport Road/Ehlen Road	1	0	0	2	0	3	0.14

All study intersections have crash rates below the 1.0 mev threshold with the exception of the OR 551/Ehlen Road intersection, with a crash rate of 1.09/MEV.

The OR 551/Ehlen Road intersection is currently listed in the ODOT Highway Safety Improvement Program (HSIP) Top 5% Report. The report describes the problem as 43% of crashes turning related, with angle and rear-end type crashes also. It noted the Boones Ferry Road intersection approximately 260 feet to the west causing issues with back to back left turns and traffic backing up through the highway. It lists potential remedies as designated left turn lanes on Ehlen Road and a traffic separator restricting turn movements to and from Boones Ferry Road. The Draft 2010-2013 STIP (key number 16121) indicates improvements are scheduled to begin in 2012. A copy of the HSIP page is located in the appendix.

GROUP MACKENZIE

IV. PRE-DEVELOPMENT CONDITIONS

IN-PROCESS TRAFFIC VOLUMES

In-process traffic volumes are generated by approved projects not yet complete at the time of this analysis. County Staff has stated there are no significant in-process projects to be included in the analysis.

BACKGROUND TRAFFIC GROWTH

Background growth is general traffic growth not related to specific projects. These volumes represent anticipated growth in the project area over the planning period. Individual neighborhoods and streets may have higher growth rates in the short term, but the overall growth rate is averaged over the planning period.

The background traffic growth rate was based on the Marion County Rural Transportation Systems Plan (RTSP) and Automatic Traffic Recorder (ATR) 24-016 data. The RTSP, Table 6-2, included in appendix, presents anticipated 2025 daily traffic volumes. Growth rates for the study area roadways range from 1.8% to 2.5%.

ATR 24-016 is located 0.22 miles south of Ehlen Road on OR 551. Being near the study area and on the major study area roadway, this ATR is a fair representation of traffic growth in the area. The ATR data presents daily traffic volumes for years 1998-2007. The 10 year growth rate is 2.0% and the 5 year growth rate is 1.0%.

For the purposes of this study a conservative 2.5% growth rate was used for all future year analyses. Figures 5A and 5B illustrates one year of background traffic growth volumes for the AM and PM peak hour.

PRE-DEVELOPMENT TRAFFIC VOLUMES

Pre-Development traffic volumes are the sum of existing traffic volumes and background traffic growth. Figures 6A and 6B presents the 2010 Pre-Development volumes in the AM and PM peak hours.

V. SITE DEVELOPMENT

TRIP GENERATION

The Helicopter Transport use is best categorized using Institute of Transportation Engineers *Trip Generation,* Land Use – 110 (General Light Industrial). Based on the anticipated operation for Helicopter Transport, it is more appropriate to estimate trips based on employees than on building size. For purposes of this analysis, the higher winter employee estimate has been used to provide a "worst case" scenario. Based on discussions with County staff, average trip rates for the peak hour of the generator will be used in the trip generation estimates.

The anticipated trip generation is presented in the following table based on the number of employees.

TABLE 3 – TRIP GENERATION

Land Use (Code)	Employees	ADT	AM Peak Hour			PM Peak Hour		
			Total	Enter	Exit	Total	Enter	Exit
Light Industrial (110)	70	211	34	28	6	36	8	28

The proposed facility is anticipated to generate an additional 211 ADT, 34 AM and 36 PM peak hour trips. Truck trips are expected to be less than 30 per day.

TRIP DISTRIBUTION AND TRAFFIC ASSIGNMENT

Trip distribution and traffic assignment were based on a review study area traffic patterns and engineering judgment. In general, 30% of site trips are anticipated to travel north on OR 551, 10% south on OR 551, 20% both west and east on Ehlen Road, and 10% east on Arndt Road. Figures 7A and 7B illustrate trip distribution and traffic assignment for the AM and PM peak hours, respectively.

POST-DEVELOPMENT TRAFFIC VOLUMES

Post-Development traffic volumes are the sum of Pre-Development and proposed development traffic volumes. Figures 8A and 8B illustrate the 2010 Post-Development traffic volumes for the AM and PM peak hour, respectively.

VI. INTERSECTION AND ROADWAY ANALYSIS

OPERATION ANALYSIS DESCRIPTION

Intersection operation characteristics are generally defined by two measurements: volume-to-capacity (v/c) ratio and level-of-service (LOS). ODOT uses v/c ratio and the County uses LOS and delay to determine intersection performance. Since both agencies have roadways within the project impact area, both measurements are included in the analysis.

V/c ratio is a measurement of capacity used by a given traffic movement for an entire intersection. It is defined by the rate of traffic flow or traffic demand divided by the theoretical capacity. Based on the 1999 Oregon Highway Plan (OHP), OR 551 is a Regional Highway. The OHP requires a maximum v/c ratio of 0.70 be maintained on OR 551 at the study area intersections.

LOS is a measure of the average control delay (in seconds) experienced by drivers at an intersection and is described by a letter on the scale from 'A' to 'F'. LOS 'A' represents optimum operating conditions and minimum delay. LOS 'F' indicates over capacity conditions causing unacceptable delay. LOS 'D' is considered the acceptable minimum by Marion County (Marion County Department of Public Works Transportation Impact Analysis (TIA) Requirements).

PEAK HOUR FACTOR

The peak hour factor (PHF) is used to determine the design hour flow rate and is defined as the ratio of total hourly flow to the peak flow rate within the hour. For analyses contained in this report, 15-minute time increments are used to measure intersection approach volumes; therefore, the PHF is the total hourly volume of all approaches divided by 4 times the peak 15-minute total approach volume. As roads approach capacity, their peak hour factors approach 1.0.

PHFs were calculated for all study area intersections. For the 2010 analysis year, PHFs were assumed to remain consistent with existing 2009 PHFs. PHF calculations are included on the volume summary sheet.

OPERATION ANALYSIS

Operation analysis was conducted for the AM and PM peak hours using Synchro software and the Highway Capacity Manual Methodologies, and following ODOT's Analysis Procedures Manual. The following scenarios were analyzed:

- 2009 Existing
- 2010 Pre-Development
- 2010 Post-Development

In accordance with ODOT standards for areas outside the Portland MPO a saturation flow rate of 1,750 passenger cars per hour of green per lane was used in the analysis. This is consistent with Marion County's standard of 1,800 unless justified by a measurement at that location.

Calculation results are summarized in the following tables. Calculation sheets from the Synchro analysis are included in the appendix.

TABLE 4 – INTERSECTION OPERATIONS										
Intersection	Time Period	2009 Existing			2010 Pre-Development			2010 Post-Development		
OR 551/Keil Road	AM	22.7	0.26	C	23.7	0.27	C	24.9	0.30	C
	PM	31.8	0.28	D	33.7	0.30	D	35.6	0.36	E
OR 551/Ehlen Road	AM	30.0	0.74	C	32.0	0.76	C	32.6	0.77	C
	PM	32.5	0.81	C	35.1	0.83	D	35.6	0.83	D
Airport Road/Keil Road	AM	10.6	0.02	A	10.7	0.02	A	10.7	0.03	A
	PM	10.7	0.09	A	10.8	0.09	B	11.1	0.13	A
Airport Road/Ehlen Road	AM	17.0	0.14	C	17.5	0.15	C	17.9	0.15	C
	PM	46.7	0.75	E	53.6	0.80	F	59.0	0.84	F
Keil Road/Site Access	AM	-	-	-	-	-	-	8.7	0.01	A
	PM	-	-	-	-	-	-	8.8	0.03	A

Signalized/Unsignalized Criteria: Delay-v/c-LOS (unsignalized v/c reported for the critical movement)

The Keil Road approach to OR 551 is anticipated to operate at a 0.36 v/c and a level of service "E" with the addition of site trips. This is consistent with ODOT and Marion County standards for an unsignalized intersection.

The OR 551/Ehlen Road intersection does not meet ODOT's mobility standard of a 0.70 v/c, with an anticipated 0.83 in the PM peak hour pre-development scenario. The addition of site trips does not change the v/c, so no mitigation is required with the project. Both ODOT and Marion County have identified that dedicated left turn lanes are needed at this intersection to improve safety and capacity; identified on ODOT's Draft 2010-2013 STIP .

The Airport Road/Keil Road intersection will continue to operate at a level of service "A" with the addition of site trips.

The Airport Road/Ehlen Road intersection is expected to operate at a level of service "F" in 2010 PM peak hour conditions regardless of site development. AM peak hour operation would remain at level of service "C". The City of Aurora is considering adding a traffic signal at this intersection in their TSP. The project is expected to add 15 PM peak hour trips or a 1.3% increase over existing volumes.

For purposes of this analysis, one access was assumed to Keil Road. The number and locations of site accesses has yet to be determined.

QUEUING ANALYSIS

Queuing calculations were prepared for the OR 551 intersections in accordance with ODOT standards using SimTraffic software. The following table presents the queuing results at each of the study intersections.

TABLE 5 – QUEUE LENGTHS (FEET)								
Intersection	Approach	Movement	2009		2010			
			Existing		Pre-Development		Post-Development	
			AM	PM	AM	PM	AM	PM
OR 551/ Keil Road	EB	Lt, Th, Rt	75	50	50	50	75	75
	WB	Lt, Th, Rt	25	75	50	75	50	75
	NB	Lt, Th, Rt	25	25	25	25	50	25
	SB	Lt	50	25	50	25	75	25
OR 551/ Ehlen Road	EB	Lt, Th, Rt	975	2100	1500	2025	1300	2150
	WB	Lt, Th, Rt	375	300	550	300	300	275
	NB	Lt	125	100	125	75	125	75
		Th	350	275	375	575	425	275
		Rt	50	25	75	25	50	25
	SB	Lt	100	325	75	325	75	300
		Th	175	675	175	750	175	625
		Rt	100	200	100	200	100	200
Airport Road/ Keil Road	EB	Lt, Rt	25	50	25	50	50	50
	NB	Lt	25	0	0	0	0	0
Airport Road/ Ehlen Road	EB	Th, Rt	75	75	75	50	100	75
	SB	Lt, Rt	50	175	75	175	75	175

The addition of trips from the proposed Helicopter Transport Services facility has little impact on the anticipated queue lengths at the study intersections. Long queues are currently experienced on the Ehlen Road eastbound approach to OR 551, caused by the lack of a dedicated left turn lane. Both ODOT and Marion County have identified the need for dedicated left turn lanes, which would address the long queues currently occurring.

SIGNAL WARRANT ANALYSIS

The City of Aurora is currently considering including a traffic signal at the intersection of Ehlen Road with Airport Road in their TSP. Traffic signal warrants presented in the Manual on Uniform Traffic Control Devises were reviewed for this intersection with the post-development traffic volumes. Specifically, Warrants 1 – Eight Hour Vehicular Volume, 2 – Four-Hour Vehicular Volume, and 3 – Peak Hour were reviewed.

For Warrant 1 – Eight Hour Vehicular Volume, ODOT's 16 hour counts were used in the review. The count was conducted in 2008, so two years of background growth were added to the hourly volumes to estimate conditions in 2010, and 10 trips were added to both the minor and major streets (this is a worst case estimate as only 15 PM peak hour trips are added). The volume threshold is only met for three hours for both conditions A and B of the warrant. This warrant is not met, as eight hours must meet the volume thresholds.

Warrant 2 - Four-Hour Vehicular Volume was also reviewed using ODOT's 16 hour counts and the addition of background growth and site traffic. As shown on the warrant figure in the appendix, only three of the hours meet the volume standards. This warrant is not met.

The peak hour warrant was reviewed using PM peak hour volumes for the post-development scenario. The warrant is just met as shown in the attached figure.

With Warrants 1 and 2 not met with development of the site trips, and Warrant 3 just met, a signal is not recommended at this time.

Copies of the warrant worksheets and volume summaries are included in the appendix.

TURN LANE WARRANT ANALYSIS

The need for right and left turn lanes at the study area intersections was reviewed using ODOT's turn-lane criterion.

No right turn lane is currently provided on OR 551 at Keil Road northbound. With development of the site, volumes will not meet ODOT's Right Turn Lane Criterion for either AM or PM peak hours. ODOT's right turn figure is included in the appendix.

No left turn lanes are provided on OR 551 at the intersection with Keil Road. Given the high through volume on the highway (over 900 AM and 1200 PM vehicles per hour in both directions), the left turn lane criterion is met with only 10 left turns in an hour. Pre-development conditions include 23 AM peak hour. The addition of site trips increases the AM left turn volume to 29 trips. The PM volumes are only 6 left turns in the pre-development scenario, and 8 left turns with the addition of site trips. Only the AM peak hour volume meets the Left Turn Lane Criterion.

The need for a left turn lane was also reviewed on Ehlen Road at the intersection with Airport Road, where no turn lanes are currently provided. The ODOT left turn criterion is met for both the pre-development AM and PM peak hour conditions.

PEDESTRIAN AND BICYCLE

None of the roadways within the study area have striped bike lanes or sidewalks. A paved shoulder is currently provided on Ehlen Road.

VII. MITIGATION

The intersections of Ehlen Road with OR 551 and Airport Road currently do not meet operating standards even without the proposed Helicopter Transport Services facility. The project will add less than 2% to these intersections and have little impact above the pre-development conditions. Both intersections have improvements identified, including a traffic signal at Airport Road and dedicated left turn lanes at Ehlen Road. A warrant analysis indicates a traffic signal is not needed with the addition of site trips.

Existing traffic volumes at the intersection of OR 551 meet ODOT's left turn criterion for the AM peak hour. The site will add to the southbound left turn movement, increasing from the existing 22 to 29 left turns.

Costs for all of the identified future improvements would likely exceed the proportionate impacts of the Helicopter Transport Services facility. Therefore, it is recommended that the project contribute a proportionate share of planned improvements.

VIII. SUMMARY

This transportation impact analysis has been prepared to support the proposed zone change and Conditional Use Permit for the 126,000 square foot Helicopter Transport Services facility in Aurora, Oregon. The site is currently zoned Exclusive Farm Use (EFU) and the proposed zone is Public (P). An airport use is a conditional use in the Public zone. The 27.48 acre site is bound by the Aurora Airport to the west, vacant land to the north, Keil Road to the south, and Airport Road to the east. There are currently two dwelling units on the property.

As identified in our March 17, 2009 scope letter to Marion County, the zone change from EFU to P does not result in an increase in trip potential. For this reason, only the condition use application is addressed for conditions at buildout of the site. Both Marion County and the Oregon Department of Transportation (ODOT) have jurisdiction over study area intersections. This analysis addresses requirements of both jurisdictions. Analysis was conducted for the AM and PM peak hour for the 2009 Existing, 2010 Pre-Development and 2010 Post-Development.

The Helicopter Transport Services facility is a repair station for the company's helicopters. The company's helicopters are located around the world at different sites, and generally are brought back to this maintenance facility once a year in the late fall for major overhaul and repair during the winter months. After a several month overhaul and repair, the helicopters, pilot crews, mechanics, and fuel tank drivers, then return to service in the spring to specific locations based on contract needs for firefighting services with the company's clients. Thus, the activities within the facility are all related to helicopter maintenance. In addition, there is supporting administrative and management activities for the helicopter maintenance operation.

During the fire season which runs from May through October/November, only support staff remain in the building, with an estimate of up to 30 employees working an 8:00 AM -5:00 PM shift. During the off-season, running from November through April, employment at the building will increase to up to 70 employees.

The site plan and access locations are still in development. Access will be provided to Keil Road, and will comply with Marion County access and spacing standards.

Traffic volume data was either collected at the study intersections between 7 AM – 9 AM and 4 AM – 6 PM in April 2009, and sixteen hour counts for the intersection of Ehlen Road/Airport Road were conducted by ODOT in 2008. A seasonal volume adjustment was made to OR 551 volumes using the 2008 Seasonal Trend Table, in accordance with ODOT standards.

Improvements are planned at the OR 551/Ehlen Road intersection, as noted in the Draft 2010-2013 STIP (key number 16121), to include building left turn lanes on Ehlen Road and a traffic separator to limit Boones Ferry to right turns. The Marion County 2005 Rural Transportation Plan, Table 8-5 also identifies improvements are needed at the OR 551/Ehlen Road intersection. Potential improvements may include "*Left Turn Lane on Ehlen; possible realignment; possible traffic signal at Boones Ferry coordinated with State Highway signal*".

The City of Aurora is currently in the process of a TSP update with public hearings scheduled for July 2009. According to City and County staff, a recommendation for a signal at the Ehlen Road/Airport Road intersection is expected to be included in the TSP.

Crash data for the study area intersections were reviewed to determine crash rates. Only the intersection of OR 551 with Ehlen Road has a crash rate above 1.0 crashes per million entering vehicles, as has been noted in the ODOT Highway Safety Improvement Program (HSIP) Top 5% Report. The planned left turn improvements are expected to address the high crash rate.

Pre-development traffic conditions were estimated by adding one year of 2.5% background growth to existing volumes. County staff has stated there are no significant in-process projects to be included in the analysis.

Trip generation estimates for the Helicopter Transport Services facility were prepared using Institute of Transportation Engineers *Trip Generation,* Land Use – 110 (General Light Industrial) based on the anticipated peak seasonal 70 employees.

Based on discussions with County staff, average trip rates for the peak hour of the generator will be used. A total of 211 daily, 34 AM peak hour and 36 PM peak hour trips are anticipated. Truck trips are expected to be less than 30 per day.

Capacity calculations were prepared in accordance with ODOT standards using Synchro software, which follows the Highway Capacity Manual methodologies.

The intersection of OR 551 with Ehlen Road does not currently meet ODOT standards of v/c 0.70, and the addition of site trips does not decrease the v/c in the critical PM peak hour. Improvements have been identified for this intersection to include left turn lanes on Ehlen Road.

The Airport Road/Ehlen Road intersection is expected to operate at a level of service "F" in 2010 PM peak hour conditions regardless of site development, which is below Marion County standards. AM peak hour operation would remain at level of service "C". The City of Aurora is considering adding a traffic signal at this intersection in their TSP.

Queuing calculations were prepared for the OR 551 intersections in accordance with ODOT standards using SimTraffic software. The addition of trips from the proposed Helicopter Transport Services facility has little impact on the anticipated queue lengths at the study intersections. Long queues are currently experienced on the Ehlen Road eastbound approach to OR 551, caused by the lack of a dedicated left turn lane. Both ODOT and Marion County have identified the need for dedicated left turn lanes, which would address the long queues currently occurring.

Traffic signal warrants presented in the Manual on Uniform Traffic Control Devises were reviewed for the intersection of Ehlen Road with Airport Road, specifically Warrants 1 – Eight Hour Vehicular Volume, 2 – Four-Hour Vehicular Volume, and 3 – Peak Hour. ODOT's sixteen hour volumes were used as a basis for review of the eight and four hour warrants. With the addition of site trips, Warrants 1 and 2 not met, and Warrant 3 is just met. Based on this analysis, a traffic signal is not recommended at this time.

The need for right and left turn lanes at the study area intersections was reviewed using ODOT's turn-lane criterion. Right turn volumes on OR 551 at Keil Road will not meet ODOT's Right Turn Lane Criterion for either AM or PM peak hours.

No left turn lanes are provided on OR 551 at the intersection with Keil Road. Given the high through volume on the highway, the left turn lane criterion is met with only 10 left turns in an hour. The criterion is met with existing AM peak hour volumes, but not with the PM peak hour volumes for the southbound left turn movement.

The need for a left turn lane was also reviewed on Ehlen Road at the intersection with Airport Road, where no turn lanes are currently provided. The ODOT left turn criterion is met for both the pre-development AM and PM peak hour conditions.

With improvements already identified for the intersections of Ehlen Road with OR 551 and Airport Road, and costs that would exceed the proportionate impacts of the Helicopter Transport Services facility, it is recommended the project contribute a proportionate share of planned improvements.

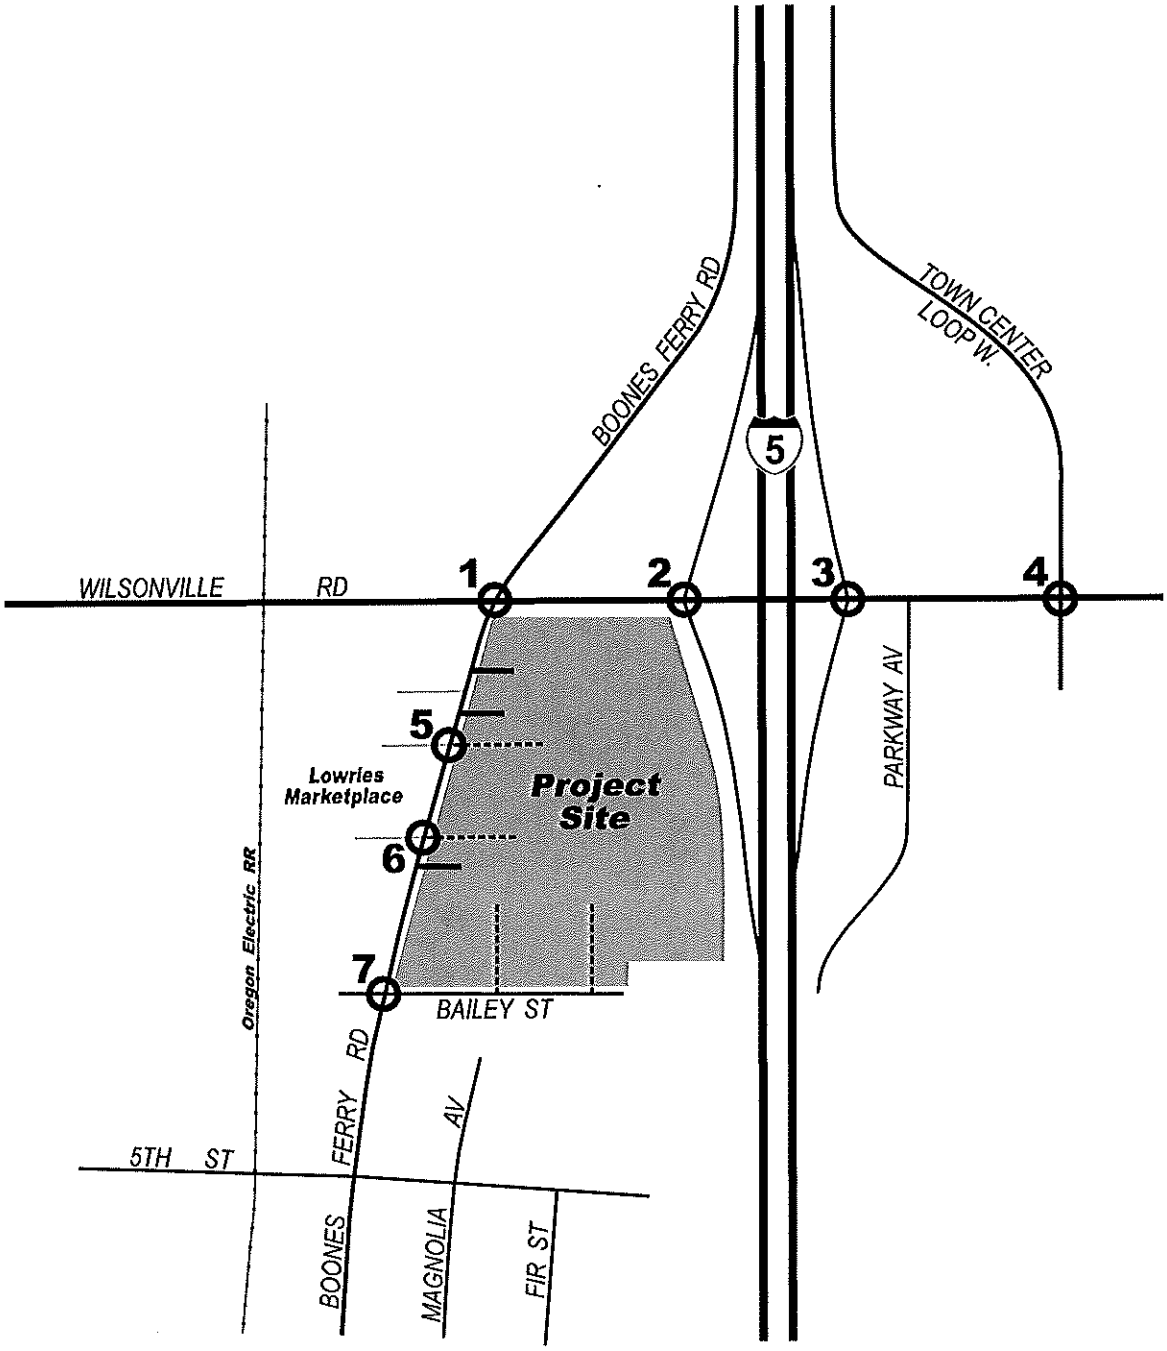
CHAPTER 1: INTRODUCTION AND SUMMARY

This study evaluates the transportation impacts for the proposed Fred Meyer development located on the northeast corner of Boones Ferry Road and Bailey Street in the City of Wilsonville, Oregon. It also recommends mitigation measures to offset the impacts.

