Public Comments (2024)

AURORA AIRPORT MASTER PLAN

All emails, letters, calls outside of meetings are included in this document for 2024 only; other years are included in separate documents to minimize the document size/length. PAC meeting conversations and questions, as well as emails sent specifically regarding the meetings can be found in the PAC meeting summaries. Comments during Public Open Houses can be found in the Open House summaries.

Please note: Emails and documents are listed alphabetically by last name, then date (from January to December for 2024).

Aurora State Airport Master Plan Website Comments

Name	Robert Altemus
Organization	Retired, GA pilot flying out of Mulino
Comments or questions?	I certainly understand the Hubbard Rd realignment to ensure meeting the RSA requirements. However I'm unsure of the requirement/reasoning to propose a 35' wide Taxilane, and a vehicle service road, to be built parallel to the existing full length Taxiway Alpha, especially considering the significant necessary acquisition and removal of existing facilities. Admittedly, I've got some catching up to do regarding this latest iteration to the Aurora Master Plan Project, but so far I haven't seen

	the history or operational data leading to this proposal. Thanks for any consideration to my query, respectfully, Bob Altemus I would like to receive email updates.
If you would like a response, please tell us the best way to contact you:	Email

Subject: Opposition to expansion of Aurora State Airport

Some people who received this message don't often get email from andrews.john2000@gmail.com. Learn why this is important

This message was sent from outside the organization. Treat attachments, links and requests with caution. Be conscious of the information you share if you respond.

My wife and I are residents of Charbonneau (Wilsonville). We wish to register our strong opposition to any proposed airport expansion. Expansion of the airport, especially the lengthening of the runway, will encourage increased air traffic and enable and encourage larger jets that will further increase overflight noise. The increased air traffic will also lead to increased local road traffic in the vicinity of the airport and on I-5.

The city of Wilsonville has registered opposition to the airport expansion and listed many reasons that the expansion is ill advised and unnecessary. We join with the City in opposition to airport expansion.

Another factor in our opposition to airport expansion is that other property owners in the vicinity of the airport will seek exceptions to the land use restrictions outside the urban development zone. Langdon Farms has already sought an exception to the land use regulations to build a truck depot. If the airport were to be expanded, that would provide more justification for Langdon Farms and other property owners to convert from recreational use and farmland to industrial uses in support of the expanded airport.

We have lived in Charbonneau for twelve years and have enjoyed the relative quiet of the area and lived with the current level of noise from jet overflights. Increase in the level of aircraft noise and road traffic through expansion of the airport would degrade the area irreparably. Please do not expand the airport and especially do not lengthen the runway to enable larger jets to land and take off from the Aurora State Airport.

I was disappointed that I was unable to speak to a senior member of the Oregon Department of Aviation at the June 13 meeting.

Best regards,
John Andrews and Jean Gaumer

This is in regard to the Aurora Airport master plan.

Due to the proposed changes I hereby request that you register and make part of the master plan record my objection and concerns to "taking" of, or destruction to any privately owned hangars on the Aurora Airport. I recommend and support airport safety improvements but only with no affect to any of the hangars.

Thank you,
David Bakke

Comments or questions?	There appears to be a security risk associated with the Aurora Airport. On multiple occasions VPDs, Vehicle, Pedestrian, Deviations have taken place. Unauthorized people have entered the airport, entered hangars, driven on the runway, walked their dog within restricted areas..... There is no standard security system or set of regulations that cover all operators at Aurora Airport. Given the airport's proximity to Portland city center and the State Capital complex, it is essential that better security be maintained at Aurora Airport. The opportunity for a terrorist attack developing due to lack of security at Aurora Airport is much too great. I would like to receive email updates.

> Alex,

Attached is an outline of the property parcel that I showed to Tony & Kenji and that is available to ODAV.
As we discussed this Aurora ramp space would facilitate a huge improvement in Aircraft and vehicle movement at UAO.
This property transfer would go along with ODAV's 1995 plans to own & control ramp space as well as the FAA's 1985 directive for ODAV to increase their UAO ownership percentage
Please add this to the master plan record and contact me with any questions.
Thank you

Comments or questions?	I request that the one-acre ramp parcel that I own abutting the SW corner of ODAV's landside parcel be considered as potential additional ODAV ramp for short term Aircraft parking and as a taxi lane to allow aircraft and vehicle access to the ODAV parcel from taxiway A. This small parcel could open up access for the tower, Pacific Coast Avionics, the CAA, and the entire ODAV ramp.

This message was sent from outside the organization. Treat attachments, links and requests with caution. Be conscious of the information you share if you respond.

Thank you all for the work on this project. I believe you've made significant propgress and that there is only one more change required but that this change is extremely significant. My PAC member input follows including some points for reference;

- Since its construction in 1943, the Aurora Airport has been a public airport with most of the adjoining properties being privately owned, this has worked very well with private investment of over $220 million in aviation businesses currently at the airport.

- Because of this public/private arrangement the local government collects over $1.8 million per year from these adjoining airport-use properties in property taxes for the local community, the business on these properties also pay ODAV runway usage fees as well as fuel taxes.

- This arrangement known is by the FAA as "though the fence" and is codified/supported in Oregon law by ORS 836.64

- There are a wide range of aviation businesses on this private property at the Aurora airport, many specializing in saving lives and fighting forest fires, as well as disaster relief, flight training for career development, law enforcement, military support, including aircraft manufacturing and many more support business providing approximately 1500 very good jobs.
  - This version of the plan includes adding a vehicle movement lane right next to the aircraft taxiway and adding a second parrell taxiway, because of these additions the plan calls for nine (one of which is in the early stages of construction) of the biggest and newest hangars to be condemned and destroyed. The owners of these hangars and the entire airport community believe this is completely unnecessary and in the case of the vehicle lane, actually significantly decreases safety. I also know that any conedemation efforts would be met with much legal action, which would be very counter-productive and I believe complely unneccesary.
  - As a compromise solution I have offered to sell at a significant discount a one-acre lot that was created specifically for the use of ODAV to assist in much of the needs for which the new vehicle lane and taxiway are envisioned

  - Our main concern past the safety compromise of the misplaced vehicle lane is not just the tens or hundreds of millions of dollars unnecessarily wasted by this plan proposal* but by the very real possibility that this would cause most of the major employers to leave the Airport and the state. And that this could happen even if no physical changes are made but as soon as this plan is made official.
  *we believe the value of the nine hangars cited for destruction will drop significantly and immediately and that the cost of demolition and replacement would be enormous.

Again, thank you for the work done and for your openess to input. I look forward to going over this with the planning group.

Subject: PAC input Aurora Master Plan

This message was sent from outside the organization. Treat attachments, links and requests with caution. Be conscious of the information you share if you respond.

Dear ODAV,

Please accept this this message as my PAC member input on the current Aurora master plan. First, I want to thank you for the great job "herding the cats" by getting input from users and affected individuals as well as organizing this project.

My strongest advice is to remove any consideration of condemning and destroying hangars, I believe these hangars are the lifeblood of the Aurora Airport and are necessary to the lives saved, forest fires fought, and many good careers created by the owner/tenants of these hangars. The method to protect those hangars is to eliminate the parallel taxiway and vehicle lane plans, neither of which are absolutely necessary and both of which can be accomplished to a degree by ODAV's purchase of the mid-field property south of the control tower that has been offered to ODAV on the 16th of this Month.

This one change will eliminate a huge amount of money being wasted, will improve safety by separating aircraft and vehicles and will protect hundreds of excellent Aviation jobs as well as protecting the 100% Aviation use of this property.

The second most important recommendation I make is to please closely consider and utilize the excellent information provided today and earlier to ODAV by the highly experienced Aviation architect and engineer Aron Faegre, reviewing this information, i see that it is straight from the FAA's own guidance. As this information was donated by airport users and airport business, it represents the best in public/private coordination, collaboration, and offers real opportunity for ODAV to create the best possible plan and save money doing so.

Thank you and please contact me with any questions.

This message was sent from outside the organization. Treat attachments, links and requests with caution. Be conscious of the information you share if you respond.

December 16, 2024

Kenji Sugahara, Director, Tony Beach Airports Manager, Alex Thomas Planning Manager,
Oregon Department of Aviation
3040 25th Street SE
Salem, OR 97302

Dear Kenji, Tony, and Alex,

Thank you three for all the time spent on the FAA-required master plan for the KUAO airport.

As the Manager and owner of Blue Sky Aurora, LLC I now offer ODAV the purchase of the Aurora Airport ramp/taxi lane property parcel # 510198 (Please see property research report dated 12/12/24 attached). This 1.07-acre parcel would connect the main ODAV ramp property to the southern portion of taxiway A by extending ODAV's parcel to the taxiway A access south of the control tower. As well as significantly increasing ODAV's ramp size.

I request that this potential addition to ODAVs ramp and taxi lane be added to the master plan that is underway.

I believe that this addition will accomplish much of the benefits of the currently planed parallel taxiway and roadway without the huge costs and legal challenges of that very unpopular plan.

This parcel was created in 1996 specifically for ODAV's future use to go along with the plan at that time of ODAV purchasing all UAO property West of the "building restriction line" that existed in 1996 and for many years leading up then.

In the spirit of cooperation and collaboration I offer this parcel to ODAV at a discount of 20% off the tax value if we can conclude a transaction by the end of 2025.

Again, thank you and please contact me with any questions.

Kayla McLennan

NOTARY PUBLIC FOR TEXAS
My commission expires:

Exhibit "A"

Real property in the County of Marion, State of Oregon, described as follows:

Parcel 1:

Parcel 1, of Partition Plat No. 96-18, recorded March 25, 1996 in Reel 1298 and Page 780, Film Records in the County of Marion, State of Oregon.

Excepting Therefrom those portions of land lying within the following deeds, recorded April 09, 1996 in Reel 1302 and Page 306, recorded August 05, 1996 in Reel 1330 and Page 64 also rerecorded in Reel 1604 and Page 504, recorded April 21, 1997 in Reel 1387 and Page 227 and recorded April 22, 1997 in Reel 1387 and Page 229, Film Records of Marion County, State of Oregon.

Parcel 2:

A tract of land situated in the Southeast 1/4 of Section 2, Township 4 South, Range 1 West, Willamette Meridian, Marion County, Oregon, described as follows:

Beginning at the East 1/4 corner of said Section 2; thence South 89° 53' 51" West along the East-West centerline of said Section 2, 951.88 feet to the Northeast corner of that tract of land conveyed to the State of Oregon by deed recorded in Volume 279 and Page 530, in Deed Records; thence South 7° 05' 20" West along the Easterly line of said State of Oregon tract, 2134.70 feet to the Southeast corner thereof, said point being the true point of beginning of the tract herein to be described; thence North 89° 49' 37" East along the South line of that tract of land conveyed to Otto Knorr, by deed recorded in Volume 152 and Page 567, in Deed Records, 808.56 feet to the Southwest corner of that tract of land conveyed to Wesleyan Methodist Church by deed recorded in Volume 522 and Page 526, in Deed Records; thence North 0° 06' 35" West along the West line of said Wesleyan Methodist Church Tract, 291.00 feet; thence South 89° 49' 37" West parallel with the South line of said Knorr Tract, 620.58 feet to a point which is 150.00 feet Southeasterly of the Easterly line of said State of Oregon Tract, when measured at right angles thereto; thence South 7° 05' 20" West parallel with said Easterly line, 79.86 feet; thence South 89° 49' 37" West parallel with the South line of said Knorr Tract, 151.22 feet to a point in the Easterly line of said State of Oregon Tract; thence South 7° 05' 20" West along said Easterly line 213.50 feet to the true point of beginning.

Excepting Therefrom that portion described in a deed recorded April 21, 1997 in Reel 1387 and Page 227, Film Records.

TOGETHER WITH a 30.00 foot wide roadway easement 15.00 feet on either side of and parallel with the following described centerline: Beginning at a point in the North line of the herein before described tract which bears South 89° 49' 37" West 15.00 feet from the Northeast corner thereof; thence North 0° 06' 35" West parallel with the West line of that tract of land conveyed to Wesleyan Methodist Church by deed recorded in Volume 522 and Page 526, in Deed Records, 261.92 feet; thence North 77° 49' 25" East along a line which is 15.00 feet Northerly of when measured at right angles to the North line of said Wesleyan Methodist Church Tract, 493.95 feet to a point in the West right of way line of Marion County Market Road No. 59

Tax Parcel Number: R10198

EXHIBIT 'B'

LEGAL DESCRIPTION:

A TRACT OF LAND LOCATED IN THE SOUTHEAST ONE-QUARTER OF SECTION 2, TOWNSHIP 4 SOUTH, RANGE 1 WEST OF THE WILLAMETTE MERIDIAN, CITY OF AURORA, MARION COUNTY, OREGON AND BEING MORE PARTICULARY DESCRIBED AS FOLLOWS:

BEGINNING AT THE NORTHWEST CORNER OF PARCEL 1 OF PARTITITION PLAT 96-18 RECORDED IN MARION COUNTY PLAT RECORDS;
THENCE NORTH 89°57'22" EAST ALONG THE NORTH LINE OF PARCEL 1, 65.50 FEET TO A POINT 365.50 FEET FROM THE CENTERLINE OF AURORA AIRPORT RUNWAY, WHEN MEASURED PERPENDICULAR THERETO;
THENCE SOUTH 07°10'21" WEST, PARALLEL TO SAID RUNWAY CENTERLINE, 596.99 FEET TO THE NORTHLINE OF THAT TRACT DESCRIBED IN REEL 2271, PAGE 472, RECORDED IN MARION COUNTY DEED RECORDS;
THENCE ON SAID NORTH LINE, SOUTH 89°47'39" WEST, 65.36 FEET TO THE WEST LINE OF PARCEL 1 OF SAID PARTITION PLAT;
THENCE ON SAID WEST LINE NORTH 07°09'24" EAST, 597.16 FEET TO THE POINT OF BEGINNING.

5. PARCEL 1 IS SUBJECT TO A 20.00 FOOT WIDE INGRESS AND EGRESS EASEMENT ALONG ITS WESTERLY LINE AS SHOWN AND NOTED. SAID EASEMENT IS FOR THE BENEFIT OF PARCEL 2.

6. PARCEL 1 IS SUBJECT TO AN INGRESS AND EGRESS EASEMENT AS SHOWN AND NOTED. SAID EASEMENT IS FOR THE BENEFIT OF AURORA AIRPARK CONDOMINIUM ASSOCIATION, INC.

NARRATIVE

THE PURPOSE OF THIS SURVEY IS TO PARTITION THAT PROPERTY DESCRIBED IN REEL 2882, PAGE 279, DEED RECORDS OF MARION COUNTY, OREGON. MY BASIS OF BEARING IS A CALCULATED BEARING BETWEEN FOUND MONUMENTS AS SHOWN AND NOTED PER MCSR 34205. FOR THE NORTH LINE I HELD FOUND MONUMENTS AT THE SOUTHEAST AND SOUTHWEST CORNERS OF PARCEL 2 OF PP 96-18 AND PROJECTED THIS LINE WESTERLY. I HELD THE FOUND MONUMENT AT THE SOUTHEAST CORNER TOGETHER WITH THE FOUND MONUMENT TO THE EAST AND PROJECTED THIS LINE WESTERLY TO ESTABLISH THE SOUTHERLY LINE. I ESTABLISHED THE SOUTHWEST CORNER OF REEL 2857, PAGE 416 ON THIS LINE AT RECORD DISTANCE FROM THE SOUTHEAST CORNER HOLDING INFORMATION PER MCSR 34205. I HELD THE RECORD BEARING FROM MCSR 34205 FOR THE WEST LINE OF REEL 2857, PAGE 416 AND INTERSECTED IT WITH THE NORTH LINE TO ESTABLISH ITS NORTHWEST CORNER. THE EAST LINE OF REEL 2857, PAGE 416 WAS ESTABLISHED BY HOLDING DEED DISTANCES ALONG THE NORTH AND SOUTH LINES AND A BEARING ROTATED TO THE WEST LINE. THE EAST LINE OF THE SUBJECT PROPERTY WAS ESTABLISHED BY HOLDING THE SOUTHEAST CORNER AND FOUND MONUMENTS AS SHOWN.

Some people who received this message don't often get email from leannrbennett@gmail.com. Learn why this is important

Good Day!

I am writing of support for the Aurora airport runway extension.

This airport is so critically important to our area, providing over 1200 jobs, providing fire fighting equipment and expertise (Columbia Helicopter/HTC) and life saving services (Lifeflight/ organ transport services).
Adding 500' to the runway will make the airport safer as any pilot can attest. Having lost a best friend in an airplane accident at Coos Bay/South Bend off the end of the runway, I know this is a life or death solution.

Please support this extension which has been part of the master plan since the 70's for safety reasons. This is also ground zero for subduction earthquake disaster relief. ODART is doing a simulation soon in support of this.

Look at the big picture. Airplanes fly over every corner of the United States- (except military restricted zones).
They use navigational way points to travel. People near those way points are just as equally affected by airplanes as those near an airport and do they send you their complaints?
I recently sold a $2,000,000 home across the street from the Newberg VOR on Chehalem Mountain. They were not concerned in the least about aircraft traffic.

Thank you for your time and consideration,

Leann Bennett, Principal Broker

Some people who received this message don't often get email from allwxrnr@gmail.com. Learn why this is important

This message was sent from outside the organization. Treat attachments, links and requests with caution. Be conscious of the information you share if you respond.

Gentlemen:

As an Oregon Native and lifelong resident, mostly under the flight pattern of KUAO, I would like to register and make part of the master plan record my very strong objection to the destruction of any privately owned hangars on the Aurora Airport.

As a professional military and airline pilot with nearly 50 years experience, I am very much interested in local aviation operations. In order to be operated safely aircraft need to be stored and maintained properly. Hangars are essential for this, as well as providing needed and meaningful employment. There is already a significant shortage of hangars at Aurora. Therefore, destroying hangars for a vehicle lane that could be easily located elsewhere makes no sense. In fact, locating the vehicle lane further from the taxiway would improve safety. There appears to be more than adequate space behind the hangars to the east to do this without the elimination of any hangar space.

I favor airport improvements but elimination of hangars in favor of a road next to a taxiway will certainly not improve safety.

Thank you.

Respectfully,
Randal Beyers
(Major, USMCR, Ret)

Dear Alex Thomas,

As a pilot flying out of Aurora State Airport (KUAO), a member of the Columbia Aviation Association and a local business owner of Willamette Drones, I urge you to reconsider the proposed condemnation and destruction of aircraft hangars in the Aurora Airport Master Plan.

The hangars play a vital role in supporting the aviation community, local businesses, and the overall infrastructure of the airport. Removing them would have significant negative impacts on pilots, aircraft owners, and the broader aviation ecosystem.

Thank you for considering this input as you move forward with the planning process. Please register my urgent request to preserve these critical assets at KUAO.

Best regards,

Jonathan Bieganski

Mr. Alex R Thomas:

Please avoid any loss of existing hangers at KUAO. These losses would devastate the owners and the airport community. I understand you need to make changes but you have alternatives such as moving the highway and the runway to the west in plan Refined Alternative 1B.

Thank you for consideration,

Steve Brenneke
Aircraft owner and hanger renter KUAO
President of Columbia Aviation Association 2025
(note clubhouse on the airport for the last 25 years)

Aurora State Airport Master Plan Website Comments

Name	stephen Brenneke
Organization	self
Comments or questions?	I have reviewed the plans for KUAO by the appropriate state agencies. It appears that it has been decided that the tower and a number of hangars would be removed and or moved to allow a passageway east of the Alpha taxiway for movement of fuel trucks etc and moving the runway to the East. As laudable and necessary as that is basically this would be a disaster for the community. This may impact multiple structures that exist east of the taxiway. The hangar space could not be replaced as there is not enough land to do this. The economics of condemning a hanger would be economically a disaster for the owners. Hangar space is at a premium currently as I personally know many pilots that would like to buy an aircraft

	but don't as there is no place to hangar it. If the agencies want to devastate the airport then continue with the proposal and we will suffer the consequences. If someone of the agencies actually saw and personally experienced the consequences, I am sure this proposal would not be suggested nor approved. The other alternative is to move the highway westward. This would be of little consequence to the airport businesses as only a temporary inconvenience for the airport. Please have some consideration to the airport community and do not devastate KUAO a highly successful functioning and laudable general aviation airport since the early 1940's. I would like to receive email updates.

Tony H. - your recollection is incorrect.

If anything, any discussion about a last minute alternate substitution was about how inappropriate it was and how we would be providing additional time for public comment to accommodate former Sen. Johnson if she so wished.

We are looking to prevent process issues that would likely result in litigation from those opposing the master plan.

Hi Tony,

I don't remember laughing about that specifically, but we'll include your comments in the record. Yes we did receive a few last second and conflicting requests to change PAC representation or add alternates within an 80 minutes of the meeting starting. I explained why we would not make these changes so close to the meeting, and that the public would have ample opportunity to comment in the meeting and provide all of their comments in full in writing. That opportunity was provided in the meeting, and we went overtime to allow the public to provide additional comment.

Regarding Mr. Brownlee's request, he was replaced on the PAC by Jon Bickford when he took over for Trent as GM for Atlantic Aviation at UAO back in September. As a reminder, the latest PAC list is on the website here: https://publicproject.net/auroraairport#

Thanks for your comments and input in the PAC meeting,

Aurora State Airport Master Plan Website Comments

Name	George Buley
Organization	Private Citizen
Comments or questions?	I am George Buley, a private citizen, and an Airport & Airway Trust Fund Taxpayer, and am recommending the following proposals be considered for evaluation in the Aurora State Airport Master Plan Update: Airport Master Plan Advisory Circular 150/5070-6B, effective date 7/29/2005 and Change 2 on 7/27/2015, states: I. Purpose:…"The intent of this AC is to foster a flexible approach to master planning that directs attention and resources to critical

issues to meet future aviation demand."
The FAA has previously demonstrated master planning "flexibility" at the following facilities:
1) Tacoma Narrows Airport. Allowing obstructions to remain in the Runway Safety Area after the Runway Safety Area was expanded.
2) Renton Municipal Airport. Allowing 737s to operate in an Airport Design Group B-II environment via a Letter of Agreement.
3) Caldwell Executive Airport. Allowing the Sponsor to determine which mitigation strategy would be most effective for meeting Runway Object Free Area (ROFA) standards for their proposed runway extension as noted in the Airport Master Plan. I.e., relocating or covering the drainage canal located in ROFA.

Based upon the aforementioned examples of flexibility in Airport Master Planning, it is recommended to evaluate either:
1) The installation of an Engineered Materials Arresting Systems on the entire west side of ROFA or relocate Hubbard Highway roadway 31' west within the 200' Right of Way and install a noise wall for the residents that will be affected on the west side of ROFA.
2) Temporarily halt the Master Plan process and submit a Modification of Standards consistent with the previously approved FAA Airport Layout Plan. The last Airport Master Planning process was completed in 2012, per FAA AC 150/5070-6B, Airport Master Planning.

Please analyze each proposal offered and consider how the community can benefit as the aviation businesses grow to improve the local economy while enabling the self-sustainability of the airport, which is also representative of the growth anticipated in the FAA-approved forecast. It is anticipated that the cost of either one of the proposals is considerably less than the $200M estimated to relocate businesses and jobs away from the local communities they serve, which appears to be an unnecessary, major expense to everyone involved.

Sincerely,

George Buley
Private Citizen, Aviation Trust Fund Taxpayer

Subject: Objection to Proposed Removal of Privately Owned Hangars

Dear Mr. Beach and Committee Members of the Oregon Department of Aviation regarding the Aurora Airport Master Plan,

I am writing to formally register my strong opposition to the proposed removal of privately owned hangars and properties as part of the ongoing Aurora Airport Master Plan.

As you are aware, there is already a significant shortage of hangars at Aurora Airport. The hangars currently slated for destruction are providing critical services and employment to local businesses and aviation professionals. The proposed "taking" of these properties would not only disrupt the local economy but also exacerbate the existing shortage of hangar space.

I understand that the proposal aims to enhance airport safety and efficiency, but I believe that the justification for the destruction of privately held hangars is insufficient. Specifically, the two key motivations for this proposal—1) relocating a vehicle lane closer to the taxiway, and 2) the creation of a parallel taxi lane—are both questionable.

1. The first motivation, to move a vehicle lane closer to the taxiway, could be achieved more effectively and safely by locating the lane further away from active flight paths and other sensitive areas. The proposed site of the lane, near the hangars, does not appear to be the most strategic or safest location.
2. The second motivation, the construction of a parallel taxi lane, is unnecessary. It is my belief that the same safety and operational benefits could be achieved by acquiring only a small portion of land—perhaps no more than one acre—from a willing seller, rather than displacing entire hangars.

Therefore, while I fully support airport safety improvements, I strongly urge the committee to reconsider any plan that would result in the destruction of privately owned hangars. There are alternatives that would allow for necessary improvements without harming local businesses or further contributing to the hangar shortage.

Thank you for your attention to this matter. I trust that the committee will carefully weigh these concerns as part of the decision-making process.

Sincerely,

Jonathan Buss

Hi Brandy,

Please see attached letter. Obviously, many at the airport are pretty concerned about the proposed solution. For my company, in particular, we are running 24/7/365 life-saving operations from our hangar. Our services are critical to the region. The proposal would cause significant disruption to us beyond the simple economics of the plan. Happy to discuss more at any point.

Re: Aurora State Airport Master Plan Proposed Preferred Alternative

Mr. Thomas,

Please enter this letter into the record for the Oregon Department of Aviation's (ODAV) proposed "Preferred Alternative" for the Aurora State Airport Master Plan. We support Director Sugahara's statement that ODAV is willing to modify its Preferred Alternative for the Aurora Airport Master Plan. We believe that it is important that ODAV do so, to enable the airport to continue to deliver significant tax benefits, family wage jobs, emergency resiliency and aeronautical innovation to the region and state. The current version of ODAV's proposed Preferred Alternative is inconsistent with these objectives.

ODAV is bound by ORS 836.640-642 which was developed by Business Oregon. That statute strongly encourages private investment at the Aurora Airport and commands ODAV to carry out that objective. Contrary to that statute, ODAV's proposed alternative contemplates ODAV taking by eminent domain the Aurora Airport front line aircraft hangars for which the owners have invested more than $200 million, created millions in tax revenue, more than a 1000 good jobs and millions in directly and indirectly related tourist revenue for surrounding communities, with ORS 836.640-642 as the catalyst.

Against this backdrop, the "Preferred Alternative" anomalously designates areas that have been set aside in airport master plans for airport related development since 1976, as areas for ODAV acquisition instead of bringing them into the airport boundary established by ORS 836.640-642 for development for airport related uses and wipes out the front-line hangars.

Both elements of the preferred alternative are misguided. Among other objectives for the Aurora Airport, ORS 836.642 requires ODAV to "Preserve investments [at the Aurora Airport] and the level of service provided by [the Aurora Airport]" and to "promote economic development" at Aurora "by creating family wage jobs, increasing local tax bases" through support of private aviation-related uses so that they may "develop and thrive." The preferred alternative is contrary to ORS 836.640-642 and expressly seeks to trade the private investment that the statute seeks to encourage and grow, for government condemnation and ownership.

Concerningly, ODAV's preferred alternative significantly gambles with the significant economic benefits that private investment at the airport has delivered, risking their continuation. The threat of ODAV condemnation, not to mention ODAV actually engaging in such litigation against those

owners, presents an unacceptable risk of driving away not only those aircraft hangar owners, but also their businesses, jobs and related tax and tourist revenue. Once they are gone, the stigma of such ODAV action could make the airport and indeed any airport that ODAV manages, a private investment pariah for decades. Such a risk should not be taken where, as here, a state statute commands ODAV otherwise and there are alternatives.

It is respectfully submitted that the justification for the "preferred alternative" simply does not justify its deleterious effects. ODAV is on record stating that these harmful consequences only flow from ODAV's desire for a "vehicle service road" (VSR) and a new aircraft taxiway. But neither necessitates the preferred alternative.

Regarding the VSR, the 2012 master plan approved a VSR that has none of the Preferred Alternative's deleterious effects and does not carry a $200 million condemnation price tag. At worst, the 2012 VSR costs the state some pavement. Moreover, we are advised that the private aeronautical stakeholder owners have offered ODAV the land needed for the 2012 MP VSR free of charge. We are unaware of any reason for ODAV to not pursue that 2012 MP VSR and we can only see good reasons to do so.

We are further advised that there are alternatives for a new taxiway that ODAV has not explored. We understand that ODAV has not explored any such alternatives because it does not own the land needed for a taxiway to be located elsewhere. However, so far as we know this has never been an impediment previously to the development of the Aurora Airport and should not be an impediment now. Many features of the proposed alternative are now contemplated on land that ODAV does not own – including the taking of the frontline hangars. Even if ODAV had to acquire some private land for a new taxiway, ODAV should explore such alternatives having the least adverse impact on the continuation and growth of private aeronautical investment at the airport, not to mention a price tag well south of the $200 million under the Preferred Alternative. Finally, we are advised that ODAV simply does not "want" to extend the airport boundary to include the land that is now and has long been foreseen for airport-related development in the airport boundary. Such a justification if true, would obviously be contrary to ODAV's mission and responsibility to enable the Aurora Airport to grow with aviation-related uses.

We are frankly perplexed by these problems given the success of the airport and the commands of ORS 836.640-642. ODAV should be eager to develop a master plan that ensures the Aurora Airport's continued growth and success over the master plan's 20-year horizon. If these problems that risk sending the airport backwards by decades arise from a lack of meaningful airport stakeholder engagement in the development of the preferred alternative, then ODAV should meaningfully engage. But whatever the reason, we strongly encourage ODAV to dismiss the Preferred Alternative and to meet with the airport stakeholders and to explore a more normative and economically reasonable preferred alternative that is consistent with ORS 836.640-642.

Sincerely,

Ben Clayton
Chief Executive Officer

Please register and make part of the master plan record my very strong objection to the "taking" of any privately owned hangars on the Aurora Airport.

There is a significant shortage of hangars. The hangars sited for destruction are all currently providing significant employment. The two motivations for the proposed destruction, 1) a vehicle lane would work MUCH better as far as possible away from the taxiway 2) The parallel taxi-lane is unnecessary, and very similar results could be achieved with ODAV purchasing only 1 acre from a willing seller.

I recommend airport safety improvements but only with no destruction of any hangars.

Thank you,
ZACHARAY AXEL CUMMINGS

Dear ODAV c/o Alex Thomas,

As a pilot that flies off KUAO, please register and record my urgent input for the Aurora Airport Master Plan that is underway not to consider the condemnation and destruction of any aircraft hangars.

Hangars are in very short supply which has driven the prices up dramatically. In addition the owners of the hangars that are proposed to be destroyed have no viable option to relocate on the airport.

There is more than ample access to KUAO via Airport Rd NE for vehicles. There is no need to add an internal roadway.

Thank you,

Ted Davis

JLA Public Involvement

Dear Alex, Tony, and Brandy:

Attached is a document which can be used to formally gain a modification of standards for the ROFA on the west side of the airport, where Highway 551 and the Airport Perimeter Fence force a reduced separation from the runway centerline.

I have taken the time to create this detailed risk analysis for ODAV, because under FAA's rules and standards this kind of modification of standards is allowed, and in this particular case the analysis fully demonstrates that the non-standard existing conditions result in an acceptable level of safety, as required by Order 5300.1G.

Equally important, this eliminates the hundreds of millions of dollars of public funds needed to move Highway 551, or to move the runway, taxiway, and tower – funds which are sorely needed for other much needed airport improvements that

can significantly improve safety – at Aurora and at other airports. Use of the modification of standards also saves hundreds of jobs at the airport that under several of the preliminary schemes would be disrupted and likely terminated.

This approach provides a win-win for all parties; I look forward to meeting with you and working cooperatively with ODAV to proceed in this direction.

Respectfully,

Aron Faegre

Aurora State Airport (UAO)
Proposed Modification of
Runway Object Free Area (ROFA) Design Standards

Prepared by: Aron Faegre, AIA, PE
Aron Faegre Airport Planning & Design

August 29, 2024

This memorandum provides an analysis and methodology by which a Modifications of FAA Airport Design Standards (MOS) at the Aurora State Airport (UAO), for the Runway Object Free Area (ROFA) can be justified as:

> "… resulting in an acceptable level of safety, useful life, lower costs, greater efficiency, or the need to accommodate an unusual local condition on a specific project through approval on a case-by-case basis." - FAA Order 5300.1G, page 1.

as defined and permitted under FAA Order 5300.1G Modifications to Agency Airport Design, Construction, and Equipment Standards[1].

1. BACKGROUND

The Aurora State Airport is surrounded by farm lands, near Aurora, Oregon, at the northern end of Marion County. It primarily serves aviation businesses involved with:

- emergency medical transport[2],
- aviation heavy-lift helicopter fire-fighting and power line construction companies (for which fixed wing aircraft are essential for support),[3]
- business jets for numerous major national corporations based within 10 miles,
- aircraft manufacturing for the S-LSA (Special Light-Sport Aircraft) and kit-build

[1] FAA Order 5300.1G Appendix A specifically gives FAA Office of Airport (ARP) and Region the authority to issue a MOS for Runway Object Free Areas. The Order can be downloaded at: https://www.faa.gov/documentLibrary/media/Order/order-5300-1G-modifications-to-standards.pdf .
[2] Regional headquarters for Life Flight Network, with bases all over Oregon, Washington, Idaho, Montana, and Nevada.
[3] Columbia Helicopters, Helicopter Transport Services, Wilson Construction, companies that work internationally with headquarters at Aurora Airport. The use of the Aurora Airport runway is essential to these companies for rapid providing of crews, equipment, and repairs to helicopters in active service of fighting fires, moving power lines, or doing rescue, relief, or humanitarian work.

industry[4], and

- other general aviation aircraft using the airfield for business, pilot training, and recreational flying.

There is no scheduled air service using the airport. The State of Oregon Department of Aviation (ODAV) owns, governs, and manages the public lands of the airport. Most of the business aircraft based at the airport access the runway via through-the-fence permits with ODAV.

Flights by based business jets, such as a Challenger 300, dictate that the Airport Reference Code is C-II. Due to the geometry of the existing site, the airport does not meet current FAA design standards for the ROFA, due primarily to adjacent Highway 551 to the west of the runway.