The currently proposed development includes a 155,881 square-foot Fred Meyer building (which includes the Fred Meyer store as well as 10,100 square feet of additional tenant space[1]), six other buildings (which include 50,879 square feet of retail/office use and a 3,316 square-foot restaurant), and 60 residential apartment units.[2] The site has four access points to the public street system: two on SW Boones Ferry Road and two on SW Bailey Street.

The study area for the project is shown in Figure 1 and was determined based on discussions with City staff. Within the study area, there are seven study intersections where traffic operations are analyzed:



- Boones Ferry Road/Wilsonville Road
- I-5 Southbound Ramps/Wilsonville Road
- I-5 Northbound Ramps/Wilsonville Road
- Town Center Loop West/Wilsonville Road
- Boones Ferry Road/Fred Meyer north access
- Boones Ferry Road/Fred Meyer south access
- Boones Ferry Road/Bailey Street

Project traffic impacts were evaluated at the study intersections for the weekday PM peak hour. The impact analysis includes trip generation, trip distribution, PM peak hour project trips through the two City of Wilsonville I-5 interchange areas, and future traffic operating conditions. The analysis also accounts for developments in the area that have Stage II approval, including those under construction but not yet occupied. Recommended mitigations are then described and analyzed. Included in the mitigations section of Chapter 3 is a conceptual cross-section layout for Boones Ferry Road between Bailey Road and Wilsonville Road (see Figure 5).

Other issues addressed in this report include Saturday peak hour safety analysis and a project site evaluation (which addresses access location and spacing), sight distance, project frontage adjustments, traffic signal warrants, internal circulation, and parking. At the end of the report, a summary is presented of the recommended transportation mitigation measures that are expected to offset the negative transportation impacts of future traffic growth.

Table 1 lists important characteristics of the study area and proposed project.

[1] Tenant space within a Fred Meyer building is typically occupied by businesses providing additional goods or services, such as coffee shops or banks.

TABLE 1: Study Area and Proposed Project Characteristics

Study Area	
Number of Study Intersections	7
Analysis Periods	Weekday PM Peak (4:00 p.m. to 6:00 p.m.) Saturday Midday Peak (11:00 a.m. to 1:00 p.m.)
Proposed Development	
Total Weekday PM Peak Hour Project Trips	1,255 (627 in, 628 out)
Non Pass-by[a] Weekday PM Peak Hour Project Trips	937 (468 in, 469 out)
Net New Weekday PM Peak Hour Project Trips	488 (244 in, 244 out)
Estimated Weekday PM Peak Hour Project Trips Through I-5/Wilsonville Road Interchange[b]	612 (768 new trips – 156 grandfathered trips)
Estimated Weekday PM Peak Hour Project Trips Through I-5/Elligsen Road Interchange	2
Vehicle Access Points	Four full access points: two on SW Boones Ferry Road and two on SW Bailey Street.
Project Vicinity	
Pedestrian Facilities	Sidewalks to be constructed along project frontage of Boones Ferry and Bailey Street with connection to Wilsonville Road.
Bicycle Facilities	Sidewalks and bike lanes on Boones Ferry Road and Wilsonville Road
Nearest Transit Stop	Boones Ferry Road (SMART Routes 1X and 203)

[a] Non-Pass-by project trips account for pass-by and internal trip reductions.
[b] The Wilsonville Road interchange area includes the Boones Ferry Road/Wilsonville Road intersection. Some of the new project trips that pass through this intersection are diverted trips.

Project Traffic Impact

To determine project impact at the study intersections, traffic operating conditions were analyzed at the study intersections during the weekday PM peak hour for the following four scenarios:

- Existing Conditions
- Existing plus Project
- Existing plus Stage II
- Existing plus Project plus Stage II

The study intersection operating conditions (assuming the existing roadway network) for the "Existing," "Existing plus Stage II," and "Existing plus Project plus Stage II" scenarios are listed in Table 2. Under existing conditions, all study intersections meet the City of Wilsonville LOS "D" standard and the Oregon Department of Transportation (ODOT) 0.99 volume-to-capacity (V/C) standard during the PM peak hour. With the addition of stage II traffic, both northbound and southbound ramps exceed operating standards. When project traffic is also added, all four study intersections on Wilsonville Road exceed operating standards. In addition, the two Fred Meyer development accesses on Boones Ferry Road operate below desired levels.

TABLE 2: Study Intersection Operating Conditions (PM Peak Hour)

Intersection	Operating Standard	Existing Conditions			Existing + Stage II			Existing + Stage II + Project		
		Delay	*LOS*	*V/C*	*Delay*	*LOS*	*V/C*	*Delay*	*LOS*	*V/C*
Signalized										
Boones Ferry Rd / Wilsonville Rd	LOS D	36.0	D	0.77	44.5	D	0.89	>80	**F**	>1.0
I-5 SB Ramps / Wilsonville Rd	LOS D, 0.99 V/C	36.1	D	0.90	79.1	**E**	**>1.0**	>80	**F**	**>1.0**
I-5 NB Ramps / Wilsonville Rd	LOS D, 0.99 V/C	37.2	D	0.91	70.9	**E**	**>1.0**	>80	**F**	**>1.0**
Town Center Loop W / Wilsonville Rd	LOS D	37.7	D	0.80	51.2	D	0.94	56.2	**E**	0.97
Unsignalized										
Boones Ferry Rd / North Project Access	-	12.7	A/B	0.13	13.9	A/B	0.18	>50	A/F	>1.0
Boones Ferry Rd / South Project Access	-	11.9	A/B	0.14	12.4	A/B	0.15	>50	A/F	0.71
Boones Ferry Rd / Bailey St	LOS D	10.9	A/B	0.06	11.6	A/B	0.06	13.8	A/B	0.12

Signalized intersections:
Delay = Average Stopped Delay per Vehicle (sec) for All Movements
LOS = Level of Service of Intersection
V/C = Volume-to-Capacity Ratio of Intersection
Bold Underlined values do not meet standards.

Unsignalized intersections:
Delay = Average Stopped Delay per Vehicle (sec) at Worst Movement
LOS = Level of Service of Major Street/Minor Street
V/C = Volume-to-Capacity Ratio of Worst Movement
Bold Underlined values do not meet standards.

Planned Wilsonville Road Improvements

Due to capacity constraints at the I-5/Wilsonville Road interchange, improvements are planned that will provide additional capacity along Wilsonville Road between Boones Ferry Road and Town Center Loop West. Recently, the City has signed an intergovernmental agreement to construct the first phase of improvements, which will consist of a Wilsonville Road 6-lane enhanced alternative that focuses on ramp improvements and on adjustments to intersection lane configurations.

For the four study intersections on the Wilsonville Road corridor, a Synchro™ model of the improved Wilsonville Road cross-section was used to analyze intersection operating conditions for each of the three

future PM peak hour traffic scenarios (i.e., "Existing plus Project", "Existing plus Stage 2", and "Existing plus Project plus Stage 2"). The results of the analysis are listed in Table 3. As shown in the table, all four study intersections on Wilsonville Road comply with the City of Wilsonville LOS D operating standard for each of the three scenarios. The two I-5 ramps also meet the Oregon Department of Transportation (ODOT) 0.99 volume-to-capacity (V/C) standard.

TABLE 3: Future Operating Conditions of Wilsonville Road Intersections with Six-Lane Enhanced Alternative Improvements (PM Peak Hour)

Intersection	Operating Standard	Existing + Project + Improvements			Existing + Stage II + Improvements			Existing + Project + Stage II + Imps.		
		Delay	*LOS*	*V/C*	*Delay*	*LOS*	*V/C*	*Delay*	*LOS*	*V/C*
Signalized										
Boones Ferry Rd / Wilsonville Rd	LOS D	37.7	D	0.66	31.1	C	0.67	39.3	D	0.75
I-5 SB Ramps / Wilsonville Rd	LOS D	20.6	C	0.64	22.0	C	0.72	22.7	C	0.76

Delay = Average Stopped Delay per Vehicle (sec)
LOS = Level of Service of Intersection
V/C = Volume-to-Capacity Ratio of Intersection
Bold Underlined values do not meet standards.

Project Impact Mitigations

To mitigate impacts at the north and south project accesses onto Boones Ferry Road, three Boones Ferry Road site frontage improvements are needed (these are in addition to the planned improvements to Boones Ferry Road that are shown on the Fred Meyer site plan):

- At the north Fred Meyer access, install a median along Boones Ferry Road to restrict movements to right-in/right-out for both the Lowries Marketplace and Fred Meyer developments; this will increase safety by removing turn lane needs at this access and will provide for better traffic flow (i.e. queuing spillback that impact Wilsonville Road). It will also accommodate turn lane placement and storage needs for the Boones Ferry Road/Wilsonville Road intersection's northbound approach traffic. Also, if desired, the north Fred Meyer access may be converted to a right-out only driveway and narrowed to one lane, which would allow additional space on the project site that could be used to increase a building pad size, the number of parking stalls, etc.
- Between the north and south Fred Meyer accesses, extend the second northbound through lane (which becomes a right turn lane at the Wilsonville Road intersection) to ensure approximately 600 feet of storage is provided for the northbound right turn lane at Wilsonville Road. This distance meets the short-term Fred Meyer needs and the long-term 20-year Wilsonville Road Interchange design needs.
- At the south Fred Meyer access, install a traffic signal to facilitate egress movements from the Lowries and Fred Meyer developments. There should also be two egress lanes (i.e., a right turn lane and a through-left lane). It is expected that warrants will be met in the near future due to the

addition of nearby developments. Installing the traffic signal with the Boones Ferry Road improvements will assure continuity between the improvements and the traffic signal construction. The signal should be coordinated with the Boones Ferry Road/Wilsonville Road signal. To enable the coordination, interconnect conduit and cable will need to be installed between the signals.

A conceptual layout of Boones Ferry Road that shows all improvements and mitigations is presented in Figure 5, which can be found in Chapter 3: Impact Analysis. The mitigated analysis results are listed in Table 4 for the north Fred Meyer access and the Boones Ferry Road/Bailey Street intersection and in Table 5 for both traffic control options at the south access (i.e., a traffic signal and four-way stop control). As shown in the tables, the three intersections have good operation levels and the two traffic control options for the south access are comparable to one another. The main benefits from the installation of the traffic signal are the ability to service platoon flow from the Boones Ferry Road/Wilsonville Road intersection and increased future capacity that will be available.

TABLE 4: Boones Ferry Road Mitigated Future Operating Conditions (PM Peak Hour)

Intersection	Operating Standard	Existing + Project + Stage II + Mitigated		
		Delay	*LOS*	*V/C*
Unsignalized – Two-way Stop Control				
Boones Ferry Rd / North Project Access	-	13.8	A/B	0.41
Boones Ferry Rd / Bailey St	LOS D	17.0	A/C	0.15

Delay = Average Stopped Delay per Vehicle (sec) at Worst Movement
LOS = Level of Service of Major Street/Minor Street
V/C = Volume-to-Capacity Ratio of Worst Movement
Bold Underlined values do not meet standards.

TABLE 5: South Project Access Mitigated Future Operating Conditions (PM Peak Hour)

Traffic Control at South Project Access	Existing + Project + Mitigated		
	Delay	*LOS*	*V/C*
Signalized (Option 1)	22.0	C	0.49
Four-way Stop Control (Option 2)	20.1	C	0.75

Delay = Average Stopped Delay per Vehicle (sec) for All Movements
LOS = Level of Service of Intersection
V/C = Volume-to-Capacity Ratio of Intersection
Bold Underlined values do not meet standards.

Additional Project Oriented Transportation Mitigations

In addition to the Boones Ferry Road mitigations, the following project related measures would typically be required as conditions of approval if the project were approved:

Site Accesses

- The south Fred Meyer access on Boones Ferry Road should be aligned with the south Lowries Marketplace driveway (i.e., near Albertsons). In addition, regarding the Fred Meyer accesses on Bailey Street, the east access should be aligned with the driveway on the south side of the street and the west access should be located in a manner that it does not create conflicting turn movements with any nearby driveways on the south side of the street.
- The radius for the right-out movement at the north access on Boones Ferry Road should be designed to allow trucks to perform a right turn without encroaching on neighboring lanes.

Intersection Alignment

- Improvements to the Boones Ferry Road/Bailey Street intersection should be constructed to ensure that the east and west legs of Bailey Street are properly aligned (these legs currently are offset).

Sight Distance

- All proposed site driveways should meet American Association of State Highway and Transportation Officials (AASHTO) sight distance requirements[3], and prior to occupancy, sight distance at the access points will need to be verified, documented, and stamped by a registered professional Civil or Traffic Engineer licensed in the State of Oregon.
- The sight triangle at each driveway should be clear of objects (large signs, landscaping, parked cars, etc.) that could potentially limit vehicle sight distance.

Boones Ferry Road Adjustments

- The Fred Meyer development site frontage will require adjustments to accommodate the increased cross-section on Boones Ferry Road (as shown in Figure 5, which is found in Chapter 3: Impact Analysis). Adjustments at the southwest corner of the site may also be needed to ensure that the east and west legs of the Boones Ferry Road/Bailey Street intersection are properly aligned (currently, these legs are offset). Because the site plan does not show the curb locations on the west side of Boones Ferry Road or south side of Bailey Street, it is not clear what exact adjustments are needed.

Internal Circulation

- Site plan changes are recommended to convert the south access into the main access. One optional method for making the conversion is presented in Figure 8 (found in Chapter 5: Site Evaluation), which shows two conceptual changes: (1) realigning the internal roadways so that priority is given to vehicles coming and going to the south access and (2) installing four-way stop-control at the internal intersection near the south access.
- The site plan is not clear in the vicinity of the buildings, but it appears that the site would provide adequate pedestrian circulation. It should be ensured that the site indeed provides pedestrian access to the buildings and to the nearby crosswalks and paths (in particular, to the paths on the north side of the site that connect to Wilsonville Road).
- All sidewalks within the site should conform to ADA requirements.[4]

[3] *Geometric Design of Highways and Streets,* AASHTO, 2004; Case B1, p. 661.
[4] *ADA Accessibility Guidelines for Buildings and Facilities,* Department of Justice, January 1998.

Traffic Signal Warrants

- Though signal warrants are not met at any unsignalized study intersection for the "Existing plus Project plus Stage II" scenario, it was determined that the peak hour warrant will be met in the near future at the south Fred Meyer access; therefore, a traffic signal should be installed in conjunction with the Fred Meyer development. This will assure continuity between the Boones Ferry Road improvements and the traffic signal construction. The signal should be coordinated with the Boones Ferry Road/Wilsonville Road signal. To enable the coordination, interconnect conduit and cable will need to be installed between the signals.

Parking

- The proposed site provides only 885 parking stalls. This is not sufficient to meet City of Wilsonville code requirements, which specifies that a minimum of 962 stalls should be provided (based on the types of uses and the total building square footage of each use). During peak parking periods (such as holiday shopping periods), not meeting code requirements may cause parking demand to exceed the number of available stalls and oblige vehicles to park in adjacent commercial and/or residential areas; therefore, either 962 parking stalls should be provided to reduce potential off site parking impacts or a parking management plan should be prepared outlining how peak parking demand needs shall be met.
- The 138 bicycle parking spaces meet City code requirements and should be distributed throughout the development and should be located near building entrances in order to provide convenient access to each building.

PFB15.	Sidewalks and pedestrian linkages shall be in compliance with the ADA Accessibility Guidelines (ADAAG), as amended in 2004, and the 2005 Draft Public Rights-of-Way Accessibility Guidelines.
PFB16.	Prior to the City issuing a construction permit, the applicant shall submit the sanitary sewer construction plans to the Department of Environmental Quality for review and approval.
PFB17.	No surcharging of sanitary or storm water manholes is allowed.
PFB18.	The project shall connect to an existing manhole or install a manhole at each connection point to the public storm system and sanitary sewer system.
PFB19.	A City approved energy dissipation device shall be installed at all proposed storm system outfalls. Storm outfall facilities shall be designed and constructed in conformance with the Public Works Standards.
PFB20.	The applicant shall provide a 'stamped' engineering plan and supporting information that shows the proposed street light locations meet the appropriate AASHTO lighting standards for all proposed streets and pedestrian alleyways.
PFB21.	All required pavement markings, in conformance with the Transportation Systems Plan and the Bike and Pedestrian Master Plan, shall be completed in conjunction with any conditioned street improvements.
PFB22.	The proposed site plan and landscape plan shall depict adequate sight distance at all project driveways. The applicant shall maintain all landscaping to ensure that it does not interfere with adequate sight distance requirements at any project driveway.
PFB23.	Access requirements, including sight distance, shall conform to the City's Transportation Systems Plan (TSP) and be approved by the City Engineer.
PFB24.	Applicant shall design interior streets and aisles to meet specifications of Tualatin Valley Fire & Rescue, Allied Waste Management (United Disposal) and South Metro Area Regional Transit (SMART) for access and use of their vehicles.
Specific Comments:	
PFB25.	At the request of Staff, DKS Associates completed a Transportation Impact Study (TIS) dated November 22, 2004. This study looked at a 166,887 s.f. Fred Meyer store with additional 9,000 s.f. of retail pads and a 6,000 s.f. restaurant; total proposed development of 182,000 s.f.. At the request of staff, a new TIS was completed by DKS dated August 19, 2008. This new study looked at a 165,981 s.f. Fred Meyer building with an additional 51,879 s.f. of retail/office pads, a 3,316 s.f. restaurant and 60 residential apartment units; total proposed development of 221,176 s.f. plus 60 residential apartments. The applicant's traffic consultant has suggested a different methodology for calculating trips. Pursuant to the DKS study, the project is estimated to generate the following traffic impacts. Estimated Weekday PM Peak Hour Trips 1,255 Estimated Weekday PM Peak Hour Trips 768 Through Wilsonville Road Interchange Area Allowing for grandfathered trips from U.S. Bank and the demolished gas station, as well as accounting for pass-by trips and internal trips, the project is hereby limited to no more than the following impacts. Estimated Net New Weekday PM Peak Hour Trips 728 Estimated Weekday Net New PM Peak Hour Trips 612 Through Wilsonville Road Interchange Area
PFB26.	Applicant shall dedicate to the City sufficient rights-of-way along frontage on Boones Ferry Road to allow construction of the roadway sections as shown in Figure 5 of the DKS TIS

	report and from material submitted by the Old Town Square development team, specifically: From Wilsonville Road to north access driveway: 5-lane section (12-ft travel lanes and 14-ft northbound left turn lane with minimum 5-ft landscape median/pedestrian refuge) with two 5-ft bike lanes and on east side from back of rainwater flow-through planter a minimum 10-ft sidewalk/landscape area. From north access driveway to south access driveway: 4-lane section (12-ft travel lanes and 14-ft southbound left turn lane with minimum 5-ft landscape median/pedestrian refuge), with two 5-ft bike lanes, and on east side from back of rainwater flow-through planter a minimum 10-ft sidewalk/landscape area. From south access driveway to Bailey Street: 3-lane section (12-foot travel lanes with 14-ft northbound and southbound left turn lanes with minimum 5-ft landscape median/ pedestrian refuge), with two 5-ft bike lanes, and on east side from back of curb a 10-ft sidewalk/landscape area.
PFB27.	Applicant shall dedicate to ODOT/City of Wilsonville sufficient rights-of-way along frontage on Wilsonville Road to allow construction of a second westbound 14-ft left turn lane and a third eastbound 12-ft travel lane, and from back of curb a 12-ft wide sidewalk/landscape area.
PFB28.	Applicant shall dedicate to the City sufficient rights-of-way along frontage on Bailey Street to allow construction of the roadway section as shown in material submitted by the Old Town Square development team and from back of curb a 5-ft wide sidewalk area.
PFB29.	On Bailey Street, left turn pockets shall meet recommended lengths as determined by DKS Associates and approved by the City. Center lane areas not required for queue lengths shall be constructed as landscape medians.
PFB30.	Applicant shall provide sufficient PUE to allow the franchise utilities to construct necessary improvements, including installation of vaults, peds, conduit, and/or other facilities needed. Applicant shall coordinate on-site landscaping and pedestrian areas to incorporate the franchise utility improvements. The City will allow PGE to have conduit and cable in the easternmost 4 feet of the proposed Boones Ferry Road right-of-way.
PFB31.	Access to public rights-of-way shall be limited to the two proposed driveways on Boones Ferry Road and the two proposed driveways on Bailey Street. Proposed southern access driveway to Boones Ferry Road shall align centerlines with driveway on opposite side of roadway. Proposed eastern driveway to Bailey Street shall align centerlines with driveway on opposite side of the roadway.
PFB32.	The northern access driveway to Boones Ferry Road shall be limited to right-in / right out traffic movement only. The other three proposed driveways are allowed to have full turning access.
PFB33.	Applicant shall place adequate signage at the north and south access driveways on Boones Ferry Road to indicate the truck turning movements and prohibited movements as shown on submitted material.
PFB34.	The northern access driveway to Boones Ferry Road shall be designed with a sufficient radius to allow egress by WB65 trucks with limited impact on the middle travel lane and no impact on adjacent pedestrian sidewalks.
PFB35.	At the eastern access driveway to Bailey Street, material submitted indicates ingress turning movements for WB-65 trucks and buses are made from the through travel lane and not the left turn lane, and even so the movements are shown to conflict with the egress left turn lane. Applicant shall redesign this entrance so as to eliminate these conflicts and turning movements are made in a legal manner consistent with the Oregon Vehicular Code.