Most recently ODAV's planned solution[5] to meeting these standards ("Refined Preliminary Alternatives Summary", by Century West Engineering, dated July 31, 2024) is one of only two options:

- relocate the highway further west, (which involves acquiring both private residential and commercial properties further west), or
- relocate the runway, taxiway, and control tower east (which involves acquiring many acres of existing private property already developed with hangars, taxilanes, and aprons for aviation uses) and demolishing numerous large 40,000 square foot aviation hangars along the taxiway.

Both options have very high financial and environmental costs (probably in the greater than $100 million range), which would make them difficult to ever be implemented. If this master plan is approved as currently planned, and one of these options were not implemented, then ODAV and FAA have reported that the airport would only receive maintenance funding and no additional safety improvement funds. This would result in the airport not keeping pace with the aviation industry standards of safety. The second option (moving the runway, control tower, and demolishing hangars), If implemented, would in addition force closure of many of the major medical transport and fire-fighting facilities on the airport, and would put many of the airport's 1,500 employees out of jobs.

It is noted that in the 2012 Airport Layout Plan (ALP), approved (signed) by both ODAV and FAA, the airport also had the same Runway Design Code (RDC) status of C-II and

[4] Van's Aircraft www.vansaircraft.com the international leader in S-LSA produced aircraft.
[5] Refined Preliminary Alternatives Summary document dated July 31, 2024 by Century West Engineer can be downloaded at: https://publicproject.net/files/UAOAMP/uao-refined-preliminary-alternatives-summary-1-.pdf?d952c4adef .

listed a MOS as the solution to the non-standard ROFA limitation on the west property line. At that time there was consensus between ODAV and FAA that a MOS was a reasonable solution.

This memorandum provides the evidence to show that the 2012 ALP was a good approach to resolution of the ROFA, and that it can reasonably be continued. This report demonstrates that there is an acceptable level of safety through modifying the ROFA standard for the specific deviation to standards located on the west side of the runway.

FAA standards for different airports ROFA's vary from 250 foot width, to an 800 foot width, depending on aircraft type using the airport. As will be shown below, the primary reason justifying the modification is that the going from B-II to C-II category is just where the 500-foot required ROFA width changes to an 800-foot wide required ROFA - yet this is the same width required for all RDC category aircraft all the way to E-VI -Portland International Airport, San Francisco Airport, and every other international airport in the country. UAO will never have the larger size of aircraft those airports accommodate – Boeing 737's to Boeing 777's – so a slight reduction in width on the west side provides a level of safety appropriate for UAO, which will always serve only much smaller aircraft.

Modifications of standards for ROFA's are common at even large national airports. For example, recently several MOS were adopted at San Jose International Airport for deficiencies in the ROFA, as well as for runway-taxiway separations, and for runway object free areas[6]. It even appears that Portland International Airport (PDX) may have their airport perimeter fence, the shoulder of NE Marine Drive, and improper grading within the 400-feet area from runway centerline, at the northeast corner of the ROFA for Runway 10L.

This memorandum provides the detailed technical background and mathematically calculated justification, needed for the FAA and ODAV to again approve a MOS for the ROFA at Aurora State Airport.

2. MOS PROCESS

The process for gaining a modification of standards is provided in FAA AC 150/5300-13B Airport Design[7] in Section 2.8. It states, and we provide commentary after each paragraph as to acceptability:

[6] Norman Y. Mineta San Jose International Airport Runway Incursion Mitigation/Airfield Design Standards Analysis, November 27, 2017. Justification for ROFA modifications in this document were often simply the practical and cost issues of modifying major adjacent highways, similar to what is at issue in a much smaller Aurora Airport.
[7] FAA AC 150/5300-13B Airport Design Available free on line at:
https://www.faa.gov/documentLibrary/media/Advisory_Circular/AC-150-5300-13B-Airport-Design-Chg1.pdf

2.8 ***Modification of Standards.***

Site-specific conditions may make it impractical to meet all FAA design standards at an airport. The FAA considers, on a case-by-case basis, modifications to design standards that result in an acceptable level of safety and efficiency. Specific operational controls may be necessary to establish an acceptable level of safety for operation of aircraft at the airport. FAA Order 5300.1 establishes FAA policy for administering airport requests for modification of standards. See paragraphs 2.4 and 2.5.

This memorandum provides this information and finds that no specific operational controls are necessary, see comments on paragraph 2.4 below.

2.8.1 The FAA views an approved modification of standards as an interim measure intended to mitigate unique site-specific conditions. Unless the FAA explicitly states otherwise in the approval action, the FAA expects airports with approved modifications to pursue ways to meet design standards. This may occur incrementally over time or at such time it becomes practical to correct the non-standard condition.

The FAA and ODAV can work with Oregon Department of Transportation on master planning future revisions to State Highway 551 so that it can be corrected "at such time it becomes practical." Also, there are potential options where ODAV and ODOT could jointly agree to relocate the airport perimeter fence closer to Highway 551, which could be an "incrementally" established improvement.

2.8.2 The FAA will not consider any request to modify design standards associated with the following:

- *RSA dimensions*
- *OFZ dimensions*
- *Approach or departure surface dimensions*
- *Standards established within a regulation (e.g., stopway, clearway).*

The ROFA is not one of these.

2.8.3 An airport seeking FAA approval of modification to a design standard submits a request using the Modification of Standards application tool within the Airport Data and Information Portal (ADIP) at https://adip.faa.gov. The FAA relies on the following information, in part, to determine the acceptability of a modification to FAA design standards:

- *Information on the standard proposed for modification.*
- *Description of proposed modification and why the airport cannot meet standards.*
- *Statement addressing how modification will provide an acceptable level of safety, economy, durability, and workmanship.*
- *Listing of any special operational measures necessary to accommodate the modification.*

This document was prepared to provide the analysis needed for ODAV to submittal for the MOS per Section 2.4.

2.4 Addressing Non-standard Airport Conditions.

> *The FAA expects airport owners to address non-standard conditions through the airport planning process. The FAA acknowledges that conformance to current standards is not always practical. However, the FAA expects airports to continue to investigate mitigation measures, whether in one or multiple phases, and correct the non-standard conditions over time.*

It is important to re-emphasize the above statement, that the FAA here "acknowledges that conformance to current standards is not always practical." Further, per this paragraph, the current master planning activity is the appropriate place for this analysis and the formal establishment of a MOS for the ROFA. This report and analysis identifies intermediate steps that can be taken, such as relocating the airport perimeter fence, that will iteratively move the airport closer to compliance.

This analysis utilizes an FAA established safety analysis methodology to show that the MOS provides an acceptable level of safety. The study found no special measures needed to accommodate the modification.

3. METHODOLOGY

In 2011, the Transportation Research Board (TRB) released Airport Cooperative Research Program (ACRP) Report #51 – Risk Assessment Method to Support Modifications of Airfield Separation Standards. The ACRP is funded by the Federal Aviation Administration (FAA). Report #51 is used to support the ROFA MOS requested at Aurora State Airport.

The proposed ROFA MOS is modeled in this report in accordance with Appendix A – Risk Assessment Methodology of ACRP Report #51[8].

This report uses risk plots, along with the annual number of operations, to analyze the cumulative risks associated with Runway to Object Separations. The operations numbers at UAO are taken from the current draft Master Plan, and are numbers already approved by the FAA in a letter[9] to ODAV dated November 15, 2023 (corrected January 23, 2024). For sake of a conservative analysis, we are using the most distant forecast projects for the year 2041, which are:

- 90,231 total operations all RDC categories, of which
- 862 operations are of RDC C-II and D aircraft

[8] ACRP Report #51 – Risk Assessment Method to Support Modifications of Airfield Separation Standards is available free on line at: https://nap.nationalacademies.org/catalog/14501/risk-assessment-method-to-support-modification-of-airfield-separation-standards

[9] Federal Aviation Administration (FAA) Aurora (UAO Aviation Activity Forecast Approval Airport Improvement Program Grant Number 3-41-0004-022-2021 available at: https://publicproject.net/files/2024-01/Aurora-Airport/uao-forecast-approval-20231115-corrected-20240123.pdf?57af6c19b7

For operations involving the runway, per the methods of Report #51, the risk is analyzed based on three distinct phases of flight:

a. Landing - Airborne Phase
b. Landing - Ground Phase
c. Takeoff

The separation distance from the runway centerline to an object is used with the associated risk plot to calculate the risk of collision per operation.

The risk of collisions per operation is then analyzed along with the number of annual airport operations for the appropriate phase of flight to determine the predicted frequency of occurrence. The frequency of occurrence is used to determine the FAA likelihood level using Table A-3 from ACRP Report #51 which is shown below:

Table A-3. FAA likelihood levels (FAA, 2010).

	General	Airport Specific	ATC Operational	
			Per Facility	NAS-wide
Frequent A	Probability of occurrence per operation is equal to or greater than 1×10^{-3}	Expected to occur more than once per week or every 2,500 departures (4×10^{-4}), whichever occurs sooner	Expected to occur more than once per week	Expected to occur every 1–2 days
Probable B	Probability of occurrence per operation is less than 1×10^{-3}, but equal to or greater than 1×10^{-5}	Expected to occur about once every month or 250,000 departures (4×10^{-6}), whichever occurs sooner	Expected to occur about once every month	Expected to occur several times per month
Remote C	Probability of occurrence per operation is less than 1×10^{-5} but equal to or greater than 1×10^{-7}	Expected to occur about once every year or 2.5 million departures (4×10^{-7}), whichever occurs sooner	Expected to occur about once every 1–10 years	Expected to occur about once every few months
Extremely Remote D	Probability of occurrence per operation is less than 1×10^{-7} but equal to or greater than 1×10^{-9}	Expected to occur once every 10–100 years or 25 million departures (4×10^{-8}), whichever occurs sooner	Expected to occur about once every 10–100 years	Expected to occur about once every 3 years
Extremely Improbable E	Probability of occurrence per operation is less than 1×10^{-9}	Expected to occur less than once every 100 years	Expected to occur less than once every 100 years	Expected to occur less than once every 30 years

Note: Occurrence is defined per movement.

Source: ACRP Report #51

The key takeaway from Table A-3 is that for a specific airport, if the likelihood of incidence is less than once every 100 years it is considered a “Extremely Improbable” Class E occurrence.

A Hazard Severity Classification is then assigned based on the worst credible outcome of an incident. Since the ACRP method is based on wingtip separation, the report states that: “From the point of view of risk and based on the records of incidents and accidents,

the worst credible consequence expected for wingtip collisions of two taxiing aircraft is aircraft damage" (ACRP Report #51 page 19). A similar aircraft damage expectation would be a wingtip collision with the airport perimeter fence, which is the ROFA limitation examined in this report.

The Hazard Severity Classifications were determined in accordance with Table A-4 FAA Severity Definitions from ACRP Report #51 and are shown below:

Table A-4. FAA severity definitions (FAA, 2010).

Hazard Severity Classification				
Minimal 5	**Minor 4**	**Major 3**	**Hazardous 2**	**Catastrophic 1**
No damage to aircraft but minimal injury or discomfort of little consequence to passenger(s) or workers	- Minimal damage to aircraft; - Minor injury to passengers; - Minimal unplanned airport operations limitations (i.e. taxiway closure); - Minor incident involving the use of airport emergency procedures	- Major damage to aircraft and/or minor injury to passenger(s)/ worker(s); - Major unplanned disruption to airport operations; - Serious incident; - Deduction on the airport's ability to deal with adverse conditions	- Severe damage to aircraft and/or serious injury to passenger(s)/ worker(s); - Complete unplanned airport closure; - Major unplanned operations limitations (i.e. runway closure); - Major airport damage to equipment and facilities	- Complete loss of aircraft and/or facilities or fatal injury in passenger(s)/ worker(s); - Complete unplanned airport closure and destruction of critical facilities; - Airport facilities and equipment destroyed

Source: ACRP Report #51

Then, using both the FAA likelihood level and the Hazard Severity Classification the risk is then analyzed using Figure A-1 FAA Risk Matrix from ACRP Report #51, shown below:

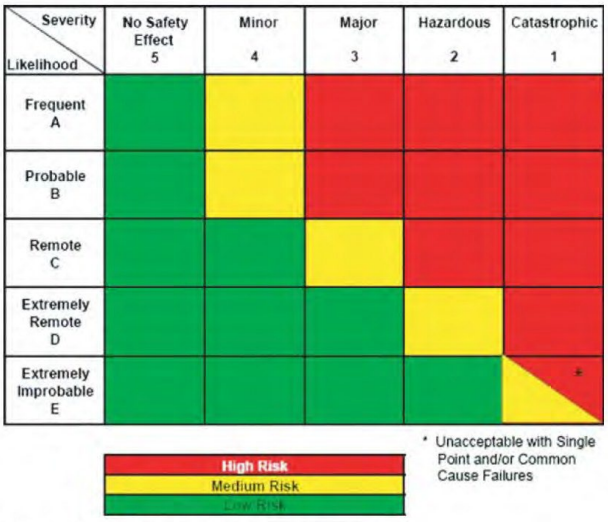

Figure A-1. FAA risk matrix (FAA, 2010).

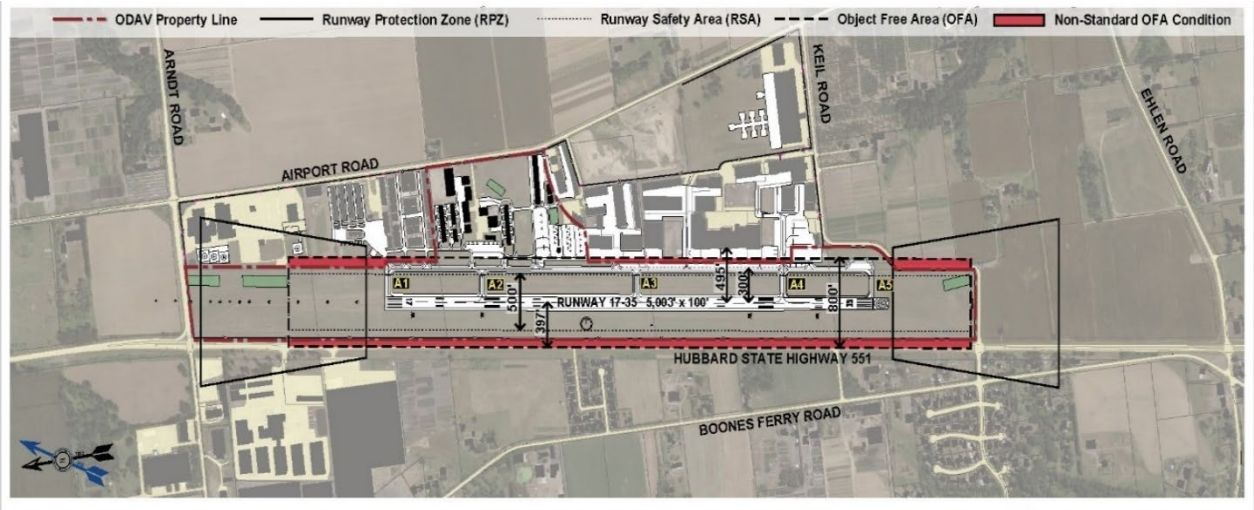
Source: ACRP Report #51



Based on Figure A-1 if the incident is Extremely Improbably (i.e. more than 100 years probability) the risk is considered “Low,” except for an incident considered catastrophic. We will use these graphs to evaluate the results from the detailed risk analysis of UAO below.

4. UAO ANALYSIS

In 2012 Master Plan and ALP established the UAO runway RDC, given existing based aircraft, as C-II, up from a B-II. The required ROFA width of a B-II runway is 500 feet centered on the runway. As it turns out, any runway of higher RDC than a B-II requires 800 feet in width. Thus, the UAO required C-II ROFA width is 800 feet centered on the runway. This 800-foot width is the standard used for aircraft ranging from a Challenger 300 business jet to the largest Boeing 777 or even the largest military aircraft. The 2012 approved ALP lists the ROFA deviation as a modification to standards, since the airport perimeter fence and Highway 551 were within the ROFA.

The UAO forecast of operations predicts that by the year 2041 there will be 90,230 annual operations at the airport, of which 862 would be an RDC above the B-II category. Thus, the 89,368 operations by B-II or lesser category clearly are operating well within ROFA safety standards, as the existing runway to road separations provide more than the 500-foot required width. It is just the 862 operations that need to be analyzed for ROFA safety relative to the required 800-foot width.

The deficiencies in the existing Runway OFA at UAO are shown in the Figure below:

UAO Figure A: Highway 551 Shown as ROFA Deviation Object
Source: Century West Engineers, Aurora State Airport Draft Airport Master Plan, Working Paper No. 1, Figure 2-15, November 2023 (Updated)

The current ROFA object deficiencies are:

d. Hubbard State Highway 551 for which the OFA penetrates 3 feet beyond the highway centerline. (368' to 377' clear width available from outer edge of highway gravel shoulder to Runway CL)
e. Perimeter Fence Inside OFA (312' clear width from Runway CL)

Potentially the airport fence could be relocated to the east edge of the 12-foot-wide gravel shoulder, since both the highway and the airport are owned by the State of Oregon. There can be an agreement between ODOT and ODAV to allow this. Relocating the fence in this way would result in a minimum width of the ROFA on the west side of the runway, to a 368-foot clearance - which would be only 32 feet out of conformance.

However, we will evaluate the ROFA for the existing conditions, and thus use the location of the airport perimeter fence as the maximum ROFA available at this time.

When analyzing the risk associated with a reduction in Runway OFA it is important to consider the purpose of the design standard. Paragraph 3.12 of Advisory Circular 150/5300-13B defines the ROFA but does not give detailed design rational behind the standard:

> *"ROFA is a clear area limited to equipment necessary for air and ground navigation, and provides wingtip protection in the event of an aircraft excursion from the runway"*

Appendix I, Paragraph I.8 of Advisory Circular 150/5300-13B provides the only available reference to the design rationale behind the Runway OFA width:

> *"The ROFA serves two principal purposes: 1. Development buffer in proximity to a runway, and 2. Wing clearance for a runway excursion event to the outer limit of the RSA. `*

Appendix I, in Section I.8.2, also clarifies that part of the "development buffer" intent is:

> *"Protection of the ROFA also reserves space for future development of a parallel taxiway that permits proper alignment of aircraft at a holding position on an entrance taxiway."*

However, for the given physical layout of UAO there can be no plan for a parallel taxiway on the west side of the runway, because of the location of Highway 551 and that there never can be hangars or other aviation uses on that side of the runway. Therefore, that leaves the only ROFA purpose for UAO as only "wingtip clearance for a runway excursion" which is precisely what this analysis provides.

Below we will analyze resolving the ROFA utilizing the risk analysis method of ACRP Report #51, for the case:

- No Change to existing ROFA conditions on West Side of Runway (Hwy 551 and Airport Perimeter Fence remain as existing) resulting in a 312-foot clearance to runway CL.

Per the methodology of ACRP Report 51, we analyze the risks for each of the takeoff and landing scenarios. For landing operations, the analysis is further divided into two parts: airborne (approach) phase and ground (landing rollout) phase. However, because the risk of veering off the runway during takeoff is so much less than for during landing, the methodology indicates that usually it is not necessary to evaluate takeoff option except if there are runways that only are used for takeoffs and not for landings. We will do that takeoff evaluation in any case, just to clearly determine what it is in the UAO context.

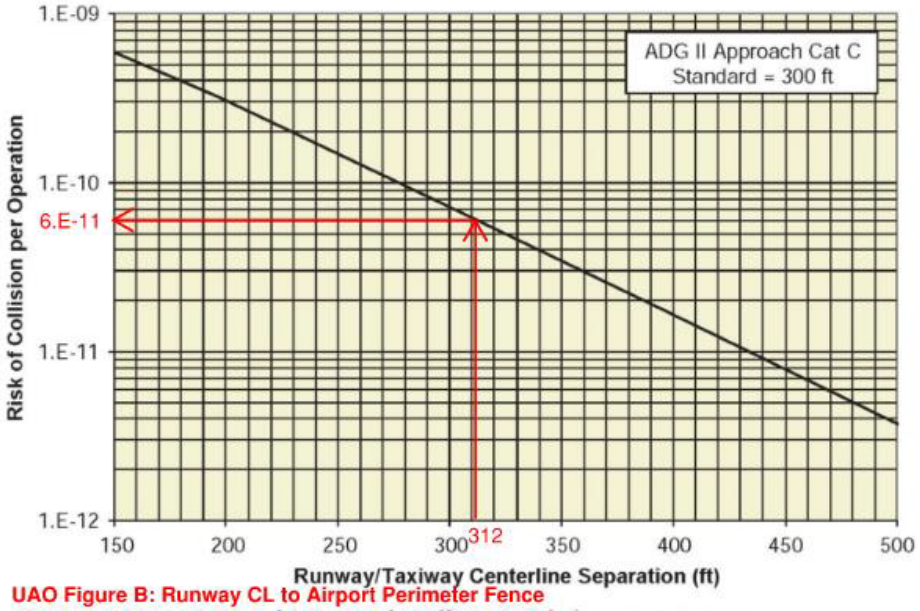
Since the existing runway to taxiway separation meets the current criteria for a C-II airport, for this study that analysis would seem unnecessary. However, we will include that option in this report because it provides a baseline of safety that the AC 150-5300-13B Airport Design Standards have determined is an acceptable and appropriate level of safety for a C-II airport.

Thus, for this UAO ROFA analysis separate risks are developed for each of:

1. Airborne Phase (Landing) is for instrument approaches which terminate the approach as a missed approach, and the risk is hitting another object such as hitting the airport perimeter fence or a vehicle on Highway 551 (using ACRP Report 51 Fig. 31); “the airborne risk is computed only for missed approaches” (ACRP Report 51, page 21).
2. Ground Phase (Landing Rollout) where risk is veering off the runway into the reduced width ROFA and hitting the fence or a car on Highway 551 (using ACRP Report 51 Fig 42). Figure 42 is based on the assumption that the risk is between the two wingtips of two aircraft, one aircraft on the edge of the runway and the other at the centerline of a taxiway. The ACRP makes clear that the x-axis distance on the Risk Figures are centerline of runway to centerline of taxiway because the risk is assumed aircraft to aircraft. However, the predicted risk is based on the wingtip-to-wingtip distance. When using the Risk Figures for objects (not aircraft) like a fence or road (which has no wings), half of the wingspan should be added to the distance to compensate for the wingtip-to-wingtip assumption. Thus, per Group II standards, the clearance distance used for Figure 42 should add half of 79 feet (equals 39.5 feet) of additional clearance, which would create a total of 351 feet to use in Fig. 42. The risk shown with the 312 feet and the 351 feet are each shown in figures.

3. Ground Phase (Takeoff) where risk is veering off the runway into the reduced width ROFA and hitting the fence or a car on Highway 551 (using ACRP Report 51 Fig 49).

Finally, to have more relevant data, we will also perform the risk analysis of the standard required 300-foot separation between runway centerline and taxiway centerline for a landing, which is the level of safety the AC 150/5300-13B sets for in a C-II airport:



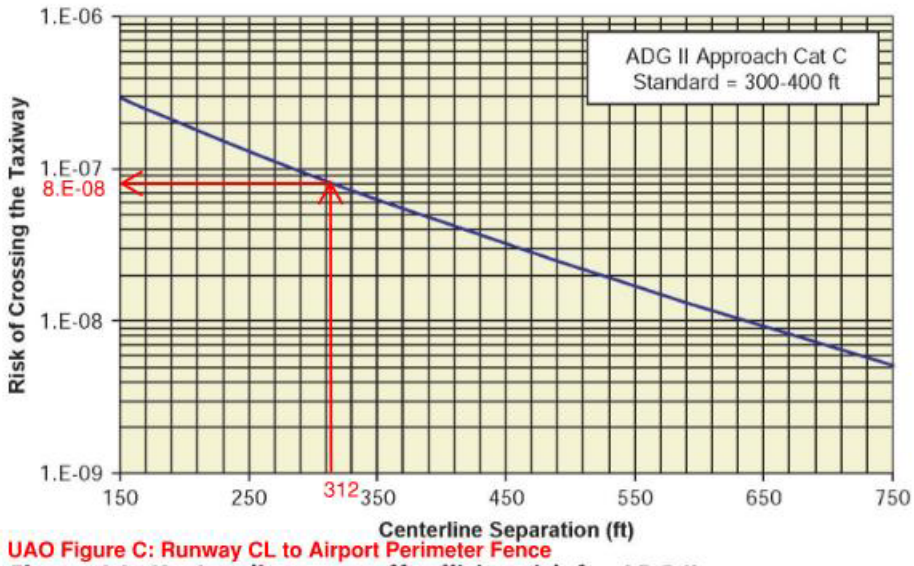
4. Ground Phase (Landing Rollout) where risk is veering off the runway into the taxiway (using ACRP Report 51 Fig 42).

This data will give us an example of an acceptable level of safety utilized in AC 150/5300-13B for a C-II airport.

5. Specific Analysis: Proposed MOS Option - No Change to Existing ROFA Conditions (312' Separation from Runway Centerline to Airport Fence)

The Perimeter Fence at the west side is located 312 feet from the runway centerline. The risks associated with leaving it there as a modification of standards, for each of the phases of flight are analyzed below:

1. Airborne Landing Phase Risk from Reduced ROFA – For a very conservative analysis we will assume that this includes all approach to landings, not just missed approaches. Using the separation of 312' and Figure AA-33 in Appendix A of ACRP Report #51, the following provides a risk level 6.0E-11 of occurrence per landing (which as an inverse, is one chance in a 16.7 trillion landings) that an aircraft gets 312' from the runway centerline. This can be seen in the figure below:



UAO Figure B: Runway CL to Airport Perimeter Fence

Figure AA-31. Missed approach collision risk for ADG II Cat I.

The current annual number of landing operations at UAO is approximately 45,115 or half of the 90,230 annual operations. As the risk is one incident in every 16.7 trillion landings, the time between occurrences is calculated as 16 trillion landings divided by 45,115 landing operations per year which equates to one incident every 369,000 years. Thus, this risk is of no significance.

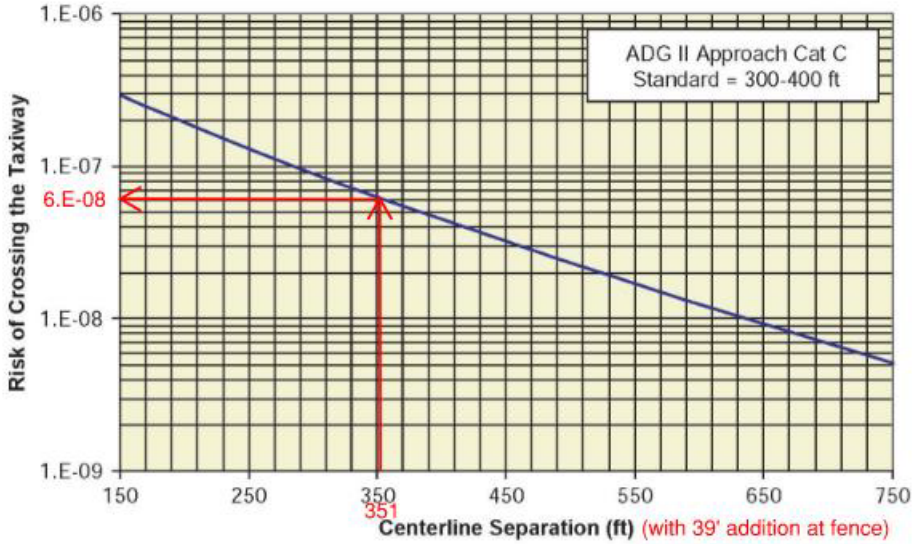
2. Landing Roll Phase Risk for Reduced ROFA - Using the separation of 312' and Figure AA-43 in Appendix A of ACRP Report #51, provides a risk level 8.0E-08 or in the inverse: one chance in 12.5 million landings. This can be seen in the figure below:

UAO Figure C: Runway CL to Airport Perimeter Fence

Figure AA-42. Landing veer-off collision risk for ADG II.

As the risk is one incident in every 12.5 million landings, the rate of occurrence is calculated as 12.5 million landings divided by 45,115 landings per year which equates to one incident every 277 years.

Using the ACRP described adjustment when the object is not another aircraft and half the C-II wingspan can be added to the clearance distance, results in a separation of 351' and Figure AA-43 in Appendix A of ACRP Report #51, provides a risk level 6.0E-08 or one chance in 16.7 million landings. This can be seen in the figure below:



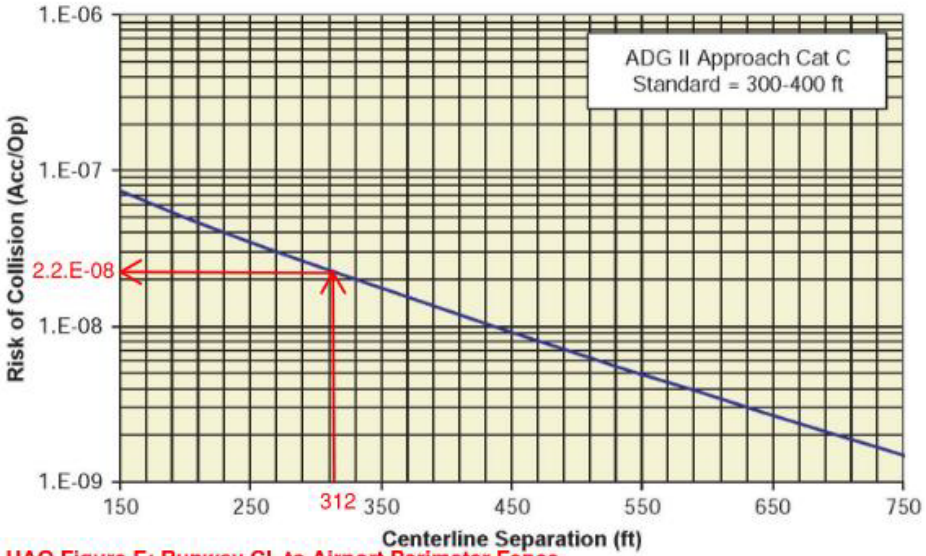


Figure AA-42. Landing veer-off collision risk for ADG II.
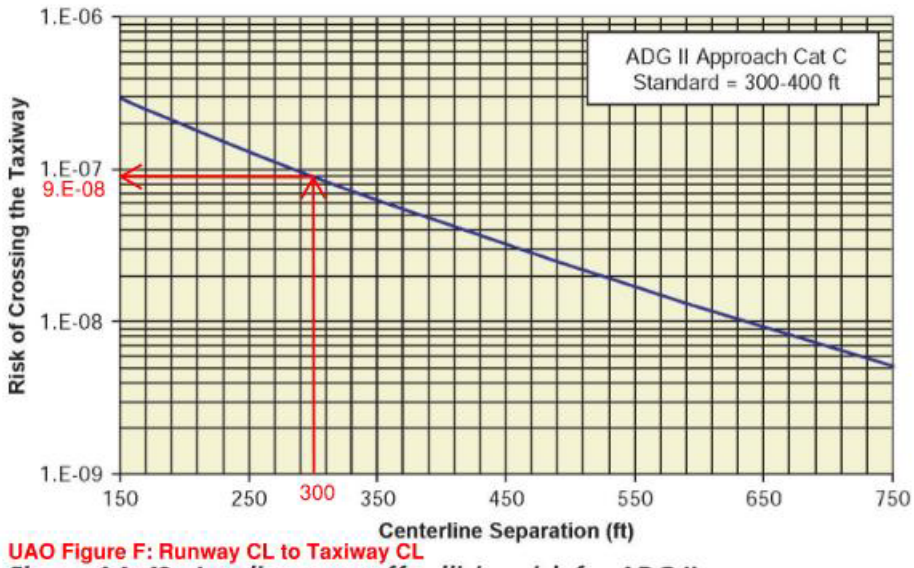
UAO Figure D: Runway CL to Airport Perimeter Fence Including Wingspan adjustment

As the risk is one incident in every 16.7 million landings, the rate of occurrence is calculated as 16.7 million landings divided by 45,115 landings per year which equates to one incident every 369 years.

3. Takeoff Roll Phase Risk for Reduced ROFA - Using the separation of 312' and Figure AA-49 in Appendix A of ACRP Report #51, provides a risk level 2.2E-08) or one chance in 45.5 million takeoffs. This can be seen in the figure below:



UAO Figure E: Runway CL to Airport Perimeter Fence
Figure AA-49. Takeoff veer-off collision risk for ADG II.

As the risk is one incident in every 45.5 million takeoffs, the rate of occurrence is calculated as 45.5 million takeoffs divided by 45,115 takeoffs per year which equates to one incident every 1,008) years.

Finally, as a test of the level of safety that AC 150/5300-13B considers acceptable we check what the predicted risk level is of the existing runway-taxiway separation considered appropriate[10] by FAA.

4. Landing Roll Phase Risk to Taxiway Consistent with Safety Standards of AC 150/5300-13B - Using the separation of 300' and Figure AA-43 in Appendix A of ACRP Report #51, provides a risk level 9.0E-08 or one chance in 11.1 million landings. This can be seen in the figure below:

UAO Figure F: Runway CL to Taxiway CL

Figure AA-42. Landing veer-off collision risk for ADG II.

As the risk is one incident in every 11.1 million landings, the rate of occurrence is calculated as 11.1 million landings divided by 45,115 landings per year which equates to one incident every 246 years.

[10] Note that Section 3-24 of Order 5100.38D Change 1 states that the FAA will not fund airport safety greater than that in the Airport Design standards, so the standard set by the runway-taxiway separation is a significant number. Order 5100.38D Change 1 can be downloaded for free at: https://www.faa.gov/documentLibrary/media/Order/AIP-Handbook-Order-5100-38D-Chg1.pdf

6. Conclusions

Considering the risk of each phase of flight, the risk of collision during the landing roll is the controlling factor. The Hazard Severity Classification for this type of operation would be major and the acceptable probability of occurrence is remote (1E-05) or less than once every 1-10 years. The following table summarizes the risk associated with each phase of flight:

Phase of Flight	Rate of Occurrence	Acceptable Level
Airborne Phase	Once every 369,000 years	Yes
Landing Roll Phase	Once every 277 years (or 369 years with calculation adjustment for fence object in lieu of wing object)	Yes
Takeoff Roll Phase	Once every 1,000 years	Yes

A runway to object separation of 312’ provides an acceptable level of safety as the controlling occurrence is once every 277 years (or 369 years with the adjustment for wingspan at the fence as allowed in the ACRP method). This is much less risk than the once per 100 years FAA standard shown in Table A-3 and results in a Category E “Extremely Improbable” occurrence. Further, per ACRP’s method, a wingtip to fence occurrence is considered by ACRP’s method to be a Table A-4 Minimal Severity occurrence. This combination via Figure A-1 concludes that the outcome as Low Risk.