Airport Master Plan Update

Aurora State Airport

WHPacific
OREGON DEPARTMENT OF AVIATION

Aurora State Airport Master Plan

Planning Advisory Committee (PAC) Meeting #4

March 10, 2011
North Marion Intermediate School, Aurora, OR

MEETING SUMMARY

Attendees

Oregon Department of Aviation (ODA) – Chris Cummings, Sandra Larsen and Mitch Swecker (also a PAC member)

WHPacific – Rainse Anderson, Sara Funk, Sarah Lucas and Casey Storey

JLA Public Involvement – Vaughn Brown, Adrienne Dedona and Sylvia Ciborowski

Public Advisory Committee (PAC) – Bruce Bennett, Jim Bernard, Jim Hansen, Tony Holt, Steve Hurst, Nick Kaiser, Rick Kosta, James Meirow, Ted Millar, Fred Netter, Dan Riches, Ray Phelps, Charlotte Lehan (for Jim Bernard), Craig Wilmes and Dave Waggoner.

Public Attendees – see attached sign in sheets

Welcome and Introductions

Chris Cummings, ODA, introduced himself and welcomed everyone to the meeting. He noted this meeting had the best public turnout so far.

Chris reviewed the meeting agenda, explaining there would be a presentation from WHPacific prior to breaking out into a public workshop. After the workshop, the PAC will reconvene for a discussion of the alternatives. Chris instructed participants to ask as many questions as possible during the workshop and indicated that there is also the opportunity to provide written comments.

Rainse Anderson, WHPacific, introduced himself and provided an overview of the study to date. He noted that at previous meetings he had told members several times to hold their comments until we review Chapter 5. Rainse explained that Chapter 5 and the draft alternatives is what we've been building up to. He said reviewing and discussing the draft alternatives in order to develop a preferred alternative is the most exciting and important part of the study. Rainse asked the remainder of the consultant team to introduce themselves and reminded everyone to sign in. He drew attention to the comment form and let people know this would be a helpful guide when reviewing the draft alternatives.

Rainse reviewed the agenda further and explained there would be a review of the forecast updates, traffic analysis and the draft alternatives prior to the public workshop. He also said there would be a discussion of the alternatives with the PAC, and at the end of the meeting, there will be time for public comments.

Presentation

Project Overview: Rainse reviewed the project purpose and explained that there are seven (7) chapters total in the Master Plan Update. The first four draft chapters have been completed and draft chapter 5 will be reviewed tonight. Following completion of the document, the draft will be submitted to FAA for review. This process typically takes 90 days prior to final publication. After this meeting, the project team will take the feedback received and begin developing the preferred alternative. The draft preferred alternative will include a public review and comment period. Once that is completed, the Airport Layout Plan (ALP) and the Capital Improvement Plan (CIP) will be developed. The ALP and CIP will be the topics for review and discussion at the next PAC meeting; tentatively scheduled for the end of June.

Traffic Analysis: Rainse said that at the first PAC meeting there was a discussion about vehicular traffic and since that time, the project team has done some analysis to look at traffic coming from and around the airport. He explained that this data was gathered from various available sources. ODOT traffic specialists were enlisted to conduct counts around the airport. Data was gathered at 11 of the gates in during a 1 week period to determine the average annual daily traffic (AADT) and peak hour traffic volumes. The result was 2,400 AADT. Located at the NE corner, Columbia Helicopters generates 47% of the total traffic (1,130 AADT). Rainse explained that this is not a typical Fixed Base Operator (FBO) tenant since they don't use the runway. The traffic analysis included HTS (Helicopter Transport Services), under construction on the corner of Keil and Airport Road, and projected 211 AADT once developed. On Airport Road itself, 2007 data shows that approximately 2,600 vehicles travel along the road between Ehlen and Arndt Road. Rainse mentioned that this data is somewhat low; when it is updated in 2011, it's expected to increase. The data will be updated by studies completed by Marion County later this year. Rainse went on to explain that there is a lot of pass-through traffic going to and from I-5. He added that the impact from the airport on the Boone Bridge was also analyzed and it was determined that the airport generates about 1.5% of the total traffic on the bridge. Currently the employment numbers at the airport are approximately 750 employees, which equates to 3.2 trips per employee. Once a 1.19% annual employment growth rate is applied, the total employment for 2030 is 950 employees, equating to an airport generated AADT of 3,040. Rainse added that additional data and background information on the traffic analysis can be found in the report and could be discussed further during the workshop session.

Traffic Analysis Recommendations: Rainse said that ODA will continue to work with Marion County and the City of Aurora as improvements to Airport Road are considered and the appropriate considerations will have to be made with regard to airport businesses and entrances along Airport Road. He added that it is likely that there will be sharing of the costs in the system development, similar to what HTS did with their system development, but this will need to be worked out between the entities.

Forecast Updates: Chris explained that the previous meeting scheduled for February was postponed because of incorrect forecast information that needed to be corrected. There was an error with previous information related to the number of aircraft based at the airport. To remedy the problem, ODA checked with tenants, sent someone out to physically count aircraft in hangars (if able), and thoroughly reviewed their database of registered aircraft. Chris said there are now new numbers and those numbers have gone down from the original count. He said this information was used to go back and correct other information previously developed in the report. Chris said that he is very confident with the count and the new forecast.

Sara Funk said that while they were doing revisions based on the aircraft count, they completed other revisions, such as:

- Information from the FAA's Terminal Area Forecast (published in December 2010).
- Comments received from the PAC previously were addressed
- Additional research was done related to the Airport Reference Code (ARC). The project team looked up what kind of airplanes there were that were previously reported as unknown.

Sara reviewed the past and current numbers of aircraft based at Aurora, including the new projections for 2030 (based upon a 1.58% annual average growth rate).

Year	Aircraft Type	Revised Forecast	Previous Forecast
2010 Historical	Single Engine	261	312
	Jets	23	21
	Multi-engine	40	59
	Helicopter	25	35
	Other	5	5
	Total	*354*	*432*
2030 Projection	*Total*	*464*	*566*
	Jets	47	51

Operations: Sara explained the takeoffs and landings changed with the based number of aircraft. This number is now estimated at 90,909 for 2010. The number was previously somewhere around 100,000. Based upon the estimated annual growth rate, the revised forecast for 2030 operations is 124,386 as compared to the previous figure of 131,312.

Sara asked the PAC if there were any questions about the traffic or forecast analysis before moving on to Chapter 5. There were no questions from the PAC.

Draft Chapter 5

Sara said that the runway length surveys have been updated to reflect at least 500 constrained annual operations, which justifies a longer runway based on the FAA criteria. Besides the additional completed surveys sent to the PAC prior to the meeting, additional surveys have been received.

Tony Holt asked about the updated survey and requested to talk about it further later.

Bruce Bennett noted that Management West is still at Aurora, although the constrained jet aircraft owned by Management West is not.

Sara explained that three build alternatives have been proposed in order to meet the facility requirements.

Sarah Lucas explained that the preferred alternative would be developed based upon the elements included in the three build alternatives and the no-build alternative and the preferred alternative would be the basis for the ALP. She explained that the various elements outlined in the comment form could be mixed and matched to develop the preferred alternative.
Sarah explained the various comparative elements within the alternatives:

- Airport Reference Code (ARC)
- Runway length and strength
- Instrument approach capability
- Hangar/tiedown locations
- Cargo apron location
- Fuel tank location
- Air traffic control tower (ATCT)
- Aurora Rural Fire Protection District Facility

Approximately 40 developable acres are needed to meet the forecasted demand for the activity at Aurora. Currently ODA has about 9 acres of developable land. Development necessary for precision approach path indicators, a cargo apron, helicopter parking, vehicle parking and some additional hangars would be built on state-owned property. In all of the build alternatives, the adjacent church camp property (16 acres) is shown to be suitable for hangars and related development.

- *No-build Alternative:* The no-build alternative is ARC B-II. An air traffic control tower (ATCT) will still be constructed in this option, but a location has not yet been identified. The runway length would remain at its current length of (5,004 feet). Instrument approach capability does not change. The approach criteria minimums remain not lower than 1 statute mile. (The Runway Protection Zone (RPZ) at the end of each runway correlates to the approach minima). The pavement strength would remain the same (45,000 pounds dual-wheel gear).
  While the no-build alternative is essentially a do nothing option, it does not mean that there would be no financial impact to the airport. Most prominently, there would still be a cost associated with maintaining the current pavement and facilities.

- *Build Alternative 1:* – Alternative 1 is also ARC B-II and includes a 600 foot runway extension. The southern RPZ would extend south of Keil Road and an aviation easement would be sought. The northern RPZ would encroach into Columbia helicopters. The majority of state-owned property would be developed as hangars in this option. The state has identified three various alternatives for the location of the air traffic control tower. This alternative includes a fire station facility near the control tower. The air traffic control tower would be located midfield on the east side. Two helipads would also be built on public property. No cargo apron is included in this build alternative. Instrument approach capability does not change although the visual glide slope indicators would be upgraded to precision approach path indicators. The pavement would be strengthened to 60,000 pounds (dual-wheel gear). The fuelling tank would be relocated to the south of Aurora Aviation.

- *Build Alternative 2* – Alternative 2 increases design standards to ARC C-II. The approach minima are greater and extend RPZs further off of airport property; requiring additional easements or land acquisition. There are further impacts to Columbia Helicopters. This alternative has a fairly equal split between development of tiedown facilities and cargo aprons. The helicopter parking pads are same as in build alternative 1. The fuel facility is located near the cargo apron, northeast of Aurora Aviation. The fire station would be located near the current water suppression system, and the air traffic control tower is located near the center of the airport. The pavement would be strengthened to 60,000 pounds (dual-wheel gear). The runway and parallel taxiway would be extended to the south by 1,000 feet, which would require the closure of Keil Road (total runway length of 6,004 feet).

- *Build Alternative 3* – Alternative 3 also increases design standards to ARC C-II and shows a precision approach. The precision approach was something a lot of pilots requested during the goals and issues identification phase. There is no runway extension included in this alternative and RPZs increase significantly. The high voltage power lines would have to be relocated or put underground. The pavement strength remains the same. The helicopter operations areas are located north of the current cargo apron. The air traffic control tower is located closer to the north end and farther from the runway than in the other two build alternatives. The Fire District's building is located east of the fire suppression system. The fuel tanks would be located at the south end of state-owned property and the cargo aprons would be centrally located on state-owned property.

Steve Hurst asked if the no build option would include an air traffic control tower. Sarah clarified that the control tower is a committed project and would be built regardless, since it's already funded.

Noise: Casey Storey explained the type of noise model used and that it looked at saturated noise vs. point in time noise. He said the model accounts for more disturbances by night time noise vs. daytime noise. Casey went on to explain that they looked at the flight paths from this year and the aircraft type and mapped where those types of aircraft will fly. The flight tracks reflect the current noise abatement flight patterns and departure procedures. Casey noted that based upon the FAA criteria, residential land use is not considered compatible within the 65 dBA (average decibel) contour. Casey reviewed the noise projections for each of the proposed alternatives:

- All 2020 alternatives have the same type of and quantity of aircraft and show an increase in noise over time.
- Build Alternative 1 shows a slight bulge/increase in noise to the north due to the expanded runway.
- Build Alternative 2 contours shift south, due to the proposed southern extension to Runway 35.
- Build Alternative 3 contours remain the same as the 2020 No Build Alternative contours, since the runway configuration would not change.

Steve Hurst asked about the maps for the noise and confirmed whether or not alternative 2 was supposed show 2010 or 2020. Casey confirmed that it should have reflected 2020 and that this was a typo.

Tony Holt asked if this assumes the traffic control tower is built. Casey replied that it did not.

Mitch Swecker added that an instrument departure would be recommended for departures as well as certain flight patterns designed to keep the aircraft away from the Charbonneau area.

Tony said that he just wanted to understand what is currently in place.

Sarah explained that there are currently noise abatement procedures in place at the airport. Instrument procedures for northward departures are expected to be approved by the FAA in the fall. These procedures are in line with the current recommended noise abatement procedures for northward departures.

Tony said that he was aware of that but many operators don't pay attention to the noise abatement procedures and he asked if other flight paths were factored into the model. Casey responded that yes, they were taken into account.

Nick Kaiser said that the decibels don't change much between the alternatives and he asked if there were things that affected that. Casey explained that there is some shift based on the type of aircraft since there will be more jets in the future.

A member of the public asked what is happening to noise abatement around Aurora. Mitch replied that they've tried to change the flight pattern to avoid flights over Aurora and planes should depart to the south around Aurora.

Bruce Bennett said that he was involved with the FAA during the time they designed the airport departures/flight pattern and that they were designed to avoid Aurora.

Rainse explained that the preferred alternative would be presented to the Oregon Aviation Board later this month and then again in April for their concurrence. Chris said that he will send information out to the public about the meetings with the State.

Nick asked about the comment period for the draft alternatives. Chris said that there will be a two week comment period prior to the presentation to the Oregon Aviation Board.

Public Workshop

Vaughn reviewed the format for the public workshop and explained there would be 45 minutes for the public and the PAC to interact with staff to ask questions and review information about the draft alternatives. He recommended that participants take a comment form in order to review information and formulate their questions and comments. Vaughn suggested that participants think about the issues that need to be identified or considered when developing the preferred alternative. He said that the group will come back together after the workshop and the feedback heard will be discussed with the PAC for 30 minutes, then there will be time for public comment. If necessary, the public comment time would be extended and each person will be given a couple of minutes to provide testimony.

After the 45 minute public workshop, Vaughn reconvened the PAC session. He said he hoped that everyone had an opportunity to ask questions and obtain information from staff and PAC members. Vaughn explained that the PAC would now have the opportunity to discuss the draft alternatives and give input on the direction for the preferred alternative.

To start off the discussion on the preferred alternatives Sylvia Ciborowski and Adrienne DeDona reported out on the group discussion during the work session related to noise impacts and the draft alternatives. The following is a summary of the comments collected on flip charts at each of the information stations:

- If the runway object free area (ROFA) extends, what will happen to the highway?
- Have you considered what this project will do to the town of Aurora? Who needs this extension?
- I'm concerned about the impact of the RPZ on off-airport properties (alternatives 2 and 3)
- There needs to be consideration for the economic feasibility. There is no way this will pencil out economically. It will result in greater revenue from gas sales, but this will never cover the huge expenditure.
- I'm concerned about the impacts/development on the best farmland in the world. This farmland is more important for the future of food production than to pave over it.
- Currently the flight plan/pattern is not followed, especially at night. Planes fly right over houses and shake the windows. Concerned about the future safety and who disciplines pilots who fly in no flight zones.
- I'm concerned about the feasibility of Alternative 3.
- Can we use the additional capacity at Salem Airport rather than expand Aurora?
- The Run-up area is too close to hangars and private property (condo association) in Alternative 2. I'm concerned about the safety of this situation and the dust flying up in the area.
- What does it take to become a C-II Airport?
- I'm concerned about what will happen to the property values of nearby homes with the noise increase.
- I'm an airport user with five planes stationed in two hangars at Aurora. I prefer Alternative 1 with the 600 foot extension and ARC C-II.
- Can alternative 1 become a C-II with all other elements remaining the same?
- I have a concern about fumes from jets on people. The wind blows fumes into residential areas.
- The no-build option is no good because it does not have a fire facility. If we have a tower, we need a fire facility.
- Since we are already a volunteer fire station in Aurora, who will pay for a new fire facility?
- Can you request a modification to standards of the ROFA (on Highway 551) from the FAA?
- Why do you need more clearance for a more precise approach?
- Has ODOT gotten onboard with road improvements, especially Keil Road?
- Use displaced thresholds as a last resort. Sarah L. explained that a displaced threshold could be done to gain runway length for takeoff. The runway could be extended, but a displaced threshold, where aircraft land, would not be placed at the end of the extended runway pavement. The runway pavement behind the threshold could be used for takeoff, but not for landing. . .
- The Tower will enforce flight patterns (to reduce noise impacts to area neighborhoods) by keeping in contact with pilots by radio.
- Three to four days a week there are early morning airplane departures at approximately 3 a.m.

- Planes should not be allowed to take off before 7 a.m.
- If the current noise/flight pattern policy isn't being followed, why would a different policy be followed?
- Where is the money/funding for the project coming from? The Runway is already long enough. Enough money has already been spent on Aurora. Aurora doesn't have a lot of constraints as compared to the Orange County Airport (CA).
- The power lines at the north end of the airport should be removed or undergrounded for community safety reasons. The expense of doing so should be shared.
- An Educational Center for children should be built at the airport as well as a mechanic school in partnership with the local community colleges. A nearby playground is also a good idea so that kids could watch the airplanes take off and land.
- The area west of highway 551 will be severely impacted if the runway is extended. Farm equipment will be forced into the busy highway, creating safety concerns. Deer Creek Mobile Home Park will have limited access due to the closure Keil Road. Highway 551 will be the only point of access.
- Helicopters fly too low and are too noisy.
- The runway extension will increase the noise impacts to Deer Creek Estates. Residents already smell jet fuel. Airplanes take off as early as 4 a.m.
- Will there be any consideration for jet fumes in any of the future alternatives?
- The impervious surfaces drain to area farmlands since adequate drainage systems do not exist.
- Who enforces the noise abatement procedures? Orange County has a good noise abatement system.
- Will future zoning be amended due to the expanded noise footprint?
- The statement in the report that indicates that NW and Charbonneau residents will not be affected (related to Environmental Justice analysis) is inaccurate. There are 141 homes in the Deer Creek neighborhood. There will be quality of life impacts to residents.
- What will be done to mitigate noise from maintenance on jet engines?
- There seems to be a high number of planes flying over the Charbonneau area when there shouldn't be (based upon recommended flight patterns/noise abatement procedures).
- Mitigation efforts done simultaneously with airport improvements will help make things better for area residents.

PAC Discussion on Alternatives:

After the report out of public comments during the work session, the PAC reconvened for further discussion on the draft alternatives. The following is a summary of their comments and recommendations for consideration when developing the preferred alternative:

- Fred Netter said that his number one concern has consistently been regarding safety. He indicated that the no-build includes the tower, but not a fire station. He said that it would be his preference to have a Fire Station facility at the Airport near Airport Road and the water suppression system. He also indicated that closing Keil Road would a safety concern due to

emergency access and farming equipment access. Fred also requested that Airport Road be improved and called for Clackamas County to assist with funding for roadway improvements.

- Charlotte Lehan said that the traffic analysis doesn't recognize Clackamas County's role in surface transportation. She explained that Clackamas County's concerns are related to the surface transportation impacts and the impacts to area agriculture (industrial development pushes agriculture out). Charlotte added that Clackamas County has been excluded from some of the planning steps in this process.
- Dave Waggoner agreed that Clackamas County should be involved in funding the airport due to the positive impact the airport has on area economic development.
- Charlotte commented that the funding for the project hasn't been addressed.
- Steve Hurst asked if increased use of GPS and other technologies could be incorporated in lieu of a need for a runway extension.
- Bruce said that in order to make take off quieter, planes/pilots must use less power. To use less power, more runway is needed. This is a typical procedure for noise abatement elsewhere.
- Tony Holt said that the Aurora Airport is constrained by three major roads and only one runway. He indicated his support for the no-build alternative.
- Bruce agreed that the airport is constrained and should 'fill-in' for development. He added that agriculture and golf courses make good neighbors to airports and that no other building development should be allowed near airports.
- Charlotte requested that the financial impact to the public should be captured somehow and that Airport Road should be part of the financial analysis.
- Nick Kaiser stated that Airport Road gets 2,600 trips a day, but is listed as a collector street. It should be listed as an arterial street and should be designed as such. He added that in Alternative 2, the RPZ goes over the Deer Creek neighborhood and highway 551; this is a safety concern.
- Fred added that development in various communities impacts the airport too.
- Steve said that the Wilsonville City Council will discuss the Airport Alternatives at an upcoming meeting and will determine a formal position within the two week comment period.
- Ted Millar said that Aurora Airport is a category 2 airport and is an important part of the National Aviation System. He added that the Airport benefits Clackamas and Washington Counties (the cities of Wilsonville and Aurora). Ted commented that from a safety and an economic development standpoint, the runway should be expanded. There is an economic opportunity and that need should be filled. He called for an additional 1,000 feet of runway and increasing the pavement thickness of the runway.
- Rick Kosta stated that National retailers can land elsewhere in Oregon (Hillsboro, Portland, and Troutdale). He went on to say that the only alternative that doesn't impact Deer Creek neighborhood is the No-build. The noise impacts to Deer Creek residents in any of the build alternatives will be over 65 dB. What mitigation can be done for Deer Creek residents?
- Mitch Swecker said that before any mitigation were to occur, actual measuring of noise exposure would likely be conducted. If impacts are shown, they may be mitigated.

- Dave said that the current situation at the airport is dangerous for run-ups and that the run-up area in alternative 2 is impractical. It's too close to hangars and one of the hangars provides space for the Emergency Operations Center. There is no run-up space allocated in alternative 3. He called for alternative 2 to be modified to allow for a run-up area that doesn't crowd the hangars.
- Bruce said a greater than ¾ statute mile (sm) approach should be required; it's safer, quieter and saves fuel. He requested the minimums be lowered with a small extension to the south.
- Tony Holt asked how many of the user surveys were based at Aurora. He added that there should be a better, more rigorous way to collect/validate this type of data.
- Dan Riches said that Columbia Helicopters has reserved land for future development, so they cannot support any type of expansion to the north. He added that Columbia Helicopters supports safety improvements and improvements to Airport Road. Dan preferred the no-build or a hybrid of the no-build alternative.
- Nick said that the 2002 noise contour showed different planes, but there is not a huge difference. There has been a larger increase in the number of aircraft.
- Fred noted that expansion of the airport may impact other businesses' future plans and suggested that monetary compensation be offered to those businesses. Dan replied stating that Columbia Helicopters monetary compensation wouldn't work in their case because they are looking for a more long-term investment.

To wrap-up the discussion on the draft alternatives and to provide direction to the project team on the development of a preferred alternative, Vaughn directed the PAC to provide their individual recommendations/feedback on the draft alternatives in a round-robin fashion. The following summarizes their feedback:

- Dave Waggoner echoed his concerns about the run-up areas.
- Nick Kaiser said that there are a lot of variables within the four alternatives, especially with regard to noise.
- Dan Riches called for the no-build option or for an extension to the south.
- Steve Hurst said that he is looking forward to hearing the public comments.
- Fred Netter commented that safety is important and a Fire Station should be part of the plan.
- Ted Millar said that the Runway should be extended in addition to the thicker pavement surface. He suggested considering a possible hybrid alternative with a displaced threshold.
- Tony Holt said the no-build is the best option and that there are other airports in the area to operators to use. He feels the expansion of Aurora is not justified.
- Bruce Bennett said lengthening and strengthening the runway are important and that the overall safety of the airport should be increased. He added that the overall noise and environmental impacts should be decreased.
- Charlotte Lehan said that Clackamas County has not yet weighed in on the project and, at this time, she supports the Fire Station and the Airport Control Tower for safety reasons.
- Rick Kosta said he supports the no-build option since there are other airports in the area.