Figure UAO F shows that the existing risk of occurrence between the existing runway and existing taxiway, which fully meets FAA standards, is one in every 246 years. This means that the risk to an occurrence at the taxiway, is much less (i.e. longer duration between events) than the FAA’s 100-year standard. The risk of collision with the perimeter fence is then even much less than that of a taxiway collision.

Finally, there is an incremental improvement option of ODAV and ODOT coming to an agreement to move the perimeter fence further west, to the east edge of the 12’ wide gravel shoulder, which would result in a 368-foot separation. If the 39.5-foot wing span correction is added at the new fence location, this results in an equivalent distance of 407 feet for use on Figure AA-42. That in turn would result in an ACRP predicted probability occurrence being once every 515 years, almost half the risk of a taxiway collision.

Given that the commercial use of aviation is itself only around 100 years old, these numbers of one predicted occurrence at the existing airport fence every 277 or 369 years, demonstrates the high level of safety that will be maintained at Aurora Airport with this MOS.

Given the regional and national importance of Aurora Airport for emergency medical, firefighting, and emergency power line moving, along with the use by local national corporations, using the MOS ensures the airport can continue to upgrade with safety improvements, and can continue to support the approximately 1,500 employees that rely on the airport for their livelihood.

This study shows definitively that the 2012 signing off on the Aurora Airport master plan and ALP with a modification of standards for the ROFA, by FAA and ODAV, was a reasonable and appropriate action to take. The same action should be taken for the current 2024 master plan work.

Author: Aron Faegre is an architect, civil engineer, physicist, and pilot who has been the lead planner and designer on over two hundred airport planning and development projects in Oregon, Washington, California, New York, and British Columbia over the past 35 years. He has a Master of Architecture from MIT and a Bachelor of Physics from Reed College.

ARON FAEGRE AND ASSOCIATES
AVIATION PLANNING AND DESIGN SERVICES FIRM PROFILE

Introduction

Aron Faegre and Associates is a multi-disciplinary firm with a special interest in performing planning and engineering for aviation projects. The principal of the firm, Aron Faegre, personally manages the firm's key projects and is an aviation planner, architect, civil engineer, and landscape architect. He is also an instrument rated commercial pilot.

Mr. Faegre's firm has completed aviation projects for the following clients:

- Oregon Department of Aviation
- Port of Walla Walla
- Quinault Indian Nation
- Horizon Air
- Southwest Airlines
- Columbia Helicopters
- Helicopter Transport Services
- Oregon Health Sciences University
- Kaiser Hospital
- Atlantic Aviation
- The Port of Portland
- Port of Columbia County Scappoose)
- The City of Portland
- City of Pendleton
- Washington State DOT
- Life Flight Network
- Van's Aircraft
- City of Newberg
- Transwestern Aviation
- Flightcraft PDX

Aviation Services

Aron Faegre & Associates provides consulting services on all aspects of aviation facilities design including:

- Airport Master Plans
- Maintenance Hangars and Shops
- Storage Hangars
- Terminals and Concourses
- Airport Layout Plans
- Runway Design
- Access Road Design
- Instrument Approach Drawings
- Apron Design
- Airport Economic Impact
- Noise Abatement Planning
- Environmental Assessment
- Fixed Base Operator Facilities
- Air Cargo Facilities
- Tenant Fit-up
- Obstruction Survey
- Taxiway Design
- Airport Security Design
- Aviation Land Use Planning
- Public-Private Partnerships

Aron Faegre, P.E, AIA is the principal of AFA, a multi-disciplinary planning and design firm. Mr. Faegre has a Master's Degree in Architecture from the Massachusetts Institute of Technology, during which he was also a National Science Foundation Fellow for three years. Mr. Faegre has a Bachelor's Degree in Physics from Reed College and has published research in scientific journals. He is licensed as a civil engineer, architect, and landscape architect. He is a commercial pilot with instrument rating. He also serves on the board of the Airway Science for Kids, an Oregon non-profit, where he also leads the TeenFlight program – where teams of 15 teenagers build an RV-12is aircraft, and then get to experience flying the airplane they built.

Outlook

Fw: Aron Faegre master plan comments for December 23 submittal

Subject: Aron Faegre master plan comments for December 23 submittal

Hi Brandy, Thomas, and Tony,

Attached are two documents for the master planning to use in modifying the airport plans in creating a final plan.

Please confirm receipt.

Thanks, and hoping you have a great holiday,

Aron

Re: Aurora State Airport Master Plan Proposed Preferred Alternative Use of Modifications of Standards

Mr. Thomas, Mr. Beach, and Ms. Steffen:

Please share this letter with the ODAV and FAA design team, and enter it letter into the record for the Oregon Department of Aviation's (ODAV) proposed "Preferred Alternative" for the Aurora State Airport Master Plan.

We support Director Sugahara's statement that ODAV is willing to modify its Preferred Alternative for the Aurora Airport Master Plan to show a phased compliance with various standards, especially the Runway Object Free Area (ROFA). This letter is to especially remind all parties that a phased approach, iteratively working toward compliance, is completely consistent with, and part of the process for using the FAA's modification of standards process.

The FAA's directions for master planning and airport design clearly describe and allow the use of the modification of standards process, and it is appropriate that it be used for the Aurora Airport Master Planning effort. In fact, it is imminently reasonable because otherwise if the master plan describes a phased process to resolve issues of standards, for the process to be successful, it will need a modification of standards, so why wait to find out the answer? The master plan process is precisely when it should be applied for and resolved.

In service of the ODAV and FAA process to accomplish this, we have prepared a risk analysis based on FAA funded methodology, that shows a modification of

standards for the ROFA provides a completely acceptable level of safety. It shows that the risk of occurrence is that an occurrence would not occur within 275 years, which is more than twice as long as the FAA standard of acceptable risk is a 100-year period.

We should keep in mind that the actual history of mankind's successful creation of flying machines – dating to the first flight on December 17, 1903 in Kitty Hawk, North Carolina – represents a period of only 121 years. The risk analysis shows that the predicted risk to an incident at the edge of the Aurora Airport existing runway fence exceeds even this by 156 years. In the world of aviation that is many lifetimes – the FAA standards for ROFA's will have changed many times by that date.

Given that the new, incoming United States President is creating a Department of Government Efficiency that is intended to root out unreasonable use of federal funds, it will be appropriate to ensure that the final approved Aurora Airport Master Plan presents an efficient, reasonable, practical, and attainable plan of action. It cannot propose the expenditure of hundreds of millions of dollars to solve aviation issues that have an unlikely risk of happening, if at all, more than two hundred years from today. By then, it can reasonably be expected that the ROFA will be clear or some other design standard will have been imposed due to unimaginable changes in aircraft technology.

We request that the Aurora Airport Master Plan effort use the established standards that actually apply to all FAA funded master plans. It is important that the Aurora Airport planning effort be allowed the same opportunities that other airports around the United States are allowed, and not discriminated against.

Concerning when Modifications of Standards are allowed to be used, we note that the AC describing Airport Master Planning work, AC 150/5070-6B with Change 2, identifies below (yellow highlight added) that:

- The ALP should show all planned modification to the airport (they do not need to yet be approved); and

- The ALP narrative should discuss modifications to FAA Airport Design Standards (there is no prohibition to applying for the mod during the master planning work) and discuss the stages of development with sketches, which would include planned mods of design standards.

202. TYPES OF MASTER PLANNING STUDIES

c. **Airport Layout Plan Updates** – An update of the airport layout plan (ALP) drawing set should be an element of any master plan study. In fact, keeping the ALP current is a legal requirement for airports that receive Federal assistance. An update of the ALP drawing set will reflect actual or planned modifications to the airport and significant off-airport development. An accompanying ALP Narrative Report should explain and document those changes and contain at least the following elements:
1) Basic aeronautical forecasts.

2) Basis for the proposed items of development.

3) Rationale for unusual design features and/or modifications to FAA Airport Design Standards.

4) Summary of the various stages of airport development and layout sketches of the major items of development in each stage. An ALP drawing set update is an appropriate alternative to a full master plan whenever the fundamental assumptions of the previous master plan have not changed. If there have not been any major changes in airport activity or improvements that have had unanticipated consequences, a master plan update is not necessary. Another situation where only an ALP update would be appropriate is the examination of a single development item, such as runway safety area improvements. As indicated above, an ALP update will typically involve fewer elements than a full master plan study, including only the aviation demand forecasts, an assessment of facility requirements, a facility implementation and financing plan, and an airport layout plan drawing set. If additional steps are required to complete the ALP update, a full master plan study is probably a better choice.

205. MASTER PLAN REVIEW BY THE FAA

a. The recommendations contained in an airport master plan represent the views, policies and development plans of the airport sponsor and do not necessarily represent the views of the FAA. Acceptance of the master plan by the FAA does not constitute a commitment on the part of the United States to participate in any development depicted in the plan, nor does it indicate that the

proposed development is environmentally acceptable in accordance with appropriate public law. The FAA reviews all elements of the master plan to ensure that sound planning techniques have been applied. However, the FAA only approves the following elements of airport master plans:

1) ***Forecasts of Demand*** – The master plan forecast should be reviewed to ensure that the underlying assumptions and forecast methodologies are appropriate. Paragraph 704.h of this guidance should be used to determine consistency of the master plan forecast levels and the Terminal Area Forecast (TAF). Inconsistencies between the master plan forecast and TAF must be resolved, and the forecast approved, before proceeding with subsequent planning work.

2) ***Airport Layout Plan*** – All airport development at Federally-obligated airports must be done in accordance with an FAA- and sponsor-approved ALP. Furthermore, proposed development must be shown on an approved ALP to be eligible for Airport Improvement Program (AIP) funding. FAA approval of the ALP indicates that the existing facilities and proposed development depicted on the ALP conforms to the FAA airport design standards in effect at the time of the approval or that an approved modification to standard has been issued. Such approval also indicates that the FAA finds the proposed development to be safe and efficient.

801. FACILITY REQUIREMENTS - GENERAL

c. The requirements for new or expanded facilities reflect the unique circumstances of each airport, such as, but not limited to, the following:
1) Capacity shortfalls, which are commonly driven by growing demand.

2) Enhanced security requirements mandated by the Transportation Security Administration, including the flexibility to respond to changes in threat levels.

3) Updated standards developed and adopted by the FAA or other regulatory agencies, to correct existing non-standard conditions and eliminate existing modifications to standards. If there are approved modifications to standards, planners should review the reasoning that led to those adjustments. The facility requirements chapter should indicate if those deviations will continue or will be eliminated in the new master plan.

4) The airport sponsor's strategic vision for the airport. Such needs are typically associated with a sponsor's strategic business plan, mission statement, or similar plans that will require modification of the airport.

5) The outdated condition, arrangement, or functionality of existing facilities.

1008. DOCUMENTATION GUIDELINES

a. The requirements for documentation of the ALP drawing set must be determined with the airport sponsor and the reviewing agency or State agency. Documentation will typically

include a complete reduced-size set of the ALP drawing set and the accompanying text. The master plan will provide the narrative if the ALP is prepared as part of a master plan. If the ALP is prepared separately as an ALP Update, an ALP narrative is required. Then narrative will typically describe ALP development criteria and the rationale for the development shown on the ALP. Examples of these include airport reference code-related design criteria unique to specific areas of the airfield, or known or proposed modifications to FAA design standards. (See Section 202.c of this AC for further guidance on the ALP Narrative Report.)

Order 5300.1G Modifications to Agency Airport Design, Construction, and Equipment Standards

1.Purpose of this Order. This order establishes the process for the initiation, revision, coordination, and management of Modifications of Standards (MOS) applicable to airport design, construction material, and equipment projects. This order is the foundation of a web-based automated application of MOS. The automated application for submitting MOS is a step-by-step process facilitated within Airports Geographic Information System (AGIS).

2.Applicability. This order is applicable to all projects funded under the Airport Improvement Program (AIP) and Passenger Facility Charge (PFC) programs at all obligated airports, or as required to support any public approach procedure. Eligibility determinations under AIP or PFC are independent of any approval action for an MOS. New MOS requests initiated after March31, 2018, must use the automated MOS process. Manual MOS processing must follow applicable sections of this order as it applies to current regional procedures until the automated tool is accessible.

5. Definitions

e.Modification of Standards (MOS). Any deviation from, or addition to standards, applicable to airport design, material, and construction standards, or equipment projects resulting in an acceptable level of safety, useful life, lower costs, greater efficiency, or the need to accommodate an unusual local condition on a specific project through approval on a case-by-case basis.

7.Background. Laws, regulations and Airport Sponsor Grant Assurances require compliance with current FAA standards. The following provisions require an airport to meet FAA standards:

c.Obligated Airport. Title 49 U.S.C. § 47107(a)(16) and Grant Assurance No. 29, *Airport Layout Plan*, require the airport to maintain an up-to-date Airport Layout Plan (ALP) depicting existing and future airport facilities as referenced in paragraph 12.b. AC 150/5070-6, *Airport Master Plans*, establishes standards for ALPs, which includes the requirement to identify unusual design features and/or modifications to FAA Airports design standards. FAA approval of an ALP indicates the existing or proposed development depicted on the ALP conforms to FAA airport design standards or that an approved modification to standards has been issued.

12.Documentation.

a.All records pertaining to the MOS, including documents, pictures, and/or approval letters,will be maintained within the Airports GIS MOS Tool.

b.The airport must update the ALP to reflect approved modifications of airport design standards. The airport must include in the ALP a table listing the approved MOS. The table must include the approval letter dates and identify associated airspace review case numbers.

In addition, we note that AC 150/5300-13B Airport Design, Change 1, identifies below (yellow highlight added) that:

- Mods are intended for cases where an unusual local condition for a specific project maintains an acceptable level of safety, and we have prepared a draft mod (attached to this letter) for use of the project, which shows that occurrences are predicted to only occur in 275 or more years, which satisfies the FAA's standard for acceptable safety; and

- There is no established FAA prohibition from requesting the mod now, during the planning process.

1.5 **Definitions.**
60. *Modification of Standards.* Any approved deviation from published FAA standards applicable to an airport design, construction, or equipment project that is necessary to accommodate an unusual local condition for a specific project while maintaining an acceptable level of safety and performance. FAA Order 5300.1 establishes FAA policy for administering requests for modification of standards.
Chapter 2. DESIGN PRINCIPLES

2.8 **Modification of Standards.**
Site-specific conditions may make it impractical to meet all FAA design standards at an airport. The FAA considers, on a case-by-case basis, modifications to design standards that result in an acceptable level of safety and efficiency. Specific operational controls may be necessary to establish an acceptable level of safety for operation of aircraft at the airport. FAA Order 5300.1 establishes FAA policy for administering airport requests for modification of standards. See paragraphs 2.4 and 2.5.

2.8.1 The FAA views an approved modification of standards as an interim measure intended to mitigate unique site-specific conditions. Unless the FAA explicitly states otherwise in the approval action, the FAA expects airports with approved modifications to pursue ways to meet design

standards. This may occur incrementally over time or at such time it becomes practical to correct the non-standard condition.

2.8.2 The FAA will not consider any request to modify design standards associated with the following:

1. RSA dimensions
2. OFZ dimensions
3. Approach or departure surface dimensions
4. Standards established within a regulation (e.g., stopway, clearway).

2.8.3 An airport seeking FAA approval of modification to a design standard submits a request using the Modification of Standards application tool within the Airport Data and Information Portal (ADIP) at https://adip.faa.gov. The FAA relies on the following information, in part, to determine the acceptability of a modification to FAA design standards:

1. Information on the standard proposed for modification.
2. Description of proposed modification and why the airport cannot meet standards.
3. Statement addressing how modification will provide an acceptable level of safety, economy, durability, and workmanship.
4. Listing of any special operational measures necessary to accommodate the modification.

2.4 **Addressing Non-standard Airport Conditions.**
The FAA expects airport owners to address non-standard conditions through the airport planning process. The FAA acknowledges that conformance to current standards is not always practical. However, the FAA expects airports to continue to investigate mitigation measures, whether in one or multiple phases, and correct the non-standard conditions over time.
1.The FAA expects implementation of new or revised standards to occur through the planning process.
2.If there is an explicit or immediate safety deficiency for a non-standard condition, the FAA expects airport owners to prioritize the mitigation of the safety deficiency using the current standard.
3.Inconvenience does not represent an acceptable justification for non-conformance to standards.
4.Justifications based on impractical conditions do not represent a permanent justification for non-conformance to standards.

In conclusion, we request that ODAV and FAA allow Aurora Airport to use the established process of modification of standards to resolve certain issues at the airport, where they are expressly permitted, and not expressly denied as options.

The FAA's modification of standards process is wisely set up precisely for such a condition as what we find at Aurora Airport – LET'S USE IT.

Respectfully submitted,

Aron Faegre, AIA, PE
Aron Faegre Airport Planning and Design

Attachment: Proposed modification of standards risk analysis document for use at Aurora Airport
dated October 5, 2024.

Aron Faegre Airport Planning & Design 13200 Fielding Road Lake Oswego Oregon 97034 aron@faegre.org

Aurora State Airport (UAO)
Proposed Modification of
Runway Object Free Area (ROFA) Design Standards

Prepared by: Aron Faegre, AIA, PE
Aron Faegre Airport Planning & Design

October 5, 2024

This memorandum provides an analysis and methodology by which a Modifications of FAA Airport Design Standards (MOS) at the Aurora State Airport (UAO), for the Runway Object Free Area (ROFA) can be justified as:

> "… resulting in an acceptable level of safety, useful life, lower costs, greater efficiency, or the need to accommodate an unusual local condition on a specific project through approval on a case-by-case basis." - FAA Order 5300.1G, page 1.

as defined and permitted under FAA Order 5300.1G Modifications to Agency Airport Design, Construction, and Equipment Standards[1].

1. BACKGROUND

The Aurora State Airport is surrounded by farm lands, near Aurora, Oregon, at the northern end of Marion County. It primarily serves aviation businesses involved with:

- emergency medical transport[2],
- aviation heavy-lift helicopter fire-fighting and power line construction companies, and for military (for which fixed wing aircraft are essential for support),[3]
- business jets for numerous major national corporations based within 10 miles,

[1] FAA Order 5300.1G Appendix A specifically gives FAA Office of Airport (ARP) and Region the authority to issue a MOS for Runway Object Free Areas. The Order can be downloaded at: https://www.faa.gov/documentLibrary/media/Order/order-5300-1G-modifications-to-standards.pdf .

[2] Regional headquarters for Life Flight Network, with bases all over Oregon, Washington, Idaho, Montana, and Nevada.

[3] Columbia Helicopters, Helicopter Transport Services, Wilson Construction, companies that work internationally with headquarters at Aurora Airport. Many of the companies have annual contracts with state and federal agencies to provide major support for fighting fires, as well as for humanitarian relief work world-wide. Some of these companies have U.S. military contracts for repair and rebuilding of military aircraft at the Aurora site. The use of the Aurora Airport runway is essential to all of these companies for rapid providing of crews, equipment, and repairs to helicopters in active service of fighting fires, moving power lines, or doing rescue, relief, or humanitarian work.

- aircraft manufacturing for the S-LSA (Special Light-Sport Aircraft) and kit-build industry[4], and
- other general aviation aircraft using the airfield for business, pilot training, and recreational flying.

There is no scheduled air service using the airport. The State of Oregon Department of Aviation (ODAV) owns, governs, and manages the public lands of the airport. Most of the business aircraft based at the airport access the runway via through-the-fence permits with ODAV.

Flights by based business jets, such as a Challenger 300, dictate that the Airport Reference Code is C-II. Due to the geometry of the existing site, the airport does not meet current FAA design standards for the ROFA, due primarily to adjacent Highway 551 to the west of the runway.

Most recently ODAV's planned solution[5] to meeting these standards ("Refined Preliminary Alternatives Summary", by Century West Engineering, dated July 31, 2024) is one of only two options:

- relocate the highway further west, (which involves acquiring both private residential and commercial properties further west), or
- relocate the runway, taxiway, and control tower east (which involves acquiring many acres of existing private property already developed with hangars, taxilanes, and aprons for aviation uses) and demolishing numerous large 40,000 square foot aviation hangars along the taxiway.

Both options have very high financial and environmental costs (probably in the greater than $100 million range), which would make them difficult to ever be implemented. If this master plan is approved as currently planned, and one of these options were not implemented, then ODAV and FAA have reported that the airport would only receive maintenance funding and no additional safety improvement funds. This would result in the airport not keeping pace with the aviation industry standards of safety. The second option (moving the runway, control tower, and demolishing hangars), If implemented, would in addition force closure of many of the major medical transport and fire-fighting facilities on the airport, and would put many of the airport's 1,500 employees out of jobs.

It is noted that in the 2012 Airport Layout Plan (ALP), approved (signed) by both ODAV

[4] Van's Aircraft www.vansaircraft.com the international leader in S-LSA produced aircraft.
[5] Refined Preliminary Alternatives Summary document dated July 31, 2024 by Century West Engineer can be downloaded at: https://publicproject.net/files/UAOAMP/uao-refined-preliminary-alternatives-summary-1-.pdf?d952c4adef .

and FAA, the airport also had the same Runway Design Code (RDC) status of C-II and listed a MOS as the solution to the non-standard ROFA limitation on the west property line. At that time there was consensus between ODAV and FAA that a MOS was a reasonable solution.

This memorandum provides the evidence to show that the 2012 ALP was a good approach to resolution of the ROFA, and that it can reasonably be continued. This report demonstrates that there is an acceptable level of safety through modifying the ROFA standard for the specific deviation to standards located on the west side of the runway.

FAA standards for different airports ROFA's vary from 250 foot width, to an 800 foot width, depending on aircraft type using the airport. As will be shown below, the primary reason justifying the modification is that the going from B-II to C-II category is just where the 500-foot required ROFA width changes to an 800-foot wide required ROFA - yet this is the same width required for all RDC category aircraft all the way to E-VI -Portland International Airport, San Francisco Airport, and every other international airport in the country. UAO will never have the larger size of aircraft those airports accommodate – Boeing 737's to Boeing 777's – so a slight reduction in width on the west side provides a level of safety appropriate for UAO, which will always serve only much smaller aircraft.

Modifications of standards for ROFA's are common at even large national airports. For example, recently several MOS were adopted at San Jose International Airport for deficiencies in the ROFA, as well as for runway-taxiway separations, and for runway object free areas[6]. It even appears that Portland International Airport (PDX) may have their airport perimeter fence, the shoulder of NE Marine Drive, and improper grading within the 400-feet area from runway centerline, at the northeast corner of the ROFA for Runway 10L.

This memorandum provides the detailed technical background and mathematically calculated justification, needed for the FAA and ODAV to again approve a MOS for the ROFA at Aurora State Airport.

2. MOS PROCESS

The process for gaining a modification of standards is provided in FAA AC 150/5300-13B Airport Design[7] in Section 2.8. It states, and we provide commentary after each paragraph as

[6] Norman Y. Mineta San Jose International Airport Runway Incursion Mitigation/Airfield Design Standards Analysis, November 27, 2017. Justification for ROFA modifications in this document were often simply the practical and cost issues of modifying major adjacent highways, similar to what is at issue in a much smaller Aurora Airport.
[7] FAA AC 150/5300-13B Airport Design Available free on line at:
https://www.faa.gov/documentLibrary/media/Advisory_Circular/AC-150-5300-13B-Airport-Design-Chg1.pdf

to acceptability:

2.8 ***Modification of Standards.***

Site-specific conditions may make it impractical to meet all FAA design standards at an airport. The FAA considers, on a case-by-case basis, modifications to design standards that result in an acceptable level of safety and efficiency. Specific operational controls may be necessary to establish an acceptable level of safety for operation of aircraft at the airport. FAA Order 5300.1 establishes FAA policy for administering airport requests for modification of standards. See paragraphs 2.4 and 2.5.

This memorandum provides this information and finds that no specific operational controls are necessary, see comments on paragraph 2.4 below.

2.8.1 The FAA views an approved modification of standards as an interim measure intended to mitigate unique site-specific conditions. Unless the FAA explicitly states otherwise in the approval action, the FAA expects airports with approved modifications to pursue ways to meet design standards. This may occur incrementally over time or at such time it becomes practical to correct the non-standard condition.

The FAA and ODAV can work with Oregon Department of Transportation on master planning future revisions to State Highway 551 so that it can be corrected "at such time it becomes practical." Also, there are potential options where ODAV and ODOT could jointly agree to relocate the airport perimeter fence closer to Highway 551, which could be an "incrementally" established improvement.

2.8.2 The FAA will not consider any request to modify design standards associated with the following:

- *RSA dimensions*
- *OFZ dimensions*
- *Approach or departure surface dimensions*
- *Standards established within a regulation (e.g., stopway, clearway).*

The ROFA is not one of these.

2.8.3 An airport seeking FAA approval of modification to a design standard submits a request using the Modification of Standards application tool within the Airport Data and Information Portal (ADIP) at https://adip.faa.gov. The FAA relies on the following information, in part, to determine the acceptability of a modification to FAA design standards:

- *Information on the standard proposed for modification.*
- *Description of proposed modification and why the airport cannot meet standards.*
- *Statement addressing how modification will provide an acceptable level of safety, economy, durability, and workmanship.*
- *Listing of any special operational measures necessary to accommodate the modification.*

This document was prepared to provide the analysis needed for ODAV to submittal for the MOS per Section 2.4.

> *2.4 Addressing Non-standard Airport Conditions.*
> *The FAA expects airport owners to address non-standard conditions through the airport planning process. The FAA acknowledges that conformance to current standards is not always practical. However, the FAA expects airports to continue to investigate mitigation measures, whether in one or multiple phases, and correct the non-standard conditions over time.*

It is important to re-emphasize the above statement, that the FAA here "acknowledges that conformance to current standards is not always practical." Further, per this paragraph, the current master planning activity is the appropriate place for this analysis and the formal establishment of a MOS for the ROFA. This report and analysis identifies intermediate steps that can be taken, such as relocating the airport perimeter fence, that will iteratively move the airport closer to compliance.

This analysis utilizes an FAA established safety analysis methodology to show that the MOS provides an acceptable level of safety. The study found no special measures needed to accommodate the modification.

3. METHODOLOGY

In 2011, the Transportation Research Board (TRB) released Airport Cooperative Research Program (ACRP) Report #51 – Risk Assessment Method to Support Modifications of Airfield Separation Standards. The ACRP is funded by the Federal Aviation Administration (FAA). Report #51 is used to support the ROFA MOS requested at Aurora State Airport.

The proposed ROFA MOS is modeled in this report in accordance with Appendix A – Risk Assessment Methodology of ACRP Report #51[8].

This report uses risk plots, along with the annual number of operations, to analyze the cumulative risks associated with Runway to Object Separations. The operations numbers at UAO are taken from the current draft Master Plan, and are numbers already approved by the FAA in a letter[9] to ODAV dated November 15, 2023 (corrected January 23, 2024). For sake of a conservative analysis, we are using the most distant forecast projects for the year 2041, which are:

- 90,231 total operations all RDC categories, of which
- 862 operations are of RDC C-II and D aircraft

[8] ACRP Report #51 – Risk Assessment Method to Support Modifications of Airfield Separation Standards is available free on line at: https://nap.nationalacademies.org/catalog/14501/risk-assessment-method-to-support-modification-of-airfield-separation-standards

[9] Federal Aviation Administration (FAA) Aurora (UAO Aviation Activity Forecast Approval Airport Improvement Program Grant Number 3-41-0004-022-2021 available at: https://publicproject.net/files/2024-01/Aurora-Airport/uao-forecast-approval-20231115-corrected-20240123.pdf?57af6c19b7

For operations involving the runway, per the methods of Report #51, the risk is analyzed based on three distinct phases of flight:

a. Landing - Airborne Phase
b. Landing - Ground Phase
c. Takeoff

The separation distance from the runway centerline to an object is used with the associated risk plot to calculate the risk of collision per operation.

The risk of collisions per operation is then analyzed along with the number of annual airport operations for the appropriate phase of flight to determine the predicted frequency of occurrence. The frequency of occurrence is used to determine the FAA likelihood level using Table A-3 from ACRP Report #51 which is shown below:

Table A-3. FAA likelihood levels (FAA, 2010).

	General	Airport Specific	ATC Operational	
			Per Facility	NAS-wide
Frequent A	Probability of occurrence per operation is equal to or greater than 1×10^{-3}	Expected to occur more than once per week or every 2,500 departures (4×10^{-4}), whichever occurs sooner	Expected to occur more than once per week	Expected to occur every 1–2 days
Probable B	Probability of occurrence per operation is less than 1×10^{-3}, but equal to or greater than 1×10^{-5}	Expected to occur about once every month or 250,000 departures (4×10^{-6}), whichever occurs sooner	Expected to occur about once every month	Expected to occur several times per month
Remote C	Probability of occurrence per operation is less than 1×10^{-5} but equal to or greater than 1×10^{-7}	Expected to occur about once every year or 2.5 million departures (4×10^{-7}), whichever occurs sooner	Expected to occur about once every 1–10 years	Expected to occur about once every few months
Extremely Remote D	Probability of occurrence per operation is less than 1×10^{-7} but equal to or greater than 1×10^{-9}	Expected to occur once every 10–100 years or 25 million departures (4×10^{-8}), whichever occurs sooner	Expected to occur about once every 10–100 years	Expected to occur about once every 3 years
Extremely Improbable E	Probability of occurrence per operation is less than 1×10^{-9}	Expected to occur less than once every 100 years	Expected to occur less than once every 100 years	Expected to occur less than once every 30 years

Note: Occurrence is defined per movement.

Source: ACRP Report #51

The key takeaway from Table A-3 is that for a specific airport, if the likelihood of incidence is less than once every 100 years it is considered a “Extremely Improbable” Class E occurrence.

A Hazard Severity Classification is then assigned based on the worst credible outcome of an incident. Since the ACRP method is based on wingtip separation, the report states that: “From the point of view of risk and based on the records of incidents and accidents,

the worst credible consequence expected for wingtip collisions of two taxiing aircraft is aircraft damage" (ACRP Report #51 page 19). A similar aircraft damage expectation would be a wingtip collision with the airport perimeter fence, which is the ROFA limitation examined in this report.

The Hazard Severity Classifications were determined in accordance with Table A-4 FAA Severity Definitions from ACRP Report #51 and are shown below:

Table A-4. FAA severity definitions (FAA, 2010).

Hazard Severity Classification				
Minimal 5	**Minor 4**	**Major 3**	**Hazardous 2**	**Catastrophic 1**
No damage to aircraft but minimal injury or discomfort of little consequence to passenger(s) or workers	- Minimal damage to aircraft; - Minor injury to passengers; - Minimal unplanned airport operations limitations (i.e. taxiway closure); - Minor incident involving the use of airport emergency procedures	- Major damage to aircraft and/or minor injury to passenger(s)/ worker(s); - Major unplanned disruption to airport operations; - Serious incident; - Deduction on the airport's ability to deal with adverse conditions	- Severe damage to aircraft and/or serious injury to passenger(s)/ worker(s); - Complete unplanned airport closure; - Major unplanned operations limitations (i.e. runway closure); - Major airport damage to equipment and facilities	- Complete loss of aircraft and/or facilities or fatal injury in passenger(s)/ worker(s); - Complete unplanned airport closure and destruction of critical facilities; - Airport facilities and equipment destroyed

Source: ACRP Report #51

Then, using both the FAA likelihood level and the Hazard Severity Classification the risk is then analyzed using Figure A-1 FAA Risk Matrix from ACRP Report #51, shown below:

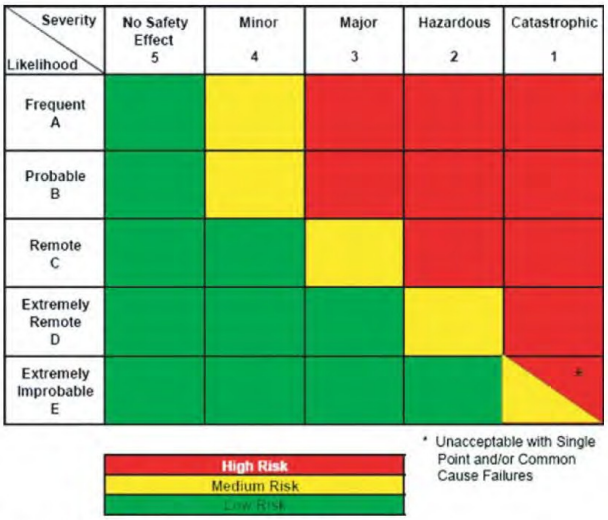

Figure A-1. FAA risk matrix (FAA, 2010).

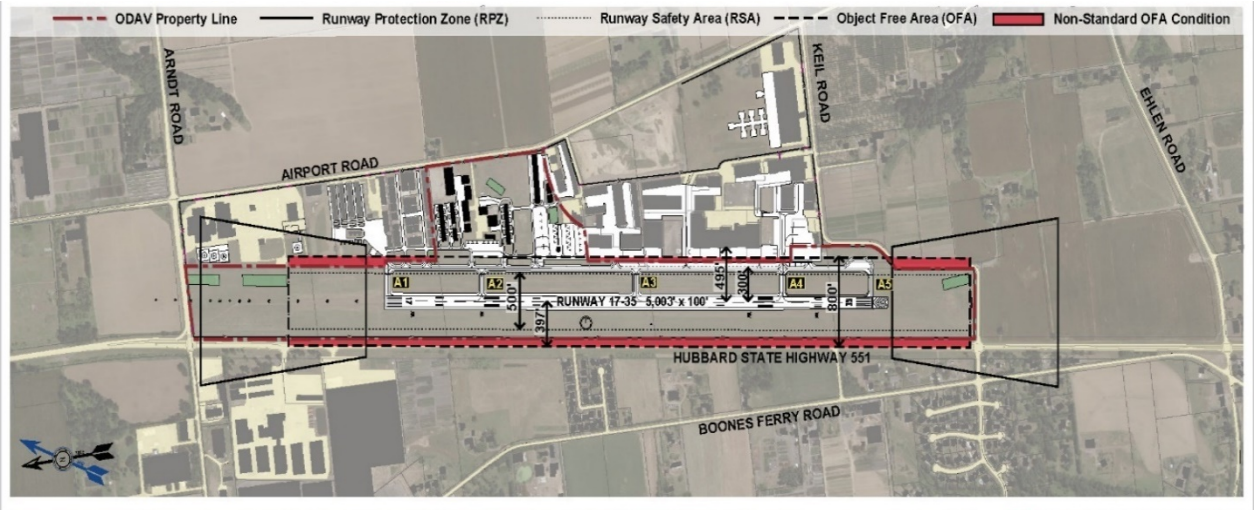
Source: ACRP Report #51



Based on Figure A-1 if the incident is Extremely Improbably (i.e. more than 100 years probability) the risk is considered “Low,” except for an incident considered catastrophic. We will use these graphs to evaluate the results from the detailed risk analysis of UAO below.