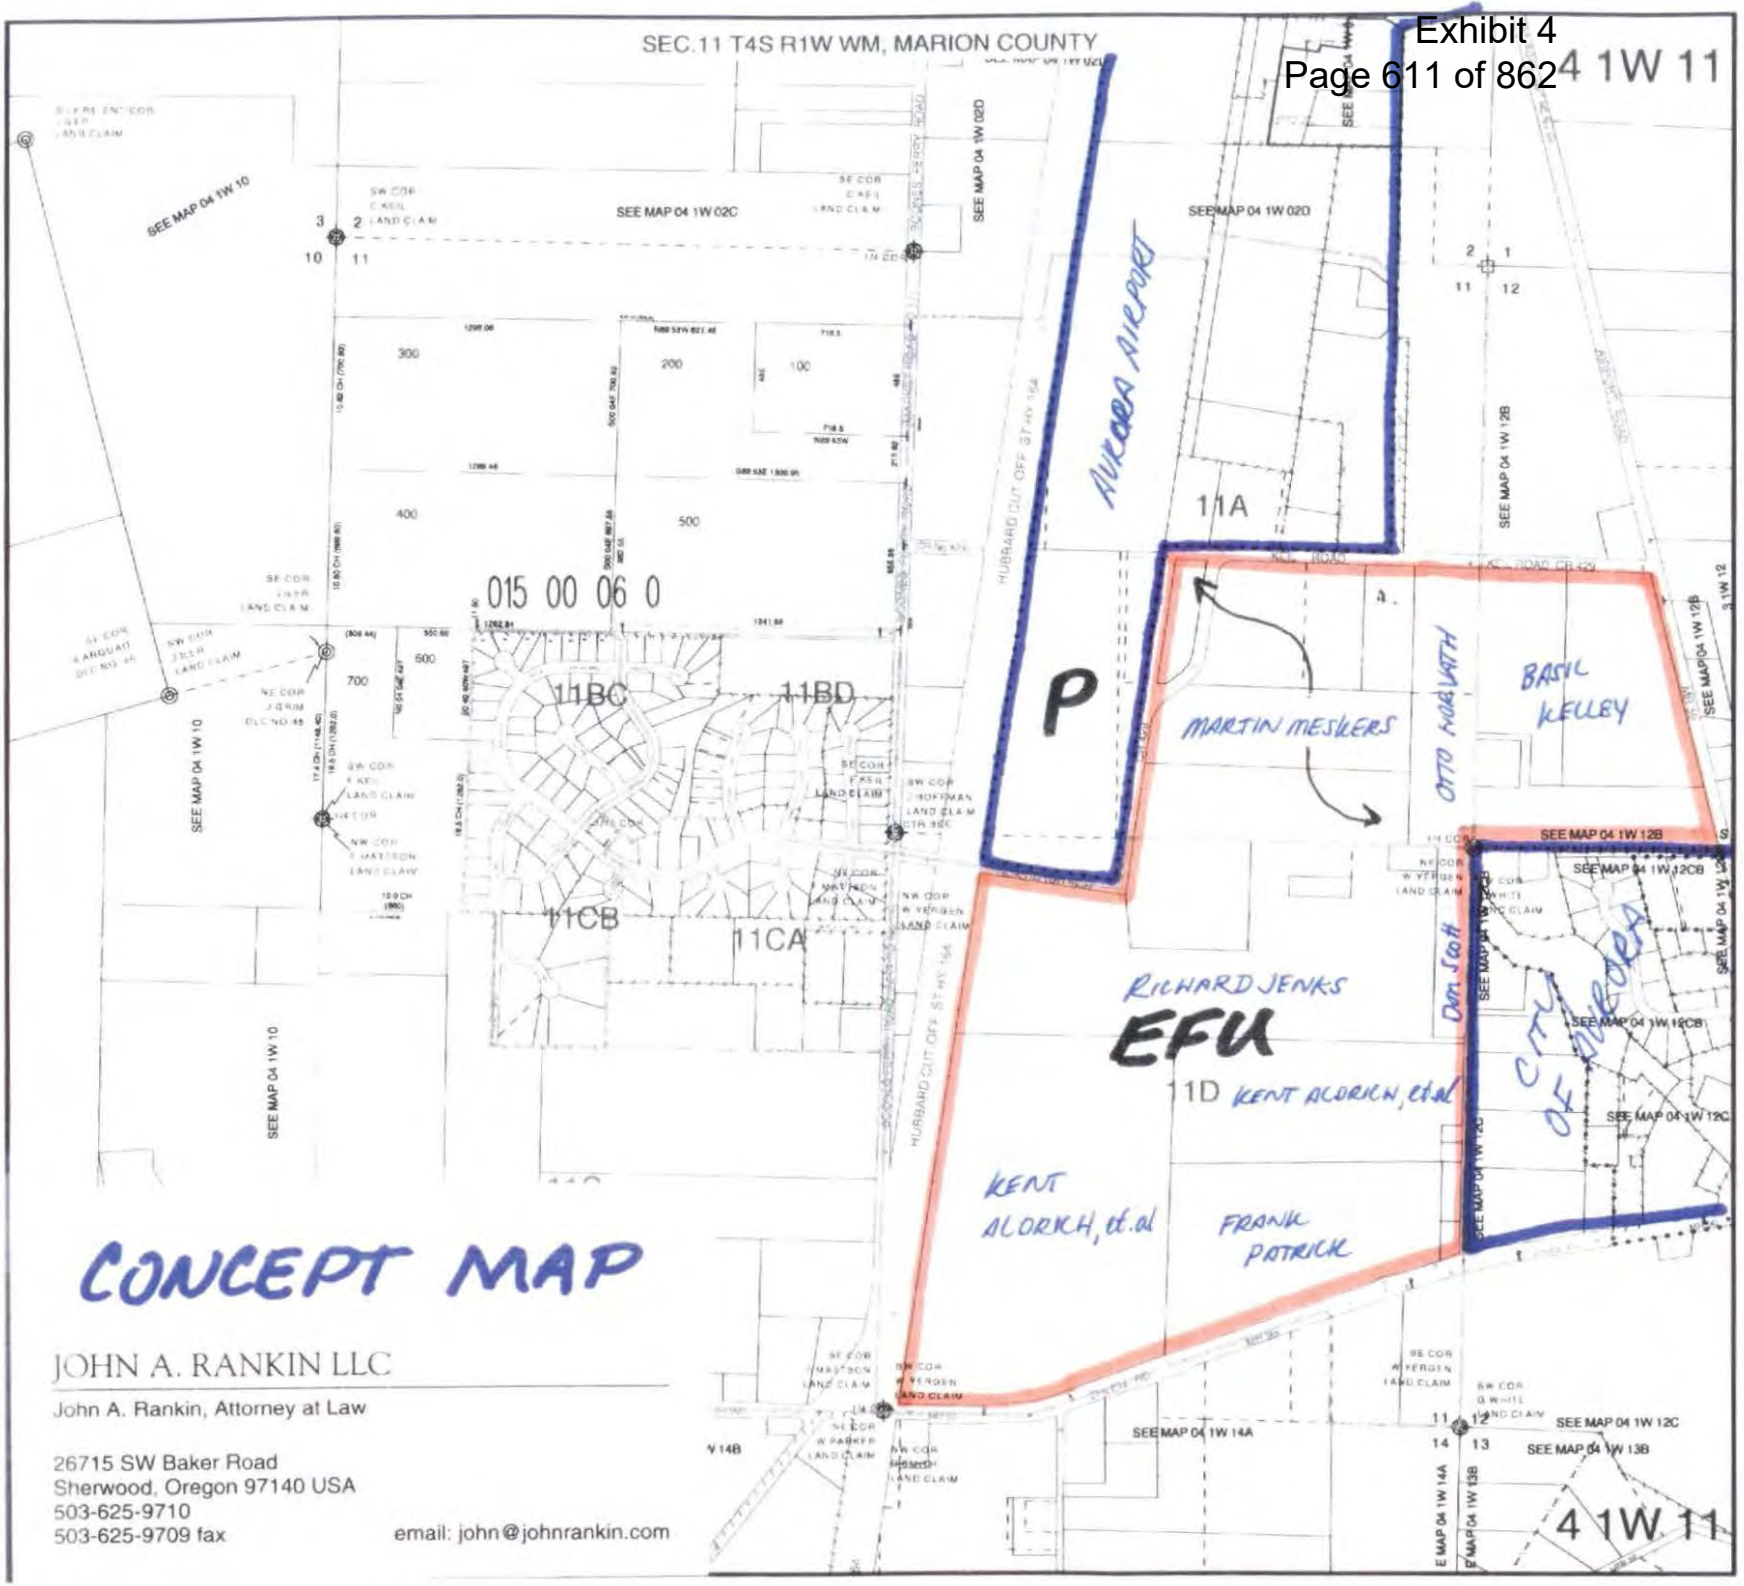
- James Meirow said that he would like to hear from the neighbors to the south of the airport.
- Craig Wilmes said he supports the run-up areas and displaced threshold.

Overall the PAC did not come to consensus on a preference for one single preferred alternative. However, there seemed to be somewhat shared support for safety improvements such as the Fire District's facility and the Air Traffic Control Tower. The consultant team and ODA will evaluate all comments and concerns received and consider them when developing the preferred alternative.

Public Comments:

Members of the public were each given two minutes to provide oral testimony regarding the draft alternatives. Several members provided written testimony in addition to or in lieu of oral testimony. Those statements are attached to this summary as separate documents.

- John Ranken, 26715 Baker Rd: He is an Attorney and consultant representing several property owners to the south. This area comprises 75 acres of properties in the EFU zone—from Airport Road to Hwy 551. Mr. Ranken was formerly the city attorney for the City of Aurora for 13 years and has been asked to help these property owners. The thanked PAC for its manner, and the public, and Chris C. for his efforts to help him get oriented to the project. He distributed information to the PAC showing the properties to the south that would be impacted. He said that at this point, their position is that they are interested in build alternative #1 since it seems to give everyone a little something. He added that this seemed to present a compromise.
- Mike Rite, NW Aircraft: Has been involved in aviation his whole life. He said he has been very involved in airport issues. Mr. Rite added that there have not been meetings in Mulino or McMinnville about expansion because no one wants to go there. He said that people are coming to Aurora because they want to be there. He said there is not as much going to Portland. Mr. Rite added that some complaints about noise will be addressed and that tower will help airplanes not go over neighborhoods as much. He indicated he supports extending the runway because it provides additional safety and will bring in other aircraft that aren't coming in currently.
- Larry EIschen, resident of Charbonneau: Mr. Elschen said he was representing Charbonneau neighbors. He presented a petition with 260 Charbonneau names on it, and indicated it should include more signatures. Mr. Elschen read from the petition (attached).
- Ken Ivey, representing a planning organization in Clackamas County. Mr. Ivey said he has heard a lot about safety and that airplanes are coming into a marginal airport, and they are choosing to create an unsafe condition. Mr. Ivey stated that these pilots have at least four alternatives within 30-40 miles that do have the infrastructure to safely handle those planes. He stated the group he represents would vote for the no-build alternative. He stated if you want to make the airport safer, direct those planes to those airports that have the infrastructure on the ground paid for, rather than asking us to shell out more money. I live near the airport, and I don't see a noisier airport and having to pay for the highway to get there.



- Ailin Ottinger: Mr. Ottinger said the main thing we are doing is making it possible for more commercial flights outside of Aurora. As a taxpayer, I wonder do the corporations have any part in funding all of this?
- Ben Williams, resident of Aurora and President of Friends of French Prairie: (submitted attached written comments). He said he was concerned about preservation of farmland and the impact on surface transportation. He said, we support addressing the safety requirements, but we have a 20-30 year history of the domino effect. With improvements, it will only get bigger and we'll need more improvements. The airport is surrounded by EFU farmland that needs to be preserved.
- Jack Kaley: He said he has a commercial pilot license and has been flying at Aurora 30 years. He is also the director of Positive Aurora Aviation Management Group. He attended the first PAC meeting, and noted that most placed aviation safety as their top concern. He said that is my top concern, especially safety issue for helicopter landing areas. He went on to say that Aurora has stated safety provisions for helicopters. We need to properly separate helicopter and fixed wing areas. Helicopters take off from tie down areas that are designated for fixed wing areas. There are no designated helicopter landing and parking areas on state owned property. Because of ground turbulence, it is essential that helicopters be separated from fixed wing tie down locations. Mr. Kaley distributed some diagrams explaining the problem. He said the FAA has established safety circles and helicopter standards. The safety circles have a range. In his drawing, he superimposed a helicopter pad between a fixed wing. The projected increase of helicopter traffic means we need safe operations. In the interest of overall safety, we must provide for proper separation. The master plan should plan for safe helicopter operation. The vacant state owned land east of the helicopter blade renovation building should be used for locating several helicopter pads.
- Manuel Martinez: chief pilot for JHRD investments: He said that his company moved from PDX to Aurora State due to his recommendations. His company has provided $2 million in local revenue. He has safety concerns in operating in and out of Aurora Airport. He felt a tower would enhance the safety margins, and runway length is a concern. In his 15 years as pilot, he has had 8 close encounters, mostly near Aurora Airport.
- Larry Brons: professional pilot, flying primarily out of Aurora, doing professional contract flying: He said he supports the Air Traffic Control Tower for safety. The additional 600 feet of runway would make operations safer and more economically viable. He said we are coming out of recession and we should try to stimulate the economy in the local area by making the airport more viable for business.
- Bryan Mobey, representative for Deer Creek Estates: He said they have concerns about their quality of life. He stated now with noise and the smell of fumes from jets, it affects us drastically. They cannot sit on their patios without being disturbed by aircraft. He supports the Air Traffic Control Tower to keep planes out of no fly zones and the Fire Response Facility. He felt an expansion at the airport will negatively affect their property values due to noise and jet fumes. He added that planes take off at 4 or 5 in the morning and that nobody has control of the

planes. Salem tells us to get the number of the aircraft, but we can't get their numbers at night. He said he is concerned about an accident in the future.

- Annie Kirk, Aurora resident: She said she is representing her family. She said regarding undue hardships and compensation, I have not heard anything about outside of the fence compensation for Aurora and Charbonneau residents. For impacts to Airport Road, who will bear the burden for those improvements? The road is grossly unimproved now. It needs to be taken care of, but we have more to come. I am comfortable with the tower and the fire services for safety. But I'm not convinced that any of the alternatives resolve the interest of the communities outside of the fence.
- Lolita Carl, full time farmer in Marion County: She said she is on Marion County Board of Directors for the Farm Bureau. Ms. Carl said that farming is the number one industry in Marion County. She said she is worried about encroachment on farmland and economic development. Agriculture is the second industry in Oregon, and all of us eat. All of the land surrounding Aurora Airport is the most fertile in the world. Once we start a little bit of development, it just encourages more. As a tax payer, she wonders where the money is coming from to support so few.
- Ron Sterba: He shared his concern with the power lines on north end of airport and asked what happens if a plane hits them? Where does the power grid go to? Hospitals or schools? They should be relocated. He said he would like to see an education center on the airport to share with high schools and local community colleges. Would like to see a realignment of runway so the approach is over I-5 on the north and to take the approach corridor off of Charbonneau and move the runway 75 feet to west to allow for an expansion of the taxi way without removing any buildings.

Meeting Adjournment

Rainse wrapped up the meeting and reviewed the next steps for the project. The next meeting will cover the Airport Layout Plan and the Capital Improvement Plan. This meeting is tentatively scheduled for the end of June. Rainse reminded everyone that there will be a public review and comment period for the preferred alternative and that an e-mail notification will be distributed with this information. The meeting was adjourned at approximately 8:30 p.m.

Aurora State Airport Alternatives Public Meeting
Comment Summary

30 comment forms were submitted at the March 10, 2011 Aurora State Airport meeting. 59 additional comment forms were faxed, mailed or e-mailed in after the meeting. 13 people submitted a comment form via the online survey.

Additionally, several people submitted other comments beyond the comment form at the public meeting and by email after the event. These comments are attached at the end of this summary.

	No Build Alternative	Alternative 1	Alternative 2	Alternative 3
Instrument Approach Capability	64 No change Approach minima to remain at visual and greater than 1 statute mile (sm)	12 No change Approach minima to remain at visual and greater than 1 statute mile (sm)	16 Improved instrument approach capability. Visibility greater than ¾ statute mile (sm)	8 Improved instrument approach capability. Visibility minima lower than ¾ statute mile (sm) (precision approaches). Parallel taxiway relocated 100 feet to the east and multiple buildings removed or altered.
Airport Reference Code	65 No change Remain at ARC B-II	16 No change Remain at ARC B-II	12 Upgrade to ARC C-II	1 Upgrade to ARC C-II
Runway Length	62 No change (total runway length: 5,004')	17 600' extension to north end of runway (total runway length: 5,604')	10 1,000' extension to south end of runway, closure of Keil Rd. (total runway length:	5 No change to length. However, relocation of the parallel taxiway is necessary for
Runway Strength	69 No change - 45,000 pounds DWG	18 Strengthen to 60,000 pounds DWG	9 Strengthen to 60,000 pounds DWG	4 No change - 45,000 pounds DWG
Air Traffic Control Tower (ATCT) Location	*Has not yet been determined.*	31 ATCT located midfield on the east side.	10 ATCT centrally located within State-owned property, but north of the location in Alternative 1.	5 ATCT located closer to the north end and farther from the runway than in the other two build alternatives.

	No Build Alternative	Alternative 1	Alternative 2	Alternative 3
Helicopter Parking Location	60 No change	18 Designation of helicopter operations area in the northwest section of State-owned property.	3 Designation of helicopter operations area, situated where the fuel tanks are currently located.	4 Designation of helicopter operations area, north of the current apron.
Fuel Station Location	64 No change	13 Fuel tank relocation south of Aurora Aviation.	6 Fuel tanks relocated northeast of Aurora Aviation.	9 Future fuel tanks located at the south end of State-owned property.
Aurora Rural Fire Protection District Location	34 No change	23 Fire District's response building located near the air traffic control tower (ATCT).	35 Fire District's response building located adjacent to the water suppression system.	3 The Fire District's response building located east of the fire suppression system.
Cargo Apron Location	66 No change	10 No change	4 Designation of a cargo apron facility, north of Aurora Aviation.	9 The cargo apron centrally located on State-owned property.

Additional comments provided on comment forms:

1) The number of air operations does not justify the lengthening of the runway. I support the no build alternative with the exception of the Aurora Rural Fire District facility. I am an elected board member of the Fire District. Aurora was never intended to be a "big jet" airport. It is too constrained both in length and width.
2) For the no build alternative, determination of the location for the ATCT is a critical addition.
3) Would like C-2, but don't think closing Keil Rd. is a good idea, increases traffic on Airport Rd. Prefer 600' extension to the north.
4) No additional growth.
5) 600' extension to begin with to the North. After a term of 5 years to help replenish funds extend an additional 600' on the South end (save Keil Rd.)
6) Roads are already over capacity!
7) Alternative 2 as depicted places a RWY 17 run-up area on Wiley Condo Association property very close to existing hangars with large operable doors. This property is not for sale and is not likely to be. Consideration should be given to an alternative that includes a 600' extension with run-up area at the North end and a 500' extension at the South end to create a 60000' runway with an upgrade to ARC C-11.

8) Representing property south of airport "P" zone south of Keil Rd. Totally approximately 75 acres.
9) Since you cut the trees down the noise is louder—trees are important to clean the air. I support the tower and fire station. NO expansion. I am very concerned about how the quality of my life will decrease because of the high noise along with the value of my property which will decrease. I live in Dear Creek Estates close to the end of the now runway and in 10 years the noise has increased greatly. Plus planes flying over our home taking a short cut to the airport.
10) The removal of the trees by the west opened up more noise. I support the no build plan, the tower and fire station.
11) I am a home owner in Aurora.
12) Why don't they do something at the airport to actually get pilots of jets to fly the pattern they are supposed to?
13) Property owner
14) Remove power lines on north end. If the power lines were hit by a plane how would the loss of power to our community. Hospitals, schools, fire police. Shared costs to relocate lines underground—Power Company, City, County, and Oregon Aviation Dept. Educational building for high school students interested in aviation, shared by community colleges and education districts; 2-story building. I have additional ideas. Email me please. (Ronald Sterba, saintesterba@msn.com)
15) Comment on Helicopter Parking Location for no build alternative: already done on whose approval?
16) Aurora is one of the most significant pieces of history in Oregon. Who benefits from a larger and busier airport? Could you consider doing something in the line of keeping the integrity of this small historic piece? It doesn't lend itself to this noisy alternative. Take an example from Vermont and keep this historic jewel as the treasure it should be.
17) Any/all proposed changes need to consider/mitigate the problems that will come outside "the fence" area. Such as east-west traffic and turn lanes, drainage issues, sewer and water supplies up to code, noise and vectoring of air traffic. If the above concerns are not met there will be many irate and vindictive neighbors to deal with going forward. Not a good situation! Given present and mean time future economic situation, we are better to not overbuild especially your way for the very few – the number of operations is still highly questionable! Use your new tower to get accurate numbers prior to any further changes. Runway lengthening and Build options 2 and 3 are not warranted.
18) What is tax payer liability for under improvements of Airport Rd? For the entire expansion?
    What are impacts of expansion on adjacent properties? Zoning? Usages?
    What is the number of regular operators that live in Clackamas or Marion County?
    What will be done prior to expansion mobilization to ensure City of Aurora's annexation of Airport?
    What are the wildlife and environmental impacts? When were studies completed?
19) We have hundreds of large geese in the Charbonneau area which could pose a serious threat to aircraft and civilians. I am not concerned about the lives of the geese—only the people. We have more than enough aircraft emanating from this airport now!