4. UAO ANALYSIS

In 2012 Master Plan and ALP established the UAO runway RDC, given existing based aircraft, as C-II, up from a B-II. The required ROFA width of a B-II runway is 500 feet centered on the runway. As it turns out, any runway of higher RDC than a B-II requires 800 feet in width. Thus, the UAO required C-II ROFA width is 800 feet centered on the runway. This 800-foot width is the standard used for aircraft ranging from a Challenger 300 business jet to the largest Boeing 777 or even the largest military aircraft. The 2012 approved ALP lists the ROFA deviation as a modification to standards, since the airport perimeter fence and Highway 551 were within the ROFA.

The UAO forecast of operations predicts that by the year 2041 there will be 90,230 annual operations at the airport, of which 862 would be an RDC above the B-II category. Thus, the 89,368 operations by B-II or lesser category clearly are operating well within ROFA safety standards, as the existing runway to road separations provide more than the 500-foot required width. It is just the 862 operations that need to be analyzed for ROFA safety relative to the required 800-foot width.

The deficiencies in the existing Runway OFA at UAO are shown in the Figure below:

UAO Figure A: Highway 551 Shown as ROFA Deviation Object
Source: Century West Engineers, Aurora State Airport Draft Airport Master Plan, Working Paper No. 1, Figure 2-15, November 2023 (Updated)

The current ROFA object deficiencies are:

d. Hubbard State Highway 551 for which the OFA penetrates 3 feet beyond the highway centerline. (368' to 377' clear width available from outer edge of highway gravel shoulder to Runway CL)
e. Perimeter Fence Inside OFA (312' clear width from Runway CL)

Potentially the airport fence could be relocated to the east edge of the 12-foot-wide gravel shoulder, since both the highway and the airport are owned by the State of Oregon. There can be an agreement between ODOT and ODAV to allow this. Relocating the fence in this way would result in a minimum width of the ROFA on the west side of the runway, to a 368-foot clearance - which would be only 32 feet out of conformance.

However, we will evaluate the ROFA for the existing conditions, and thus use the location of the airport perimeter fence as the maximum ROFA available at this time.

When analyzing the risk associated with a reduction in Runway OFA it is important to consider the purpose of the design standard. Paragraph 3.12 of Advisory Circular 150/5300-13B defines the ROFA but does not give detailed design rational behind the standard:

> *"ROFA is a clear area limited to equipment necessary for air and ground navigation, and provides wingtip protection in the event of an aircraft excursion from the runway"*

Appendix I, Paragraph I.8 of Advisory Circular 150/5300-13B provides the only available reference to the design rationale behind the Runway OFA width:

> *"The ROFA serves two principal purposes: 1. Development buffer in proximity to a runway, and 2. Wing clearance for a runway excursion event to the outer limit of the RSA.* `

Appendix I, in Section I.8.2, also clarifies that part of the "development buffer" intent is:

> *"Protection of the ROFA also reserves space for future development of a parallel taxiway that permits proper alignment of aircraft at a holding position on an entrance taxiway."*

However, for the given physical layout of UAO there can be no plan for a parallel taxiway on the west side of the runway, because of the location of Highway 551 and that there never can be hangars or other aviation uses on that side of the runway. Therefore, that leaves the only ROFA purpose for UAO as only "wingtip clearance for a runway excursion" which is precisely what this analysis provides.

Below we will analyze resolving the ROFA utilizing the risk analysis method of ACRP Report #51, for the case:

- No Change to existing ROFA conditions on West Side of Runway (Hwy 551 and Airport Perimeter Fence remain as existing) resulting in a 312-foot clearance to runway CL.

Per the methodology of ACRP Report 51, we analyze the risks for each of the takeoff and landing scenarios. For landing operations, the analysis is further divided into two parts: airborne (approach) phase and ground (landing rollout) phase. However, because the risk of veering off the runway during takeoff is so much less than for during landing, the methodology indicates that usually it is not necessary to evaluate takeoff option except if there are runways that only are used for takeoffs and not for landings. We will do that takeoff evaluation in any case, just to clearly determine what it is in the UAO context.

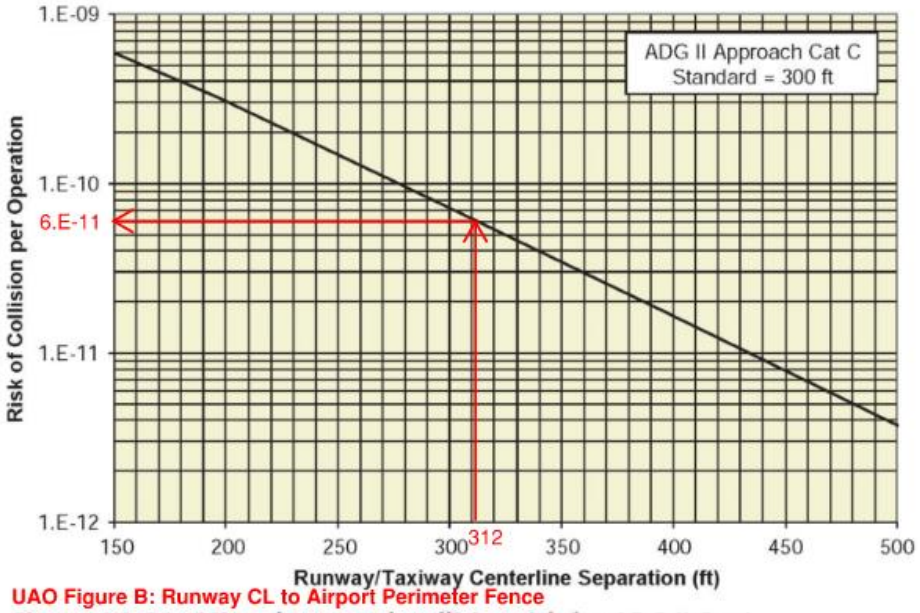
Since the existing runway to taxiway separation meets the current criteria for a C-II airport, for this study that analysis would seem unnecessary. However, we will include that option in this report because it provides a baseline of safety that the AC 150-5300-13B Airport Design Standards have determined is an acceptable and appropriate level of safety for a C-II airport.

Thus, for this UAO ROFA analysis separate risks are developed for each of:

1. Airborne Phase (Landing) is for instrument approaches which terminate the approach as a missed approach, and the risk is hitting another object such as hitting the airport perimeter fence or a vehicle on Highway 551 (using ACRP Report 51 Fig. 31); “the airborne risk is computed only for missed approaches” (ACRP Report 51, page 21).
2. Ground Phase (Landing Rollout) where risk is veering off the runway into the reduced width ROFA and hitting the fence or a car on Highway 551 (using ACRP Report 51 Fig 42). Figure 42 is based on the assumption that the risk is between the two wingtips of two aircraft, one aircraft on the edge of the runway and the other at the centerline of a taxiway. The ACRP makes clear that the x-axis distance on the Risk Figures are centerline of runway to centerline of taxiway because the risk is assumed aircraft to aircraft. However, the predicted risk is based on the wingtip-to-wingtip distance. When using the Risk Figures for objects (not aircraft) like a fence or road (which has no wings), half of the wingspan should be added to the distance to compensate for the wingtip-to-wingtip assumption. Thus, per Group II standards, the clearance distance used for Figure 42 should add half of 79 feet (equals 39.5 feet) of additional clearance, which would create a total of 351 feet to use in Fig. 42. The risk shown with the 312 feet and the 351 feet are each shown in figures.

3. Ground Phase (Takeoff) where risk is veering off the runway into the reduced width ROFA and hitting the fence or a car on Highway 551 (using ACRP Report 51 Fig 49).

Finally, to have more relevant data, we will also perform the risk analysis of the standard required 300-foot separation between runway centerline and taxiway centerline for a landing, which is the level of safety the AC 150/5300-13B sets for in a C-II airport:



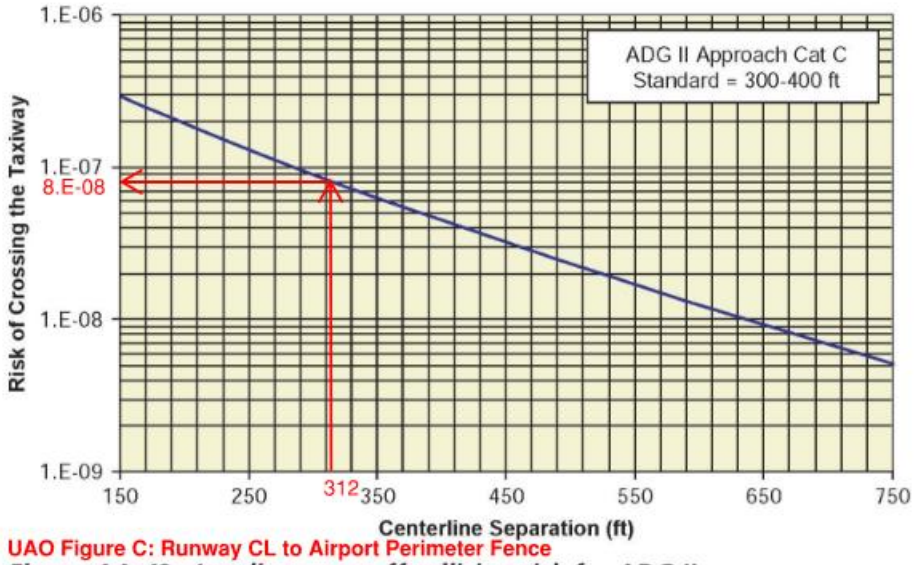
4. Ground Phase (Landing Rollout) where risk is veering off the runway into the taxiway (using ACRP Report 51 Fig 42).

This data will give us an example of an acceptable level of safety utilized in AC 150/5300-13B for a C-II airport.

5. Specific Analysis: Proposed MOS Option - No Change to Existing ROFA Conditions (312' Separation from Runway Centerline to Airport Fence)

The Perimeter Fence at the west side is located 312 feet from the runway centerline. The risks associated with leaving it there as a modification of standards, for each of the phases of flight are analyzed below:

1. Airborne Landing Phase Risk from Reduced ROFA – For a very conservative analysis we will assume that this includes all approach to landings, not just missed approaches. Using the separation of 312' and Figure AA-33 in Appendix A of ACRP Report #51, the following provides a risk level 6.0E-11 of occurrence per landing (which as an inverse, is one chance in a 16.7 trillion landings) that an aircraft gets 312' from the runway centerline. This can be seen in the figure below:



UAO Figure B: Runway CL to Airport Perimeter Fence

Figure AA-31. Missed approach collision risk for ADG II Cat I.

The current annual number of landing operations at UAO is approximately 45,115 or half of the 90,230 annual operations. As the risk is one incident in every 16.7 trillion landings, the time between occurrences is calculated as 16 trillion landings divided by 45,115 landing operations per year which equates to one incident every 369,000 years. Thus, this risk is of no significance.

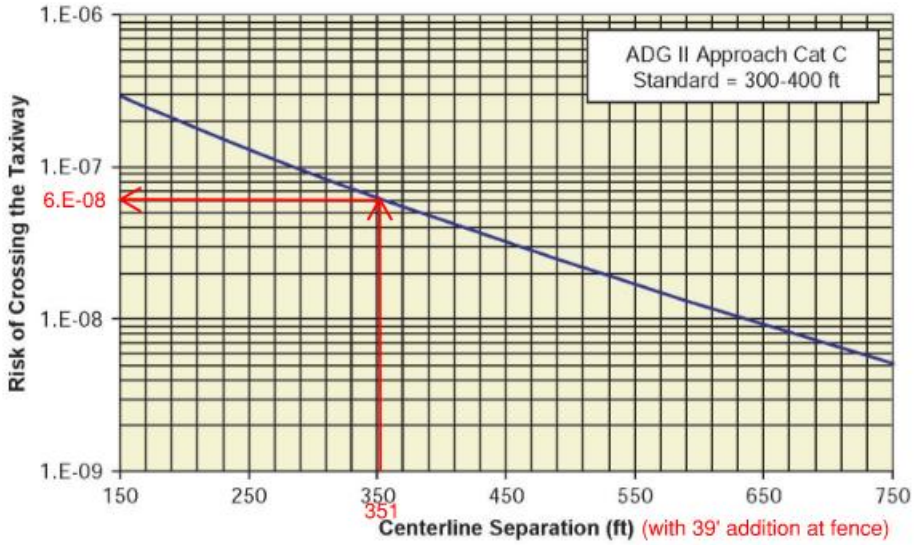
2. Landing Roll Phase Risk for Reduced ROFA - Using the separation of 312' and Figure AA-43 in Appendix A of ACRP Report #51, provides a risk level 8.0E-08 or in the inverse: one chance in 12.5 million landings. This can be seen in the figure below:

UAO Figure C: Runway CL to Airport Perimeter Fence

Figure AA-42. Landing veer-off collision risk for ADG II.

As the risk is one incident in every 12.5 million landings, the rate of occurrence is calculated as 12.5 million landings divided by 45,115 landings per year which equates to one incident every 277 years.

Using the ACRP described adjustment when the object is not another aircraft and half the C-II wingspan can be added to the clearance distance, results in a separation of 351' and Figure AA-43 in Appendix A of ACRP Report #51, provides a risk level 6.0E-08 or one chance in 16.7 million landings. This can be seen in the figure below:



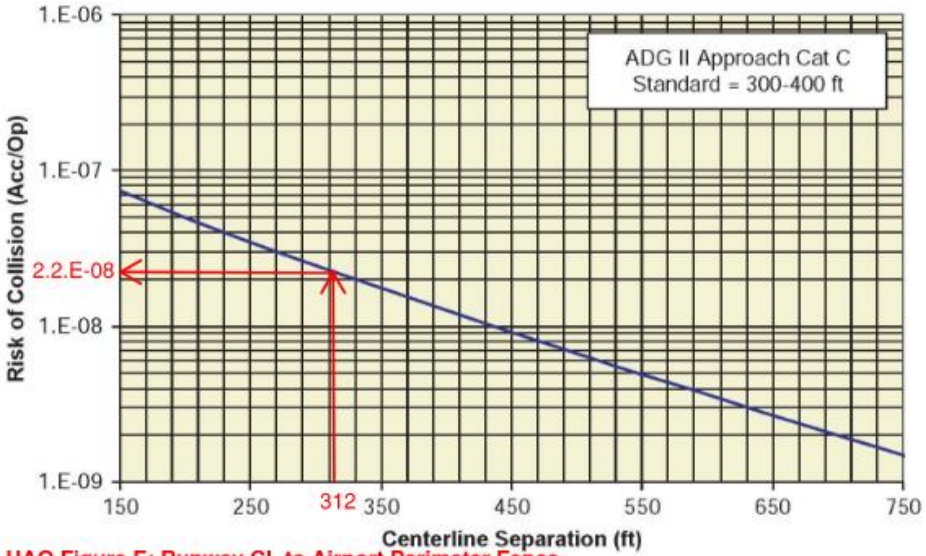


Figure AA-42. Landing veer-off collision risk for ADG II.
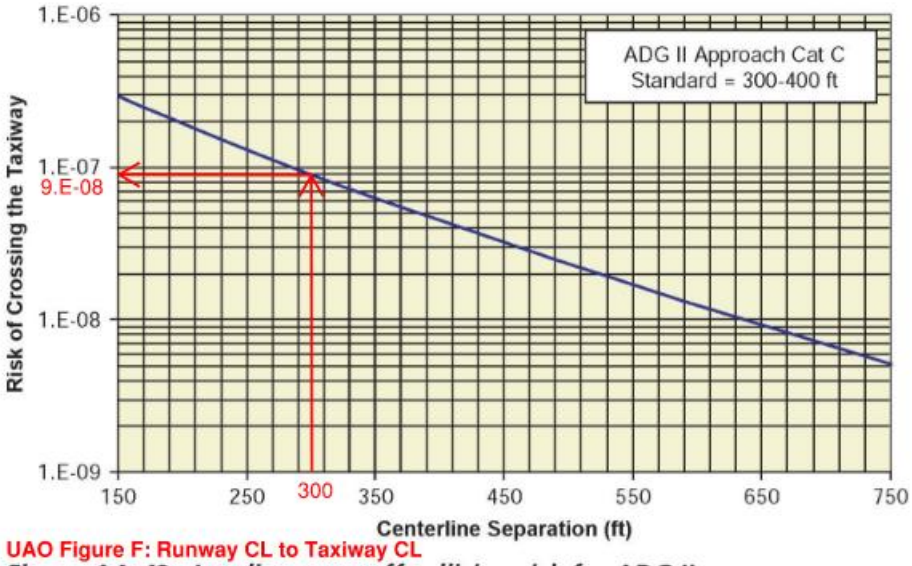
UAO Figure D: Runway CL to Airport Perimeter Fence Including Wingspan adjustment

As the risk is one incident in every 16.7 million landings, the rate of occurrence is calculated as 16.7 million landings divided by 45,115 landings per year which equates to one incident every 369 years.

3. Takeoff Roll Phase Risk for Reduced ROFA - Using the separation of 312' and Figure AA-49 in Appendix A of ACRP Report #51, provides a risk level 2.2E-08) or one chance in 45.5 million takeoffs. This can be seen in the figure below:



UAO Figure E: Runway CL to Airport Perimeter Fence
Figure AA-49. Takeoff veer-off collision risk for ADG II.

As the risk is one incident in every 45.5 million takeoffs, the rate of occurrence is calculated as 45.5 million takeoffs divided by 45,115 takeoffs per year which equates to one incident every 1,008) years.

Finally, as a test of the level of safety that AC 150/5300-13B considers acceptable we check what the predicted risk level is of the existing runway-taxiway separation considered appropriate[10] by FAA.

4. Landing Roll Phase Risk to Taxiway Consistent with Safety Standards of AC 150/5300-13B - Using the separation of 300' and Figure AA-43 in Appendix A of ACRP Report #51, provides a risk level 9.0E-08 or one chance in 11.1 million landings. This can be seen in the figure below:

UAO Figure F: Runway CL to Taxiway CL

Figure AA-42. Landing veer-off collision risk for ADG II.

As the risk is one incident in every 11.1 million landings, the rate of occurrence is calculated as 11.1 million landings divided by 45,115 landings per year which equates to one incident every 246 years.

[10] Note that Section 3-24 of Order 5100.38D Change 1 states that the FAA will not fund airport safety greater than that in the Airport Design standards, so the standard set by the runway-taxiway separation is a significant number. Order 5100.38D Change 1 can be downloaded for free at: https://www.faa.gov/documentLibrary/media/Order/AIP-Handbook-Order-5100-38D-Chg1.pdf

6. Conclusions

Considering the risk of each phase of flight, the risk of collision during the landing roll is the controlling factor. The Hazard Severity Classification for this type of operation would be major and the acceptable probability of occurrence is remote (1E-05) or less than once every 1-10 years. The following table summarizes the risk associated with each phase of flight:

Phase of Flight	Rate of Occurrence	Acceptable Level
Airborne Phase	Once every 369,000 years	Yes
Landing Roll Phase	Once every 277 years (or 369 years with calculation adjustment for fence object in lieu of wing object)	Yes
Takeoff Roll Phase	Once every 1,000 years	Yes

A runway to object separation of 312’ provides an acceptable level of safety as the controlling occurrence is once every 277 years (or 369 years with the adjustment for wingspan at the fence as allowed in the ACRP method). This is much less risk than the once per 100 years FAA standard shown in Table A-3 and results in a Category E “Extremely Improbable” occurrence. Further, per ACRP’s method, a wingtip to fence occurrence is considered by ACRP’s method to be a Table A-4 Minimal Severity occurrence. This combination via Figure A-1 concludes that the outcome as Low Risk.

Figure UAO F shows that the existing risk of occurrence between the existing runway and existing taxiway, which fully meets FAA standards, is one in every 246 years. This means that the risk to an occurrence at the taxiway, is much less (i.e. longer duration between events) than the FAA’s 100-year standard. The risk of collision with the perimeter fence is then even much less than that of a taxiway collision.

Finally, there is an incremental improvement option of ODAV and ODOT coming to an agreement to move the perimeter fence further west, to the east edge of the 12’ wide gravel shoulder, which would result in a 368-foot separation. If the 39.5-foot wing span correction is added at the new fence location, this results in an equivalent distance of 407 feet for use on Figure AA-42. That in turn would result in an ACRP predicted probability occurrence being once every 515 years, almost half the risk of a taxiway collision.

Given that the commercial use of aviation is itself only around 100 years old, these numbers of one predicted occurrence at the existing airport fence every 277 or 369 years, demonstrates the high level of safety that will be maintained at Aurora Airport with this MOS.

Given the regional and national importance of Aurora Airport for emergency medical, firefighting, and emergency power line moving, along with the use by local national corporations, using the MOS ensures the airport can continue to upgrade with safety improvements, and can continue to support the approximately 1,500 employees that rely on the airport for their livelihood.

This study shows definitively that the 2012 signing off on the Aurora Airport master plan and ALP with a modification of standards for the ROFA, by FAA and ODAV, was a reasonable and appropriate action to take. The same action should be taken for the current 2024 master plan work.

Re: Aurora State Airport Master Plan Proposed Preferred Alternative
Septic Drainfield Geotech Report Review: Additional Information

Mr. Thomas, Mr. Beach, and Ms. Steffen:

Please share this letter with the ODAV and FAA design team, and enter it into the record for the Oregon Department of Aviation's (ODAV) proposed "Preferred Alternative" for the Aurora State Airport Master Plan.

Century West Engineering in the last few days has added some email history from December 2022 through February 2023 concerning the use of existing drainfields. HDSE had proposed modifying the drainfields by using a top layer of modern geofabrics through which grass can grow up through. These materials are specifically designed to allow support loads like fire trucks in grass areas. The FAA standard for soil compaction required in the Runway Safety Area requires that it be capable, in dry conditions, of supporting fire trucks as well as aircraft. At Aurora Airport aircraft maximum weights will all be similar or less than a fire truck. In fact, NV5 designed the fabric in this case, to be capable of supporting the largest Gulfstream aircraft. These modern geofabrics provide an innovative and inexpensive way to comply with the FAA soil strength standards.

Per the attached additional email history, we had specifically requested that our geotech (NV5) be allowed to talk directly to ODAV's geotech (GRI), in order to resolve the final detailed questions. It is noted that NV5 and GRI are Oregon's two most prestigious and experienced geotech firms. It is reasonable to have them talk together and resolve final review issues, since they are the experts on the subject. We are still requesting ODAV to allow this joint meeting to occur.

It also was our understanding, that before completing the review of use of geofabrics at the septic fields, ODAV first wanted to examine another possibility, that the HDSE sewer system might use the Columbia Helicopters drainfields at the north end of the airport. ODAV was thinking this might be in lieu of using the geofabric at the existing drainfield site. It was our understanding that ODAV was creating a report to determine if that would be a viable alternative. Has that report been completed?

Another issue raised, was that with ODAV denying the geotech engineers an opportunity to talk to each other, it seemed that the review process was not proceeding in good faith. Tony Helbling was discussing this problem with ODAV upper management as will be seen in one of the attached emails. It was requested that the review be accomplished in a more collaborative approach.

We request that the two geotech companies simply be allowed to talk together about the proposed use of geofabric at the existing drainfields, and see if there is common ground to show that a solution is possible. This is not rocket science, as these geofabrics are now in regular use in many civil engineering applications that require allowing vehicular loads on soft ground. It is reasonable to have this proposed use at the drainfields continue to be vetted by geotechnical experts.

Respectfully submitted,

Aron Faegre, AIA, PE

Hi Tony,

Copy all on coming up with something a little more creative and let me chat with Betty a bit this week. I won't be around until the latter part of next week so if we could postpone the zoom chat until then I would appreciate it.

Best,
Martha

Subject: HDSE Drain Field Issue

Martha,

Bottom Line Up Front – we're asking for a "sea change" in the way we are working with ODA – a change to where we can work collaboratively in real time rather than barrier/administrative methodology. We're hoping your leadership could help with this philosophical change in how we could work together.

1st off – we are appreciative of the meeting Betty and Tony Beach held the other day with the engineers to discuss the drain field issues.

2nd – we're hoping to shift to a different, collaborative methodology in which we can work together instead of vertical, authoritative, administrative approach spelled out by Tony Beach following that meeting. (see attached – specifically second to the last paragraph).

ODA and multiple other users at Aurora stand to benefit as we seek to both continue to use the existing drain field and explore the expansion in the RSA, specifically on the west side toward HWY 551. We understand and respect James Kirby's position that a design would include, say a vault lid, that would need to withstand the point load of a G650 nose gear. (We got excited that he's going to allow G650s at KUAO!)

With that said, we'd like to work collaboratively and develop solutions that meet requirements as opposed to our side of the team expending a lot of time and expense to develop something that may not get approved. (For example - how we got to today's meeting, submittals leading to questions, leading to engineering, leading to delayed meetings with weeks in between as ODA decision makers decide who is allowed to talk to who. We asked on the call for Brett (our engineer) to be able to communicate ideas directly with Lindsey (ODA consultant) – this was met with trepidation by Tony Beach on behalf of ODA and the resulting email.)

One of the underlying foundations of ODA's charter and as called out in the Oregon Aviation Plan is to further and promote General Aviation in Oregon – especially at State airports. Additionally, KUAO as called out by SB680 a while back which is not codified in state law. That said, thinking here, on this drain field issue is that we come to an agreement on a vision for providing a usable drain field that benefits ODA's properties (tower and land holdings) as well as other entities on the airport HDSE, the CAA and at least the Condo Association in between if not more.

Once we share that vision, we (to include ODA's contracted engineers) shift from a proposal/review methodology to a joint effort, collaboratively working to design a system that will serve the airport, long into the future. The thing is, as a public/private partnership approach, private enterprise would be carrying the bulk of the load with respect to design and construction and the ODA would be reaping the benefit (for a substantial savings over going it alone) to get services for ODA properties. This becomes especially important as we look to the State's resiliency efforts, we're both jointly working toward at the Governor's Office level.

The clock is ticking on the existing drain field. Because the August, 2024 end date is looming on the horizon, we have a few choices; HDSE could expend time and money on the alternative to disposing of the effluent outside the RSA, or we could spend that same money and time on coming up with a long term solution that benefits more than just the HDSE. We'd like to pursue the latter!

We'd like to brainstorm with ODA and explore the potential of extending the existing lease to a time later than 2024 - to coincide with the runway extension. Ideas would include the collaborative planning of a new drain field where we've already done the exploration on that west side of where the runway extension would be. The actual construction of the pipe runs and drain field could be done concurrently with the runway extension construction.

Bottom Line – we're asking for a "sea change" in the way we are working with ODA – a change to where we can work collaboratively in real time rather than a vertical barrier/administrative methodology. We're hoping your leadership could help with this philosophical change in how we could work together.

Again – we're appreciative of the meeting and we'd really like to move forward. This project could be a shining example of furthering GA in Oregon for everyone involved.

Are you available to get on a zoom call, early next week to discuss? Tuesday is open for us.

This message was sent from outside the organization. Treat attachments, links and requests with caution. Be conscious of the information you share if you respond.

Hi Tony,

Hope your holidays went well.

Would it help to have our geotech consultant meet with your geotech consultant to get this resolved? We have provided detailed information for each of your questions, showing that the runway safety area complies with FAA standards. The standards acknowledge that utility systems can be in runway safety areas, and this is an important utility system for the airport.

Aron

Subject: RE: HDSE drainfield expansion area at UAO

Hi Tony

One last thing. I should have added a note to your question about whether infiltration testing was done. The testing for a drainfield is quite different than for normal stormwater infiltration testing. In fact, too rapid of an infiltration requires a more complicated septic drainfield piping design. Our septic processing system and drainfield designs are approved directly through State of Oregon DEQ.

Subject: RE: HDSE drainfield expansion area at UAO

Hi Michelle, thank you for your patience as we look into the information you have provided.

Our consultants have taken a first pass through the report along with their Geotech GRI, and they came up with the following list of questions/clarifications/additional information needed:

GRI requests the additional data listed below based on reviewing the November 8, 2021 report "Report of Geotechnical Engineering Services: Aurora State Airport Septic Drain Field Improvements for HDSE Sewer System." [*HDSE drainfield expansion Geotech Study AronFA-2-01-110821-geor.pdf*]

- Field Data Collection
    - Date of soil sampling
    - Were any logs prepared to describe the bulk sampling results?
    - Was a sieve analysis and/or Atterberg Limits test performed to validate the Silt visual classification?
    - Was infiltration testing performed? If not, why?

- As-builts or other construction documents pertaining to the existing drain field

- Report references
    - Geoweb design procedure
    - Provide addition discussion on how the 6-inch geoweb, with 2/3 aggregate and 1/3 topsoil, replaces 12 inches of compacted soil.
    - Equivalent Single Wheel Load source
    - Source identifying the critical aircraft type

- Report figures
    - Figure A-1: graphic does not show up in the provided pdf
    - Figure A-2: graphic does not show up in the provided pdf

- "Such stringent compaction is not permitted in the soil cover of drain fields"
    - Where does this statement come from?

In addition to the list above, we will also need specifics on the proposed Geoweb reinforced drain field construction.

- Materials/Construction Proposed
    - What materials specification is to be used (ODOT, proprietary, etc.) for the aggregate?
    - What compaction specifications and test methods are proposed to achieve the proposed Geoweb strengths?
    - What compaction specifications and test methods are proposed for soil layers to be placed along with the Geoweb?
    - What subgrade compaction specifications and test methods are proposed for the expanded drain field areas?
    - What materials are proposed for use in the rest of the elements of the drain field system (pipes, manifolds, perf spec., etc.)?

Could you please provide this information so I may forward it to our consultants for review?

Thank you,

Tony Beach

Subject: FW: HDSE drainfield expansion area at UAO

Dear Betty and Anthony,

This missive from me, in my capacity as the attorney for TLM Holdings LLC and from Tony Helbling, as a director of HDSE Sewer System Owners Association and Chairperson of the Southend Corporate Airpark Condominium Owners Association, requests that you (i) rescind your denial of HDSE's plans to expand the HDSE drainfield on UAO property, (ii) retract ODA's stated intention to not renew HDSE's drainfield lease in

2024, and (iii) issue an approval of the expansion plans as previously submitted earlier this year. The attached study and our explanations below respond to the concerns ODA cited as the reason for its decisions.

The denial of the proposed expansion was sent to me in the email from Anthony dated July 30, 2021 in the email string below. ODA's expansion denial and threat to terminate the drainfield located on the Aurora State Airport that serves HDSE users (all buildings at Southend) sent concerned shock-waves through the Southend Airpark community because of the vital importance of the drainfield to the HDSE Sewer System, and the HDSE Sewer System to the continued operation of all of the property at Southend. The threat to "not renew" was made notwithstanding that the Non-Commercial Site Lease provides HDSE with two 5-year options and that the Utility Easement recorded as Instrument No. 2020-00001957 on January 13, 2020 is perpetual.

The attached geotechnical study by NV5 (formerly known as GeoDesign), dated November 8, 2021 demonstrates through detailed soil analysis that the drainfield areas already are likely capable "under dry conditions, of supporting snow removal equipment, aircraft rescue and fire-fighting equipment, and the occasional passage of aircraft without causing damage to the aircraft" [AC 150/5300-13A, p. 61]. The area is also free of objects, is drained by grading and a perimeter drain system to avoid accumulation of water, and has no ruts, humps, depressions or other surface variations, as required by the FAA's design standards for RSA's.

We propose resolution of this issue by:

a. Making no changes to the existing drainfields as they have been in the RSA for around 20 years now, with no problems occurring, and the gravel filled drainfield trenches already demonstrating regular supporting of tractors for mowing and thus physically demonstrating meeting the RSA vehicle support requirements.

b. For the new expansion drainfields use the addition of the 6 inch geo-fabric in the top layer, which then results in gaining of 95% compaction (in fact with a 1.5 safety factor bearing capacity over that).

In addition, we note as mitigating factors that:

- To promote the functionality of Aurora Airport as a resiliency resource following a major earthquake, the septic system will allow the airport to seamlessly continue operation following an earthquake, whereas those airports relying on urban sanitary systems will generally require from one month to a year to become functional after the earthquake – thus the HDSE's septic system is an advantage to promote at Aurora Airport.

- The existing and proposed drainfields are approximately 150 feet or more to the side of the runway centerline, and thus they are areas that are least likely to be needed for emergency use.

- Many existing areas of the RSA do not currently meet the 95% compaction requirement (as shown in the geotech study).

Sincerely yours,

Tony Helbling

To: Michelle DaRosa <mdarosa@landandcondolaw.com>
Subject: RE: HDSE drainfield expansion area at UAO

Good morning Ms. DaRosa,

I am writing to follow up on your request for 103,104 square feet of additional drain field and reserve area lease space at the Aurora State Airport. We understand your client, HDSE Sewer System Owners Association, already has 61,375 square feet of premises leased for a drain field, reserve area, and piping. We are also aware that the existing lease was entered into with a general understanding that additional space would be needed, and that additional space would be made available by the Oregon Department of Aviation. Though both drain field use and leasing within Runway Safety Areas are unusual in my experience, I have been working to honor that arrangement with the intent of accommodating the expansion.

In initiating the Pen and Ink change to our Airport Layout Plan for this expansion, some concerns were raised by the FAA regarding compatibility of drain fields and Runway Safety Areas (RSA). The RSA enhances the safety of aircraft which undershoot, overrun, or veer off the runway, and it provides greater accessibility for firefighting and rescue equipment during such incidents. There are four requirements that our RSAs must meet, those include being:

1. cleared and graded and have no potentially hazardous ruts, humps, depressions, or other surface variations;
2. drained by grading or storm sewers to prevent water accumulation;
3. capable, under dry conditions, of supporting snow removal equipment, Aircraft Rescue and Fire Fighting (ARFF) equipment, and the occasional passage of aircraft without causing damage to the aircraft; and
4. free of objects, except for objects that need to be located in the RSA because of their function…

To address these concerns we closely evaluated the information you provided, and we analyzed what impacts, if any, a drain field would have on meeting the RSA's design standards. What we have found is that generally leach field soils are

not compacted to the densities needed to support vehicle loads. The effluent from the waste stream has to be able to move into the pores of the soil around the drain tiles for the leach field to function. This increases the moisture content of the soils and further reduces their ability to support loads. At best, we are concerned that vehicle loading (including mowers) will reduce the porosity of the leach field soil (resulting in slower infiltration over time) or, at worst, cause damage to the shallow drain tiles and manifolds resulting in surface failures. It is our conclusion that drain fields in the RSA present a potential hazard to aircraft forced to roll out in the RSA. They are especially hazardous for heavier aircraft or those with higher tire pressures.