20) The noise level now is too high with low flying planes and helicopters who don't seem to care that people would very much appreciate a quiet neighborhood in which to find refuge. It is unfortunate that we in Clackamas County must suffer the consequences of Marion County decisions on this matter. More planes also mean more cars and trucks on our exits and entrances to the I-5 corridor which is awful right now as it is.
21) Some Charbonneau residents are curious when we see the map showing the sound pressure level (yellow line) following the exact southern boundary of Charbonneau. Also at the DOA meeting we heard SPL/Ob numbers for aircraft on this boundry to be 65 or 75 Db. Institutions such as MIT and HUD have said that the Db for flushing a toilet is 75 Db and a business office is 85 Db. I have a hard time believing that the planes going over as we dine on our patios are more quiet than a toilet or a business office.
    We have taken a straw poll of Charbonneau residents, at a recent social function and well over 95% of us are strongly opposed to the airport expansion!
22) No more noisy planes over Charbonneau!
23) It is hard for me to believe that fuel tax would pay for all the proposed changes. As a tax payer I don't want to have any part of paying for the ability to have more corporate jets landing at the Aurora Airport!
24) I have had enough as it is of planes flying over Charbonneau. I came here from Beaverton because of the rural atmosphere and less crowding. Why must it always be ruined?
25) To approve any changes is "letting the camel in the tent!" Good, bad, indifferent—the future cannot be controlled. Surely a tower and instrument approach would improve safety but that is the camel.
26) Rw 17 run-up area on Alternative 2 is not desirable to owners of Wylee property. It would add constant noise and blast to adjacent hangars. Better solution must be found, preferably adjacent to Willamette Aviation facility on runway extension to north.
27) It is my feeling that most Charbonneau residents have little sympathy for the needs and wishes of users of the Aurora Airport, because pilots presently flying in and out of the airport just don't give a shit about avoiding the airspace above Charbonneau. Improved facilities can only mean continued disregard for the neighborhood, on a larger scale.
28) Locate ATCT at mid-field west of the highway to Hubbard. This will require land acquisition but will reduce tower height with no loss of 2 acres of airport land.
    Locate the helicopter parking in the fire suppression system area. This will totally separate helicopter traffic from fixed wing, plus make room for helicopter business and hangars.
    A reasonable return on investment should always be a paramount consideration where major investment is required. I don't feel that has happened when consideration for runway strengthening or extension is being considered. To spend millions of dollars for the possibility of a very small return on investment makes no sense, especially when both the state and federal government is broke. Lets get realistic.
29) A tower and runway extension is not so good in this climate.
30) Who wrote this? Our biggest problem is people who don't have a clue about aviation write questionnaires like this. Get someone involved in aviation to help make airport programs! You are wasting our money.
31) Justify all projects by cost.

32) The noise over our house is BAD enough as it is. I certainly don't want any increase! I wish there were no Aurora Airport at all.
33) Any changes will only benefit a small handful of users of the airport, not the general public.
34) We hope that the airport is not enlarged! There is enough jet noise now over Charbonneau!
35) Larger jets = more noise
36) Runway extension – particularly north will result in heavier noisier aircraft taking off closer (& lower over) populated areas. Noise problem. Environmental problem. Safety problem. Please do not extend runways.
37) Planes are flying over Charbonneau even though they are required not to. Expansion would only increase the noise level in this area. Think of the noise level at our Portland International Airport. We don't need to push in that direction. Thanks.
38) Aircraft coming and going creates a worsening noise problem for those of us who live in Charbonneau. Making the changes sought will only make a bad problem worse!
39) I trust you will not move north. It would be too close to a population of a growing city (Wilsonville and Tualatin).
40) See submitted letter and petition from Friends of French Prairie.
41) We are concerned about the noise level from larger jets. The hundreds of geese that flock to the small lakes in Charbonneau are a hazard to the jet engines. Longer runways bring larger planes. Larger planes bring freight. Freight needs to be hauled away in big trucks. I-5 in the Wilsonville area and beyond is the most deadly in the State. We don't need more truck traffic and congestion.
42) We hate to see an increase in the airport. Already the noise and planes flying low is very unpleasant. Quality of living in a somewhat rural area is suffering from all of this. Homes to the south would really feel this with runway extensions.
43) In as much as the Charbonneau is a heavily populated area at the southern most edge of the city of Wilsonville, every effort should be taken to not degrade the environmental and living conditions of the residents while improving or, at the very least, mitigating the physical risk to person and property. To that end, I recommend the following: 1) any fuel storage should be located as far to the southern end of the airport as possible. That provides, by physical distance, the maximum protection to the populace in the case of explosion. 2) Approach capability should NOT be lowered below the current one statute mile minimum. North-to-south approaches typically pass over Charbonneau. Lowering the approach minimum directly increases the risk to the populace by reducing the vertical distance between the aircraft and the ground in case of an in-flight emergency such as mechanical failure, bird strikes, and/or wind shear. Further, the potential for increased air traffic coupled with lowering the approach minimum directly and dramatically degrades the quality of life around the airport by increasing the noise pollution associated the lower approaches. 3) Strengthening the runway only serves to allow larger, louder aircraft to access the airport. This change will result in further increasing noise pollution and dramatically increases the risk of damage to property and person in the case of an aircraft crash. 4) Helicopter operations should be located as far away from heavily populated areas as possible. This dislocation not only affords increased protection for the populace but also reduces the noise pollution associated with these aircraft types.

44) My husband and I would like our opinion on the Aurora Airport known. I have attached a copy of the survey for the airport. As you can see we have MARKED every box in the "NO Build Alternative" column. We DO NOT want and improvements done to the Aurora Airport. We would like to see the larger jets go to another airport. The noise from the jets is extremely annoying, especially when the come screaming over the house late at night. We have lived here since 1977. We know there will be change. But we DO NOT want the airport any larger or improved from how it is now. The current JETS are loud and at times too low during landing. The size of aircraft is getting too large for this location.
45) Helicopter parking location should be in south end only.
46) From 1/14/11 to present there have been 127 flights at the intersection of Miley Rd and Airport Rd that are totally out of FAA compliance, according to the flight directory rules. This intersection is 1.6 miles from the airport.
    1. Average flight inbound is 337 yards AGL (laser sighted)
    2. All aircraft are flying in an illegal pattern
    3. Noise abatement—some cases rattle windows
    4. Number of aircraft per month is 113 flights
    5. Most critical—who at the State Department did the bird counts for possible bird strikes?
    6. Four witnesses working on counting birds including AGL and direction of flight have been monitoring morning and night
    7. Flocks of over 1,000+ to as few as 25 or 30 generally fly pattern at 020 degrees to 219 degrees. These are the biggest migration pattern for these birds. These birds are directly in the fly pattern of aircraft flying over the intersection of Miley Rd and Airport Rd.
    8. The first engine out bird strike outbound is going to land in the middle of Wilsonville Shopping Center. It is a coincidence that average AGL for aircraft is 337 yards and geese are 215 to 480 yards AGL.

    With these documentations and witnesses to what may happen in the event of a major accident, who exactly are we going to sue? All flight in and out of this airport should use the FAA directory per its rules and you will find it is pretty safe flying conditions.

Comments from Online Survey

1) I have flown into and out of 3S2/ KUAO for 14 years. The demand for greater volume of aircraft is evident, and improved operational conditions would help Aurora, the local economy and the state of Oregon, whilst improving safety.
2) I have no opinion or inadequate information on other choices, what about both extensions? Why only 60,000 pounds; many business jets today push 100,000 pounds.
3) The city believes that the Airport should be allowed to grow, But it also believes that no growth should happen outside the existing boundaries of the airport until the airport is annexed into the City Of Aurora. In talking to adjacent property owners it seems they also agree with the City. Please consider our comments in your decision.
4) Before selecting the preferred alternative, comprehensive traffic and noise impact studies on surrounding communities need to be completed. The work done on these problems to date is cursory and insufficient for the size of the projects contemplated.

Additional Comments Submitted

Bernice -

Here are some of the questions that need to be addressed along with some additonal information that you will need at the meetings that you are going to attend.

1. FLOCKS OF GEESE

Since the meeting on the 12/12/10, my neighbor, Mike Farmer and I, have monitored the geese on the approach pattern from 7:30 am to 5:00 pm. In two days the average elevation was 1100'. The flocks range from 15 to more than 200 geese in the flock. We are going to keep monitoring the geese to prove how unsafe this is for the possibility of aircraft bird stikes.

2. DO THE PILOTS FLYING IN THE AIRSPACE AROUND THE AURORA AIRPORT HAVE TO ABIDE BY REGULATIONS FOR LANDING CONFIGERATIONS AND TAKE OFFS, INCLUDNG ANY ABATEMENTS OR RESTRICTIONS WHILE FLYING IN THESE PATTERNS?

3. ARE THERE ANY RESTICTIONS AROUND THE AURORA AIRPORT THAT CONCERNS SOUND ABATEMENT? WE WOULD LIKE YOU TO CLARIFY WHAT DECIBLE READING WOULD BE TOO HIGH FOR THE HOUSING AREA THAT SURROUNDS THE AURORA AIRPORT. IS THIS GOING TO BE A FAA READING OR ONE THAT YOU ARE GOING TO APPROVE ON YOUR OWN?

4. WHAT ARE THE RULES FOR ELEVATIONS FOR AIRCRAFTS AFTER CROSSING THE WILLAMETTE RIVER ON FINAL APPROACH TO AURORA AIRPORT?

5. DON'T JETS HAVE TO FOLLOW THE SAME RULES AND REGULATIONS, INCLUDING LANDING CONFIGERATIONS, AS PER THE FAA LAWS AND RULES THAT ARE
IN COMPLETE DETAIL IN THE AIRPORT DIRECTORY THAT IS USED BY ALL PILOTS?

6. WILL THERE BY ANY REGULATIONS THAT CONCERNS "CALM WIND DAYS" WITH WINDS 10 MPH OR LESS? ALL AIR TRAFFIC, IN BOUND AND OUT BOUND, SHOULD BE TAKING OFF FROM THE SOUTH ONLY. THIS WOULD EASE SOME OF THE TENSION FOR THE THOUSANDS OF PEOPLE INVOLVED TO THE NORTH.

All the questions above clearly indicate that no one is monitoring those pilots that are violating the FAA laws. When these laws are broken, will the pilots be fined or lose their license or will a new directory be written by the Aurora Airport to fit their needs?

As of 12/12/10, we have been monitoring incoming and out going aircraft, expecially their elevations (AGL). Just as a note, on 12/15/2010, Aurora Airport manager (FBO)
was notified that at 11:16 am, 11:21 am, 11:37 am and 11:46 am, the highest elevation for a DC3 was 301 yds and as low as 257 yds above Prairie View Estates. After the call, the DC3 stopped making its practice runs.

HARLAN REETZ

I do not believe citizens or local property owners benefit from the airport improvements that are going to be adopted by this master plan. I also don't believe it makes any difference if citizen's comment with disapproval, Marion County and the ODA will give the airport whatever they decide it needs or wants.

I've watched a film of a town hall meeting, concerning the master plan, from 10 years ago. Local citizens were very disapproving of all the improvements being offered. It made no difference. Marion County commissioners have allowed unrestrained growth. Now, 10 years later, the airport claims they need a tower because of safety issues, that were brought on by that unrestrained growth. In today's financial crisis, I am appalled that our federal and state governments are funding a tower. Millions of dollars could be put to much better use than to build a tower at Aurora.

I would encourage citizens to take a look at what has happened at the Hillsboro airport. The "improvements" being adopted here are designed to promote private aviation business interests such as flight training or aviation hobbyists whose comfortable lifestyle allows them to own or rent private aircraft.

I am against lengthening or strengthening the runway, the taking of farmland for hangers or the building of a tower. Attracting bigger jets or more aircraft only benefits a small minority and diminishes livability for those who live in the area. The no build option is best for the majority of citizens. The roads are already to busy and tax payers should not have to pay the cost of road and utility improvements, that only benefit a few private aviation businesses.

The Marion County Commissioners have demonstrated their support for aviation development over the environment, livable neighborhoods or protecting farmland. Clackamas County residents have not been given equal representation even though the airport expansion and development affects us as well as Marion County citizens.

The impact would be temp, but not for making large aircraft accessible. The environmental impact of a busier facility is a detriment to agriculture and to the livability of the entire area.

March 7, 2011

To: PAC of Aurora State Airport

I am concerned with increased noise and air pollution to nearby residents and potential disturbance to wildlife in the area if airport traffic is increased and more jets begin to use the airport. The small, local airport is already here, and we accept that once in a while a small jet flies in. But we are distressed that if it is opened to more and larger jets, our quality of life and property values will be diminished.

Perhaps the addition of a tower and/or runway extension would improve safety at the airport, but the increased noise levels of more jets using the airport are problematic. Jets that are really pounding to gain altitude would definitely affect noise levels. Plus, with the smaller planes that are currently using the airport there is almost no night-time traffic--I'm concerned that with more jets, we would have more noise and increased safety risk at night. I am also concerned about the possibility of more around the clock jet cargo traffic in the future.

The FAA performs extensive noise tests on hundreds of models that fly in the United States, making generalizations difficult. However, according to figures taken from FAA records, the median decibel level upon takeoff of all models of two common small jets, Learjet and Gulfstream, at 76 decibels, is somewhat higher than those of two common small propeller plane manufacturers, Piper and Cessna, at 69 decibels. Even a small increase in jet traffic would have an adverse noise impact. *(Longmont Ledger, April 23, 2010)*

Lorna Dove, who lives in Georgetown near Seattle, has devoted extensive hours toward researching and measuring chemicals like benzene and toluene, byproducts of jet fuel and plane exhaust. Dove's strongest ally has been the Agency for Toxic Substances and Disease Registry in Atlanta, which, after conducting a risk assessment of air quality in 1998, found that Georgetown residents had "a higher risk for leukemia and thyroid cancer" than the population at large. I would like to see studies of environmental impact of increased air traffic on our area. *(The Stranger, July 2, 2008)*

Our area is called French Prairie. Let's talk about the historical significance of this area and the importance of preserving it. A larger commercial airport will undermine the agricultural character and general livability of our community.

Look at CAAP (Citizens Against Airport Pollution), a community based organization that seeks to reduce pollution caused by airport operations.

July 20, 2010

Citizens Against Airport Pollution [CAAP] has filed a lawsuit against the City of San Jose because the City recently approved a major amendment to the Airport Master Plan without an Environmental Impact Report describing what adverse affect these amendments will have on the environment.

The suit alleges that the City failed to conduct the proper environmental investigation necessary prior to the approval of a major amendment to the Airport Master Plan, as required by CEQA. Air pollution impacts, noise pollution impacts and impacts on wildlife are unknown. In an effort to avoid litigation, CAAP previously requested the City to defer action approving the major amendment so that these issues could be evaluated and discussed without litigation. The City chose to ignore these concerns and approved the major amendment to the Airport Master Plan without a clear understanding of its impact on the environment.

For over 20 years, Citizens Against Airport Pollution has been the only watchdog organization committed to protecting the environment from pollution caused by Mineta San Jose International Airport. CAAP has always supported a first class airport to serve the needs of the Southbay. Protecting the quality of life for San Jose residents and maintaining a first class airport is doable. However, it requires thoughtful planning and a keen sensitivity to environmental protections. If Silicon Valley is to become the center of "green" technology, the City of San Jose must make every effort to make its airport environmentally sensitive and a good neighbor. CAAP believes that the protection of the quality of life in the neighborhoods should be the highest priority to the City of San Jose. http://www.caap.org/

I hope the ones who finally make the decision in this matter will take into consideration the appeals of their neighbors, and not jeopardize their ability to continue living comfortably in their homes. Please slow down the premature rush to expand this airport.

LOGBOOKENTRY | COMMENTARY

BY ROBERT E. BREILING
FOUNDER, ROBERT E. BREILING ASSOCIATES

Statistics that improve safety

Compiling business jet and turboprop accident statistics has been an objective of mine since the early 1960s. When I was a Navy carrier pilot and safety officer—and later a Pan Am pilot—I met an insurance executive who was concerned about insuring the new business jets and turboprops being bought by corporations. As I had some 3,000 hrt flight hours, I was retained as a consultant by the underwriter to visit and evaluate its operations. When Pan Am furloughed junior pilots, I went to work for the insurance underwriter to perform new-aircraft analyses, establish an engineering department, and supervise the company's fleet of 12 piston aircraft. There I began to compile business turbine aircraft statistics.

More than 50 percent of the bizjet accidents and incidents continue to occur in the landing phase year after year (for turboprops, it's 43 percent).

During this period I served on the NBAA board of directors, as head of its safety committee, and made numerous statistical presentations at Flight Safety Foundation's Corporate Aviation Safety Seminar, Bombardier's Safety Standdown, and others. I also worked with Donald Engen to establish the AOPA Air Safety Institute's light aircraft database.

I was then offered an opportunity to join the start-up team of SimuFlite, where one of my objectives was to secure an FAA exemption to use "advanced" simulators for training in lieu of aircraft. I showed the FAA that 52 business-jet accidents occurred during in-aircraft training from 1964 through 1980. We received the exemption, which benefitted both SimuFlite and FlightSafety International, the two training companies at the time. The accident rate began to fall (improve) so much that underwriters offered a reduced hull rate if companies trained in advanced simulators for both jets and turboprops. In 1985 we saw a need for this data by aviation insurance underwriters and corporate operators and began publishing our *Annual Business Turbine Aircraft Accident Review*, where we identified by specific aircraft the accident rates, phase of operation in which the accident occurred, causal factors, and other pertinent information.

In review of this data over the years, we found several dominant trends. For example, more than 50 percent of the bizjet accidents and incidents continue to occur in the landing phase year after year (for turboprops, it's 43 percent). Surprisingly, 76 percent of the jet accidents occur on 5,000-foot or longer runways, 10 percent on 4,000- to 5,000-foot-long runways, and 8 percent on runways shorter than 4,000 feet. Sixty-five percent were in VMC, and 24 percent were on contaminated runways. It is obvious that pilots are not adhering to positive landing techniques. They continue to land long, add a few knots to V_{REF}—which is already 30 percent above stall speed—"grease it on," delay reverser use, and use positive braking.

With respect to turboprops, accidents in the approach phase are higher with 17.6 percent occurring here, versus 7 percent in bizjets. My opinion is that many approach accidents involve single pilots, where it is apparent that the pilot gets to minimums and, being unfamiliar with the missed approach procedure, goes lower or performs an improper missed approach. I might add that single pilots have a 50-percent greater accident rate than aircraft flown by two pilots.

Single-engine turboprops, mostly flown by single pilots, are involved in a higher number of high-altitude upsets than other turboprops. It seems apparent that pilots are over-relying on the autopilot and when a malfunction occurs, loss of control follows. More instrument flight proficiency and upset training may be necessary.

Also noted over the years is that the number of reported incidents is increasing, and many result in serious damage. It is interesting to note that a turboprop can land gear up, and cause serious damage, yet this is classified as an incident—whereas a light jet can experience a gear collapse while taxiing, causing relatively light damage, and it is classified as an accident.

We believe that our annual reviews are invaluable to any bizjet or turboprop operator to aid in identifying specific aircraft problems, support the fact that short runways should not be used, and illustrate how business aviation safety compares to charter air taxi, fractionals, airline operations, single-pilot involvement, et cetera.

We publish the review annually and offer the complete study, including turbine helicopters, for $375; the jet section or turboprop section can be purchased separately for $175 each. For more see our website (www.breilinginc.com) or call us at 561-338-6900. AOPA

Subject: Comment: Aurora State Airport Master Plan

I attended the meeting earlier this month but unfortunately could not stay for the public comment portion that was begun at the end of the meeting.

One of the questions I have and I posed it to several people at the breakout session: Why is the Aurora Airport the subject of expansion when McNary Field is 20 miles away and has an existing longer runway than Aurora? Most of the responses to my questions were "convenience and closer to downtown Portland". I think that the overall public may be better served by exploring the options of McNary Field in Salem instead of embarking on this costly expansion.

If this expansion at Aurora proceeds the State of Oregon needs to impose stringent and enforced noise abatement procedures for the surrounding neighborhoods. This would mean monitoring by the control tower of violators and the imposition of fines and or license suspensions for pilots of aircraft that do not comply. To help with noise abatement the arrival/departure flight path from/to the north should be directed over the I-5 corridor and not Wilsonville.

Lastly, has an environmental impact study been conducted as to the affects of wildlife on airport operations. This area of the Willamette valley is a

large flyway for Canada geese. Wouldn't this be a safety issue?

I would appreciate your thoughts on my comments.

To: Adrienne DeDona
Subject: Aurora Airport

Dear Adrienne,

Thank you for taking the time to listen to the residents concern about the proposed expansions to the Aurora airport.

I live nearby in an area that is supposed to be a "no fly" zone. It is anything but. We have planes flying over frequently and sometimes very low.
Low enough on occasion that I am concerned they are in distress and are about to crash.

An expansion would only increase these problems with the addition of increased jets and larger planes in the area and the subsequent noise issues.

It seems there are enough larger airports in the vicinity already with PDX and Hillsboro, both with greater activity and facilities than here.
Please do not turn this area into another large airport and all the noise and safety issues that would go with it.

Keep us safe and quiet!

Thank you for taking our welfare into your consideration.

A local resident and neighbor of the Aurora Airport.

Lynell Cooper-Joslin
Charbonneau

I, Kenneth W. Hawken agree with the proposal noted below. Please add my name to the petition.

Aurora Airport Master Planning Process
Petition to the Oregon Department of Aviation
from
Aurora Airport Neighbors in the Prairie View Community

Whereas, the Aurora State Airport lies less 1 1/2 miles south of the Prairie View residential community and over-flights of Prairie View are already frequent and noisy and

Whereas, the Oregon Department of Aviation is considering the possible inclusion of an extension of the existing runway and/or strengthening the runway to accommodate heavier aircraft in the current master planning process,

We, the undersigned residents of Prairie View support the petition from Charbonneau residents and express our grave concern about the number of larger jets that such an extension would bring, with the resultant increase in noise pollution for neighboring communities. We oppose such action for the following reasons:

1. At this airport, landings to the south require jets and others to fly low over dense residential areas of Wilsonville and surrounding communities. The proposed control tower, operating only during daylight hours, will not be able to fully mitigate this problem.

2. The environmental impact of a runway extension or strengthening, bringing additional and larger jet traffic, will be to reduce property values for many Wilsonville residents including those living in Charbonneau and Prairie View.

3. The extension proposed is sought by a very small number of operators, most of whom regularly use its current runway. At a time of extreme State and Federal budget difficulties it is unacceptable to consider spending large sums of taxpayer money on development to benefit so few special interests.

4. This Airport is constrained on all sides by roads and residences, by one runway, and by private infrastructure close to the taxiway and runway, all hampering long term expansion. For example, it is not practically possible, nor financially feasible, to reduce the approach minimums, something that would make the Airport a more reliable destination in bad weather. If a longer runway is required in the region this should be done at a rural area airport with many fewer constraints, such as Mulino.

For all the above reasons we request that consideration of a runway extension and/or strengthening the weight-bearing load of the runway at Aurora Airport be postponed to allow study of the most appropriate location and timing for such developments and any extension or strengthening be excluded from the current Master Plan update.

To who it may concern, we agree with the proposal below.

I agree with the proposal noted below and would like to add the following:

As a tax paying citizen, it is appalling to me that millions are going to be spent to build a tower at the Aurora Airport. It is obvious the ODA at the State of Oregon and the FAA will promote private aviation business interests over those of neighboring property owners. Marion County should not legally be allowed to expand the airport when it affects the residents of Clackamas County without equal representation. Sitting on an advisory committee outnumbered by airport business interests is not representation.

IT IS THE SPECIAL INTERESTS OF A SMALL MINORITY THAT BENEFITS BY DIMINISHING THE RIGHTS AND LIVIBILITY OF PROPERTY OWNERS.

Aurora Airport Master Planning Process

Petition to the Oregon Department of Aviation from Aurora Airport Neighbors in the Prairie View Community

Whereas, the Aurora State Airport lies less 1 1/2 miles south of the Prairie View residential community and over-flights of Prairie View are already frequent and noisy and

Whereas, the Oregon Department of Aviation is considering the possible inclusion of an extension of the existing runway and/or strengthening the runway to accommodate heavier aircraft in the current master planning process,

We, the undersigned residents of Prairie View support the petition from Charbonneau residents and express our grave concern about the number of larger jets that such an extension would bring, with the resultant increase in noise pollution for neighboring communities. We oppose such action for the following reasons:

1. At this airport, landings to the south require jets and others to fly low over dense residential areas of Wilsonville and surrounding communities. The proposed control tower, operating only during daylight hours, will not be able to fully mitigate this problem.

2. The environmental impact of a runway extension or strengthening, bringing additional and larger jet traffic, will be to reduce property values for many Wilsonville residents including those living in Charbonneau and Prairie View.

3. The extension proposed is sought by a very small number of operators, most of whom regularly use its current runway. At a time of extreme State and Federal budget difficulties it is unacceptable to consider spending large sums of taxpayer money on development to benefit so few special interests.

4. This Airport is constrained on all sides by roads and residences, by one runway, and by private infrastructure close to the taxiway and runway, all hampering long term expansion. For example, it is not practically possible, nor financially feasible, to reduce the approach minimums, something that would make the Airport a more reliable destination in bad weather. If a longer runway is required in the region this should be done at a rural area airport with many fewer constraints, such as Mulino.

For all the above reasons we request that consideration of a runway extension and/or strengthening the weight-bearing load of the runway at Aurora Airport be postponed to allow study of the most appropriate location and timing for such developments and any extension or strengthening be excluded from the current Master Plan update.

=

Bernice,

First a thank you for all the time and effort you put in for all of our sakes. We both appreciate it.

We agree with the attached proposal, namely the Petition to the Oregon Department of Aviation from the Aurora Airport Neighbors in the Prairie View Community.

Robert C. Brooks 14510 NE Mulligan Court, Aurora, OR 97002
Susan G. Brooks 14510 NE Mulligan Court, Aurora, OR 97002

Thank you.

Aurora Airport Master Planning Process
Petition to the Oregon Department of Aviation
from
Aurora Airport Neighbors in the Prairie View Community

Whereas, the Aurora State Airport lies less 1 1/2 miles south of the Prairie View residential community and over-flights of Prairie View are already frequent and noisy and

Whereas, the Oregon Department of Aviation is considering the possible inclusion of an extension of the existing runway and/or strengthening the runway to accommodate heavier aircraft in the current master planning process,

We, the undersigned residents of Prairie View support the petition from Charbonneau residents and express our grave concern about the number of larger jets that such an extension would bring, with the resultant increase in noise pollution for neighboring communities. We oppose such action for the following reasons:

1. At this airport, landings to the south require jets and others to fly low over dense residential areas of Wilsonville and surrounding communities. The proposed control tower, operating only during daylight hours, will not be able to fully mitigate this problem.

2. The environmental impact of a runway extension or strengthening, bringing additional and larger jet traffic, will be to reduce property values for many Wilsonville residents including those living in Charbonneau and Prairie View.

3. The extension proposed is sought by a very small number of operators, most of whom regularly use its current runway. At a time of extreme State and Federal budget difficulties it is unacceptable to consider spending large sums of taxpayer money on development to benefit so few special interests.

4. This Airport is constrained on all sides by roads and residences, by one runway, and by private infrastructure close to the taxiway and runway, all hampering long term expansion. For example, it is not practically possible, nor financially feasible, to reduce the approach minimums, something

that would make the Airport a more reliable destination in bad weather. If a longer runway is required in the region this should be done at a rural area airport with many fewer constraints, such as Mulino.

For all the above reasons we request that consideration of a runway extension and/or strengthening the weight-bearing load of the runway at Aurora Airport be postponed to allow study of the most appropriate location and timing for such developments and any extension or strengthening be excluded from the current Master Plan update.

Aurora State Airport Master Plan Update
COMMENT FORM

The chart below includes features of the no build alternative and the three build alternatives. Please indicate what features of the alternatives you prefer by checking the appropriate box.

	No Build Alternative	Alternative 1	Alternative 2	Alternative 3
Instrument Approach Capability	☒ No change. Approach minima to remain at visual and greater than 1 statute mile (sm)	☐ No change. Approach minima to remain at visual and greater than 1 statute mile (sm)	☐ Improved instrument approach capability. Visibility greater than ¾ statute mile (sm)	☐ Improved instrument approach capability. Visibility minima lower than ¾ statute mile (sm) (precision approaches). Parallel taxiway relocated 100 feet to the east and multiple buildings removed or altered.
Airport Reference Code	☒ No change. Remain at ARC B-II	☐ No change. Remain at ARC B-II	☐ Upgrade to ARC C-II	☐ Upgrade to ARC C-II
Runway Length	☒ No change (total runway length: 5,004')	☐ 600' extension to north end of runway (total runway length: 5,604')	☐ 1,000' extension to south end of runway, closure of Keil Rd. (total runway length: 6,004')	☐ No change to length. However, relocation of the parallel taxiway is necessary for precision approach. (total runway length: 5,004')
Runway Strength	☒ No change (45,000 pounds DWG)	☐ Strengthen to 60,000 pounds DWG	☐ Strengthen to 60,000 pounds DWG	☐ No change (45,000 pounds DWG)
Air Traffic Control Tower (ATCT) Location	*Has not yet been determined. Please select your preferred location from Alternative 1, 2 or 3.*	☒ ATCT located midfield on the east side.	☐ ATCT centrally located within State-owned property, but north of the location in Alternative 1.	☐ ATCT located closer to the north end and farther from the runway than in the other two build alternatives.

	No Build Alternative	Alternative 1	Alternative 2	Alternative 3
Helicopter Parking Location	☒ No change	☐ Designation of helicopter operations area in the northwest section of State-owned property.	☐ Designation of helicopter operations area, situated where the fuel tanks are currently located.	☐ Designation of helicopter operations area, north of the current apron.
Fuel Station Location	☒ No change	☐ Fuel tank relocation south of Aurora Aviation.	☐ Fuel tanks relocated northeast of Aurora Aviation.	☐ Future fuel tanks located at the south end of State-owned property.
Aurora Rural Fire Protection District Location	☐ No change	☒ Fire District's response building located near the air traffic control tower (ATCT).	☐ Fire District's response building located adjacent to the water suppression system.	☐ The Fire District's response building located east of the fire suppression system.
Cargo Apron Location	☒ No change	☐ No change	☐ Designation of a cargo apron facility, north of Aurora Aviation.	☐ The cargo apron centrally located on State-owned property.

Additional Comments:

The Number of Air operations Does not Justify the long Hauling of the Runway
I Support the 'no Build' Alternate with the Exception of the Aurora Rural Fire District Facility - I am an Elected Board Member of the Fire District.
Aurora was never Intended to Be a 'Big Jet' Airport. It is Too Constrained Both in length & Width. GREG LEO

Additional Comments:

Would like C-2, but don't think closing Keil Rd a good idea, increase traffic on ~~Butteville~~ Airport Rd. Parlee 600' extension to North

Aurora State Airport Master Plan Update
COMMENT FORM

The chart below includes features of the no build alternative and the three build alternatives. Please indicate what features of the alternatives you prefer by checking the appropriate box.

	No Build Alternative	Alternative 1	Alternative 2	Alternative 3
Instrument Approach Capability	☐ No change. Approach minima to remain at visual and greater than 1 statute mile (sm)	☐ No change. Approach minima to remain at visual and greater than 1 statute mile (sm)	☒ Improved instrument approach capability. Visibility greater than ¾ statute mile (sm)	☐ Improved instrument approach capability. Visibility minima lower than ¾ statute mile (sm) (precision approaches). Parallel taxiway relocated 100 feet to the east and multiple buildings removed or altered.
Airport Reference Code	☐ No change. Remain at ARC B-II	☐ No change. Remain at ARC B-II	☒ Upgrade to ARC C-II	☐ Upgrade to ARC C-II
Runway Length	☐ No change (total runway length: 5,004')	☒ 600' extension to north end of runway (total runway length: 5,604')	☐ 1,000' extension to south end of runway, closure of Keil Rd. (total runway length: 6,004')	☐ No change to length. However, relocation of the parallel taxiway is necessary for precision approach. (total runway length: 5,004')
Runway Strength	☐ No change (45,000 pounds DWG)	☒ Strengthen to 60,000 pounds DWG	☐ Strengthen to 60,000 pounds DWG	☐ No change (45,000 pounds DWG)
Air Traffic Control Tower (ATCT) Location	*Has not yet been determined. Please select your preferred location from Alternative 1, 2 or 3.*	☒ ATCT located midfield on the east side.	☐ ATCT centrally located within State-owned property, but north of the location in Alternative 1.	☐ ATCT located closer to the north end and farther from the runway than in the other two build alternatives.

	No Build Alternative	Alternative 1	Alternative 2	Alternative 3
Helicopter Parking Location	☐ No change	☒ Designation of helicopter operations area in the northwest section of State-owned property.	☐ Designation of helicopter operations area, situated where the fuel tanks are currently located.	☐ Designation of helicopter operations area, north of the current apron.
Fuel Station Location	☐ No change	☒ Fuel tank relocation south of Aurora Aviation.	☐ Fuel tanks relocated northeast of Aurora Aviation.	☐ Future fuel tanks located at the south end of State-owned property.
Aurora Rural Fire Protection District Location	☐ No change	☒ Fire District's response building located near the air traffic control tower (ATCT).	☐ Fire District's response building located adjacent to the water suppression system.	☐ The Fire District's response building located east of the fire suppression system.
Cargo Apron Location	☐ No change	☐ No change	☒ NO Designation of a cargo apron facility, north of Aurora Aviation.	☒ The cargo apron centrally located on State-owned property.

Additional Comments:

ALTERNATIVE 2 AS DEPICTED PLACES A RWY 17 RUN-UP AREA ON WILEY CONDO ASSOCIATION PROPERTY VERY CLOSE TO EXISTING HANGARS WITH LARGE OPERABLE DOORS. THIS PROPERTY IS NOT FOR SALE AND IS NOT LIKELY TO BE. CONSIDERATION SHOULD BE GIVEN TO AN ALTERNATIVE THAT INCLUDES A 600' EXTENSION WITH RUN-UP AREA AT THE NORTHEND AND A 500' EXTENSION AT THE SOUTH END TO CREATE A 6000'+ RUNWAY WITH AN UPGRADE TO ARC C-II.

	No Build Alternative	Alternative 1	Alternative 2	Alternative 3
Helicopter Parking Location	❑ No change	❑ Designation of helicopter operations area in the northwest section of State-owned property.	❑ Designation of helicopter operations area, situated where the fuel tanks are currently located.	❑ Designation of helicopter operations area, north of the current apron.
Fuel Station Location	❑ No change	❑ Fuel tank relocation south of Aurora Aviation.	❑ Fuel tanks relocated northeast of Aurora Aviation.	❑ Future fuel tanks located at the south end of State-owned property.
Aurora Rural Fire Protection District Location	❑ No change	❑ Fire District's response building located near the air traffic control tower (ATCT).	❑ Fire District's response building located adjacent to the water suppression system.	❑ The Fire District's response building located east of the fire suppression system.
Cargo Apron Location	❑ No change	❑ No change	❑ Designation of a cargo apron facility, north of Aurora Aviation.	❑ The cargo apron centrally located on State-owned property.

Since you cut the trees down the noise is louder — trees important — support the tower & fire station DO EXPAND

Additional Comments:

I am very concerned about how the quality of my life will decrease because of the high noise along with the value of my property which will decrease. We live in Deer Creek Estates close to the end of the runway and in 10 years the noise has increased greatly. Please please take under consideration a short cut to Aurora

The chart below includes features of the no build alternative and the three build alternatives. Please indicate what features of the alternatives you prefer by checking the appropriate box.

	No Build Alternative	Alternative 1	Alternative 2	Alternative 3
Instrument Approach Capability	☐ No change. Approach minima to remain at visual and greater than 1 statute mile (sm)	☑ No change. Approach minima to remain at visual and greater than 1 statute mile (sm)	☐ Improved instrument approach capability. Visibility greater than ¾ statute mile (sm)	☐ Improved instrument approach capability. Visibility minima lower than ¾ statute mile (sm) (precision approaches). Parallel taxiway relocated 100 feet to the east and multiple buildings removed or altered.
Airport Reference Code	☐ No change. Remain at ARC B-II	☑ No change. Remain at ARC B-II	☐ Upgrade to ARC C-II	☐ Upgrade to ARC C-II
Runway Length	☐ No change (total runway length: 5,004')	☑ 600' extension to north end of runway (total runway length: 5,604')	☐ 1,000' extension to south end of runway, closure of Keil Rd. (total runway length: 6,004')	☐ No change to length. However, relocation of the parallel taxiway is necessary for precision approach. (total runway length: 5,004')
Runway Strength	☐ No change (45,000 pounds DWG)	☑ Strengthen to 60,000 pounds DWG	☐ Strengthen to 60,000 pounds DWG	☐ No change (45,000 pounds DWG)
Air Traffic Control Tower (ATCT) Location	*Hos not yet been determined. Please select your preferred locotion from Alternative 1, 2 or 3.*	☐ ATCT located midfield on the east side.	☐ ATCT centrally located within State-owned property, but north of the location in Alternative 1.	☑ ATCT located closer to the north end and farther from the runway than in the other two build alternatives.

	No Build Alternative	Alternative 1	Alternative 2	Alternative 3
Helicopter Parking Location	☑ No change	☐ Designation of helicopter operations area in the northwest section of State-owned property.	☐ Designation of helicopter operations area, situated where the fuel tanks are currently located.	☐ Designation of helicopter operations area, north of the current apron.
Fuel Station Location	☑ No change	☐ Fuel tank relocation south of Aurora Aviation.	☐ Fuel tanks relocated northeast of Aurora Aviation.	☐ Future fuel tanks located at the south end of State-owned property.
Aurora Rural Fire Protection District Location	☐ No change	☐ Fire District's response building located near the air traffic control tower (ATCT).	☐ Fire District's response building located adjacent to the water suppression system.	☐ The Fire District's response building located east of the fire suppression system.
Cargo Apron Location	☐ No change	☐ No change	☐ Designation of a cargo apron facility, north of Aurora Aviation.	☐ The cargo apron centrally located on State-owned property.

Cargo Apron Location	☒ No change	☐ No change	☐ Designation of a cargo apron facility, north of Aurora Aviation.	☐ The cargo apron centrally located on State-owned property.

Additional Comments:

Aurora is one of the most significant pieces of history in Ore.
Who benefits from a larger and busier airport?
Could you consider doing something in the line of keeping the integrity of this small historic piece? It doesn't lend itself to this noisy alternative. Take an example from Vermont and keep this historic jewel as the treasure it should be.

Cargo Apron Location	☒ No change	☒ No change	☐ Designation of a cargo apron facility, north of Aurora Aviation.	☐ The cargo apron centrally located on State-owned property.

Additional Comments:

Any/all proposed changes need to consider/mitigate the problems that will come outside the "fence" area. Such as E-W traffic & turn lanes / drainage issues / sewer & water supplies & up to code, Noise & vectoring of traffic (air). If the above concerns aren't met, there will be many irate and vindictive neighbors to deal with going forward. Not a good situation!

Given present and near future econ. situation - we are better to not overbuild especially runway for the very few - the numbers of operations is still highly questionable! Use your new tower to get accurate numbers prior to any B dd 243 are not warranted.

Additional Comments:

I have had enough as it is of planes flying over Charbonneau. I came here from Beaverton because of the rural atmosphere and less crowding. Why must it always be ruined?

	No Build Alternative	Alternative 1	Alternative 2	Alternative 3
Helicopter Parking Location	☒ No change	☐ Designation of helicopter operations area in the northwest section of State-owned property.	☐ Designation of helicopter operations area, situated where the fuel tanks are currently located.	☐ Designation of helicopter operations area, north of the current apron.
Fuel Station Location	☒ No change	☐ Fuel tank relocation south of Aurora Aviation.	☐ Fuel tanks relocated northeast of Aurora Aviation.	☐ Future fuel tanks located at the south end of State-owned property.
Aurora Rural Fire Protection District Location	☐ No change	☐ Fire District's response building located near the air traffic control tower (ATCT).	☒ Fire District's response building located adjacent to the water suppression system.	☐ The Fire District's response building located east of the fire suppression system.
Cargo Apron Location	☒ No change	☐ No change	☐ Designation of a cargo apron facility, north of Aurora Aviation.	☐ The cargo apron centrally located on State-owned property.

Additional Comments:

It is hard for me to believe that fuel tax would pay for all the proposed changes. As a tax payer I don't want to have any part of paying for the ability to have more coperate jets landing at the Aurora Airport!

Aurora State Airport Master Plan Update
COMMENT FORM

The chart below includes features of the no build alternative and the three build alternatives. Please indicate what features of the alternatives you prefer by checking the appropriate box.

	No Build Alternative	Alternative 1	Alternative 2	Alternative 3
Instrument Approach Capability	☒ No change. Approach minima to remain at visual and greater than 1 statute mile (sm)	☐ No change. Approach minima to remain at visual and greater than 1 statute mile (sm)	☐ Improved instrument approach capability. Visibility greater than ¾ statute mile (sm)	☐ Improved instrument approach capability. Visibility minima lower than ¾ statute mile (sm) (precision approaches). Parallel taxiway relocated 100 feet to the east and multiple buildings removed or altered.
Airport Reference Code	☒ No change. Remain at ARC B-II	☐ No change. Remain at ARC B-II	☐ Upgrade to ARC C-II	☐ Upgrade to ARC C-II
Runway Length	☒ No change (total runway length: 5,004')	☐ 600' extension to north end of runway (total runway length: 5,604')	☐ 1,000' extension to south end of runway, closure of Keil Rd. (total runway length: 6,004')	☐ No change to length. However, relocation of the parallel taxiway is necessary for precision approach. (total runway length: 5,004')
Runway Strength	☒ No change (45,000 pounds DWG)	☐ Strengthen to 60,000 pounds DWG	☐ Strengthen to 60,000 pounds DWG	☐ No change (45,000 pounds DWG)
Air Traffic Control Tower (ATCT) Location	*Has not yet been determined. Please select your preferred location from Alternative 1, 2 or 3.*	☒ ATCT located midfield on the east side.	☐ ATCT centrally located within State-owned property, but north of the location in Alternative 1.	☐ ATCT located closer to the north end and farther from the runway than in the other two build alternatives.

	No Build Alternative	Alternative 1	Alternative 2	Alternative 3
Helicopter Parking Location	☒ No change	☐ Designation of helicopter operations area in the northwest section of State-owned property.	☐ Designation of helicopter operations area, situated where the fuel tanks are currently located.	☐ Designation of helicopter operations area, north of the current apron.
Fuel Station Location	☒ No change	☐ Fuel tank relocation south of Aurora Aviation.	☐ Fuel tanks relocated northeast of Aurora Aviation.	☐ Future fuel tanks located at the south end of State-owned property.
Aurora Rural Fire Protection District Location	☐ No change	☐ Fire District's response building located near the air traffic control tower (ATCT).	☒ Fire District's response building located adjacent to the water suppression system.	☐ The Fire District's response building located east of the fire suppression system.
Cargo Apron Location	☒ No change	☐ No change	☐ Designation of a cargo apron facility, north of Aurora Aviation.	☐ The cargo apron centrally located on State-owned property.

Fuel Station Location	☒ No change	☐ Fuel tank relocation south of Aurora Aviation.	☐ Fuel tanks relocated northeast of Aurora Aviation.	☐ Future fuel tanks located at the south end of State-owned property.
Aurora Rural Fire Protection District Location	☒ No change N/A	☐ Fire District's response building located near the air traffic control tower (ATCT).	☒ Fire District's response building located adjacent to the water suppression system.	☐ The Fire District's response building located east of the fire suppression system.
Cargo Apron Location	☒ No change	☐ No change	☐ Designation of a cargo apron facility, north of Aurora Aviation.	☐ The cargo apron centrally located on State-owned property.

Additional Comments: Some Charbonneau residents are curious when we see the map showing the Sound Pressure Level (yellow line) following the exact southern boundy of Charbonneau. Also at the DOA meeting we heard SPL/Db numbers for aircraft on this boundy to be 65 or 75 Db. Institutions such as MIT and HUD have said that the Db for flushing a toilet is 75 Db and a business office is 85 Db. I have a hard time believing that the planes going over as we dine on our patios are more quiet than a toilet or a business office.

We have taken a straw poll of Charbonneau residents at a recent social function and well over 95% of us are strongly opposed to the airport expansion!

Additional Comments:

The noise level now is too high with low flying planes and helicopters who dont seem to care that people would very much appreciate a quiet neighborhood in which to find refuge. It's unfortunate that we in Clackamas County must suffer the consequences of Marion County decisions on this matter. More planes also mean more cars + trucks on our exits and entrances to the I 5 corridor which is awful right now as it is

	No Build Alternative	Alternative 1	Alternative 2	Alternative 3
Helicopter Parking Location	☐ No change	☐ Designation of helicopter operations area in the northwest section of State-owned property.	☐ Designation of helicopter operations area, situated where the fuel tanks are currently located.	☒ Designation of helicopter operations area, north of the current apron.
Fuel Station Location	☐ No change	☐ Fuel tank relocation south of Aurora Aviation.	☒ Fuel tanks relocated northeast of Aurora Aviation.	☐ Future fuel tanks located at the south end of State-owned property.
Aurora Rural Fire Protection District Location	☐ No change	☒ Fire District's response building located near the air traffic control tower (ATCT).	☐ Fire District's response building located adjacent to the water suppression system.	☐ The Fire District's response building located east of the fire suppression system.
Cargo Apron Location	☐ No change	☐ No change	☐ Designation of a cargo apron facility, north of Aurora Aviation.	☒ The cargo apron centrally located on State-owned property.

Additional Comments:

Rw 17 runup area on Alternative 2 not desirable to owners of Wylee property. It would add constant noise & blast to adjacent hangars. Better solution must be found -- preferably adjacent to Willamette Aviation facility on runway extension to north.

Aurora State Airport Master Plan Update
COMMENT FORM

The chart below includes features of the no build alternative and the three build alternatives. Please indicate what features of the alternatives you prefer by checking the appropriate box.

	No Build Alternative	Alternative 1	Alternative 2	Alternative 3
Instrument Approach Capability	☑ No change. Approach minima to remain at visual and greater than 1 statute mile (sm)	☐ No change. Approach minima to remain at visual and greater than 1 statute mile (sm)	☐ Improved instrument approach capability. Visibility greater than ¾ statute mile (sm)	☐ Improved instrument approach capability. Visibility minima lower than ¾ statute mile (sm) (precision approaches). Parallel taxiway relocated 100 feet to the east and multiple buildings removed or altered.
Airport Reference Code	☑ No change. Remain at ARC B-II	☐ No change. Remain at ARC B-II	☐ Upgrade to ARC C-II	☐ Upgrade to ARC C-II
Runway Length	☑ No change (total runway length: 5,004')	☐ 600' extension to north end of runway (total runway length: 5,604')	☐ 1,000' extension to south end of runway, closure of Keil Rd. (total runway length: 6,004')	☐ No change to length. However, relocation of the parallel taxiway is necessary for precision approach. (total runway length: 5,004')
Runway Strength	☑ No change (45,000 pounds DWG)	☐ Strengthen to 60,000 pounds DWG	☐ Strengthen to 60,000 pounds DWG	☐ No change (45,000 pounds DWG)
Air Traffic Control Tower (ATCT) Location	*Has not yet been determined. Please select your preferred location from Alternative 1, 2 or 3.*	☐ ATCT located midfield on the east side.	☐ ATCT centrally located within State-owned property, but north of the location in Alternative 1.	☐ ATCT located closer to the north end and farther from the runway than in the other two build alternatives.