Due to the decreased soil strength and increased water accumulation caused by a drain field's function, we are unable to expand your client's drain field and reserve areas. Further, because the existing drain field and reserve area are not compatible within the RSA, we will not be able to renew the lease once the current term expires August 30th, 2024. At that time, all pipes and associated equipment will need to be removed by the Lessee, and the site will need to be returned to its original condition.

I am sorry I don't have a better answer for you, please let me know if you have any questions,

Tony
Due to the short time frame I had to do much of this drawing while traveling for holidays, and I apologize for the difficulties with reading the drawing.

This attached pdf with the "b" after the date is hopefully finally cleaned up and easily readable.

Most importantly, I hope the concepts shown for:

1) phasing the corrections of the ROFA over several iterations through use of a mod of standard, and

2) ODAV being offered easements or purchase of properties for an internal circulation road that better will meet the circulation needs of this kind of airport where circulation is most often between existing businesses by walking, bicycle, or motor vehicle.

are useful. The airport users believe they are practical, efficient, and provide a solution that can be accomplished at reasonable cost.

Thanks

Aron

Hi Aron,

Even zooming in (screenshot below) it is difficult to read, especially for anyone not as familiar with the airport and master plan discussions as we are. Just so there is no question surrounding your input, could you send it in again with more legible text?

Thank you and happy holidays,

Tony Beach

Hi Tony

It is intended to either be printed on a large sheet of paper, or zoomed in to read specific areas.

I can revise to larger fonts, and submit the revision in a week if that is helpful. Just let me know.

Thanks for you help in making it as useful as possible.

Aron

Hi Wendie, thank you for your comments, this will be included in the record for the UAO master plan.

The text in the "EXHIBIT 1 MP- Masterplan Alternative 2024-12-23 final.pdf" attachment is not very legible, I'm not sure if the resolution got lost along the way, but even zooming in it is hard to read. Could you resend it with more legible text? I want to make sure we have a clear understanding of everything that has been submitted. If you need more time to edit the document, we'll accept an updated version of that document only by end of day 12/30/2024 (1 week).

Thank you,

Dear Planning Committee,

I am writing to formally register my strong objection to any proposal in the Aurora Airport Master Plan that involves the demolition or "taking" of privately owned hangars at Aurora Airport.

There is already a significant shortage of hangars, and those identified for demolition currently support meaningful employment and contribute to our local economy. The reasons given for this proposed destruction—a vehicle lane set farther from the taxiway and a new parallel taxi lane—do not justify the loss of valuable hangar space. In fact, the same objectives could be met without hangar destruction, such as by purchasing a small additional parcel from a willing seller.

While I support efforts to improve airport safety, I firmly believe this can be achieved without demolishing any hangars.

Thank you for considering my concerns.

Sincerely,

Frederick Farnbach, CFI

You don't often get email from dfellin@gmail.com. Learn why this is important

This message was sent from outside the organization. Treat attachments, links and requests with caution. Be conscious of the information you share if you respond.

Hi there! My name is Dan Felin.

I'm a pilot that's based out of UAO. My last flight from UAO was on 12-9-2024. I'd like to register a public comment on the Preliminary Alternatives I reviewed here:

https://publicproject.net/files/UAOAMP/uao-refined-preliminary-alternatives-summary-1-.pdf?d952c4adef=

> Extends Runway 497 feet north to a total length of 5,500 feet

An appropriate and helpful change!

> Includes a full length parallel taxilane and vehicle service road east of Taxiway A to address direct runway access and VPD issues

Based on my experience flying out of UAO, I personally don't see a need for a parallel taxilane / road. In practice, there is minimal conflict between ground vehicles and aircraft. They share the existing taxiway and ramp space quite well.

> South apron aeronautical properties are acquired, and hangars removed to accommodate parallel taxilane and vehicle service road

This change will negatively affect aviation and business operations at UAO. There is currently a critical shortage of hangar space at UAO.

It feels like the Preliminary Alternatives as currently written tries to solve a theoretical potential future issue (conflict between ground vehicles and aircraft) by exacerbating a concrete real actual issue (hangar shortage at UAO).

I respectfully suggest that ODAV first submits plans to construct hangars to the north and to lengthen the runway. After submitting those plans and monitoring how airport traffic and

business operations evolve, there can be an ongoing dialogue with the FAA as to when the implementation of the parallel taxiway + road might be appropriate.

Thank you for registering my public comments!

Cheers,
Dan Fellin

Dear ODAV c/o Alex Thomas,

I am a pilot that flies out of KUAO and two other airports nearby.
Please register and record my urgent input for the Aurora Airport Master Plan not to consider the condemnation and destruction of any aircraft hangars.

Hangarage in this area is already scarce and therefore expensive, and aviation cannot survive without a stock of affordable hangars. Demolition of any hangars at Aurora State airport will add to what is already a big problem, and will have a far reaching economic impact.

Thank you

Adrian Funnell

RE: Comments on July 30, 2024 Aurora Master Plan Alternatives

Ladies and Gentlemen,

This letter is written on behalf of the direct airport stakeholders whose aviation related businesses are located at, and rely upon, the Aurora Airport. Please include this letter in the record of the 2023-2024 Aurora Airport Master Plan proceedings.

On July 30, 2024, the Oregon Department of Aviation (ODAV) presented three alternatives for the development of the Aurora Airport for the next 20 years and invited comment on those alternatives. **The direct airport stakeholders strongly OBJECT to all of those proposed alternatives: 1A, 1B and 2.**

Objection to Process

At the July 30, 2024 meeting, PAC members were invited to comment on the proposed alternatives via checking a box on an online form to identify which of ODAV's three alternatives they preferred. Participants had no way to offer meaningful comments or explain why none of the alternatives were acceptable. The undersigned strongly objects to ODAV's process as it is not reasonably calculated to solicit input from stakeholders as required by federal law to determine a preferred alternative. Reserving that objection, the Aurora Airport direct airport stakeholders present the following comments on the July 30, 2024 ODAV proposed master plan alternatives.

General Objection – the Alternatives Present a False Choice: Sacrifice the Safety of the Aurora Airport in the Name of Safety

Under ODAV's "alternatives" the runway extension that is well-documented to be badly needed now for safety, is held hostage to prerequisites that will take a decade or more (if they can even happen at all) and hundreds of millions of dollars that no one has. In other words, ODAV's alternatives ensure that the runway safety improvement will never happen or will happen only if the airport is less safe, all in service of perfect prerequisite compliance with design standards. This is a false choice and one that the FAA does not and in fact cannot demand and ODAV should not demand this false choice either. The false choice is not only contrary to the very purposes of aviation master planning and federal law but also ORS 836.600-642 and ODAV's mission.

Alternatives Proceed from False Assumptions

For the alternatives to have legitimacy, they must proceed from accurate assumptions. The proposed alternatives do not proceed from accurate assumptions. To the contrary, each of the three proposed alternatives proceed from false premises.

The first false assumption is that the FAA will not allow the airport to "maintain current non-standard conditions" and if the airport has any "non-standard conditions," then the FAA will place the runway "in maintenance only mode ***."[1]

The second false ODAV assumption is that it is necessary for ODAV to acquire the privately owned "through the fence" properties adjacent to the airport "to ensure [their] continued long-term aeronautical use."

---

[1] ODAV July 30, 2024 PPT Presentation to Planning Advisory Committee. This erroneous assumption carries forward to the August 1, 2024 "Refined Preliminary Alternatives Analysis" which similarly begins by asserting that ODAV has "recognized that maintaining current non-standard conditions is not acceptable to the Federal Aviation Administration (FAA)." There is no such lawful FAA position that ODAV may "recognize." To the extent that ODAV has adopted such a "recognition" it is contrary to both federal and state law and may not serve as the foundation for the airport's 20-year future.

Starting with the second false assumption, we note that there is nothing to support the assumption that if ODAV owned the undersigned's private aviation related properties they would be bettered assured to remain in aeronautical use. Respectfully, there are a lot of reasons to believe ODAV ownership of our property would have a contrary result. It is we, the private through the fence owners, who have the strong incentive to maintain robust aviation use of our adjacent private property because it is suitable for no economic use other than aeronautical use and we have invested and continue to invest ***millions of dollars*** to assure the success of our aviation related uses there.

Conversely, we have not seen evidence that ODAV is committed to growing and supporting aeronautical use of our properties at the Aurora Airport. We have pushed for more than a decade for ODAV to remove trees that are a hazard to aviation. ODAV hasn't gotten around to doing that. We have pushed for decades for ODAV to extend the airport's runway for safety, but ODAV hasn't gotten around to doing that, despite the runway extension being approved on the 2012 airport ALP. ODAV told the airport's opponent's that the 2012 airport master plan had not been finally adopted when ODAV had clearly adopted it (otherwise there would have been no 2012 ALP), inviting years of litigation that resulted in a remand of the 2012 master plan on land use grounds. ODAV did not bother to respond to that remand of the 2012 master plan, as it should have.

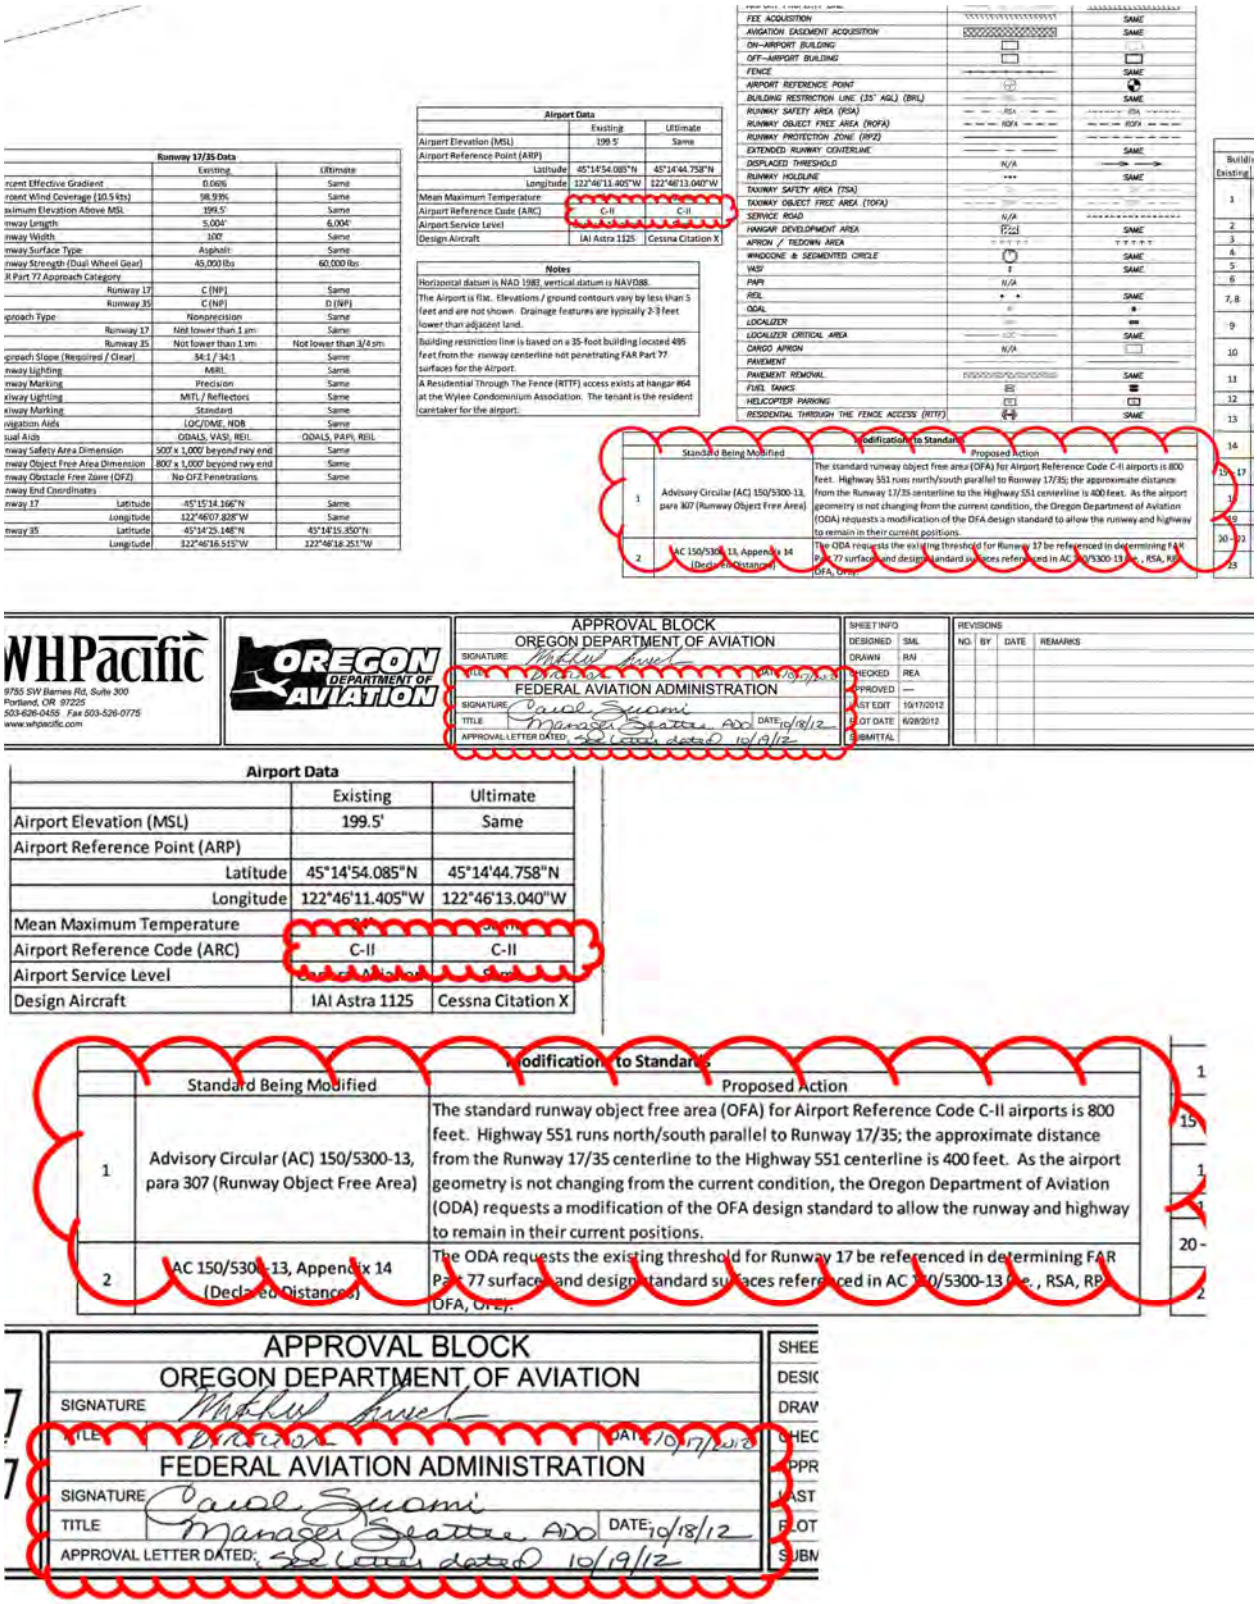
With all respect, the only evidence is that the private through the fence owners have the great documented interest in the continued aeronautical use of their property – they (we) have invested millions of dollars to support aviation use at the Aurora Airport and we continue to do so, our properties are useful for nothing but aviation related use in fact. There is simply nothing to support ODAV's "assumption" that ODAV needs to buy our property to ensure its continued aeronautical use. We note that this second premise is also contrary to the legislative command in ORS 836.640-642 that ODAV **support** the private through the fence ownerships and their economic development, not buy them out. ODAV is constrained by this legislative command. The second "assumption" is simply a nonstarter.

With respect to the first erroneous assumption, the assumption's referenced "non-standard conditions" are primarily the Runway Object Free Area (ROFA) required separation for C-II design aircraft between the runway and Highway 551. [2] The law does not support ODAV's first erroneous premise that the FAA always requires that airports meet all design standards. The law and FAA's decades of practice is exactly the opposite.

In this regard, federal law expressly provides FAA with authority to issue modifications to standards "when necessary to meet local conditions" so long as the "modification will provide an acceptable level of safety, economy, durability and workmanship." 14 CFR 152.11(b). FAA staff lack authority to override that federal law that recognizes that "non-standard conditions" happen and can be allowed to continue in the right circumstances, as presented here.

The truth is that FAA routinely approves modifications to standards where the modification provides the requisite "acceptable level of safety." FAA has approved modifications at airports from Renton where 737's takeoff and land daily at a B-II airport, to SJC which has modifications to standards for many FAA requirements. This happens frequently enough that, as required by Congress, FAA in conjunction with the National Transportation Research Board and National Academies of Sciences, published a technical handbook entitled "**Risk Assessment Method to Support Modification of Airfield Separation Standards"** that goes to a lot of trouble to explain exactly how to assess whether a modification to an airport design standard will provide an acceptable level of safety. Contrary to the July 30 ODAV "assumptions" and August 1 ODAV "recognition",

---



[2] ODAV's "alternatives" assume another "non-standard" condition regarding the location of the airport's septic drainfields in the north and south. The septic drainfield in the south was expressly approved by ODAV, FAA and Marion County in a land use process. It is not "non-standard" or if it is, it is already approved – by ODAV and FAA. Moreover, if necessary, those drainfields can be brought to whatever standard applies. But ODAV may not merely assume they are "non-standard", say they will be "removed" in all alternatives but have no other location for them and no analysis of whether it is feasible to establish any alternative location for them. If ODAV's unstated plan is just to annex the airport to the 900-population City of Auora that has done nothing but oppose the airport for the past decade, and that had a mayor who we understand to be on record saying the city wanted to annex the airport to shut it down, the private airport stakeholders strongly oppose any such -as yet – unarticulated plan.

this federal risk assessment publication states that "**FAA does accept requests from airports for modifications to standards**."

Following federal law and the FAA Risk Assessment publication, respected airport planner, Aron Faegre prepared such an analysis under the FAA published risk-assessment methodology that **concludes maintaining the existing ROFA between the runway and Highway 551 provides an acceptable level of safety.** In other words, were ODAV to merely ask (and Mr. Faegre has done the work to support that), a modification to the ROFA would be granted. Which means contrary to ODAV's "assumptions" underpinning the three alternatives that ODAV revealed on July 30, 2024, the FAA would approve maintaining the existing non-standard conditions at the airport. This should not be a surprise because the FAA approved the exact ROFA modification for a C-II design aircraft that Mr. Faegre demonstrates meets modification standards, when it approved the 2012 ALP for the airport.

FAA Approved the Modification for the ROFA - Separation of the Runway to Highway 551 – in the 2012 ALP under Airport Design Standards for a C-II Airport

The approved ALP that currently governs the airport shows that the FAA approved the runway extension to the south with a ROFA modification to standards for the C-II design aircraft for the separation between the runway and Highway 551.

Modification to Standards

	Standard Being Modified	Proposed Action
1	Advisory Circular (AC) 150/5300-13, para 307 (Runway Object Free Area)	The standard runway object free area (OFA) for Airport Reference Code C-II airports is 800 feet. Highway 551 runs north/south parallel to Runway 17/35; the approximate distance from the Runway 17/35 centerline to the Highway 551 centerline is 400 feet. As the airport geometry is not changing from the current condition, the Oregon Department of Aviation (ODA) requests a modification of the OFA design standard to allow the runway and highway to remain in their current positions.
2	AC 150/5300-13, Appendix 14 (Declared Distances)	The ODA requests the existing threshold for Runway 17 be referenced in determining FAR Part 77 surfaces and design standard surfaces referenced in AC 150/5300-13 (i.e., RSA, RPZ, OFA, OFZ).

NO.	BY	DATE	REMARKS

That means there is no reason to think that the same ROFA modification to standards cannot be approved here. ODAV should apply for it and the FAA almost certainly will grant it.

Proper Assumptions for this Master Planning Effort

With all due respect, there are proper assumptions for this master planning effort. The direct airport stakeholders urge ODAV to adopt the following assumptions and goals for the Aurora Airport Master Plan:

- ODAV can and should apply for modifications to C-II design standards for existing conditions at the airport that would otherwise require unachievable prerequisites to the runway extension.
- ODAV should grow and support the through the fence aviation operations as it is instructed to do in ORS 836.640-642. Accordingly, ODAV should expand the airport boundary to enable the last undeveloped through the fence areas shown on the draft master plan to grow and flourish.
- ODAV has an obligation to manage the Aurora Airport to safely support the general aviation that has grown to rely upon it and the Oregonians who rely upon that general aviation.
- ODAV should support the Aurora Airport as an economic powerhouse for the region being responsible for thousands of jobs and millions of dollars in payroll and visitor spending.
- ODAV should support the Aurora Airport that is known to be a resiliency center in the event of natural disasters – whether they be wildfire disasters or the Cascadia Subduction Event.
- ODAV should support the Aurora Airport that is home to Life Flight that provides important air ambulance service to needy Oregonians and delivers organs for transplant that saves lives.
- To the extent ODAV is privately planning otherwise, ODAV should strongly resist efforts by opponent municipalities like the city of Aurora to annex the airport.
- The airport should not be casually discarded to the bin of unachievable prerequisites.

Alternative that ODAV Should Consider

A wholly achievable alternative that is consistent with the FAA and state law that ODAV should consider is:

a. a 500' runway extension to the north; better yet a 750' runway extension to the north. 750' is well-understood to be better and more appropriate for the long master planning horizon

b. Reapproval for the necessary existing modification to standards for existing conditions

c. Adjust the airport boundary to include the undeveloped through the fence areas on the current draft

d. Show the Internal Circulation Road location that was shown on the 2012 ALP

Conclusion

The direct airport stakeholders stand ready to work cooperatively with ODAV toward an appropriate 20-year master plan for the Aurora Airport along the lines of the alternative that we outline above. However, respectfully, we cannot abide any of the July 30, 2024 proposed alternatives and strongly oppose all of them. We hope that ODAV will agree that the assumptions and alternative proposed by the direct airport stakeholders are appropriate ones that ODAV should adopt in support of general aviation at the airport, regional disaster resilience and economic vitality for the decades to come. The future of aviation at the Aurora Airport depends upon it.

Thank you for your consideration.

Sincerely,

William R. Granewich

Thanks so much Don.

I also spoke with Eileen today about the project. I would recommend that you all watch the video from the last PAC, if you haven't already done so, where the preliminary alternatives are explained (https://publicproject.net/AuroraAirport# on the meetings page) and then provide feedback via the form (in my previous email). Hopefully you can also attend our working session on 7/30.

Good luck with the comp plan, TSP and UGB updates! That is a lot at one time. Please let us know if you have any questions about the Aurora Airport project; we just wanted to make sure you're aware of what is happening.

Thanks,
Brandy

Hi Brandy,

Thank you for your email and invite to the open house. Unfortunately, we were not able to attend.

I reached out to Jamie Stickel our Economic Development Director, and she is interested in the advisory committee, and I've cc'd her. She has been tracking the Aurora Airport issues and will spend some time looking at the master plan.

We are in the middle of a comprehensive plan, transportation system plan and urban growth boundary process and updating all of our housing policies and Jamie has been involved in all of these. We had three meetings on these this week, lots going on in Canby.

Don

Hi Don and Emily,

I wanted to reach out to you to make sure you're aware of the current Airport Master Plan taking place at the Aurora Airport (https://publicproject.net/AuroraAirport).

We don't currently have anyone representing Canby on the Project Advisory Committee and are wondering if you all are interested. I believe that Alex with ODAV has reached out but not heard from anyone, so if you're not the right people, please let me know.

Additionally, we have a public open house this Thursday where you can learn more about the project.

Finally, I'm open to chat about this anytime. Please reach out via email or schedule a time to chat using the link in my email signature below.

Thanks,
Brandy

Brandy –

Trying to get this in under the wire for today's deadline for response to last meeting. Accelerate/Stop distance for the design class is 5500'.
Couple things…

We feel the 5500' number is predicated on a "uncontaminated runway" = dry runway, and pilots perform with exact precision. It rains A LOT here in Oregon… most of the year. Add in human factors and that 5500' number is a very tight limitation. Thinking 6000' (as has historically been called out in past master plans over the past 45+ years), gives a better margin for safety.

We agree the FAA may recognize the design class/category is based on specific example models of aircraft. We want it noted that most of those aircraft are aging aircraft (15 to 20 years old) and will age more before this runway is extended (5 years? So 20 to 25 year old airframes). Most newer aircraft in the design class are up against that 5500' number and we predict future (quieter) aircraft could exceed it.

As we look to the future of the airport, it only makes sense to plan the investment wisely to include a margin of safety. In the grand scheme of things, the return on investment will be human lives.

You don't often get email from brandy.steffen@jla.us.com. Learn why this is important

Hello PAC members,

We are looking forward to seeing you at the **next meeting (VIRTUAL) on Tuesday, June 11, 2024 from 5:00-8:00 p.m.** *(please note this is an hour longer than our normal meeting time).*

The recording from our last meeting (April 30) is posted on the project website and **we would like comments back from you for inclusion in the meeting summary by next Tuesday, May 14.**

Date/Time: Tuesday, June 11, 2024 from 5:00-8:00 p.m.
Topic: The preliminary alternatives will be presented for the Aurora State Airport Master Plan.
Location: Zoom

- PAC members have been registered via Zoom and will get an email directly from Zoom with the login information (please check your junk folder). Please do not forward this email to anyone.

- Others can register for the meeting under their own names at: Webinar Registration - Zoom

Materials: Just a reminder that meeting materials will be posted on the website:
https://publicproject.net/AuroraAirport#

Additionally, we want to announce and invite you to our next public open house, which will be held in-person. We hope to see you there.

Thursday, June 13, 2024
Drop by between 4:00-7:00 pm
North Marion High School, Commons
(20167 Grim Rd NE, Aurora, OR 97002)

Light refreshments provided; children welcome
Tendremos interpretación en español en la reunión. We will have Spanish interpretation at the meeting.

This meeting provided an opportunity for the neighbors, PAC members, and other interested community members to learn about the Airport Master Plan project. This meeting will present the preliminary alternatives for the Aurora State Airport Master Plan. All written and verbal comments collected during the open house will be included in the event Summary.

Thank you again for your continued interest in, and participation with, the Aurora Airport Master Plan project.
Brandy

Potential for MOS related to runway extensions at UAO.eml;

Hi Tony,

I know you've been speaking to ODAV and FAA separately but I want to make sure that we close the loop on these two questions. We'll also include these questions on the website's "frequently asked questions" section. The feedback form is up until September 3, so feel free to send additional comments through that form or directly to me.

1. We'd like to know who in the FAA stated "Maintaining current non-standard conditions is not acceptable to the FAA" – please send contact info and/or docs to support that claim.
    a. Tim House, FAA Community Planner has coordinated with FAA, ADO and Regional Level Management and they have indicated that a modification of standards (MOS) would not be supported by FAA until the ROFA and RSA standards are met. This is acknowledged in an email from FAA on March 26, 2024 (*attached*). The Planning Team has asked FAA to provide additional information that can be shared with the PAC.
2. What FAA regulation is cited for "Runway may be placed in maintenance only mode by FAA until progress is made toward meeting design standards" – could you send any or sort of memo or guidance quoted that would put KUAO into "maintenance mode only"? We've never heard of this "mode".
    a. There is no formal "maintenance mode" description by FAA that can be provided. The term is often used to describe airports that do not meet standards; whereas FAA advises the airport sponsor that only maintenance projects and projects that bring the airport up-to standards would be funded. Maintenance projects include, but are not limited to, crack fill, sealcoat, and pavement overlays. Pavement reconstruction is not considered maintenance and would be in-eligible unless standards are met.

Thanks,
Brandy

As per conversation today we are asking for a 30 day extension to the August 20 deadline for comments to the presented alternative at the July 30 meeting we feel this is too short of fuse for us to adequately respond additionally we still want answers to the basis of the assumptions ODAV made or the consultant made for the alternatives

Thank for the message Tony. I appreciate your call yesterday, conversation today and your time assisting the Master Plan effort by serving on the PAC.

I did pull up the AIP handbook after we talked and found the specific passage that controls our AIP funding in these situations. The following section speaks to the issue. I have included a copy of the full AIP handbook for your use.

> **3-23. Modification to FAA Standards (or Specifications).**
>
> Where the FAA has published specifications for specific items, it is FAA policy that sponsors must use the specifications as written, with no changes from the specifications, except where explicitly allowed in the specification.
>
> The sponsor must obtain an FAA modification to standards approval for any change that is not specifically allowed, no matter how minor it may seem to the sponsor. This is necessary to ensure an acceptable level of safety, capacity, efficiency, utility or access. Additionally, the FAA review will ensure the proposed modification will not unduly limit competition, eliminate FAA approved vendors, compromise statutory or regulatory requirements, or negatively impact the project.
>
> For AIP funding purposes, some modifications to FAA standards (such as those examples in Table 3-16) will not be considered because they violate 2 CFR part 200 or deviate from FAA design standards. The ADO or AAS-100 must not approve such requests for AIP funded projects. However, in the event of a pre-existing nonstandard airfield configuration, AIP funds may only be used to rehabilitate or reconstruct the affected airfield element if FAA has formally approved a modification to standards or the airfield element is brought up to standards.
>
> The current version of FAA Order 5300.1, Modifications to Agency Airport Design, Construction, and Equipment Standards contains the requirements for modification to standards.

After reading your message to Tony below and seeing the "maintenance mode", I think this requirement related to Modification to FAA Standards is what they were referring to. Because if you can't do rehab and reconstruction then all that is left is maintenance. This is what we have been talking about with ODAV and the planners.

Tim,

Thanks so much for the call back today. Appreciate the advice on finding the AIP stuff – will search out that info – if you have a fast reference – would appreciate anything you could send.

Start at the bottom and read up….

Subject: RE: Extension Request

Hi Tony, I have received your email and forwarded it to the master planning team.

A couple clarifications, I don't recall making statements exactly as you described below. I remember explaining that the FAA has been very clear about the need for UAO to meet standards, especially regarding the ROFA. I also didn't ask anyone to "play ball," but I did state that we risk losing NPIAS status if we don't address the airport's issues.

I believe you've been in touch with the appropriate point of contact at the FAA to get answers to your questions. We'll be back in touch regarding your requests as soon as we can.

Subject: Extension Request

This message was sent from outside the organization. Treat attachments, links and requests with caution. Be conscious of the information you share if you respond.

Tony,

At my computer this morning – following up on our phone conversation yesterday.

We are asking for a 30 day extension to the August 20, 2024 deadline for comments to the July 30, 2024 presented MP Alternatives.

I fully understand ODAV has spent $$ advertising future dates, meetings, etc.

I looked at the JLA website to find contact names you specified at the consultant's office to also send this extension request. Only name on there is Alex in your shop. Please forward this email on to the consultants as I don't have their contact info.

As discussed, the PAC was not allowed to see the proposed alternatives BEFORE the meeting. We were VERY surprised to see the extent of affect on private properties on BOTH sides of highway 551.

We were given three weeks to comment or propose our alternatives to a document call for the taking of private property. This is far too short a time to respond to this important an issue.

Additionally, we've asked for documentation providing background on the two assumptions –

1. there will be no more modifications to standards and

2. if the airport does not come into compliance, KUAO will move into a "maintenance mode".

In our discussion yesterday, you explained this was not ODAV's decision, it was the decision of the FAA/ADO both in Seattle and nationally to place these restrictions. We want to know who at the FAA/ADO made those statements an/or that ODAV provide source documents. You also explained it would be nearly impossible to provide documentation before the August 20th deadline.

You told me that if KUAO does not come into compliance and if we as owners "play ball" with ODAV on this, the FAA will rescind NPIAS status of KUAO will be taken away by the FAA. We are now asking you to provide source information for the potential cancelation of NPIAS status. Who at the FAA is claiming that KUAO may lose NPIAS status?

We are very concerned with the presented alternatives for obvious reasons and now, an additional reason… even though the proposed alternatives are in "draft" right now, they DIRECTLY AND IN REAL TIME affect the value of the properties. **This is absolutely not acceptable**.

Please acknowledge receipt of this email.

U.S. DEPARTMENT OF TRANSPORTATION
FEDERAL AVIATION ADMINISTRATION

National Policy

ORDER 5100.38D, Change 1

Effective date:
September 30, 2018

SUBJ: Airport Improvement Program Handbook

1. PURPOSE.

This Handbook provides guidance and sets forth policy and procedures used in the administration of the Airport Improvement Program.

2. DISTRIBUTION.

This Handbook is located on the FAA Office of Airports website (see Appendix B for link) where it is available to all interested parties.

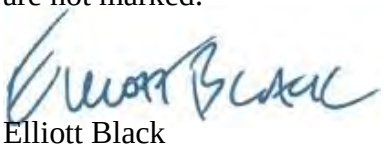
3. CANCELLATION.

This Handbook cancels the following order:

- FAA Order 5100.38D, Airport Improvement Program Handbook (dated September 30, 2014).

4. EXPLANATION OF CHANGES.

This Handbook replaces the above order with updated information that reflects current legislation and policy as of September 30, 2018, with the exception Program Guidance Letter (PGL) 17-01. The changes in this Handbook also reflect feedback from industry stakeholders over the last four years, and does not yet reflect changes in FAA Reauthorization Act of 2018 (Public Law 115-254), which will initially be addressed in the form of a PGL and then in a subsequent update of the AIP Handbook itself. The FAA Office of Airports has streamlined this Handbook and replaced guidance with references where there is a more appropriate source of guidance (such as in other orders or advisory circulars). This included deleting guidance on airport planning, capital planning, labor rates, and civil rights. The references appear as the basic publication number without any suffix. The intent is for the reader to use the latest version of the referenced publication.



The Office of Airports is issuing Change 1 to this Handbook to:

- Incorporate program guidance letters (PGL) issued up to, but not including PGL 17-01.
- Reflect the transition to 2 Code of Federal Regulations (CFR) part 200, which became effective on December 19, 2014.
- Incorporate legislation from the authorization extensions following the expiration of the FAA Modernization and Reform Act of 2012 (Public Law 112-95), which includes the following.

- The Airport and Airway Extension Act of 2015 (Public Law 114-55) enacted September 30, 2015.
- The Airport and Airway Extension Act of 2016 (Public Law 114-141) enacted March 30, 2016.
- The FAA Extension, Safety, and Security Act of 2016 (Public Law 114-190) enacted on July 15, 2016.
- The Disaster Tax Relief and Airport and Airway Extension Act of 2017 (Public Law 115-63) enacted September 29, 2017.
- The Consolidated Appropriations Act, 2018 (Public Law 115-141) enacted March 23, 2018.
- Note that the FAA Reauthorization Act of 2018 (Public Law 115-254) enacted on October 5, 2018 *was not* incorporated.

- Include provisions from the following appropriation:
  - The Consolidated Appropriations Act of 2016 (Public Law 114-113), enacted December 18, 2015.
  - The Consolidated Appropriations Act of 2017 (Public Law 115-31) enacted May 5, 2017.
  - The Consolidated Appropriations Act, 2018 (Public Law 115-141) enacted March 23, 2018.

Vertical bars in the margins indicate the substantive text revisions made in Change 1. The FAA Office of Airports will publish a separate summary of changes as a companion document to Change 1. Non-substantive formatting, grammar, and wording changes were made throughout Change 1, which requires FAA Order 5100.38D to be replaced by Change 1 in its entirety, and are not marked.

Elliott Black
Director, Office of Airports Planning and Programming

Table of Contents

Chapter 1. What do I need to know about this order? 1-1

1-1. This Order Is Called the *Handbook*. 1-1
1-2. Purpose of the Handbook. 1-1
1-3. Handbook Audience. 1-1
1-4. Handbook Location on the Internet. 1-1
1-5. Publications this Handbook Cancels. 1-1
1-6. Relevant AIP Legislation (Referred to as the Act). 1-1
1-7. AIP Transition to 2 CFR part 200. 1-2
1-8. Format for References to the Act. 1-4
1-9. Broad Objective of the Act. 1-4
1-10. The Act is a *Permissive* Statute. 1-4
1-11. Aviation Priorities in the Act. 1-5
1-12. List of Handbook References (with Links to the Associated Websites). 1-5
1-13. General Principles of this Handbook. 1-5
1-14. Warning on Taking Handbook Text Out of Context. 1-6
1-15. Use of the Term Airports District Office (ADO). 1-6
1-16. Use of the Phrase *ADO has the option*. 1-6
1-17. FAA Office of Airports Positions/Divisions/Branches Referenced in this Handbook. 1-6
1-18. Location of Handbook Definitions. 1-7
1-19. Process for Handbook Changes. 1-7
1-20. Supplemental Guidance and Standard Operating Procedures. 1-7
1-21. New Handbook Layout and Format. 1-7

Chapter 2. Who can get a grant? 2-1

2-1. Grant Recipients are Referred to as Sponsors. 2-1
2-2. Type of Sponsors. 2-1
2-3. Type of Projects Each Sponsor Type Can Receive in a Grant. 2-2
2-4. Grant Assurances – Definition and Which Ones to Use. 2-5
2-5. Grant Assurances – Duration and Applicability. 2-9
2-6. Sponsor Qualification Criteria. 2-14
2-7. State Sponsorship Benefits. 2-20
2-8. Sponsorship Determination Process. 2-20
2-9. Transfer of Sponsorship. 2-20
2-10. Conflicting Grant Requests from More than One Entity. 2-21

Chapter 3. What projects can be funded? 3-1

Section 1. List of 16 Requirements for Project Funding. 3-1

3-1. List of 16 Requirements for Project Funding. 3-1

Section 2. Project Eligible. 3-2

3-2. The Act Establishes the General Types of Eligible Projects. 3-2
3-3. Project Requirement Tables (in the Appendices by Project Type). 3-2
3-4. Prohibited Project and Unallowable Cost Tables. 3-2
3-5. Only Specific Equipment is Eligible under the Act. 3-2
3-6. Eligibility of Maintenance, Rehabilitation, Reconstruction, and Replacement Projects. 3-2
3-7. Difference between AIP and Passenger Facility Charge (PFC) Eligibility. 3-6

Section 3. Project Justified. 3-7

3-8. Three Basic Tests for Project Justification. 3-7
3-9. Justification Requirements for Safety and Security Projects. 3-8
3-10. Justification Requirements for Unclassified Airport Projects. 3-8
3-11. The Use of Critical Aircraft for Justification. 3-9

3-12. Useful Life Test for Equipment and Facilities. 3-9
3-13. Benefit-Cost Analysis (BCA) for NAVAIDs and Weather Reporting Equipment. 3-10
3-14. BCAs for Capacity Projects Using Discretionary Funds. 3-10
3-15. BCAs for All Other Projects. 3-12

Section 4. Project on Airport Property (with Good Title). 3-12

3-16. On-Airport Property Requirements. 3-12

Section 5. Project on Airport Layout Plan. 3-14

3-17. Airport Layout Plan Requirement. 3-14

Section 6. Intergovernmental Review and Airport User Consultation Complete. 3-15

3-18. Intergovernmental Review. 3-15
3-19. Consultation with Airport Users. 3-16

Section 7. FAA Environmental Finding Complete. 3-17

3-20. Environmental Finding Requirements. 3-17

Section 8. Usable Unit of Work Obtained. 3-17

3-21. Usable Unit Requirements (and Phased Project Conditions). 3-17

Section 9. FAA Standards Met. 3-18

3-22. Mandatory FAA Standards. 3-18
3-23. Modification to FAA Standards (or Specifications). 3-19
3-24. Standards that Exceed those of the FAA. 3-20
3-25. Eligibility Differences between the Handbook and the Advisory Circulars. 3-23
3-26. Approval and Use of State Standards. 3-23
3-27. Projects with No FAA Standard. 3-24
3-28. ADO Review of Plans and Specifications. 3-24

Section 10. Project Procured Correctly. 3-25

3-29. Importance of 2 CFR §§ 200.317-200.326 (Formerly 49 CFR § 18.36). 3-25
3-30. Sponsor Procurement Requirements. 3-26
3-31. Summary Table of Mandatory/Optional ADO Procurement Review. 3-26
3-32. Bid Protests and Appeals. 3-29
3-33. Procurement Protests and Appeals after the Contract Award. 3-31
3-34. Bonding that Does Not Meet the Minimum Requirements. 3-31
3-35. Noncompetitive Proposals (Including Sole Source and Inadequate Number of Qualified Sources). 3-32
3-36. Limited Noncompetitive Proposal Situations (ALCMS Modifications, One Manufacturer, Sponsor Preferred, Prohibited LED Lighting). 3-32
3-37. Change Orders, Supplemental Agreements, and Contract Modifications. 3-34
3-38. Contract Clauses and Contract Provisions Required for AIP Grants. 3-34
3-39. Contracts Containing Ineligible and/or Non-AIP Funded Work (Including Proration). 3-34
3-40. Contracts Containing Requirements that May Reduce the Number of Potential Bidders. 3-36
3-41. Contracts Containing Work that Exceeds FAA Standards. 3-36
3-42. Consultant Contracts (Qualifications Based with Negotiated Price). 3-37
3-43. Design-Build and Construction Manager-at-Risk Contracts. 3-37
3-44. Engineering Materials Arrestor System (EMAS). 3-38
3-45. Bid Alternates (Including Life Cycle Cost Analysis Alternates) and Bid Additives. 3-39
3-46. Bidding Asphalt and Concrete Alternates. 3-39
3-47. Buy American Requirements. 3-39
3-48. DOT Office of Inspector General (OIG) Notification of Potential Procurement/Bid Improprieties. 3-40
3-49. Escalator Clauses. 3-41

3-50. Plans and Specifications Review. 3-41
3-51. Pre-award Review of Contracts. 3-41
3-52. Sponsor's Procurement System. 3-42
3-53. Force Account Work. 3-42
3-54. Value Engineering. 3-44
3-55. Indefinite Delivery (Task Orders) Extensions for *Construction* Services. 3-45
3-56. Indefinite Delivery (Task Orders) Extensions for *Consultant* Services. 3-45
3-57. Suspension or Debarment of Persons or Companies. 3-45

Section 11. Cost Allowable. 3-46

3-58. Allowable Cost Legislation and Policy. 3-46
3-59. Unallowable Cost Table. 3-47
3-60. Administrative Costs. 3-47
3-61. Indirect Costs. 3-50
3-62. Architectural Enhancements Costs. 3-52
3-63. Benefit-Cost Analysis (BCA) Costs. 3-53
3-64. Construction Costs. 3-53
3-65. Construction Project Signs Costs. 3-53
3-66. Computer Software and Data Subscription Costs. 3-53
3-67. Disadvantaged Business Enterprise (DBE) Plan Updates. 3-53
3-68. Drainage Costs. 3-54
3-69. Duct Bank Costs for Ineligible Facilities. 3-54
3-70. Energy Efficiency (Green/Sustainable) Improvement Costs. 3-54
3-71. Engineering and Architectural (A/E) Costs. 3-55
3-72. Environmental Finding Costs. 3-56
3-73. Equipment Leasing (instead of Purchase) Costs. 3-56
3-74. Facility Impeding an AIP Development Project – Costs to Rebuild or Relocate in Another Location. 3-56
3-75. Flight Check. 3-62
3-76. Force Account Costs. 3-63
3-77. Geographic Information System (GIS) Data Collection. 3-63
3-78. Heated Airfield Pavement. 3-64
3-79. Historic Building Costs. 3-64
3-80. Hydrant Fuel Lines and Pit Costs. 3-64
3-81. Land Acquisition Costs. 3-64
3-82. Legal Fees and Settlement Costs. 3-67
3-83. Lighted X's and Other Runway Closure Markings Costs. 3-68
3-84. Nonroad Diesel Engines. 3-68
3-85. Normally Unallowable Costs that are Necessary to Carry Out the Project. 3-69
3-86. Project Formulation Costs. 3-69
3-87. Reimbursable Agreements with Other Federal Agencies. 3-70
3-88. Safety Management System (SMS) and Safety Risk Management (SRM) Costs. 3-70
3-89. Secondary Electrical Power Supply Costs. 3-71
3-90. Seismic Standards. 3-72
3-91. Site Preparation Costs for Ineligible Work. 3-72
3-92. Spare Part Costs. 3-72
3-93. Sponsor Furnished Materials or Supplies. 3-73
3-94. Temporary Construction Costs. 3-75
3-95. Thermoplastic Markings. 3-76
3-96. Used Equipment Costs. 3-76
3-97. Utility Costs. 3-76
3-98. Value Engineering. 3-77

Section 12. Costs Necessary (Allowable Cost Rule #1). 3-77

3-99. Requirements for Costs to be Necessary. 3-77

Section 13. Costs Incurred after Grant Executed (Allowable Cost Rule #2). 3-77

3-100. Rules for Reimbursing Project Costs Prior to the Grant (or LOI) Execution Date. 3-77

Section 14. Costs Reasonable (Allowable Cost Rule #3). 3-83

3-101. Sponsor Requirements. 3-83
3-102. ADO Review Requirements. 3-86
3-103. Documentation of ADO Determination. 3-86

Section 15. Costs Not in Another Federal Grant (Allowable Cost Rule #4). 3-87

3-104. Requirement for Costs to Not be in Another Federal Grant. 3-87

Section 16. Costs within Federal Share (Allowable Cost Rule #5). 3-87

3-105. Allowable Federal Share Requirement. 3-87

Section 17. No Unreasonable Delay in Completion. 3-87

3-106. Requirement for No Unreasonable Delay in Project Completion. 3-87

Chapter 4. What AIP funding is available? 4-1

4-1. Legislation Needed to Issue AIP Grants (Authorization/Appropriation). 4-1
4-2. Airport and Airway Trust Fund (Source of AIP). 4-1
4-3. Calendar Year Used for Passenger Boardings, Entitlements, and Cargo Landed Weight. 4-1
4-4. Categories of AIP Funding (Including Calculations and Legislative References). 4-1
4-5. Types of Potential Funding by Airport Type (Including Airport Type Definitions). 4-7
4-6. Airports that Can Use Each Fund Type (Funding Restrictions by Airport Type). 4-14
4-7. Project Restrictions by Fund Type. 4-18
4-8. Fund Expiration Time Frames by Airport and Fund Type. 4-23
4-9. Federal Share by Airport Type (Including Exceptions). 4-24
4-10. Federal Share Exception for States with Large Amounts of Public Land 4-28
4-11. Transfer of Entitlement Funds between Airports. 4-29
4-12. Use of Donations (or Previously Acquired Land) as the Sponsor Share. 4-33
4-13. Budget Augmentation (Combining Funds between Different Federal Programs). 4-42

Chapter 5. How does the grant process work? 5-1

Section 1. Basic Grant Steps. 5-1

5-1. Basic Grant Steps. 5-1

Section 2. Pre-Grant Actions. 5-1

5-2. Introduction. 5-1
5-3. Identification of Potential Projects by Sponsors and ADO. 5-2
5-4. Early Coordination between ADO and Sponsor. 5-4
5-5. ADO Verification of Sponsor Eligibility. 5-5
5-6. ADO Verification that All Project Requirements Will Be Met. 5-5
5-7. ADO Verification that Airport Layout Plan is Current. 5-5
5-8. ADO Notification to New Sponsors of Flood Insurance Requirements. 5-6
5-9. ADO Notification and Verification of Sponsor Civil Rights Requirements. 5-6
5-10. ADO Verification that Risk Level Determination is Current. 5-7
5-11. ADO Review of Open Grant Status. 5-7
5-12. ADO Verification that Competition Plan is Current. 5-7

Section 3. Grant Programming. 5-8

5-13. Introduction. 5-8
5-14. Project Evaluation Report and Development Analysis (PERADA) Completion. 5-8
5-15. Grant Programming. 5-8

5-16. Congressional Notification. 5-8
5-17. Sponsor Notification. 5-9

Section 4. Grant Application, Offer, and Acceptance. 5-9

5-18. Introduction. 5-9
5-19. Grant Application Package Submittal. 5-9
5-20. Grant Application Review. 5-12
5-21. Reservation of Funds. 5-13
5-22. Grant Offer. 5-14
5-23. Grant Acceptance 5-23
5-24. The FAA Office of Finance and Management, FAA Accounts Payable Section B (AMK-314) Notification. 5-23

Section 5. ADO Grant Oversight. 5-23

5-25. ADO Oversight (and Required Sponsor Documentation) Based on Sponsor Risk Level. 5-23
5-26. Requirement to Include a Copy of FAA Determinations in the Grant File. 5-24
5-27. Statutory Requirement for ADO Project Oversight. 5-24
5-28. Safety Risk Management (SRM) Panels 5-24
5-29. Construction Safety Phasing Plans. 5-24
5-30. Predesign, Prebid, and Preconstruction Conferences. 5-24
5-31. Equipment Photographs. 5-25
5-32. Construction Photographs. 5-25
5-33. Construction Management Programs. 5-25
5-34. Notices to Proceed. 5-25
5-35. Change Orders, Supplemental Agreements, and Contract Modifications. 5-25
5-36. Periodic Inspections. 5-30
5-37. Construction Progress and Inspection Report. 5-30
5-38. Meetings for Planning and Environmental Study Grants. 5-30
5-39. Forecasts in Planning or Environmental Projects. 5-30
5-40. Performance Report (formerly called Quarterly Performance Report). 5-30
5-41. Annual Reporting of Residential Population Benefits. 5-32
5-42. Final Inspection. 5-32

Section 6. Grant Payments. 5-32

5-43. Summary of Payment Request Requirements and Limitations. 5-32
5-44. Requirements and Process for Using the Current DOT Electronic Payment System. 5-33
5-45. Requirements for Frequency of Payment Requests and Expenditure Rate. 5-34
5-46. Requirements for Approving Payment within the Last 10% of the Federal Share. 5-34
5-47. Requirements for Payment Requests to be Based on Incurred Costs. 5-35
5-48. Requirements for Reducing or Withholding Payments. 5-35
5-49. Limitations for Contract Retainage. 5-36
5-50. Limitations for Contractor Disputed Costs. 5-38
5-51. Limitations for Land Acquisition Costs. 5-38
5-52. Requirements for Avoiding Improper Payments. 5-38
5-53. Requirements for Financial Reporting (Standard Forms 425, 271, and 270). 5-40
5-54. Requirements for Retaining/Providing Supporting Documentation. 5-40

Section 7. Grant Amendments. 5-40

5-55. Criteria for Amending a Grant. 5-40
5-56. Procedure for the ADO to Process an Amendment. 5-51

Section 8. Grant Closeouts. 5-52

5-57. Grant Closeout Steps and Requirements. 5-52
5-58. Block Grant Closeout. 5-57

Section 9. Grant Suspension and/or Termination. 5-58

5-59. Reasons for Possible Grant Suspension or Termination. 5-58
5-60. Suspension of a Grant. 5-58
5-61. Termination for Cause. 5-59
5-62. Termination for Convenience. 5-60

Section 10. Post-Grant Actions. 5-60

5-63. Sponsor Records Retention. 5-60
5-64. ADO Records Retention. 5-61
5-65. Reopening Grants. 5-61
5-66. Audit Requirements. 5-61
5-67. Disposal of AIP Funded Equipment. 5-63
5-68. Disposal of Excess/Unneeded AIP Funded Land (and ADO/Sponsor Tracking). 5-64

Chapter 6. What special AIP programs are available? 6-1

Section 1. Letters of Intent (LOI). 6-1

6-1. LOI Overview. 6-1
6-2. LOI Funding Rules and Policy. 6-1
6-3. LOI in the Context of an Airport's Overall Capital Program. 6-3
6-4. LOI Project Criteria by Airport Type. 6-4
6-5. LOI Approval/Disapproval Process. 6-7
6-6. Sponsor LOI Submission Requirements. 6-9
6-7. LOI Evaluation Criteria. 6-12
6-8. LOI Offer Package 6-12
6-9. LOI Grant Administration. 6-14
6-10. LOI Amendments. 6-14
6-11. LOI Closeout. 6-15
6-12. Revising, Suspending, or Terminating an LOI. 6-15

Section 2. State Block Grant. 6-15

6-13. General. 6-15
6-14. Limited State Flexibility. 6-15
6-15. Responsibilities Retained by the FAA. 6-15
6-16. Legislative History and List of Participants. 6-16
6-17. State Block Grant Program Application 6-17
6-18. FAA Selection of State Block Grant Participants. 6-18
6-19. Memorandum of Agreement. 6-19
6-20. Grant Assurances 6-19

6-75. Availability of Guidance. 6-39

Appendix A. Definitions of Terms Used in this Handbook A-1

A-1. Definitions of Terms Used in this Handbook. A-1

Appendix B. References and Web Links B-1

B-1. References and Web Links. B-1

Appendix C. Prohibited Projects and Unallowable Costs C-1

C-1. Examples of General Prohibited Projects/Costs (for All Types of Projects). C-1
C-2. Examples of Construction Prohibited Projects/Costs. C-6
C-3. Examples of Equipment Prohibited Projects/Costs. C-14
C-4. Examples of Land Prohibited Projects/Costs. C-18
C-5. Examples of Noise Mitigation Prohibited Projects/Costs. C-19
C-6. Examples of Planning or Environmental Prohibited Projects/Costs. C-22

Appendix D. Miscellaneous Projects D-1

D-1. How to Use This Appendix. D-1
D-2. Airfield Needs Requirement for Revenue Producing Aeronautical Support Facilities. D-1
D-3. Project Requirements. D-1

Appendix E. Planning Projects E-1

E-1. How to Use This Appendix. E-1
E-2. Conditions for Posting Planning Documents on the Internet. E-1
E-3. Disclaimer for AIP Funded Planning Studies. E-1
E-4. Stand-Alone Master Plan and System Plan (Metropolitan and State) Projects. E-1
E-5. Project Requirements Table. E-4

Appendix F. New Airport Projects F-1

F-1. How to Use This Appendix. F-1
F-2. Project Requirements Tables. F-1

Appendix G. Runway Projects G-1

G-1. How to Use This Appendix. G-1
G-2. Secondary, Crosswind and Additional Runways. G-1
G-3. Pavement Condition Index Requirements for Airfield Pavement Projects. G-2
G-4. Project Requirements Tables. G-3

Appendix H. Taxiway Projects H-1

H-1. How to Use This Appendix. H-1
H-2. Taxiway Types (and Associated AIP Funding Rules). H-1
H-3. Pavement Condition Index Requirements for Airfield Pavement Projects. H-2
H-4. Project Requirements Tables. H-2

Appendix I. Apron Projects I-1

I-1. How to Use This Appendix. I-1
I-2. Non-Exclusive Use Available for Public Aircraft Parking/Access. I-1
I-3. Apron in Front of a Building. I-1
I-4. Pavement Condition Index Requirements for Airfield Pavement Projects. I-1
I-5. Project Requirements Tables. I-2

Appendix J. Airfield Marking, Signage, and Lighting Projects J-1

J-1. How to Use This Appendix. J-1
J-2. Eligibility of Pavement Marking as a Stand-Alone Project. J-1
J-3. Eligibility of Sign Panel Replacement as a Stand-Alone Project. J-1
J-4. Airport Lighting Control Panel Modification. J-2
J-5. Certified Lighting Equipment for which there is Only a Single Manufacturer. J-3
J-6. Lighting for Pavement that Exceeds FAA Design Standards. J-3
J-7. Project Requirements Table. J-3

Appendix K. Navigational Aid (NAVAID) and Weather Reporting Equipment Projects K-1

K-1. How to Use This Appendix. K-1
K-2. Installation of Instrument Landing Systems (ILS). K-1
K-3. Transfer of Equipment to the FAA Air Traffic Organization (ATO). K-1
K-4. Required FAA Air Traffic Organization (ATO) Coordination. K-2
K-5. Designated Instrument Runway Requirement. K-2
K-6. NAVAID and Weather Reporting Equipment Communication Requirements. K-2
K-7. Compass Calibration Pad. K-2
K-8. Airside Service Roads to Access AIP Eligible NAVAIDs. K-2
K-9. Project Requirements Table. K-2

Appendix L. Safety and Security Equipment Projects L-1

L-1. How to Use This Appendix. L-1
L-2. Justification for Safety and Security Equipment. L-1
L-3. Safety Equipment beyond 14 CFR part 139 Requirements. L-1
L-4. Use of Safety and Security Equipment. L-1
L-5. Off-Airport Storage of ARFF Equipment. L-1
L-6. Radios and Communication Equipment. L-2
L-7. Security Equipment beyond 49 CFR part 1542 Requirements. L-2
L-8. Sensitive Security Information. L-2
L-9. Project Requirements Table. L-2

Appendix M. Other Equipment Projects M-1

M-1. How to Use This Appendix. M-1
M-2. Project Requirements Table. M-1

Appendix N. Terminal Building Projects N-1

N-1. How to Use This Appendix. N-1
N-2. Eligibility of Terminals Non-Commercial Service Airports. N-1
N-3. Public-Use and Movement of Passengers/Baggage Requirements. N-1
N-4. Revenue Producing Eligibility and Conditions for Terminal Buildings. N-2
N-5. Safety, Security, and Access Needs Met. N-3
N-6. Terminal Areas Related to Security (Landside, Sterile, and Secured). N-3
N-7. Prorated Areas and High Cost Eligible/Ineligible Items. N-4
N-8. Terminal Area Impacted by an AIP Eligible Terminal Project. N-4
N-9. Typical Eligible Areas/Equipment within a Terminal Building. N-4
N-10. Additional Eligible Terminal Areas/Equipment at Nonhub Primary and Nonprimary Airports. N-7
N-11. Terminal Building Funding Rules by Airport Type. N-8
N-12. Project Requirements Tables. N-10

Appendix O. Other Building Projects O-1

O-1. How to Use This Appendix. O-1
O-2. Aircraft Rescue & Firefighting Building Costs at 14 CFR part 139 Airports. O-1
O-3. Project Requirements Tables. O-2

Appendix P. Roads and Surface Transportation Projects P-1

P-1. How to Use This Appendix. P-1
P-2. Project Requirements Tables. P-1

Appendix Q. Land Projects Q-1

Q-1. How to Use This Appendix. Q-1
Q-2. General Eligibility Requirements. Q-1
Q-3. Applicable Land Orders, Regulations, and Advisory Circulars. Q-1
Q-4. Appraisal Requirement. Q-1

Q-5. Good Title Requirements for Land and Easement Acquisition. Q-2
Q-6. Acceptable Land Interests. Q-2
Q-7. Logical Boundaries. Q-3
Q-8. Uneconomic Remnants. Q-3
Q-9. Disposal of Excess Land. Q-3
Q-10. Purchasing Land from a State/Local Public Agency. Q-3
Q-11. Project Requirements Tables. Q-4

Appendix R. Noise Compatibility Planning/Projects R-1

R-1. How to Use This Appendix. R-1
R-2. General Eligibility Requirements (The Four Types of Justification). R-1
R-3. Noncompatible Land Uses. R-1
R-4. Not all 14 CFR part 150 Measures are Eligible. R-2
R-5. Reduction Due to Aircraft Noise Associated with the Airport. R-2
R-6. Eligible Noise Contour Threshold (or the Use of a Lower Local Standards). R-2
R-7. Required Validation of the Noise Exposure Maps. R-2
R-8. Interior Noise Level Requirements. R-3
R-9. Block Rounding. R-4
R-10. Neighborhood Equity. R-4
R-11. Pre- and Post-Testing Criteria for Noise Insulation Projects. R-5
R-12. Conditions for Posting Planning Documents on the Internet. R-8
R-13. Disposal of Excess/Unneeded AIP Funded Noise Land (and ADO/Sponsor Tracking). R-8
R-14. Project Requirements Tables. R-8

Appendix S. Environmental Planning/Mitigation Projects S-1

S-1. How to Use This Appendix. S-1
S-2. Conditions for Posting Planning Documents on the Internet. S-1
S-3. Project Requirements Tables. S-1

Appendix T. Military Airport Program Projects T-1

T-1. How to Use This Appendix. T-1
T-2. Project Requirements Tables. T-1

Appendix U. Sponsor Procurement Requirements (Including 2 CFR §§ 200.317-200.326 (formerly 49 CFR § 18.36)) U-1

U-1. Appendix Layout. U-1
U-2. Sponsor Force Account Costs. U-1
U-3. Sponsor Furnished Material or Supplies. U-1
U-4. Buy American Requirements. U-1
U-5. Suspension or Debarment of Persons or Companies. U-1
U-6. Terminology Used in Industry U-2
U-7. Prohibited Light Emitting Diode (LED) Lighting. U-2
U-8. Why 2 CFR §§ 200.317-200.326 is Reproduced in This Appendix. U-3
U-9. 2 CFR § 200.317 - Procurements by States. U-3
U-10. 2 CFR § 200.318 - General Procurement Standards. U-3
U-11. 2 CFR § 200.319 - Competition. U-7
U-12. 2 CFR § 200.320 - Methods of Procurement to be Followed. U-10
U-13. 2 CFR § 200.320(a) - Procurement by Micro-Purchases. U-11
U-14. 2 CFR § 200.320(b) - Procurement by Small Purchase Procedures. U-12
U-15. 2 CFR § 200.320(c) - Procurement by Sealed Bids (Formal Advertising). U-13
U-16. 2 CFR § 200.320(d) - Procurement by Competitive Proposals. U-16
U-17. 2 CFR § 200.320(e) - Reserved. U-21
U-18. 2 CFR § 200.320(f) - Procurement by Noncompetitive Proposals. U-22
U-19. 2 CFR § 200.321 - Contracting with Small and Minority Businesses, Women's Business Enterprises, and Labor Surplus Area Firms. U-24
U-20. 2 CFR § 200.322 - Procurement of Recovered Materials. U-25

U-21. 2 CFR § 200.323, Contract Cost and Price. U-26
U-22. 2 CFR § 200.324 - Federal Awarding Agency or Pass-Through Entity Review. U-28
U-23. 2 CFR § 200.325 - Bonding Requirements. U-30
U-24. 2 CFR § 200.326 - Contract provisions. U-31

Appendix V. Revenue Sources for the Airport and Airway Trust Fund V-1

V-1. General. V-1

Appendix W. Competition Plans W-1

W-1. Legislative History. W-1
W-2. Purpose. W-1
W-3. Covered Airports. W-1
W-4. Prohibition on Grant Execution. W-1
W-5. Requirements for Initial Plan Submittal and Updates. W-2
W-6. Initial Competition Plan Contents. W-3
W-7. Competition Plan Update Contents. W-7
W-8. Sponsor Guidance. W-8
W-9. Plan Review Process. W-8
W-10. Additional FAA Actions. W-8
W-11. Plan Development Eligibility. W-8

Appendix X. Buy American Guidance X-1

X-1. General Sponsor Buy American Requirements. X-1
X-2. Other Buy American and Buy America Requirements. X-1
X-3. Changes Orders and Buy American Requirements. X-1
X-4. Buy American Waiver Process and Delegation. X-1
X-5. National Buy American Waiver. X-4
X-6. Definitions. X-4

Appendix Y. Federal Share at Public Land State Airports Y-1

Y-1. General Federal Share Definition. Y-1
Y-2. Public Land States Definition. Y-1
Y-3. History of the Public Land Share Formula. Y-2
Y-4. Calculating the Federal Share in Public Land States Using the Part ‘b’ and Part ‘c’ Formulas. Y-3
Y-5. Part ‘b’ Formula. Y-3
Y-6. Part ‘c’ Calculation (the Grandfather Rule). Y-9
Y-7. Public Land State Federal Share Results. Y-10

Appendix Z. Establishment and Category Upgrade Policy for Instrument Landing Systems (ILS) Z-1

Z-1. Background. Z-1
Z-2. Use of RNAV Approaches Instead of Cat I ILS Systems. Z-1
Z-3. FAA Air Traffic Organization (ATO) Funding for Cat I ILSs. Z-1
Z-4. AIP Funding for Cat I ILSs. Z-2
Z-5. AIP or ATO Funding of Cat II/III ILSs. Z-2
Z-6. AIP Transition from ILS to RNAV. Z-2

Chapter 1. What do I need to know about this order?

1-1. This Order Is Called the *Handbook*.

Throughout this document, we refer to this order (FAA Order 5300-38D, Change 1, Airport Improvement Program Handbook) as the *Handbook*.

1-2. Purpose of the Handbook.

This Handbook provides guidance and sets forth policies and procedures for the Airport Improvement Program (AIP).

1-3. Handbook Audience.

All FAA organizations that work with the Airport Improvement Program will use this Handbook, in particular, the FAA Office of Airports (ARP) headquarters and field offices. This Handbook will also be publicly available to airports, consultants, state agencies and others associated with the Airport Improvement Program.

1-4. Handbook Location on the Internet.

You can find this Handbook on the FAA Office of Airports website (see Appendix B for link).

1-5. Publications this Handbook Cancels.

a. FAA Order 5100.38C, AIP Handbook, dated June 28, 2005.

b. FAA Order 5100.20C, Programming Control and Reporting Procedures Grant-In-Aid Program, dated December 7, 1999.

1-6. Relevant AIP Legislation (Referred to as the Act).

The contents of this Handbook are based on the AIP related legislation contained in the United States Code (USC). Throughout this Handbook, the AIP related legislation under Title 49 is referred to as the *Act.* This legislation is shown in Table 1-1. Previously, AIP was authorized by the Airport and Airway Improvement Act of 1982 (Public Law 97-248), which Congress repealed in 1994 and recodified as Title 49 § 47101, et seq. (Public Law 103-272).

14 CFR part 151 (Federal Aid to Airports) and 14 CFR part 152 (Airport Aid Program) were regulations for previous programs that existed prior to AIP and do not apply to AIP.

Table 1-1 AIP Related Legislation

The USC contains…	Which contains…	Which contains…	Which contains…	That Authorizes…	Under Sections (§)…
Title 49 (Transportation)	Subtitle VII (Aviation Programs)	Part B (Airport Development and Noise)	Chapter 471 (Airport Development)	The Airport Improvement Program	49 USC § 47101 through 49 USC § 47175 Most, but not all, sections within this range apply.
Title 49 (Transportation)	Subtitle VII (Aviation Programs)	Part B (Airport Development and Noise)	Chapter 475 (Noise)	Noise compatibility planning and projects	49 USC § 47501 through 49 USC § 47507 Most, but not all, sections within this range apply.
Title 49 (Transportation)	Subtitle VII (Aviation Programs)	Part C (Financing)	Chapter 481 (Airport and Airway Trust Fund Authorizations).	The FAA to have contract authority to issue grants	49 USC § 48103
Title 49 (Transportation)	Subtitle VII (Aviation Programs)	Part A (Air Commerce and Safety)	Chapter 445 (Facilities, Personnel, and Research)	The FAA to install an instrument landing system with AIP funds that can be turned over to the FAA for operation and maintenance	49 USC § 44502(e)

1-7. AIP Transition to 2 CFR part 200.

2 CFR part 200 became effective for AIP on December 19, 2014. This version of the Handbook contains the correct 2 CFR part 200 references and text. 2 CFR part 200 includes the requirements formerly contained in OMB Circular A-102 (administrative); OMB Circular A-87 (cost principles); and OMB Circulars A-89 and A-133 (audit requirements) for Federal awards. Available crosswalks between 2 CFR part 200 and these OMB circulars are listed in Table 1-2 (see Appendix B for link to the website containing these crosswalks). 2 CFR part 200 also includes the requirements formerly contained in 49 CFR § 18.36.

There are some differences between 2 CFR part 200 and AIP policy. On occasion, the AIP statute contains certain requirements (or lack thereof) which do not permit application of a part

of 2 CFR part 200. Wherever this occurs, it will be noted in this Handbook. Some of the differences occur where 2 CFR part 200 is addressing grant program administration. These differences are due principally because of the types of grant programs that are covered by 2 CFR part 200. Examples are included in Table 1-3. Some of the differences between AIP policy and 2 CFR part 200 are listed in Table 1-4.