	No Build Alternative	Alternative 1	Alternative 2	Alternative 3
Helicopter Parking Location	☑ No change	☐ Designation of helicopter operations area in the northwest section of State-owned property.	☐ Designation of helicopter operations area, situated where the fuel tanks are currently located.	☐ Designation of helicopter operations area, north of the current apron.
Fuel Station Location	☑ No change	☐ Fuel tank relocation south of Aurora Aviation.	☐ Fuel tanks relocated northeast of Aurora Aviation	☐ Future fuel tanks located at the south end of State-owned property.
Aurora Rural Fire Protection District Location	☐ No change	☐ Fire District's response building located near the air traffic control tower (ATCT).	☑ Fire District's response building located adjacent to the water suppression system.	☐ The Fire District's response building located east of the fire suppression system.
Cargo Apron Location	☑ No change	☐ No change	☐ Designation of a cargo apron facility, north of Aurora Aviation.	☐ The cargo apron centrally located on State-owned property.

Additional Comments: IT IS MY FEELING THAT MOST CHARBONNEAU RESIDENTS HAVE LITTLE SYMPATHY FOR THE NEEDS AND WISHES OF USERS OF THE AURORA AIRPORT, BECAUSE PILOTS PRESENTLY FLYING IN AND OUT OF THE AIRPORT JUST DONT GIVE A SHIT ABOUT AVOIDING THE AIRSPACE ABOVE CHARBONNEAU. IMPROVED FACILITIES CAN ONLY MEAN CONTINUED DISREGARD FOR THE NEIGHBORHOOD, IN A LARGER SCALE.

Cargo Apron Location	☒ No change	☐ No change	☐ Designation of a cargo apron facility, north of Aurora Aviation.	☐ The cargo apron centrally located on State-owned property.

Additional Comments:

A RESONABLE RETURN ON INVESTMENT SHOULD ALWAYS BE A PARAMOUNT CONSIDERATION WHERE MAJOR INVESTMENT IS REQUIRED. I DONT FEEL THAT HAS HAPPENED WHEN CONSIDERATION FOR RUNWAY STRENGHENING OR EXTENSION IS BEING CONSIDERED. TO SPEND MILLIONS OF DOLLARS FOR THE POSSIBILITY OF VERY SMALL RETURN ON INVESTMENT MAKES NO SENSE, ESPECIALLY WHEN BOTH THE STATE ~~AND OR~~ FEDERAL GOVERNMENT IS BROKE. LETS GET REALISTIC.

Aurora State Airport Master Plan Update
COMMENT FORM

The chart below includes features of the no build alternative and the three build alternatives. Please indicate what features of the alternatives you prefer by checking the appropriate box.

	No Build Alternative	Alternative 1	Alternative 2	Alternative 3
Instrument Approach Capability	☑ No change. Approach minima to remain at visual and greater than 1 statute mile (sm)	☐ No change. Approach minima to remain at visual and greater than 1 statute mile (sm)	☐ Improved instrument approach capability. Visibility greater than ¾ statute mile (sm)	☐ Improved instrument approach capability. Visibility minima lower than ¾ statute mile (sm) (precision approaches). Parallel taxiway relocated 100 feet to the east and multiple buildings removed or altered.
Airport Reference Code	☑ No change. Remain at ARC B-II	☐ No change. Remain at ARC B-II	☐ Upgrade to ARC C-II	☐ Upgrade to ARC C-II
Runway Length	☑ No change (total runway length: 5,004')	☐ 600' extension to north end of runway (total runway length: 5,604')	☐ 1,000' extension to south end of runway, closure of Keil Rd. (total runway length: 6,004')	☐ No change to length. However, relocation of the parallel taxiway is necessary for precision approach. (total runway length: 5,004')
Runway Strength	☑ No change (45,000 pounds DWG)	☐ Strengthen to 60,000 pounds DWG	☐ Strengthen to 60,000 pounds DWG	☐ No change (45,000 pounds DWG)
Air Traffic Control Tower (ATCT) Location	*Has not yet been determined. Please select your preferred location from Alternative 1, 2 or 3.*	☐ ATCT located midfield on the east side.	☐ ATCT centrally located within State-owned property, but north of the location in Alternative 1.	☐ ATCT located closer to the north end and farther from the runway than in the other two build alternatives.

	No Build Alternative	Alternative 1	Alternative 2	Alternative 3
Helicopter Parking Location	☐ No change	☐ Designation of helicopter operations area in the northwest section of State-owned property.	☐ Designation of helicopter operations area, situated where the fuel tanks are currently located.	☐ Designation of helicopter operations area, north of the current apron.
Fuel Station Location	☐ No change	☐ Fuel tank relocation south of Aurora Aviation.	☐ Fuel tanks relocated northeast of Aurora Aviation.	☐ Future fuel tanks located at the south end of State-owned property.
Aurora Rural Fire Protection District Location	☐ No change	☐ Fire District's response building located near the air traffic control tower (ATCT).	☐ Fire District's response building located adjacent to the water suppression system.	☐ The Fire District's response building located east of the fire suppression system.
Cargo Apron Location	☐ No change	☐ No change	☐ Designation of a cargo apron facility, north of Aurora Aviation.	☐ The cargo apron centrally located on State-owned property.

Additional Comments:

We hope that the airport is not enlarged! There is enough jet noise now over Charbonneau!

Additional Comments:

Planes are flying over Charbonneau even though they are required not to. EXPANSION would only increase the noise level in this area. THINK OF the noise level at our PORTLAND INTERNATIONAL AIRPORT. We DON'T need TO push IN that direction.

Thanks

Aurora State Airport Master Plan Update
COMMENT FORM

The chart below includes features of the no build alternative and the three build alternatives. Please indicate what features of the alternatives you prefer by checking the appropriate box.

	No Build Alternative	Alternative 1	Alternative 2	Alternative 3
Instrument Approach Capability	☒ No change. Approach minima to remain at visual and greater than 1 statute mile (sm)	☐ No change. Approach minima to remain at visual and greater than 1 statute mile (sm)	☐ Improved instrument approach capability. Visibility greater than ¾ statute mile (sm)	☐ Improved instrument approach capability. Visibility minima lower than ¾ statute mile (sm) (precision approaches). Parallel taxiway relocated 100 feet to the east and multiple buildings removed or altered.
Airport Reference Code	☒ No change. Remain at ARC B-II	☐ No change. Remain at ARC B-II	☐ Upgrade to ARC C-II	☐ Upgrade to ARC C-II
Runway Length	☒ No change (total runway length: 5,004')	☐ 600' extension to north end of runway (total runway length: 5,604')	☐ 1,000' extension to south end of runway, closure of Keil Rd. (total runway length: 6,004')	☐ No change to length. However, relocation of the parallel taxiway is necessary for precision approach. (total runway length: 5,004')
Runway Strength	☒ No change (45,000 pounds DWG)	☐ Strengthen to 60,000 pounds DWG	☐ Strengthen to 60,000 pounds DWG	☐ No change (45,000 pounds DWG)
Air Traffic Control Tower (ATCT) Location	*Has not yet been determined. Please select your preferred location from Alternative 1, 2 or 3.* No opinion	☐ ATCT located midfield on the east side.	☐ ATCT centrally located within State-owned property, but north of the location in Alternative 1.	☐ ATCT located closer to the north end and farther from the runway than in the other two build alternatives.

	No Build Alternative	Alternative 1	Alternative 2	Alternative 3
Helicopter Parking Location	☒ No change	☐ Designation of helicopter operations area in the northwest section of State-owned property.	☐ Designation of helicopter operations area, situated where the fuel tanks are currently located.	☐ Designation of helicopter operations area, north of the current apron.
Fuel Station Location	☒ No change	☐ Fuel tank relocation south of Aurora Aviation.	☐ Fuel tanks relocated northeast of Aurora Aviation.	☐ Future fuel tanks located at the south end of State-owned property.
Aurora Rural Fire Protection District Location	☒ No change	☐ Fire District's response building located near the air traffic control tower (ATCT).	☐ Fire District's response building located adjacent to the water suppression system.	☐ The Fire District's response building located east of the fire suppression system.
Cargo Apron Location	☒ No change	☐ No change	☐ Designation of a cargo apron facility, north of Aurora Aviation.	☐ The cargo apron centrally located on State-owned property.

Additional Comments: We are concerned about the noise level from larger jets.
The hundreds of Geese that flock to the small lakes in Charbonneau are a hazard to the jet engines.
Longer runways bring larger planes. Larger planes bring freight. Freight needs to be hauled away in big trucks - I-5 in the Wilsonville area and beyond is the most deadly in the State. We don't need more truck traffic and congestion.

Additional Comments:

We hate to see an increase in the Airport - Already the Noise & Planes flying Low is very unpleasant. Quality of Living in A Somewhat Rural Area is suffering from All of This - Homes To The South would Really feel This with Runway Extensions

AUORA STATE AIRPORT MASTER PLAN UPDATE
COMMENT FORM ADDENMUM

Additional Comments:

In as much as the Charbonneau is a heavily populated area at the southern most edge of the city of Wilsonville, every effort should be taken to not degrade the environmental and living conditions of the residents while improving or, at the very least, mitigating the physical risk to person and property. To that end, I recommend the following:

- Any fuel storage should be located as far to the southern end of the airport as possible. This provides, by physical distance, the maximum protection to the populace in the case of explosion.
- Approach capability should NOT be lowered below the current one statute mile minimum. North-to-south approaches typically pass over Charbonneau. Lowering the approach minimum directly increases the risk to the populace by reducing the vertical distance between the aircraft and the ground in case of an in-flight emergency such as mechanical failure, bird strikes, and/or wind shear. Further, the potential for increased air traffic coupled with lowering the approach minimum directly and dramatically degrades the quality of life around the airport by increasing the noise pollution associated the lower approaches.
- Strengthening the runway only serves to allow larger, louder aircraft to access the airport. This change will result in further increasing noise pollution and dramatically increases the risk of damage to property and person in the case of an aircraft crash.
- Helicopter operations should be located as far away form heavily populated areas as possible. This dislocation not only affords increased protection for the populace but also reduces the noise pollution associated with these aircraft types.

dditional Comments:

We have lived here since 1977.
We know there will be change.
But we DO NOT want the
airport any larger or improved
from how it is now.
The current JETS are loud and at
times too low during landing.
The size of aircraft is getting too large
for this location. Deb Barnes

Subject: Aurora Airport
Attachments: scan0002.jpg; scan0003.jpg

My husband and I would like our opinion on the Aurora Airport known.

I have attached a copy of the survey for the airport. As you can see we have MARKED every box in the "NO Build Alternative" column.

We DO NOT want and improvements done to the Aurora Airport. We would like to see the larger jets go to another airport. The noise from the jets is extremely annoying, especially when the come screaming over the house late at night.

Thank you,
Deb and Bob Barnes

From 1/14/11 to present there have been 127 flights at the intersection of Miley Road and Airport Road that are totally out of FAA compliance, according to the flight directory rules. This intersection is 1.6 miles from the airport.

1. Average flight inbound is 337 yards AGL (laser sighted)
2. All aircraft are flying in an illegal pattern
3. Noise abatement – Some cases rattle windows
4. Number of aircraft per month is 113 flights
5. Most critical-who at the state dept did the bird counts for possible bird strikes?
6. Four witnesses working on counting birds including AGL and direction of flight have been monitoring morning and night
7. Flocks of over 1,000+ to as few as 25 or 30 generally fly pattern at 020 degrees to 219 degrees. These are the biggest migration pattern for these birds. These birds are directly in the fly pattern of aircraft flying over the intersection of Miley Road and Airport Road.
8. The first engine out bird strike outbound is going to land in the middle of Wilsonville Shopping Center. It is a coincidence that average AGL for aircraft is 337 yards and geese are 215 to 480 yards AGL.

With these documentations and witnesses to what may happen in the event of a major accident, who exactly are we going to sue? All flight in and out of this airport should use the FAA directory per its rules and you will find it is pretty safe flying conditions.

Appendix L:
CIP COST ESTIMATES

Airport Master Plan Update

Aurora State Airport

WHPacific
OREGON DEPARTMENT OF AVIATION

Aurora State Airport CIP 2012 - 2032

#	Year	Description	Total Cost	ODA share	FAA Share	Private Share	Other Funding
Phase I (2012-2016)							
1	2012	Construct ATCT[1]	$ 3,369,000.00	$ 673,800.00	$ -	$ -	$ 2,695,200.00
2	2012	Service Road	$ 1,017,000.00	$ 50,850.00	$ 966,150.00	$ -	$ -
3	2013	PMP (2013)[2]	$ 27,000.00	$ 20,250.00	$ 6,750.00	$ -	$ -

	Total	**$ 20,671,000**	**$ 959,600**	**$ 17,008,900**	**$ 2,702,500**

* Eligibility for FAA funding does not insure that funds will be available or granted for the project.
- Total costs include construction, temporary flagging and signing, construction staking, testing, engineering, administration, and contingency, as applicable.

Aurora State Airport

1: 2012 Construct ATCT1

Assumptions:

Project includes construction of Air Traffic Control Tower. Estimate includes all site work and construction of the Tower building along with Engineering and Administration.

Cost Estimate:

Item Description	Qty	Unit	Price/Unit	Cost
ATCT	1	LS	$3,369,000	$3,369,000
Total Cost				$3,369,000
Total Rounded Cost				**$3,369,000**

Aurora State Airport

3: 2013 PMP (2013)2

Assumptions:

Project includes crack sealing, AC patching, and surface sealants at various locations on the Airport. Estimate was based on 2009 ODA PMP project cost for Aurora.

Cost Estimate:

Item Description	Qty	Unit	Price/Unit	Cost
Crack Sealing and AC Patching	1	LS	$10,000	$10,000
Surface Sealants	25000	SF	$0.25	$6,250
Subtotal Construction				$16,250
Mobilization	10.0%		$16,250	$1,625
Total Construction				**$17,875**

Engineering & Administration	30%		$17,875	$5,363
Contigency	20%		$17,875	$3,575
Total Cost				$26,813
Total Rounded Cost				**$27,000**

Aurora State Airport

4: 2014 Helicopter Landing Pads

Assumptions:

Project includes painting of 2 Helicopter Landing Pads near midfield.

Cost Estimate:

Item Description	Qty	Unit	Price/Unit	Cost
Subtotal Striping	500	SF	$10.00	$5,000
Subtotal Other Site Improvements	1	LS	$500	$500
Subtotal Construction				$5,500
Mob., Testing, Temp. Flagging, Surv & Mrkg	20%		$5,500	$1,100
Total Construction				**$6,600**

Engineering & Administration	40%		$6,600	$2,640
Contigency	15%		$6,600	$990
Total Cost				$10,230
Total Rounded Cost				**$11,000**

Aurora State Airport

6: 2014 Taxilane Development (Hangar Access)

Assumptions:

Project includes construction of Taxilanes on the east side of the parallel Taxiway near midfield to provide access to new hangar developments. Items included in the construction estimate are drainage improvements, site preparation, excavation, paving, striping, and seeding. Construction unit prices and soft cost percentages were estimated starting from ODA 2009 Unit Cost Estimate for Region 1.

Cost Estimate:

Item Description	Qty	Unit	Price/Unit	Cost
Subtotal Paving and Excavation	300	SY	$59.00	$17,700
Subtotal Other Site Improvements	1	LS	$9,000	$9,000
Subtotal Construction				$26,700
Mob., Testing, Temp. Flagging, Surv & Mrkg	15.0%		$26,700	$4,005
Total Construction				**$30,705**

Engineering & Administration	25%		$30,705	$7,676
Contigency	15%		$30,705	$4,606
Total Cost				$42,987
Total Rounded Cost				**$43,000**

5: 2014 Ramp Reconstruction - State Leased

Assumptions:

Project includes the re-construction of a state leased Apron Ramp on the east side of the parallel Taxiway, in front of the Aurora Aviation FBO. Items included in the construction estimate are drainage improvements, site preparation, excavation, paving, striping. Construction unit prices and soft cost percentages were estimated starting from ODA 2009 Unit Cost Estimate for Region 1.

Cost Estimate:

Item Description	Qty	Unit	Price/Unit	Cost
Subtotal Paving and Excavation	8888.889	SY	$60.00	$533,333
Subtotal Other Site Improvements	1	LS	$80,000	$80,000
Subtotal Construction				$613,333
Mob., Testing, Temp. Flagging, Surv & M	15.0%		$613,333	$92,000
Total Construction				**$705,333**

Engineering & Administration	25%		$705,333	$176,333
Contigency	15%		$705,333	$105,800
Total Cost				$987,467
Total Rounded Cost				**$988,000**

Aurora State Airport

7: 2015 Hangar Development

Assumptions:

Project includes construction of approximately 10 Hangars totaling 44,000 square feet. Estimate includes all site work and construction of the Hangars. Project was estimated to be broken out in 3 phases.

Cost Estimate:

Item Description	Qty	Unit	Price/Unit	Cost
Aircraft Hangars	14667	SF	$75	$1,100,000
Site Work	1	LS	$110,000	$110,000
Subtotal Construction				$1,210,000
Mob., Testing, Temp. Flagging, Surv & Mrkg	15.0%		$1,210,000	$181,500
Total Construction				**$1,391,500**

Engineering & Administration	30%		$1,391,500	$417,450
Contigency	20%		$1,391,500	$278,300
Total Cost				$2,087,250
Total Rounded Cost				**$2,088,000**

Aurora State Airport

9: 2016 Environmental Assessment (Runway Improvements)

Assumptions:

Project includes Environmental Assessment for Runway 17-35 Improvements.

Cost Estimate:

Item Description	Qty	Unit	Price/Unit	Cost
Runway Improvement EA	1	LS	$350,000	$350,000
Total Cost				$350,000
Total Rounded Cost				**$350,000**

Aurora State Airport

10: 2016 PMP (2016)

Assumptions:

Project includes crack sealing, AC patching, and surface sealants at various locations on the Airport. Estimate was based on 2009 ODA PMP project cost for Aurora.

Cost Estimate:

Item Description	Qty	Unit	Price/Unit	Cost
Crack Sealing and AC Patching	1	LS	$10,000	$10,000
Surface Sealants	25000	SF	$0.25	$6,250
Subtotal Construction				$16,250
Mobilization	10.0%		$16,250	$1,625
Total Construction				**$17,875**

Engineering & Administration	30%		$17,875	$5,363
Contigency	20%		$17,875	$3,575
Total Cost				$26,813
Total Rounded Cost				**$27,000**

Aurora State Airport

11: 2017 Aurora RFPD Response Facility

Assumptions:

Project includes construction of a RFPD Response Facility of approximately 2,000 square feet. Estimate includes all site work and construction of the Hangars.

Cost Estimate:

Item Description	Qty	Unit	Price/Unit	Cost
Aircraft Hangars	2000	SF	$150	$300,000
Site Work	1	LS	$30,000	$30,000
Subtotal Construction				$330,000
Mob., Testing, Temp. Flagging, Surv & Mrkg	15.0%		$330,000	$49,500
Total Construction				**$379,500**

Engineering & Administration	30%		$379,500	$113,850
Contigency	20%		$379,500	$75,900
Total Cost				$569,250
Total Rounded Cost				**$570,000**

Aurora State Airport

13: 2018 Property Acquisition (R17 Displaced Threshold)

Assumptions:

OFA Property Acquisition for Runway 17 Displaced Threshold includes costs of purchasing land and negotiations.

Cost Estimate:

Item Description	Qty	Unit	Price/Unit	Cost
Land Acquisition	2.2	ACRE	$25,000.00	$55,000
Property Negotiations	3	EA	$10,000	$30,000
Subtotal				**$85,000**

Engineering & Administration	5%		$85,000	$4,250
Contigency	15%		$85,000	$12,750
Total Cost				$102,000
Total Rounded Cost				**$102,000**

Aurora State Airport

14: 2018 Avigation Easement Acquisition (R17 RPZ)

Assumptions:

Avigation Easement for Runway 17 Displaced Threshold includes negotiation costs and per acre costs.

Cost Estimate:

Item Description	Qty	Unit	Price/Unit	Cost
Avigation Easement	2.6	ACRE	$10,000	$26,000
Property Negotiations	1	EA	$10,000	$10,000
Subtotal				**$36,000**

Engineering & Administration	5%		$36,000	$1,800
Contigency	15%		$36,000	$5,400
Total Cost				$43,200
Total Rounded Cost				**$44,000**

Aurora State Airport

16: 2020 Displaced Threshold (R17 - 800')

Assumptions:

Project includes construction of 800 lineal feet of runway to displace Runway 17 along with 800 lineal feet of parallel Taxiway A east of the runway on the north end. Items included in the construction estimate include drainage improvements, site preparation, excavation, paving, striping, lighting, signage, and seeding. Construction unit prices and soft cost percentages were estimated starting from ODA 2009 Unit Cost Estimate for Region 1.

Cost Estimate:

Item Description	Qty	Unit	Price/Unit	Cost
Subtotal Paving Section and Excavation	15126	SY	$59.00	$892,424
Runway Grooving	8889	SY	$2.00	$17,778
Runway Lighting per Length Runway	800	LF	$56.00	$44,800
Runway Striping per Length Runway	800	LF	$6.40	$5,120
Taxiway Lighting per Length Taxiway	1050	LF	$112.00	$117,600
Subtotal Other Site Improvements	1	LS	$151,712	$151,712
Subtotal Construction				$1,229,434
Mob., Testing, Temp. Flagging, Surv & Mrkg	15.0%		$1,229,434	$184,415
Total Construction				**$1,413,849**

Engineering & Administration	25%		$1,413,849	$353,462
Contigency	15%		$1,413,849	$212,077
Total Cost				$1,979,389
Total Rounded Cost				**$1,980,000**

Aurora State Airport

17: 2020 Install Runway 17-35 PAPIs

Assumptions:

Project includes installation of a new PAPI navaid systems for Runway 17-35. Construction unit prices and soft cost percentages were estimated starting from ODA 2009 Unit Cost Estimate for Region 1.

Cost Estimate:

Item Description	Qty	Unit	Price/Unit	Cost
Runway 17 PAPI	1	LS	$40,000	$40,000
Runway 35 PAPI	1	LS	$40,000	$40,000
Subtotal Construction				$80,000
Mob., Testing, Temp. Flagging, Surv & Mrkg	15.0%		$80,000	$12,000
Total Construction				**$92,000**

Engineering & Administration	25%		$92,000	$23,000
Contigency	15%		$92,000	$13,800
Total Cost				$128,800
Total Rounded Cost				**$129,000**

Aurora State Airport

18: 2020 R17 Run-Up Area

Assumptions:

Project includes construction of a Runnup Apron on the east side of the parallel Taxiway for Runway 17. Items included in the construction estimate are drainage improvements, site preparation, excavation, paving, striping, taxiway lighting and seeding. Construction unit prices and soft cost percentages were estimated starting from ODA 2009 Unit Cost Estimate for Region 1.