Table 1-2 Crosswalk between 2 CFR part 200 and Previous OMB Circulars (see Appendix B for link to the website containing these crosswalks)

The following crosswalk…	Addresses the following AIP related policy…
a. Uniform Guidance Crosswalk from Predominant Source in Existing Guidance	Summary crosswalk for all OMB circulars (including A-89 which does not have detailed crosswalks)
b. Uniform Guidance Crosswalk to Predominant Source in Existing Guidance	Summary crosswalk for all OMB circulars in reverse order from above (including A-89 which does not have detailed crosswalks)
c. Uniform Guidance Cost Principles Text Comparison	Includes a detailed crosswalk for OMB Circular A-87
d. Uniform Guidance Audit Requirements Text Comparison	Includes a detailed crosswalk for OMB Circular A-133
e. Uniform Guidance Administrative Requirements Text Comparison	Includes a detailed crosswalk for OMB Circular A-102

Table 1-3 Examples of Differences Where 2 CFR part 200 is Addressing Grant Program Administration

Examples include…
a. The Federal Highway Administration (FHWA) issues grants for a state's grant programs. The state Departments of Transportation then issue subgrants and administer the FHWA grant funding (this is similar to the FAA AIP Block Grant Program).
b. AIP is a project grant program. AIP grants are written for a specific grant project. AIP grants do not allow a sponsor to use AIP to fund administration of the grant program, or to pay for sponsor overhead costs that are not specifically and directly related to a grant.

Table 1-4 Differences Between AIP Policy and 2 CFR part 200

AIP Policy (which governs)	2 CFR part 200	AIP Policy
Costs to recover improper payments are not allowable.	**2 CFR § 200.428** considers costs incurred recovering improper payments to be allowable costs. Costs to recover improper payments are part of grant program administration. AIP does not fund program administration. However, some Federal grant programs are allowed to use grant funds for administration. These agencies do not have any other source of local funds, and must use grant funds to recover improper payments.	**49 USC § 47110(b)(1)** indicates all costs paid with AIP funds must be *necessary* to carry out the project. It is the sponsor's responsibility to recover improper payments without using AIP funding to carry out the work effort.

1-8. Format for References to the Act.

Specific references to sections (§) of the Act are provided in the form of 49 USC § XXXXX. It is useful to note that the first three numbers in the section reference are always the chapter number.

1-9. Broad Objective of the Act.

The Act's broad objective is to help in developing a nationwide system of public-use airports that meets the current needs and the projected growth of civil aviation.

1-10. The Act is a *Permissive* Statute.

The key nature of the Act is that it is a *permissive statute*, rather than a mandatory or prohibitory one. Put more simply, if the AIP statute does not provide the authority to fund an action or an item, that action or item cannot be funded under AIP.

A permissive statute does not contain a comprehensive list of mandatory or prohibited actions. Rather, a permissive statute gives permission to do certain things. As such, an airport is not required to construct some or all of the items that are allowed under AIP, but may do so provided that the FAA determines that the items are justified at that airport.

This is not a concept exclusive to AIP. This is a rule that stems from Federal appropriations law, which applies to Federal agencies. The Government Accountability Office's (GAO) Principles of Federal Appropriations Law, Third Edition (commonly referred to as the Red Book) states that "A Federal agency is a creature of law and can function only to the extent authorized by law" (*Atlantic City Electric Co. v. Federal Energy Regulatory Commission*, 295 F.3d 1, (D.C. Cir. 2002)). The Supreme Court (*United States v. MacCollom*, 426 U.S. 317, 321 (1976)) has upheld this notion by stating "[T]he established rule is that the expenditure of public funds is

proper only when authorized by Congress, not that public funds may be expended unless prohibited by Congress."

1-11. Aviation Priorities in the Act.

49 USC § 47101 lists the policy directives and aviation priorities of the United States. These priorities include:

a. Providing a safe and secure airport and airway system.

b. Minimizing airport noise impacts on nearby communities.

c. Developing reliever airports, cargo hub airports, and intermodalism.

d. Protecting natural resources.

e. Reducing aircraft delays.

f. Converting former military air bases to civil use or improving joint-use airports.

g. Carrying out various other projects to ensure a safe and efficient airport system.

1-12. List of Handbook References (with Links to the Associated Websites).

Appendix B contains a list of the documents referenced in this Handbook. Links for these references are also provided in the Appendix B (they are not given again in the Handbook) and were current on the Handbook publication date. Each reference is also followed by a brief summary of what the document contains and how it relates to AIP. The versions of these reference documents are not given (use the current version of the document).

1-13. General Principles of this Handbook.

The contents of this Handbook are based on principles below:

a. The Use of the AIP Handbook is Mandatory. The Handbook is the published policy for AIP. Except where options are specifically noted or where non-mandatory language is used, the procedures and requirements are mandatory. The Director of the Office of Airport Planning and Programming (APP-1) must approve any deviation from the procedures or requirements. All requests for deviations must be sent to APP-1 for processing.

b. Use of the Term *FAA Policy*. The term *FAA policy* denotes policy that the FAA Office of Airports has established for AIP where there is not a direct statutory reference in the Act .

c. Regional Office Discretion. Unless set procedures are necessary to achieve national standardization in grant program administration, regional offices may adjust procedures that are not dictated by legislation, rule, this Handbook, other published Federal policy, or reasons beyond the FAA's control.

d. Reference to Other Guidance. The Handbook summarizes pertinent information from other guidance material when appropriate to relieve users from needing to reference another document. The source documents, rather than this Handbook, are the authoritative technical sources; however, this Handbook is the authoritative source on AIP, including eligibility.

1-14. Warning on Taking Handbook Text Out of Context.

There may be paragraphs in this Handbook that appear to conflict with the general requirements for eligibility, justification, or program administration. This is usually due to legislative exceptions for a specific project or location. These exceptions do not amend, change, or modify the general guidance and requirements. These exceptions do not apply to other situations and must not be taken out of context.

1-15. Use of the Term Airports District Office (ADO).

For the purposes of this Handbook, we are using ADO to reference the FAA Office of Airports office that directly works with the sponsor. In regional offices that do not have ADOs, the use of the term ADO refers to the FAA Office of Airports branch within the regional office that deals directly with the sponsors.

1-16. Use of the Phrase *ADO has the option*.

For the purposes of this Handbook, the phrase, *the ADO has the option* indicates situations where there is a choice to be made and that the ADO will make the choice.

1-17. FAA Office of Airports Positions/Divisions/Branches Referenced in this Handbook.

A list of the key positions within the FAA Office of Airports is contained in Table 1-5 and a list of the divisions and branches within the FAA Office of Airports is contained in Table 1-6. The routing codes for many of these positions, divisions, and branches are used throughout this Handbook.

Table 1-5 FAA Office of Airports Key Positions

Routing Code	Position Name
ARP-1	Associate Administrator
AAS-1	Director, Airport Safety and Standards
APP-1	Director, Airport Planning and Programming
ACO-1	Director, Airport Compliance and Management Analysis
AXX-600	Regional Division Manager (AXX meaning the regional designation of AAL, AEA, ACE, AGL, ANE, ANM, ASO, ASW, or AWP)

Table 1-6 FAA Office of Airports Divisions and Branches

Routing Code	Organization Name
AAS-100	Airport Engineering Division
AAS-300	Airports Safety and Operations Division
ACO-100	Airport Compliance Division
APP-400	Airport Planning and Environmental Division
APP -500	Airports Financial Assistance Division
APP-510	Financial Analysis and Passenger Facility Charge Branch
APP-520	Airport Improvement Program Branch

1-18. Location of Handbook Definitions.

Definitions are an important part of this Handbook. As with any large program, there are many words and phrases that have specific, defined meanings within the program. Appendix A contains the definitions of terms used in this Handbook.

1-19. Process for Handbook Changes.

APP-500 will continue to issue program guidance letters (PGLs) for short-term policy guidance between Handbook changes. In addition, APP-500 has the option to issue official numbered changes to the Handbook. The ADOs have the option to forward these PGLs to block grant state sponsors or others impacted by the PGLs.

1-20. Supplemental Guidance and Standard Operating Procedures.

The FAA Office of Airports has the option of issuing additional guidance, such as FAA Office of Airports Standard Operating Procedures (see Appendix B for link) as well as other formats, to supplement this Handbook. The ADOs have the option to forward the additional guidance to block grant state sponsors or others impacted by the guidance.

1-21. New Handbook Layout and Format.

The format of this version of the Handbook is significantly altered from the FAA Order 5100.38C, AIP Handbook.

a. Chapters. The chapters are reduced and are organized in question format as shown in Table 1-7. This allows the reader to more easily identify the chapter they need to reference.

b. Appendices. Detailed information and long lists were moved to the appendices to simplify the main body of the Handbook. For instance, while Chapter 3 provides the general requirements that each project must meet in order to be considered for AIP funding, the project specific requirements have been split out into appendices and are in tabular format for easier reference. Where a paragraph from an appendix is referenced, the reference will be in the form, Paragraph X-##. A list of the appendices is provided in Table 1-8.

Table 1-7 Handbook Chapters

Chapters in this handbook include…
Chapter 1. What do I need to know about this order?
Chapter 2. Who can get a grant?
Chapter 3. What projects can be funded?
Chapter 4. What AIP funding is available?
Chapter 5. How does the grant process work?
Chapter 6. What special AIP programs are available?

Table 1-8 Handbook Appendices

Appendices in this handbook include…
Appendix A. Definitions of Terms Used in this Handbook
Appendix B. References and Web Links
Appendix C. Prohibited Projects and Unallowable Costs
Appendix D. Miscellaneous Projects
Appendix E. Planning Projects
Appendix F. New Airport Projects
Appendix G. Runway Projects
Appendix H. Taxiway Projects
Appendix I. Apron Projects
Appendix J. Airfield Marking, Signage, and Lighting Projects
Appendix K. Navigational Aid (NAVAID) and Weather Reporting Equipment Projects

Chapter 2. Who can get a grant?

2-1. Grant Recipients are Referred to as Sponsors.

A recipient of an AIP grant is normally called a sponsor.

2-2. Type of Sponsors.

For AIP purposes, sponsors are broken down into the specific types shown in Table 2-1. This table also lists each of the entities that may qualify under each sponsor type.

Table 2-1 Types of Sponsors

For the following type of sponsor…	Only the following entities may qualify…
a. Airport sponsors	Public agency owning (or leasing from another government entity) a public-use airport. A state; a political subdivision of a state (such as a city, municipality, or state agency); a tax-supported organization; or an Indian tribe or pueblo are all considered public agencies. Private entity owning a public-use airport. State acting as a sponsor for one or more specific airports in the state. Indian tribe or pueblo owning or leasing a public-use airport. The Secretary of the Interior, during fiscal years 2012-2018 for Midway Island Airport per Section 186(d) of the Vision 100 – Century of Aviation Reauthorization Act (Public Law 108-176) as amended by Section 102 of Division M, Title I of the Consolidated Appropriations Act, 2018 (Public Law 115-141). The Republic of the Marshall Islands, Federated States of Micronesia, and Republic of Palau (or political subdivision) during fiscal years 2012-2018 (per 49 USC § 47115(j)).
b. Sponsors that are not currently airport owners (in the planning stages of acquiring or constructing the airport)	Public agency not owning or leasing a public-use airport.
c. Sponsors that are not currently airport owners (after the planning is complete and before the airport is open)	Public agency not owning or leasing a public-use airport.
d. Planning agency sponsors	Metropolitan planning agency. State planning agency. Council of governments.

Table 2-1 Types of Sponsors

For the following type of sponsor…	Only the following entities may qualify…
e. Noise compatibility project sponsors that are not airport owners	Public agency not owning or leasing a public-use airport.
f. State block grant sponsor	State approved by the FAA to be in the State Block Grant Program.
g. Sponsors for compatible land use *planning* or compatible land use *projects* per 49 USC § 47141	State or local government around Medium or Large Hub Airports (if the airport has not submitted a Noise Compatibility Program to the FAA or updated the Noise Compatibility Program within the past ten years).
h. Sponsors that are acquiring airport development rights from a privately-owned public-use airport under the pilot program in 49 USC § 47138(a)	State or a political subdivision of a state (such as a city, municipality, or state agency) in the same state as the airport.
i. Sponsors designated under 49 USC § 47118(h)	Federal agency owning an FAA designated safety critical airport.

2-3. Type of Projects Each Sponsor Type Can Receive in a Grant.

For each sponsor type, Table 2-2 lists the entities that qualify for that sponsor type and the types of projects they may receive in a grant.

Table 2-2 Types of Projects that May be Included in a Grant (by Sponsor Type)

For the following type of sponsor…	Only the following entities may qualify…	And may only receive grants for the following types of projects…
a. Airport sponsors	Public agency owning (or leasing from another government entity) a public-use airport. A state; a political subdivision of a state (such as a city, municipality, or state agency); a tax-supported organization; or an Indian tribe or pueblo are all considered public agencies. Private entity owning a public-use airport. State acting as a sponsor for one or more specific airports in the state. Indian tribe or pueblo owning or leasing a public-use airport. The Secretary of the Interior, during fiscal years 2012-2018 for Midway Island Airport per Section 186(d) of the Vision 100 – Century of Aviation Reauthorization Act (Public Law 108-176) as amended by Section 102 of Division M, Title I of the Consolidated Appropriations Act, 2018 (Public Law 115-141). The Republic of the Marshall Islands, Federated States of Micronesia, and Republic of Palau (or political subdivision) during fiscal years 2012-2018, per 49 USC § 47115(j).	Airport master planning Airport development Noise compatibility planning Noise compatibility projects *When a state is acting as a sponsor for more than one airport within the state, this is often referred to as a various locations grant.* *Note: Per Public Law 108-176, the Secretary of the Interior may only receive Airport Development grants for Midway Island.*
b. Sponsors that are not currently airport owners (in the planning stages of acquiring or constructing the airport)	Public agency not owning or leasing a public-use airport.	Planning grants associated with acquiring or establishing a public-use airport
c. Sponsors that are not currently airport owners (after the planning is complete and before the airport is open)	Public agency not owning or leasing a public-use airport.	Acquisition of existing airports Acquisition of land in anticipation of constructing a new airport Initial airport development
d. Planning agency sponsors	Metropolitan planning agency. State planning agency. Council of governments.	System planning

Table 2-2 Types of Projects that May be Included in a Grant (by Sponsor Type)

For the following type of sponsor…	Only the following entities may qualify…	And may only receive grants for the following types of projects…
e. Noise compatibility project sponsors that are not airport owners	Public agency not owning or leasing a public-use airport.	Noise compatibility planning Noise compatibility projects
f. State block grant sponsor	State approved by the FAA to be in the State Block Grant Program.	A state block grant for funds to be issued in subgrants to airports in the State Block Grant Program for: Airport master planning Airport development Noise compatibility planning Noise compatibility projects
g. Sponsors for compatible land use *planning* or compatible land use *projects* per 49 USC § 47141	State or local government around Medium or Large Hub Airports (if the airport has not submitted a Noise Compatibility Program to the FAA or updated the Noise Compatibility Program within the past ten years).	Compatible land use *planning* and compatible land use *projects*
h. Sponsors that are acquiring airport development rights from a privately-owned public-use airport under the pilot program in 49 USC § 47138(a)	State or a political subdivision of a state (such as a city, municipality, or state agency) in the same state as the airport.	Acquisition of airport development rights

Table 2-2 Types of Projects that May be Included in a Grant (by Sponsor Type)

For the following type of sponsor…	Only the following entities may qualify…	And may only receive grants for the following types of projects…
i. Sponsors designated under 49 USC § 47118(h)	Federal agency owning an FAA designated safety critical airport.	A project to preserve or enhance minimum airfield infrastructure if the project meets all of the following criteria: **(1)** The project is necessary to meet the minimum safety and emergency operational requirements established under 14 CFR part 139. **(2)** The project is necessary to support emergency diversionary operations for transoceanic flights in locations that meet the following criteria: **(a)** Locations within United States jurisdiction or control. **(b)** Locations where there is a demonstrable lack of diversionary airports within the distance or flight-time required by regulations governing transoceanic flights.

2-4. Grant Assurances – Definition and Which Ones to Use.

When airport owners or sponsors, planning agencies, or other organizations accept AIP funds, they must agree to certain obligations. These obligations are called grant assurances. The grant assurances require the recipients to maintain and operate their facilities safely and efficiently and in accordance with specified conditions, while some grant assurances state conditions that must occur before a grant is issued, or are specific to implementation of grant projects. These grant assurances are either included in the grant or are specifically incorporated by reference. The assurances are based on the legislation shown in Table 2-3.

Table 2-3 Statutory Basis for Grant Assurances

The following statutory reference…	Does the following…
49 USC § 47105	Gives the requirements for the FAA to approve a grant application.
49 USC § 47106	Permits the FAA to give a grant if the FAA is satisfied that a number of specific project requirements will be met.
49 USC § 47107	Requires the FAA to obtain written assurances from sponsors concerning current and future airport operations.

There are three sets of grant assurances (Airport Sponsors, Planning Agency Sponsors, and Non-Airport Sponsors Undertaking Noise Compatibility Program Projects) for AIP funded projects that are not issued through the State Block Grant Program. In addition, there are Aviation Block Grant Program Assurances that apply only to State Block Grant Program sponsors (see Paragraph 6-20). For each sponsor type, Table 2-4 lists the entities that qualify for that sponsor type, the types of projects they may receive a grant for, and the set of grant assurances they must follow.

The current versions of the assurances can be obtained from the FAA Office of Airports website (see AIP Grant Assurances link in Appendix B).

Table 2-4 Applicable Grant Assurances (by Sponsor and Project Type)

For the following type of sponsor…	Only the following entities may qualify…	And may only receive grants for the following types of projects…	And must follow this set of grant assurances…
a. Airport sponsors	Public agency owning (or leasing from another government entity) a public-use airport. A state; a political subdivision of a state (such as a city, municipality, or state agency); a tax-supported organization: or an Indian tribe or pueblo are all considered public agencies. Private entity owning a public-use airport. State acting as a sponsor for one or more specific airports in the state.	Airport master planning Airport development Noise compatibility planning Noise compatibility projects *Note: When a state is acting as a sponsor for more than one airport within the state, this is often referred to as a various locations grant.*	Airport Sponsors

Table 2-4 Applicable Grant Assurances (by Sponsor and Project Type)

For the following type of sponsor…	Only the following entities may qualify…	And may only receive grants for the following types of projects…	And must follow this set of grant assurances…
	Indian tribe or pueblo owning or leasing a public-use airport. The Secretary of the Interior, during fiscal years 2012-2018 for Midway Island Airport per Section 186(d) of the Vision 100 – Century of Aviation Reauthorization Act (Public Law 108-176) as amended by Section 102 of Division M, Title I of the Consolidated Appropriations Act, 2018 (Public Law 115-141). The Republic of the Marshall Islands, Federated States of Micronesia, and Republic of Palau (or political subdivision) during fiscal years 2012-2018 per 49 USC § 47115(j).		
b. Sponsors that are not currently airport owners (in the planning stages of acquiring or constructing the airport)	Public agency not owning or leasing a public-use airport.	Planning grants associated with acquiring or establishing a public-use airport	Planning Agency Sponsors
c. Sponsors that are not currently airport owners (after the planning is complete and before the airport is open)	Public agency not owning or leasing a public-use airport.	Acquisition of existing airports Acquisition of land in anticipation of constructing a new airport Initial airport development	Airport Sponsors
d. Planning agency sponsors	Metropolitan planning agency. State planning agency.	System planning	Planning Agency Sponsors

Table 2-4 Applicable Grant Assurances (by Sponsor and Project Type)

For the following type of sponsor…	Only the following entities may qualify…	And may only receive grants for the following types of projects…	And must follow this set of grant assurances…
e. Noise compatibility project sponsors that are not airport owners	Public agency not owning or leasing a public-use airport.	Noise compatibility planning Noise compatibility projects	Non-Airport Sponsors Undertaking Noise Compatibility Program Projects
f. State Block Grant Program sponsor	State approved by the FAA to be in the State Block Grant Program.	Planning Airport development Noise compatibility planning Noise compatibility projects	Aviation Block Grant Program *See Paragraph 6-20 to see how these relate to subgrant assurance obligations.*
g. Sponsors for compatible land use *planning* or compatible land use *projects* per 49 USC § 47141	State or local government around Medium or Large Hub Airports (if the airport has not submitted a Noise Compatibility Program to the FAA or updated the Noise Compatibility Program within the past ten years).	Compatible land use *planning* and compatible land use *projects*	Non-Airport Sponsors Undertaking Noise Compatibility Program Projects
h. Sponsors that are acquiring airport development rights from a privately-owned public-use airport under the pilot program in 49 USC § 47138(a)	State or a political subdivision of a state (such as a city, municipality, or state agency) in the same state as the airport.	Acquisition of airport development rights	None (per FAA policy)

Table 2-4 Applicable Grant Assurances (by Sponsor and Project Type)

For the following type of sponsor…	Only the following entities may qualify…	And may only receive grants for the following types of projects…	And must follow this set of grant assurances…
i. Sponsors designated under 49 USC § 47118(h)	Federal agency owning an FAA designated safety critical airport.	A project to preserve or enhance minimum airfield infrastructure if the project meets all of the following criteria: **(1)** The project is necessary to meet the minimum safety and emergency operational requirements established under 14 CFR part 139. **(2)** The project is necessary to support emergency diversionary operations for transoceanic flights in locations that meet the following criteria: **(a)** Locations within United States jurisdiction or control, or **(b)** Locations where there is a demonstrable lack of diversionary airports within the distance or flight-time required by regulations governing transoceanic flights.	None. 49 USC § 47118(h) specifically exempts these sponsors from normal AIP requirements.

2-5. Grant Assurances – Duration and Applicability.

The duration and applicability for each set of grant assurances (Airport Sponsor, Planning Agency Sponsor, Non-Airport Sponsors Undertaking Noise Compatibility Program Projects, and Aviation Block Grant Program) are listed in Table 2-5, Table 2-6, Table 2-7, and Table 2-8,

respectively. Note that the grant assurance numbers are different between these four sets of grant assurances.

Table 2-5 Duration and Applicability of Grant Assurances (Airport Sponsors)

Assurances that…	Include (by assurance # if applicable)…
a. Must be met before a grant is offered	#2 Responsibility and Authority of the Sponsor #3 Sponsor Fund Availability #4 Good Title #6 Consistency with Local Plans #7 Consideration of Local Interest #8 Consultation with Users #9 Public Hearings #12 Terminal Development Prerequisites
b. Apply until the grant is closed	#1 General Federal Requirements (except for 49 CFR part 23) #10 Air and Water Quality Standards #14 Minimum Wage Rates #15 Veteran's Preference #16 Conformity to Plans and Specifications #17 Construction Inspection and Approval #18 Planning Projects #32 Engineering and Design Services #33 Foreign Market Restrictions #34 Policies, Standards, and Specifications #35 Relocation and Real Property Acquisition
c. Apply for three years after the grant is closed	#13 Accounting System, Audit, and Record Keeping Requirements #26 Reports and Inspections

Table 2-5 Duration and Applicability of Grant Assurances (Airport Sponsors)

Assurances that…	Include (by assurance # if applicable)…
d. Apply for the useful life of the project (not to exceed 20 years from the grant acceptance date) except in the case of a land acquisition grant, for which the useful life is indefinite and the assurance obligations do not expire.	#5 Preserving Rights and Powers #11 Pavement Preventive Maintenance (This applies to all of the airfield pavement on the airport, not just the specific pavement in the grant.) #19 Operations and Maintenance #20 Hazard Removal and Mitigation #21 Compatible Land Use #22 Economic Nondiscrimination #24 Fee and Rental Structure #27 Use by Government Aircraft #28 Land for Federal Facilities #29 Airport Layout Plan #36 Access by Intercity Buses #37 Disadvantaged Business Enterprises (See 49 CFR parts 23 and 26, since certain program requirements may extend the obligation beyond the 20 year period, while the DBE requirements for the project apply until the project is closed.) #38 Hangar Construction #39 Competitive Access
e. Last for as long as the airport is owned and operated as an airport	#23 Exclusive Rights #25 Airport Revenue #30 Civil Rights #31 Disposal of Land

Table 2-6 Duration and Applicability of Grant Assurances (Planning Agency Sponsors)

Assurances that…	Include (by assurance # if applicable)…
a. Must be met before a grant is offered	#2 Responsibility and Authority of the Sponsor #3 Sponsor Fund Availability #5 Consistency with Local Plans

Table 2-6 Duration and Applicability of Grant Assurances (Planning Agency Sponsors)

Assurances that…	Include (by assurance # if applicable)…
b. Apply until the grant is closed	#1 General Federal Requirements (except for 49 CFR part 23) #4 Preserving Rights and Powers #7 Planning Projects #9 Civil Rights #10 Engineering and Design Services #11 Foreign Market Restrictions #12 Policies, Standards, and Specifications #13 Disadvantaged Business Enterprises (See 49 CFR parts 23 and 26, since certain program requirements may extend the obligation beyond the 20 year period)
c. Apply for three years after the grant is closed	#6 Accounting System, Audit, and Record Keeping Requirements #8 Reports and Inspections The three year duration for record keeping is a requirement of The Single Audit Act of 1984, Public Law 98-502 (as amended in 1996, Public Law 104-156, as amended and recodified at 31 USC § 7501 et seq.) and 2 CFR § 200.333-200.337.

Table 2-7 Duration and Applicability of Grant Assurances (Non-Airport Sponsors Undertaking Noise Compatibility Program Projects)

Assurances that…	Include (by assurance # if applicable)…
a. Must be met before a grant is offered	#2 Responsibility and Authority of the Sponsor #3 Sponsor Fund Availability #4 Good Title #6 Consistency with Local Plans #7 Consideration of Local Interest

Table 2-7 Duration and Applicability of Grant Assurances (Non-Airport Sponsors Undertaking Noise Compatibility Program Projects)

Assurances that…	Include (by assurance # if applicable)…
b. Apply until the grant is closed	#1 General Federal Requirements #9 Minimum Wage Rates #10 Veteran's Preference #11 Conformity to Plans and Specifications #12 Construction Inspection and Approval #18 Engineering and Design Services #19 Foreign Market Restrictions #21 Relocation and Real Property Acquisition
c. Apply for three years after the grant is closed	#8 Accounting System, Audit, and Record Keeping Requirements #16 Reports and Inspections
d. Apply for the useful life of the project (not to exceed 20 years from the grant issuance date) except in the case of a land acquisition grant, for which the useful life is indefinite and the assurance obligations do not expire.	#5 Preserving Rights and Powers #13 Operations and Maintenance #14 Hazard Prevention #15 Compatible Land Use #22 Disadvantaged Business Enterprises (See 49 CFR parts 23 and 26, since certain program requirements may extend the obligation beyond the 20 year period), while the DBE requirements for the project apply until the project is closed.
e. Last for as long as the airport is owned and operated as an airport	#17 Civil Rights #20 Disposal of Land

Table 2-8. Duration and Applicability of Grant Assurances (Aviation Block Grant Program)*

Assurances that…	Include (by assurance # if applicable)…
a. Must be met before a grant is offered	#7 State Resources
b. Apply until the grant is closed	#1 Incorporated in Grant Agreement #2 General Federal Requirements #6 Environmental Responsibilities
c. Apply for three years after the grant is closed	#3 Program Reporting
d. Last for as long as the state is in the Block Grant Program	#5 Compliance Requirements
e. Meets the duration of the following assurances: Airport Sponsors and Non-Airport Sponsors Undertaking Noise Compatibility Program Projects	#4 Obligated to Standard Assurances

* Block grant states must ensure that subrecipients are obligated to the applicable grant assurances by attaching the appropriate set(s) of grant assurances to each subgrant. In addition, block grant states that perform actions for the subrecipient that are beyond their block grant state administrative responsibilities must comply with all sponsor assurances associated with those actions.

2-6. Sponsor Qualification Criteria.

For an ADO to issue a grant, the FAA must first determine that the sponsor is able to assume the responsibilities defined in the grant. Details of this requirement are outlined in 49 USC § 47105, § 47106 and § 47107. The general sponsorship criteria are different for public agencies and private entities. The criteria for public agencies are listed in Table 2-9 and for private entities are listed in Table 2-10. Additional criteria, requirements, and considerations that apply to specific sponsorship situations are listed in Table 2-11. These requirements do not

apply to Federal agency sponsors of an FAA designated safety critical airport eligible under 49 USC § 47118(h).

Table 2-9 Legal and Financial Requirements for Public Agencies

The criteria are…
a. Per 49 USC § 47105(b)(2), a sponsor must be proposing a project for a public-use airport included in the current National Plan of Integrated Airport Systems (NPIAS).
b. Per 49 USC § 47106(a)(3), a sponsor must be financially able to assume and carry out the sponsor's duties in the AIP project application and grant agreements. This includes being able to finance the sponsor share of grants. Per FAA policy, if a public sponsor has an open grant from a Federal agency that requires compliance with 2 CFR part 200 Subpart E (OMB Circulars A-87, Cost Principles for State, Local, and Indian Tribal Governments and OMB Circulars A-102, Grants and Cooperative Agreements with State and Local Governments), this requirement is met. Otherwise, the ADO must work with ACO-100 to make this determination.
c. Per 49 USC § 47106(b)(1), the sponsor, another public agency, or the Federal government must have good title to the areas of the airport used or intended to be used for the landing, taking off, or surface maneuvering of aircraft. Per FAA policy, if the good title requirement is not met prior to the grant being issued, the acquisition of good title must be in process. Also per FAA policy, the sponsor can meet this good title requirement by leasing from another public agency that holds good title, provided that the duration of the lease is at least as long as the useful life of the project. (A lease from a private entity does not provide good title.)
d. Per 49 USC § 47106(a)(5), a sponsor must legally have the authority to act as a sponsor. The sponsor must not be encumbered by any existing agreements that would prevent it from acting as a sponsor. Legal authority to be a public sponsor comes from its state authorizing legislation, also called state enabling legislation. The authorizing legislation must clearly provide the sponsor the authority to carry out the obligations and responsibilities of sponsorship. Per FAA policy, the sponsor must provide a copy of the state authorizing legislation to the ADO prior to the sponsor applying for its first grant. Per FAA policy, the ADO has the option to require an opinion from the sponsor's attorney regarding whether the sponsor has the legal authority to act as a sponsor.
e. Per 49 USC § 47106(d), if a sponsor has previously received a grant, the sponsor must be in compliance with its current grant obligations. The ADO and regional office must obtain a list of the sponsors that are not in compliance from ACO-100.
f. Per 49 USC § 47107(d), the sponsor must be able to maintain and operate the airport as a public-use airport to FAA standards.
g. Per 2 CFR part 180, a sponsor must not be suspended or debarred by the Federal government.

Table 2-10 Legal and Financial Requirements for Private Entities

The criteria are…
a. Per 49 USC § 47105(b)(2), a sponsor must be proposing a project for a public-use airport included in the current National Plan of Integrated Airport Systems (NPIAS).
b. Per 49 USC § 47102(26)(B), the sponsor must be the private owner of a public-use airport. 49 USC § 47102(22)(B) defines a privately-owned airport as a public use airport if it is used or intended to be used for public purposes and meets one of the following conditions: **(1)** Is a reliever airport. The FAA defines which airports are privately owned reliever airports in the current version of FAA Order 5090.3, Field Formulation of the National Plan of Integrated Airport Systems (NPIAS). **(2)** The FAA has determined that the airport has at least 2,500 passenger boardings each year and receives scheduled passenger aircraft service.
c. Per 49 USC § 47106(b), the sponsor must have good title to the airport property. Per FAA policy, if the good title requirement is not met prior to the grant being issued, the acquisition of good title must be in process. Also per FAA policy, the sponsor can meet this good title requirement by leasing from a public agency that holds good title, provided that the duration of the lease is at least as long as the useful life of the project.
d. Per 49 USC § 47107(d), the sponsor must be able to maintain and operate the airport as a public-use airport to FAA standards.
e. Per 49 USC § 47106(a)(3), a sponsor must be financially able to assume and carry out the sponsor's duties in the AIP project application and grant agreements. If a private sponsor can provide documentation that a certified public accounting firm has determined they are financially able to assume and carry out the sponsor duties, this requirement has been met. The certified public accounting firm must have reviewed the sponsor's financial documentation and affirmed the sponsor has sufficient funds on hand, or a combination of funds and agreements with airport tenants, that will provide adequate income to finance the sponsor share and costs of operating/maintaining the airport for at least 10 years in the future. Otherwise, the ADO must have obtained concurrence from ACO-100 to proceed.
f. Per 49 USC § 47106, a sponsor must legally have the authority to act as a sponsor. The sponsor must not be encumbered by any existing agreements that would prevent it from acting as a sponsor. The ADO may require an opinion of the sponsor's attorney of its legal authority to act as a sponsor and carry out its responsibilities under the grant agreement.
g. Per 49 USC § 47106(d), if a sponsor has previously received a grant, the sponsor must be in compliance with its current grant obligations. The ADO and regional office may obtain a list of the sponsors that are not in compliance from ACO-100.
h. Per 2 CFR part 180, a sponsor must not be suspended or debarred by the Federal government.

Table 2-11 Additional Criteria, Requirements, and Considerations for Specific Sponsorship Situations

For the following sponsorship situation…	The additional criteria, requirements, and considerations apply…
a. A state acting as a sponsor for one or more specific airports (*Note: When a state is acting as a sponsor for more than one airport within the state, this is often referred to as a various locations grant.*)	**(1)** 49 USC § 47105(a)(1)(B) allows state sponsorship of development and planning projects for one or more airports provided: **(a)** The sponsor of each airport consents in writing to the state sponsorship. **(b)** There is administrative merit and aeronautical benefit to the state sponsorship. Per FAA policy, the ADO makes this determination. **(c)** There is written documentation that the state will comply with the required grant conditions and assurances. Per FAA policy, the ADO makes this determination. **(2)** 49 USC § 47102(27) defines a state as a state of the United States, the District of Columbia, Puerto Rico, the Virgin Islands, American Samoa, Guam, and the Trust Territory of the Pacific Islands (Republic of the Marshall Islands, the Federated States of Micronesia, the Commonwealth of the Northern Mariana Islands, the Republic of Palau). **(3)** This sponsorship type is not the State Block Grant Program. **(4)** The state must provide the signed copy of FAA Form 5100-128, Agreement on State Sponsorship and Airport Sponsor Obligations (see the AIP Forms link in Appendix B) to the ADO with the grant application and the ADO must approve or disapprove any changes or addendum to the agreement.
b. A state approved by the FAA to be in the block grant program	**(1)** State block grant sponsorship is restricted to states selected for the State Block Grant Program as discussed in Section 2 of Chapter 6. **(2)** Under the State Block Grant Program, the state is the sponsor. The state then issues subgrants to the airports that are included in the program.
c. A public agency not owning or leasing a public-use airport	**(1)** During the acquisition or establishment of an airport, the regional division manager must have made two separate sponsor designations. **(2)** First, the regional division manager may designate a public agency as a sponsor for a planning grant to acquire or establish a public-use airport. **(3)** Second, if the regional division manager, ADO, and the sponsor decide to continue with the airport acquisition or establishment, the regional division manager must separately designate that the sponsor is legally and financially able to assume the responsibilities of a sponsor. This is because the Planning Agency Sponsors Assurances are less extensive than the Airport Sponsors Assurances.