Cost Estimate:

Item Description	Qty	Unit	Price/Unit	Cost
Subtotal Paving and Excavation	2585	SY	$59.00	$152,541
Subtotal Other Site Improvements	1	LS	$23,000	$23,000
Taxiway Lighting per Length Runway	400	LF	$112.00	$44,800
Subtotal Construction				$220,341
Mob., Testing, Temp. Flagging, Surv & Mrkg	15.0%		$220,341	$33,051
Total Construction				**$253,392**

Engineering & Administration	25%		$253,392	$63,348
Contigency	15%		$253,392	$38,009
Total Cost				$354,749
Total Rounded Cost				**$355,000**

Aurora State Airport

19: 2018 Property Acquisition (R35 RPZ)

Assumptions:

Property Acquisition within the RPZ of the extended Runway 35. Costs include cost per acre of purchasing real property and negotiations required.

Cost Estimate:

Item Description	Qty	Unit	Price/Unit	Cost
Property with Residence (14018 NE Keil Rd)	1	EA	$240,000.00	$240,000.00
Property with Residence (21860 NE Boones Ferry Rd)	1	EA	$275,000.00	$275,000.00
Property with Residence (21830 NE Boones Ferry RD)	1	EA	$130,000.00	$130,000.00
Property with Residence (21810 NE Boones Ferry RD)	1	EA	$150,000.00	$150,000.00
Relocation Assistance	4	EA	$50,000.00	$200,000.00
Land Acquisition	44.46	ACRE	$25,000.00	$1,111,500
Property Negotiations	12	EA	$10,000	$120,000
Subtotal				**$2,226,500**

Engineering & Administration	5%		$2,226,500	$111,325
Contigency	10%		$2,226,500	$222,650
Total Cost				$2,560,475
Total Rounded Cost				**$2,561,000**

Aurora State Airport

20: 2019 Keil Road Relocation

Assumptions:

Project includes relocating Keil Road where it enters the extended Runway 35 OFA and RPZ. Items included in the construction estimate are Right of Way (ROW) acquisition, drainage improvements, site preparation, excavation, paving, striping, and seeding. Construction unit prices and soft cost percentages were estimated starting from ODA 2009 Unit Cost Estimate for Region 1.

Cost Estimate:

Item Description	Qty	Unit	Price/Unit	Cost
Subtotal Paving and Excavation	11333	SY	$55	$623,333
ROW Acquisition	3.9	ACRE	$20,000	$78,000
ROW Negotiations	6	EA	$10,000	$60,000
Subtotal Other Site Improvements	1	LS	$125,000	$125,000
Subtotal Construction				$886,333
Mob., Testing, Temp. Flagging, Surv & Mrkg	15.0%		$886,333	$132,950
Total Construction				**$1,019,283**

Engineering & Administration	25%		$1,019,283	$254,821
Contigency	15%		$1,019,283	$152,893
Total Cost				$1,426,997
Total Rounded Cost				**$1,427,000**

Aurora State Airport

21: 2020 Runway Extension (R35 - 1000')

Assumptions:

Project includes construction of 1000 lineal feet of runway to extend Runway 35 along with 1000 lineal feet of parallel Taxiway east of the runway on the south end. Items included in the construction estimate include drainage improvements, site preparation, excavation, paving, striping, lighting, signage, navaid improvements, and seeding. Construction unit prices and soft cost percentages were estimated starting from ODA 2009 Unit Cost Estimate for Region 1.

Cost Estimate:

Item Description	Qty	Unit	Price/Unit	Cost
Subtotal Paving Section and Excavation	18148	SY	$59.00	$1,070,706
Runway Grooving	11111	SY	$2.00	$22,222
Runway Lighting per Length Runway	6000	LF	$56.00	$336,000
Runway Striping per Length Runway	6000	LF	$6.40	$38,400
Taxiway Lighting per Length Runway	1300	LF	$112.00	$145,600
Subtotal Other Site Improvements	1	LS	$182,000	$182,000
Runway 35 PAPI	1	LS	$40,000	$40,000
Runway 35 Relocate Localizer	1	LS	$50,000	$50,000
Subtotal Construction				$1,884,928
Mob., Testing, Temp. Flagging, Surv & Mrkg	15.0%		$1,884,928	$282,739
Total Construction				**$2,167,668**

Engineering & Administration	25%		$2,167,668	$541,917
Contigency	15%		$2,167,668	$325,150
Total Cost				$3,034,735
Total Rounded Cost				**$3,035,000**

Aurora State Airport

22: 2020 Install Runway 17 PAPIs

Assumptions:

Project includes installation of a new PAPI navaid system for Runway 17. Construction unit prices and soft cost percentages were estimated starting from ODA 2009 Unit Cost Estimate for Region 1.

Cost Estimate:

Item Description	Qty	Unit	Price/Unit	Cost
Runway 17 PAPI	1	LS	$40,000	$40,000
Subtotal Construction				$40,000
Mob., Testing, Temp. Flagging, Surv & Mrkg	15.0%		$40,000	$6,000
Total Construction				**$46,000**

Engineering & Administration	25%		$46,000	$11,500
Contigency	15%		$46,000	$6,900
Total Cost				$64,400
Total Rounded Cost				**$65,000**

Aurora State Airport

23: 2019 PMP (2019)

Assumptions:

Project includes crack sealing, AC patching, and surface sealants at various locations on the Airport. Estimate was based on 2009 ODA PMP project cost for Aurora.

Cost Estimate:

Item Description	Qty	Unit	Price/Unit	Cost
Crack Sealing and AC Patching	1	LS	$10,000	$10,000
Surface Sealants	25000	SF	$0.25	$6,250
Subtotal Construction				$16,250
Mobilization	10.0%		$16,250	$1,625
Total Construction				**$17,875**

Engineering & Administration	30%		$17,875	$5,363
Contigency	20%		$17,875	$3,575
Total Cost				$26,813
Total Rounded Cost				**$27,000**

Aurora State Airport

24: 2019 Taxilane Development (Hangar Access)

Assumptions:

Project includes construction of Taxilanes on the east side of the parallel Taxiway near midfield to provide access to new hangar developments. Items included in the construction estimate are drainage improvements, site preparation, excavation, paving, striping, and seeding. Construction unit prices and soft cost percentages were estimated starting from ODA 2009 Unit Cost Estimate for Region 1.

Cost Estimate:

Item Description	Qty	Unit	Price/Unit	Cost
Subtotal Paving and Excavation	300	SY	$59.00	$17,700
Subtotal Other Site Improvements	1	LS	$9,000	$9,000
Subtotal Construction				$26,700
Mob., Testing, Temp. Flagging, Surv & Mrkg	15.0%		$26,700	$4,005
Total Construction				**$30,705**

Engineering & Administration	25%		$30,705	$7,676
Contigency	15%		$30,705	$4,606
Total Cost				$42,987
Total Rounded Cost				**$43,000**

Aurora State Airport

25: 2020 R17/35 Strengthening Overlay

Assumptions:

Project includes a strength overlay of Runway 16-34 which will include a 1/2" Grind and 3" Overlay along with 2.5" transitions to Connector taxiways. Construction unit prices and soft cost percentages were estimated starting from ODA 2009 Unit Cost Estimate for Region 1 along with Bid results from Grants Pass Runway Rehab project.

Cost Estimate:

Item Description	Qty	Unit	Price/Unit	Cost
Asphalt 1/2" Grinding	69067	SY	$2.00	$138,133
Subtotal Paving	69067	SY	$14.00	$966,933
Runway Grooving	66667	SY	$2.00	$133,333
Runway Striping per Length Runway	6000	LF	$6.40	$38,400
Subtotal Other Site Improvements	1	LS	$2,763	$2,763
Subtotal Construction				$1,279,563
Mob., Testing, Temp. Flagging, Surv & Mrkg	14.5%		$1,279,563	$185,537
Total Construction				**$1,465,099**

Engineering & Administration	25%		$1,465,099	$366,275
Contigency	15%		$1,465,099	$219,765
Total Cost				$2,051,139
Total Rounded Cost				**$2,052,000**

Aurora State Airport

27: 2021 Master Plan Update

Assumptions:

Project includes Master Plan update for Aurora State Airport

Cost Estimate:

Item Description	Qty	Unit	Price/Unit	Cost
Runway Improvement EA	1	LS	$200,000	$200,000
Total Cost				$200,000
Total Rounded Cost				**$200,000**

Aurora State Airport

26: 2021 Hangar Development

Assumptions:

Project includes construction of approximately 10 Hangars totaling 44,000 square feet. Estimate includes all site work and construction of the Hangars. Project was estimated to be broken out in 3 phases.

Cost Estimate:

Item Description	Qty	Unit	Price/Unit	Cost
Aircraft Hangars	14667	SF	$75	$1,100,000
Site Work	1	LS	$110,000	$110,000
Subtotal Construction				$1,210,000
Mob., Testing, Temp. Flagging, Surv & Mrkg	15.0%		$1,210,000	$181,500
Total Construction				**$1,391,500**

Engineering & Administration	30%		$1,391,500	$417,450
Contigency	20%		$1,391,500	$278,300
Total Cost				$2,087,250
Total Rounded Cost				**$2,088,000**

Aurora State Airport

28: PMP (2022, 2025, 2028, 2031)

Assumptions:

Project includes crack sealing, AC patching, and surface sealants at various locations on the Airport. Estimate was based on 2009 ODA PMP project cost for Aurora multiplied by 4 for each 2022, 2025, 2028, and 2031.

Cost Estimate:

Item Description	Qty	Unit	Price/Unit	Cost
Crack Sealing and AC Patching	1	LS	$10,000	$10,000
Surface Sealants	25000	SF	$0.25	$6,250
Subtotal Construction				$16,250
Mobilization	10.0%		$16,250	$1,625
Total Construction				**$17,875**

Engineering & Administration	30%		$17,875	$5,363
Contigency	20%		$17,875	$3,575
Subtotal Cost Per year				$26,813
Total Rounded Cost				**$108,000**

Aurora State Airport

2: 2012 Service Road

Assumptions:

Project includes construction a service road through the airport. Estimate includes easement acquisition, drainage improvements, site preparation, excavation, paving, striping, and seeding. Construction unit prices and soft cost percentages were estimated starting from ODA 2009 Unit Cost Estimate for Region 1.

Cost Estimate:

Item Description	Qty	Unit	Price/Unit	Cost
Subtotal Paving and Excavation	8400	SY	$55	$461,982
Easement Acquisitions	4	EA	$20,000	$80,000
Subtotal Other Site Improvements	1	LS	$92,000	$92,000
Subtotal Construction				$633,982
Mob., Testing, Temp. Flagging, Surv & Mrkg	14.5%		$633,982	$91,927
Total Construction				**$725,909**

Engineering & Administration	25%		$725,909	$181,477
Contigency	15%		$725,909	$108,886
Total Cost				$1,016,273
Total Rounded Cost				**$1,017,000**

Aurora State Airport

29: Apron Development

Assumptions:

Project includes construction of Aircraft Parking Aprons on the east side of the parallel Taxiway near midfield. Items included in the construction estimate are drainage improvements, site preparation, excavation, paving, striping, and seeding. Construction unit prices and soft cost percentages were estimated starting from ODA 2009 Unit Cost Estimate for Region 1.

Cost Estimate:

Item Description	Qty	Unit	Price/Unit	Cost
Subtotal Paving and Excavation	15676	SY	$59.00	$924,875
Subtotal Other Site Improvements	1	LS	$92,000	$92,000
Subtotal Construction				$1,016,875
Mob., Testing, Temp. Flagging, Surv & Mrkg	15%		$1,016,875	$152,531
Total Construction				**$1,169,407**

Engineering & Administration	25%		$1,169,407	$292,352
Contigency	15%		$1,169,407	$175,411
Total Cost				$1,637,170
Total Rounded Cost				**$1,638,000**

Aurora State Airport

30: Taxilane Development (Hangar Access)

Assumptions:

Project includes construction of Taxilanes on the east side of the parallel Taxiway near midfield to provide access to new hangar developments. Items included in the construction estimate are drainage improvements, site preparation, excavation, paving, striping, and seeding. Construction unit prices and soft cost percentages were estimated starting from ODA 2009 Unit Cost Estimate for Region 1.

Cost Estimate:

Item Description	Qty	Unit	Price/Unit	Cost
Subtotal Paving and Excavation	300	SY	$59.00	$17,700
Subtotal Other Site Improvements	1	LS	$9,000	$9,000
Subtotal Construction				$26,700
Mob., Testing, Temp. Flagging, Surv & Mrkg	15.0%		$26,700	$4,005
Total Construction				**$30,705**

Engineering & Administration	25%		$30,705	$7,676
Contigency	15%		$30,705	$4,606
Total Cost				$42,987
Total Rounded Cost				**$43,000**

Aurora State Airport

31: Hangar Development

Assumptions:

Project includes construction of approximately 10 Hangars totaling 44,000 square feet. Estimate includes all site work and construction of the Hangars. Project was estimated to be broken out in 3 phases.

Cost Estimate:

Item Description	Qty	Unit	Price/Unit	Cost
Aircraft Hangars	14667	SF	$75	$1,100,000
Site Work	1	LS	$110,000	$110,000

Total Construction				**$140,811**

Engineering & Administration	25%		$140,811	$35,203
Contigency	15%		$140,811	$21,122
Total Cost				$197,136
Total Rounded Cost				**$198,000**

Aurora State Airport

33: Relocate Fuel Tanks

Assumptions:

Project includes relocating fuel storage. Estimate includes new pavement approximately 50'x75' and relocating the tanks.

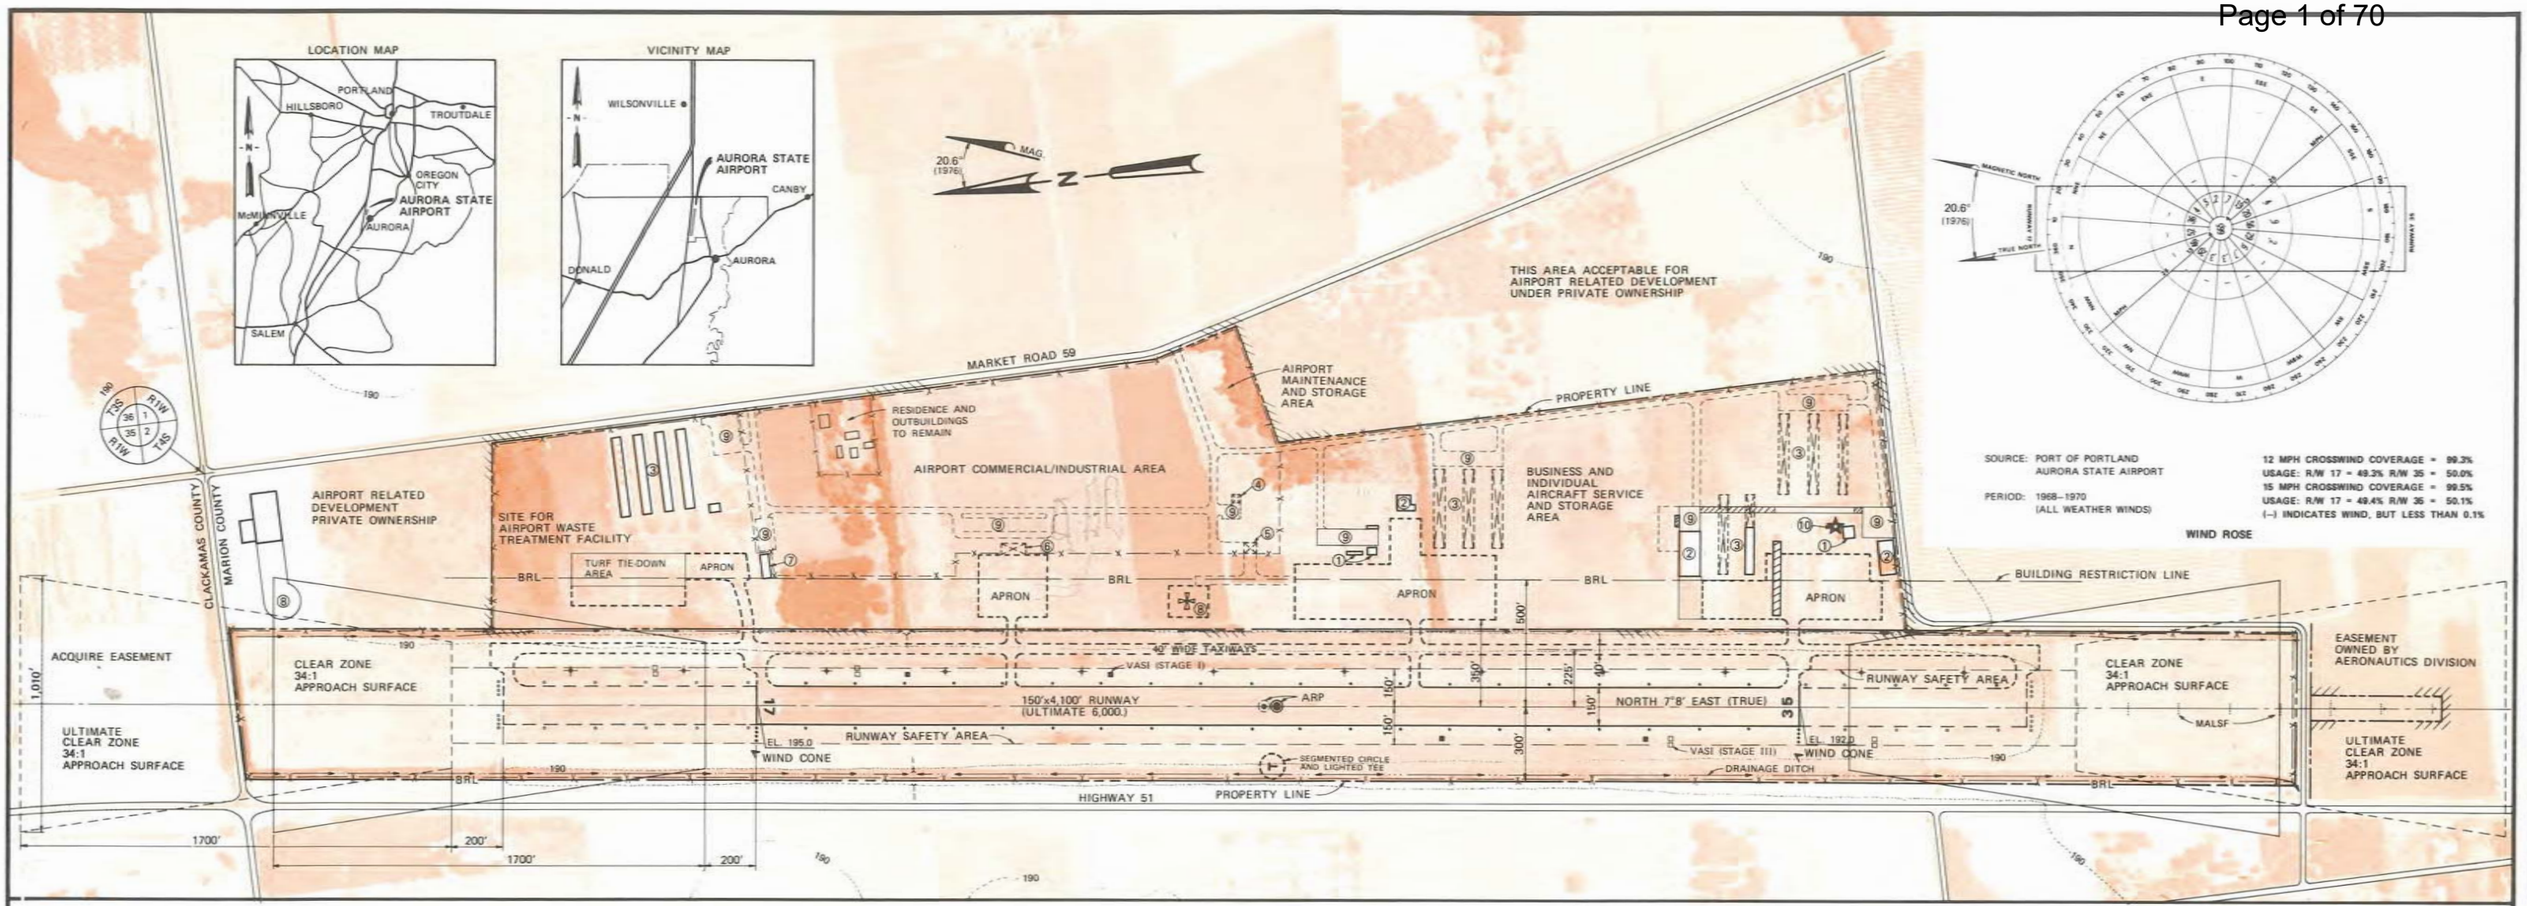
Cost Estimate:

Item Description	Qty	Unit	Price/Unit	Cost
Subtotal Paving new Fuel Storage pad	416.7	SY	$55.00	$22,917
Relocate Fuel Storage Tank	1	LS	$30,000.00	$30,000
Subtotal Other Site Improvements	1	LS	$2,292	$2,292
Subtotal Construction				$55,208
Mob., Testing, Temp. Flagging, Surv & Mrkg	14.5%		$55,208	$8,005
Total Construction				**$63,214**

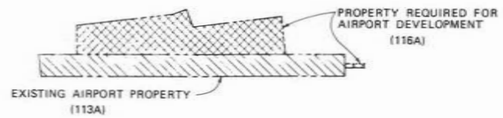
Engineering & Administration	25%		$63,214	$15,803
Contigency	15%		$63,214	$9,482
Total Cost				$88,499
Total Rounded Cost				**$89,000**

Aurora State Airport

34: R17 Run-Up Area4



Assumptions:



Project includes construction of a Runnup Apron on the east side of the parallel Taxiway for Runway 17. Items included in the construction estimate are drainage improvements, site preparation, excavation, paving, striping, taxiway lighting and seeding. Construction unit prices and soft cost percentages were estimated starting from ODA 2009 Unit Cost Estimate for Region 1.

Cost Estimate:

Item Description	Qty	Unit	Price/Unit	Cost
Subtotal Paving and Excavation	2585	SY	$59.00	$152,541
Subtotal Other Site Improvements	1	LS	$23,000	$23,000
Taxiway Lighting per Length Runway	400	LF	$112.00	$44,800
Subtotal Construction				$220,341
Mob., Testing, Temp. Flagging, Surv & Mrkg	15.0%		$220,341	$33,051
Total Construction				**$253,392**

Engineering & Administration	25%		$253,392	$63,348
Contigency	15%		$253,392	$38,009
Total Cost				$354,749
Total Rounded Cost				**$355,000**