Table 2-11 Additional Criteria, Requirements, and Considerations for Specific Sponsorship Situations

For the following sponsorship situation…	The additional criteria, requirements, and considerations apply…
d. A metropolitan planning agency or a state planning agency	**(1)** A planning agency sponsor must be authorized by the laws of the state (or states or political subdivisions concerned) to engage in area-wide planning for the areas in which the grant funding is to be used. **(2)** Typical state agencies that may qualify as a planning agency sponsor are planning offices, aeronautics commissions, and departments of transportation. **(3)** Typical metropolitan planning agencies include metropolitan planning organizations, councils of government, and regional planning commissions.
e. Entities acting as sponsor agents (including channeling act states)	**(1)** A public agency may act as an agent of the sponsor without being considered a co-sponsor. These agents are not true sponsors or co-sponsors, but they do play a role in the AIP grant process. **(2)** Channeling is the most common type of agent agreement. State channeling of Federal airport grants occurs in various forms within numerous states. Normally, when an airport is in a channeling act state, the sponsor submits payment request information to the state, who then submits the request to the FAA. In this case, the FAA makes payments to the state, and the state then distributes the payment to the sponsor. In some cases, the state may also provide technical oversight and review, which may include state submittal of grant applications and/or closeout requests. This is based on state enabling legislation, rather than Federal law. In many cases, the state also signs the grant agreements. Channeling agreements based on state enabling legislation do not need approval from the ADO. **(3)** Except for channeling act agreements, other agent-sponsor agreements require prior ADO review and regional division manager approval in order to be valid. These agreements are rare and must include the terms, conditions, powers, responsibilities, and relationship of the agent to the sponsor. The agreement may be in the form of a resolution or ordinance, and a copy of the agreement, along with regional division manager's concurrence, must be kept on file in the ADO.

Table 2-11 Additional Criteria, Requirements, and Considerations for Specific Sponsorship Situations

For the following sponsorship situation…	The additional criteria, requirements, and considerations apply…
f. Two or more entities acting as co-sponsors	**(1)** The FAA has determined that the public agencies either independently (or jointly) meet the sponsorship requirements. The ADO agrees to the co-sponsorship by issuing the grant. **(2)** Each of the co-sponsors is individually bound to the terms and conditions of the grant agreement unless their respective rights and obligations are otherwise set forth in a written agreement. The agreement must, as a minimum, set forth: **(a)** The responsibilities of each cosponsor to the other(s) with respect to the accomplishment of the proposed development, operation, and maintenance of the airport; **(b)** The obligations which each will assume to the United States: **(c)** The names of the sponsor or sponsors who will accept the grant agreement; and **(d)** The names of the sponsor or sponsors who will accept receipt of and disburse grant payments. **(3)** Channeling act states are not considered to be co-sponsors, they are sponsor agents even if they sign the grant agreement. **(4)** Any two or more public agencies may submit a request to the FAA to co-sponsor a project. The FAA will consider the relationship of the proposed cosponsors to the airport. **(5)** The FAA is not a party to a co-sponsorship agreement. Therefore, disagreements between co-sponsors must be addressed at a local or state level, as appropriate.
g. Sponsors for compatible land use *planning* or compatible land use *projects* per 49 USC § 47141	**(1)** The sponsor has authority to plan and adopt land use compatibility plans and control measures, including zoning, in the planning area in and around the airport. **(2)** The sponsor and the airport must enter into a written agreement to prepare the compatible land use plan cooperatively.
h. Sponsors that are acquiring airport development rights from a privately-owned public-use airport under the pilot program in 49 USC § 47138(a)	**(1)** The additional sponsor requirements are contained in Section 8 of Chapter 6, which covers the airport development rights pilot program.

2-7. State Sponsorship Benefits.

One of the benefits of having a state act as a sponsor for more than one airport (like for various location grants) is that it may reduce ADO, state, or sponsor workload by combining multiple grants into one. It may also provide economies of scale through state sponsorship. For instance, equipment can be acquired in quantity at potentially lower unit cost, several small and similar construction projects can be accomplished or related airport master plans or airport layout plans can be prepared. Co-sponsorship of projects between the airport and the state remains an alternative to this procedure if the airport, the state and ADO believe this to be more efficient.

2-8. Sponsorship Determination Process.

The FAA Office of Airports is responsible for making sponsor determinations for AIP. The process differs by entity type as outlined below. For Federal agency sponsors of an FAA designated safety critical airport eligible under 49 USC § 47118(h), this determination will be made by APP-1.

a. Public Agencies. Per the current version of FAA Order 1100.145, Delegations of Authority, Appendix 4, the regional division manager is delegated to take actions with respect to their function and assigned responsibilities, which are detailed in the current version of FAA Order 1100.5, FAA Organization – Field. These responsibilities include making sponsorship determinations for public agencies. The regional division manager may document their determination in one of two ways. First, the regional division manager may make a written designation of sponsorship prior to issuing a grant. Second, if there is no controversy or complexity, the regional division manager may make an implicit determination by allowing the ADO to issue a grant to the proposed sponsor. The FAA has determined that it is preferable to have a written determination of sponsorship prior to the regional division manager issuing the first grant to a new sponsor. Therefore, for determinations made by the regional division manager after the publication of this Handbook, the regional division manager must make a written determination prior to issuing the first grant to the new sponsor. The regional division manager and ADO may contact APP-500, ACO-100, or regional legal counsel for assistance with these sponsorship determinations.

b. Private Entities. APP-1 makes the sponsorship determination for a private entity. APP-1 must have made a written designation of sponsorship prior to the ADO issuing the first grant (an implicit determination is not an option).

c. Public Private Entities. In addition, a sponsor may also fall in the rare public-private sponsorship category. This is where an airport privatizes some, but not all, of the management of the airport. In this case, the regional division manager and ADO must consult ACO-100 and APP-500 for direction on how to proceed. APP-1 must have made a written designation of sponsorship prior to the ADO issuing the first grant (an implicit determination is not an option).

2-9. Transfer of Sponsorship.

In order for an existing sponsor to transfer the sponsorship of an obligated airport to another entity, the sponsor must obtain pre-approval from the FAA. Per the current version of FAA Order 5190.6, FAA Airport Compliance Manual, the existing sponsor must first obtain

ARP-1 pre-approval to release the entire airport. Then the FAA must make a sponsorship determination for the new entity as discussed in Paragraph 2-8. The existing sponsor cannot transfer sponsorship unless ARP-1 approves the release of the airport and the FAA makes a positive sponsorship determination for the new sponsor. The ADO must refer to the current version of FAA Order 5190.6, FAA Airport Compliance Manual for specific sponsor transfer requirements, including the willingness of the sponsor to take on the applicable grant assurances and obligations.

The ADO and regional office must contact APP-500 and ACO-100 to determine the current process prior to initiating the review of a sponsorship transfer request.

2-10. Conflicting Grant Requests from More than One Entity.

Where more than one entity applies for a grant for the same or similar project, and where identification of the appropriate agency empowered to do the project is not clear, the regional division manager will designate the eligible applicant based on which one is best equipped to do the project. This is a rare situation and is generally related to a planning project. APP-400 can provide assistance to the regional division manager and the ADO in these cases.

This page has been intentionally left blank.

Chapter 3. What projects can be funded?

Section 1. List of 16 Requirements for Project Funding.

3-1. List of 16 Requirements for Project Funding.

A project must meet the 16 general requirements listed in Table 3-1 in order for the ADO to consider it for AIP funding. The ADO must not approve projects that do not meet these requirements. The remaining sections of this chapter discuss each of these 16 general requirements in greater detail.

Table 3-1 The 16 General Requirements for Project Funding

The general requirements are…	As found in…
a. Is the project eligible?	Section 2
b. Is the project justified?	Section 3
c. Is the project on airport property (with good title)?	Section 4
d. Is the project on the FAA approved airport layout plan?	Section 5
e. Has the sponsor satisfied the intergovernmental review and airport user consultation requirements?	Section 6
f. Has the FAA completed an environmental finding for the project?	Section 7
g. Will the project result in a usable unit of work?	Section 8
h. Will the project be planned, designed, and/or constructed to FAA standards?	Section 9
i. Has the project been procured correctly?	Section 10
j. Are the project costs allowable?	Section 11
k. Are the project costs necessary to accomplish the project (Allowable Rule #1)?	Section 12
l. Were the project costs incurred after the grant was executed (Allowable Rule #2)?	Section 13
m. Are the project costs reasonable (Allowable Rule #3)?	Section 14
n. Is this the only Federal grant containing these project costs (Allowable Rule #4)?	Section 15
o. Are the project costs within the allowable Federal share (Allowable Rule #5)?	Section 16
p. Can the project be completed without unreasonable delay?	Section 17

Section 2. Project Eligible.

3-2. The Act Establishes the General Types of Eligible Projects.

The Act identifies the general types of projects that may be funded with AIP, which are airport planning, airport development, noise compatibility planning, and noise compatibility projects (see 49 USC § 48103).

Only these types of projects are eligible and can be funded. The Federal Appropriations Law prohibits the ADO from funding ineligible projects (as discussed in Paragraph 1-10). If this Handbook does not list a project as eligible, the ADO *must* receive an eligibility determination from APP-500 in order to proceed with the project. This effort will maintain consistency on a national basis.

However, just because a project is eligible under the Act, it does not mean that the ADO can fund the project. The project *must* meet the other requirements further outlined in this chapter.

3-3. Project Requirement Tables (in the Appendices by Project Type).

The tables in the appendices contain project specific requirements for projects that are eligible under the Act. These tables have been broken out into the appendices for ease of use. ADOs *must not* use these appendices independently. They must also apply the 16 general project requirements outlined in this chapter to determine if a project can be funded with AIP.

3-4. Prohibited Project and Unallowable Cost Tables.

Appendix C contains tables that the ADO can use to help determine if the FAA has previously identified a project or cost to be ineligible or unallowable.

3-5. Only Specific Equipment is Eligible under the Act.

49 USC § 47102(3) lists the specific pieces of equipment eligible under AIP. No other pieces of equipment (including associated computer hardware or software for the equipment) are eligible unless AAS-1 has made a written determination that the equipment will contribute significantly to airport safety or security.

3-6. Eligibility of Maintenance, Rehabilitation, Reconstruction, and Replacement Projects.

These concepts cause much confusion. The goal for all of the actions above is to obtain a functioning unit as the final outcome. What differentiates these concepts is the level of effort and the resulting change in useful life. As the work effort for a category increases, the question of whether the work belongs in the category surfaces (for example, determining when timely maintenance is actually rehabilitation.) As a result, the conclusion of which category the project falls into rests with the specific circumstances. Table 3-2 explains the differences between these concepts and Table 3-3 provides eligibility examples.

Table 3-2 Differences between Maintenance, Rehabilitation, Reconstruction, and Replacement Projects

Item	Explanation	Eligibility
a. Maintenance (including minor repair)	Maintenance includes any regular or recurring work necessary to preserve existing airport facilities in good condition, any work involved in the care or cleaning of existing airport facilities, and any incidental or *minor* repair work on existing airport facilities. Minor repair is a stopgap measure taken by a sponsor to keep a facility operational until the sponsor can complete a rehabilitation, reconstruction, or replacement project. Replacing individual parts and mending portions of a facility are considered minor repair.	Maintenance work is not airport development as defined in the Act. Therefore, it is not eligible for AIP funding except for one specific situation. 49 USC § 47102(3)(H) provides the exception for routine runway, taxiway, or apron maintenance at nonhub primary airports and nonprimary airports. Typical runway, taxiway, or apron maintenance includes routine cleaning, filling, and or sealing of longitudinal and transverse cracks; grading pavement edges; maintaining pavement drainage systems; patching pavement; and remarking pavement areas.
b. Rehabilitation	Rehabilitation is a more comprehensive restoration of an original functionality that results in a piece of pavement, piece of equipment, or building with a useful life of at least 10 years, or half of the useful life per Table 3-7, whichever is less. This approach deals with the facility or item as a whole and is more far-reaching than the minor repair discussed under maintenance.	Rehabilitation is generally eligible (but must still be justified).
c. Reconstruction	Reconstruction is a complete restoration of an original functionality that results in a virtually new piece of pavement, piece of equipment, or building with a use life as listed in Table 3-7.	Reconstruction is generally eligible (but must still be justified).

Table 3-2 Differences between Maintenance, Rehabilitation, Reconstruction, and Replacement Projects

Item	Explanation	Eligibility
d. Replacement (including replacement of damaged equipment)	Replacement is building a complete new facility or replacing a whole new piece of equipment that has reached the end of its useful life.	Replacement is generally eligible (but must still be justified) provided; **(1)** The facilities or equipment was destroyed, become obsolete, worn out, or otherwise deemed inoperable through no fault of the sponsor under normal use. An example of this may be replacement of Engineered Materials Arresting System (EMAS) panels that were destroyed by an aircraft, only if the sponsor can prove that there is no other avenue, such as insurance, for funding the replacement. **(2)** The sponsor has determined that there are no other avenues for replacement (such as through insurance or by another Federal agency responsible for such disasters).

Table 3-3 Examples of Maintenance, Rehabilitation, Reconstruction, and Replacement Projects

The following project of…	Is considered…	And is…
a. Applying a herbicide on cracks in asphalt pavement	Maintenance	Not eligible at any airport
b. Changing fluid on a scheduled basis to keep a vehicle's engine and parts functional	Maintenance	Not eligible at any airport
c. Mowing the airfield grass	Maintenance	Not eligible at any airport
d. Sweeping airfield pavement	Maintenance	Not eligible at any airport
e. Re-topping trees for approach protection if this work was previously completed in an AIP grant	Maintenance	Not eligible at any airport
f. Replacing airfield light bulbs	Maintenance	Not eligible at any airport
g. Replacing runway lighting fixtures due to snow plow damage	Maintenance	Not eligible at any airport

Table 3-3 Examples of Maintenance, Rehabilitation, Reconstruction, and Replacement Projects

The following project of…	Is considered…	And is…
h. Replacing a component of an existing eligible equipment or system. Examples include replacement of a regulator for an airfield lighting circuit; replacement of a transmission in an Aircraft Rescue and Firefighting (ARFF) truck; and replacement of a sensor for an AWOS system.	Maintenance	Not eligible at any airport
i. Replacing carpeting (or other flooring, such as tiles or terrazzo), painting, wall coverings, doors or ceiling tiles in a terminal not required as a result of an eligible terminal project	Maintenance	Not eligible at any airport
j. Replacing public-use seating (including fixed tables and counters) in a terminal that is bolted or affixed to the terminal wall or floor, if the replacement is not associated with a larger terminal project.	Maintenance	Not eligible at any airport
k. Replacing small sections of roofing in terminals and airport buildings	Maintenance	Not eligible at any airport
l. Replacing faded sign panels	Maintenance or incidental costs, depending on the situation	See Paragraph J-3 for details.
m. Minor work or repair on a turf or aggregate runway	Maintenance	Eligible at a nonhub primary airports or nonprimary airport (subject to adequate justification)
n. Performing spall repair, crack sealing, or repair of a small portion of the total taxiway, runway or apron pavement	Maintenance	Eligible at a nonhub primary airports or nonprimary airport (subject to adequate justification)
o. Applying seal coats or slurry seal, or resealing of joints for a major portion of a taxiway, runway or apron pavement	Rehabilitation	Eligible at any airport (subject to adequate justification)
p. Rehabilitation of a turf or aggregate runway	Rehabilitation	Eligible at any airport (subject to adequate justification)
q. Replacing panels and replacing all joint seal material on concrete pavement to obtain at least 10 years of useful life	Rehabilitation	Eligible at any airport (subject to adequate justification)

Table 3-3 Examples of Maintenance, Rehabilitation, Reconstruction, and Replacement Projects

The following project of…	Is considered…	And is…
r. Milling and repaving an apron to obtain at least 10 years of useful life	Rehabilitation	Eligible at any airport (subject to adequate justification)
s. Completely renovating the terminal restrooms	Rehabilitation	Eligible at any airport (subject to adequate justification)
t. Performing lid rehabilitation for Engineered Material Arresting System (EMAS) blocks installed with AIP funds prior to fiscal year 2007 (after fiscal year 2007, the manufacturer began fully encasing the blocks, eliminating the need for lid replacement)	Rehabilitation	Eligible at any airport (subject to adequate justification)
u. Bringing a runway down to its subgrade and completely repaving it	Reconstruction	Eligible at any airport (subject to adequate justification)
v. Replacement of sign panels required by a change in airfield geometry or new sign panel specifications	Replacement	Eligible at any airport (subject to adequate justification)
w. Purchasing an ARFF vehicle to replace one paid for with AIP funding	Replacement	Eligible at any airport (subject to adequate justification)
x. Replacement of damaged Engineered Material Arresting System (EMAS) panels that were damaged by an aircraft and the sponsor can prove that there is no other avenue for funding the replacement, such as the aircraft owner's or sponsor's insurance	Replacement	Eligible at any airport (subject to adequate justification)
y. Replacement of terminal escalators	Replacement	Eligible at any airport (subject to adequate justification)

3-7. Difference between AIP and Passenger Facility Charge (PFC) Eligibility.

While closely related, there are differences between project eligibility between AIP and the PFC program. These differences are discussed in the current version of FAA Order 5500.1, Passenger Facility Charge.

Section 3. Project Justified.

3-8. Three Basic Tests for Project Justification.

The ADO must apply the three basic tests in Table 3-4 to determine if a project is justified. The ADO must not fund projects or project elements that are not justified based on the following three tests. Table 3-5 contains examples where one or more of the following tests are not met.

Table 3-4 Three Basic Tests to Determine if a Project is Justified

The three basic tests to determine if a project is justified are…
a. The Project Advances an AIP Policy. The ADO must verify that the project advances at least one of the AIP policies contained in 49 USC § 47101. The basic goals and objectives in these policies include airport safety, airport security, airport capacity, meeting an FAA standard, preserving airport infrastructure through reconstruction or rehabilitation, protecting and enhancing the environment, minimizing aircraft noise impacts, and airport planning. AIP funds must not be used for a project that does not specifically advance one of the AIP policies.
b. There is an Actual Need. Per FAA policy, the ADO must determine if there is an actual need for the project at the airport within the next five years (per the definition near-term development per the current version of Advisory Circular 150/5070-6, Airport Master Plans). This includes all subcomponents of the project.
c. The Project Scope is Appropriate. The ADO must determine that only the elements that are required to obtain the full benefit of the project are included in the project scope. Any elements that do not meet these criteria must stand on their own separate merit and justification. The current version of FAA Order 5100.39, Airports Capital Improvement Plan, discusses this concept in further detail in the discussions on overall development objective.

Table 3-5 Examples of Projects Not Meeting the Basic Justification Tests

For the following situation…	Is not justified because…
a. A sponsor has a runway shown on their ALP and would like to build it to increase capacity. However, the airport already has adequate capacity and will continue to have adequate capacity in the foreseeable future.	This project does not advance an AIP policy. The actual need does not exist.
b. A sponsor would like to build a runway extension to attract a new class of aircraft or for marketing purposes. In this case, the need is speculative and not based on documented future need.	The actual need does not exist.
c. A sponsor would like include dorm rooms and day rooms in an ARFF building expansion for an airport with a class of certification that does not require 24/7 ARFF personnel.	This project scope is not appropriate.

Table 3-5 Examples of Projects Not Meeting the Basic Justification Tests

For the following situation…	Is not justified because…
d. A sponsor would like to replace its existing asphalt pavement with concrete even though the pavement section has existing useful life.	The actual need does not exist.

3-9. Justification Requirements for Safety and Security Projects.

Safety and security projects are not automatically justified. In all cases, the ADO must review these projects to determine if the project meets the eligibility and justification requirements outlined in this Handbook. Safety and security projects that require additional review by the ADO include, but are not limited to, those listed in Table 3-6.

Table 3-6 Safety and Security Projects Proposals Requiring Additional ADO Review

Examples of proposals that require additional ADO review for eligibility and justification…
a. A proposal that addresses a14 CFR part 139 violation
b. A written recommendation by a 14 CFR part 139 certification inspector
c. A proposed runway incursion prevention measure
d. A Runway Safety Action Team recommendation
e. An item included in an Airport Emergency Plan
f. An item included in an Airport Certification Manual
g. An item included in a wildlife hazard assessment (or associated wildlife hazard management plan) or wildlife hazard site visit (or associated written sponsor adoption of the site visit recommendations).
h. An item included in an airport's approved 49 CFR part 1542 security program (typically eligible security projects are included in Appendix L and Appendix N and the commonly requested security projects that have been determined ineligible are included in Appendix C).

3-10. Justification Requirements for Unclassified Airport Projects.

Very-low activity nonprimary airports that are not classified as National, Regional, Local, or Basic airports in the latest edition of the FAA Asset or the latest NPIAS report are designated as *unclassified* airports. Because these airports are low-activity, the only projects for which these airports are justified are: projects to rehabilitate the airport's existing primary runway pavement

at a frequency not to exceed 10 years; a one-time project to remove obstructions from each end of the primary runway; and runway maintenance projects allowed per 49 USC § 47102(3)(H).

Other projects, including those needed to correct design standards issues, may be considered by the ADO in limited cases where extraordinary justification exists. The ADO must not program these types of projects unless the project has received pre-approval by APP-500. APP-500 provides the current pre-approval process for each fiscal year in an internal Regional Guidance Implementation Memo.

3-11. The Use of Critical Aircraft for Justification.

For some projects, the ADO must determine if a project is justified based on the applicable critical aircraft for the project. More than one critical aircraft may control the design of any specific airport's different facility features, such as runway length, strength of paved areas or lateral separations in airfield layout. The ADO must use the current version of Advisory Circular 150/5000-17, Critical Aircraft and Regular Use Determination, to determine the critical aircraft for specific projects and airport types. For funding purposes, it is APP-500 policy that the annual operations requirement for critical aircraft must not include military or federally-owned aircraft.

The ADO has the option to determine that a project is justified based on existing activity at the airport or activity that is projected to be at the airport within the next five years. The ADO has the option to require the sponsor to submit letters of support from airport users if the justification is based on projected activity. The letter must describe the airport user's plans or anticipated activity by the most demanding airplane, or critical aircraft.

3-12. Useful Life Test for Equipment and Facilities.

The useful life of the facility or equipment being rehabilitated, reconstructed or replaced must have been met in order for the project to be funded. The exception is when the ADO has determined that the rehabilitation, reconstruction, or replacement is necessary for safety reasons. Table 3-7 provides a list of minimum useful lives.

Although the minimum useful life of facility, equipment or vehicles may have been met, this does *not* automatically mean that the rehabilitation, reconstruction or replacement of the item is needed. Simply meeting the minimum useful life does not justify replacing the item if the facility, equipment, or vehicle is performing as intended.

Table 3-7 Minimum Useful Life

Project Type	Useful Life
a. All construction projects (unless listed separately below)	20 years
b. All equipment and vehicles (unless listed separately below)	10 years
c. Pavement rehabilitation (not reconstruction, which is 20 years)	10 years
d. Asphalt seal coat, slurry seal, and joint sealing	3 years
e. Concrete joint replacement	7 years
f. Airfield lighting and signage	10 years
g. ARFF vehicles	15 years
h. ARFF structural gear (firefighting suits), which has less heat insulation than proximity gear (per the National Fire Protection Association 1971 Standard on Protective Ensembles for Structural Firefighting and Proximity Firefighting)	7 years
i. ARFF proximity gear (firefighting suits), which is also referred to as slicks, bunker, or turn out gear (per the National Fire Protection Association 1971 Standard on Protective Ensembles for Structural Firefighting and Proximity Firefighting)	5 years
j. NAVAIDs and Weather Reporting Equipment	15 years
k. Buildings	40 years
l. Land	Unlimited
m. Loading Bridges	20 years
n. Fencing	20 years

3-13. Benefit-Cost Analysis (BCA) for NAVAIDs and Weather Reporting Equipment.

If a BCA is required for a NAVAID or weather reporting equipment, this requirement is listed in the appendices for that specific project. The ADO must contact APP-500 for the latest tools and procedures for this process.

3-14. BCAs for Capacity Projects Using Discretionary Funds.

A BCA is a tool to determine if a project's benefits outweigh its costs. If the ADO is considering funding a capacity project with AIP discretionary funding, 49 USC § 47115(d) requires that the FAA review a BCA. It is FAA policy that, as of October 28, 2011, a BCA is only required if the sponsor is requesting more than $10 million in discretionary funding over the life of the project.

This is a key change to the detailed BCA preparation guidance contained in the document titled FAA Airport Benefit-Cost Analysis Guidance (see Appendix B for link). A few of the more important highlights from this document are included below.

a. Capacity Project Definition. This definition is included in Appendix A. Except for the two types of projects listed in Table 3-8, it is FAA policy that the ADO must obtain a joint APP-400 and APP-510 concurrence on whether the project is considered capacity and therefore requires a BCA.

Table 3-8 Projects Where the FAA Has Determined if a BCA is Required

For the following project…	A BCA is…
a. Construct a new airport that is not replacing an existing airport of any type or obligation status.	**Required.** By definition, the airport will create capacity where none currently exists.
b. Rehabilitate/reconstruct eligible airfield infrastructure with no increase to the original functionality.	**Typically Not Required, although the FAA may require a BCA.** Although the FAA Airport Benefit-Cost Analysis Guidance (see Appendix B for link) requires that the FAA make this determination on a case by case basis, the FAA has determined that these projects are cost beneficial and typically do not require a separate BCA.

b. Associated Work. When preparing the BCA, the sponsor must include all of the development items directly associated with the capacity project in the BCA. The sponsor cannot pull out pieces of the associated work, even if the sponsor believes the associated work is not capacity related, without the express approval of the FAA.

c. Estimates of Future AIP Funding. Since the BCA must occur before the project is planned in detail, the financial analysis may be incomplete, or not detailed enough to identify all the funding sources for the project. A sponsor may be uncertain about its future entitlement funds and is unable to predict accurately the discretionary funds needed to fund the project. In cases like these, the sponsor and the FAA must jointly agree on a reasonable amount of discretionary funding, given the best information available at the time.

d. BCA Process. The BCA process, per FAA policy, is outlined in Table 3-9.

Table 3-9 BCA Process

The BCA process steps include…
a. ADO Notification to Regional Office and APP-500. ADOs must notify the regional office and APP-500 promptly when the ADO determines that a sponsor will be submitting a BCA in the near future. Preliminary information provided to APP-500 must include a general description of the project, the estimated cost, and the project's justification.
b. APP-500 Guidance to Regional Office and ADO. Based on the project, APP-500 will indicate whether a BCA is required and provide the ADO and regional office with the appropriate review method, internal coordination, appropriate samples, and other necessary information.
c. Sponsor Preparation of BCA. Sponsors must use FAA Airport Benefit-Cost Analysis Guidance (see Appendix B for link) when preparing a BCA for a capacity project.
d. Sponsor Submittal. Sponsors must submit one hard copy and one electronic copy of the BCA to the ADO. Sponsor must submit BCAs far enough in advance of any requested grants or LOI offers in order to avoid potential delays in funding decisions.
e. FAA Determination. In most cases, APP-500 will prepare the official FAA determination, which may include internal coordination with other FAA offices, and forward a copy of the official determination to the ADO and regional office.
f. ADO Notification to Sponsor. The ADO will send the official FAA determination to the sponsor and will place a copy in the grant file.

3-15. BCAs for All Other Projects.

The FAA also reserves the option to require a BCA for any AIP funded project, regardless of project type, funding type, or funding amount.

Section 4. Project on Airport Property (with Good Title).

3-16. On-Airport Property Requirements.

As a general rule, projects must be located on airport property (to which the sponsor holds good title). Per FAA policy, off-airport projects are limited to those listed in Table 3-10. As discussed in Table 2-9, leasing from a private entity does not meet the requirements for good title.

Table 3-10 Eligible Off-Airport Projects

Eligible off-airport projects are limited to…	And the sponsor, at a minimum, must have…
a. Removal of obstructions.	**An easement or verification of adequate land use controls (such as ordinances or zoning) that would prohibit the obstruction from reoccurring.** Easements must be shown on the Exhibit A (property inventory map). The reason the ADO must not issue a grant to remove the obstruction without an easement or land use control is because the obstruction removal needs to be a permanent solution.
b. Marking or lighting obstructions.	**An easement or a written agreement.** If the sponsor executes an easement, the easement must be shown on the Exhibit A (property inventory map). If the sponsor wants to use a written agreement, the ADO has the option to contact APP-400 to ensure that the written agreement is adequate. The agreement must also transfer the responsibility of maintaining the development to the property owner once the project is complete.
c. Outfall drainage ditches.	**An easement.** The easement must be shown on the Exhibit A (property inventory map).
d. Relocation of roads and utilities constituting airport obstructions or to allow eligible airport development.	**A written agreement.** The sponsor must have a formal written agreement with the property owner that allows the work to be done. The agreement must also transfer the responsibility of maintaining the development to the property owner once the project is complete.
e. Installation or relocation of NAVAIDs.	**An easement.** The easement must be shown on the Exhibit A (property inventory map).
f. Construction or installation of eligible utilities.	**An easement.** The easement must be shown on the Exhibit A (property inventory map).
g. Airport waste-water treatment plants.	**An easement.** The easement must be shown on the Exhibit A (property inventory map).
h. Noise soundproofing projects.	**A written agreement.** The sponsor must have a formal written agreement with the property owner that allows the work to be done. The agreement must also transfer the responsibility of maintaining the development to the property owner once the project is complete.
i. Noise implementation projects requiring placement of sponsor owned equipment (such as installation of noise monitors).	**An easement.** The easement must be shown on the Exhibit A (property inventory map).

Table 3-10 Eligible Off-Airport Projects

Eligible off-airport projects are limited to…	And the sponsor, at a minimum, must have…
j. Environmental mitigation measures required as a condition of environmental approval for property improvements (such as wetlands replacement).	**A written agreement** The sponsor must have a formal written agreement with the property owner that allows the work to be done. The agreement must also transfer the responsibility of maintaining the development to the property owner once the project is complete.
k. Environmental mitigation measures required as a condition of environmental approval for placement of sponsor owned equipment (such as installation of noise monitors).	**An easement.** The easement must be shown on the Exhibit A (property inventory map).
l. Regional Aircraft Rescue and Firefighting Training Facility	**A written agreement.** The sponsor must have a formal written agreement with the property owner that allows the work to be done. The agreement must also outline who is responsible for maintaining the project when it has been completed.

Section 5. Project on Airport Layout Plan.

3-17. Airport Layout Plan Requirement.

49 USC § 47107(a)(16) requires that the sponsor must maintain a current airport layout plan (ALP). It also prohibits the sponsor from altering the airport unless the ADO has determined that the project will not adversely affect the safety, utility, and efficiency of the airport.

Per FAA policy, the ADO must not program a project that needs to be added to an FAA approved ALP until the sponsor submits a revised ALP and it receives FAA approval.

Therefore, for projects not shown on the approved ALP that are expected to have a significant impact on aeronautical or airport operations, the ADO must advise the sponsor to complete an ALP Update for FAA review and approval.

For projects not shown on the approved ALP that are not expected to have a significant impact on aeronautical or airport operations, the ADO may allow the sponsor to revise their ALP by submitting an aeronautical study. If the aeronautical study does not result in an objection from the FAA, the ADO may accept the ALP revision by issuing a letter to the sponsor that includes a reference of the aeronautical study determination number in the approval letter. If the aeronautical study results in an objection from the FAA, then the sponsor must revise the scope of the project as necessary to address the objection, and submit another aeronautical study. The ADO must not program the grant until an acceptable aeronautical study is complete. In addition,

the ADO must then require the sponsor to submit a revised ALP as a condition of closing the grant.

In limited cases where directed by APP-500, the ADO may program the project without the above ALP or aeronautical study approval; however the ADO must complete the required determination prior to issuing the grant per 49 USC § 47107(a)(16)(C).

The methods presented under this section do not preclude or satisfy the sponsor's requirement to conduct an environmental review of the project.

Section 6. Intergovernmental Review and Airport User Consultation Complete.

3-18. Intergovernmental Review.

The current version of FAA Order 1200.21, Intergovernmental Review of FAA Programs and Activities contain intergovernmental review requirements for AIP projects. This satisfies the requirement in 49 USC § 47106(a)(1) that the project be consistent with plans (existing at the time the ADO issues the grant offer) of public agencies around the airport.

Sponsors are required to coordinate projects through the appropriate state contact for projects listed in Table 3-11. The state contact information is available on the Intergovernmental Review page of the Office of Management and Budget (OMB) website (see Appendix B for link). Table 3-12 contains key requirements.

Table 3-11 Projects Requiring Intergovernmental Review

The sponsor must coordinate projects through the appropriate state contact for…
a. Projects that significantly affect state or local governments beyond airport boundaries.
b. Projects specifically requested under a state's review process.
c. Projects at a medium or large hub airport that involve the siting of the airport location, a new runway or a major runway extension. In this case, 49 USC § 47106(c)(1)(A) requires that the sponsor must also provide airport layout plan amendments (and an associated master plan) upon request by the relevant Metropolitan Planning Organization (MPO).

Table 3-12 Key Requirements for Intergovernmental Review

Some of the key requirements are…
a. Sponsor Notification. The regional office is responsible for informing new sponsors of the required intergovernmental project review process per the current version of FAA Order 1200.21, Intergovernmental Review of FAA Programs and Activities, however the regional office may delegate this to the ADO. The ADO must also notify all affected sponsors when a Federal change is made to the review process.
b. Review Timeline. It normally takes state and local agencies 60 days to complete their review. The sponsor must not submit a grant application before this coordination is complete. The ADO must not issue a grant before the 60 day review period is over.
c. Early Project Review. If an interagency review was completed in the environmental or planning stage of the project, it normally will not need to be repeated during the implementation stage unless the scope of work has changed, substantial new information has become available, or significant time has passed.
d. Process Changes. The ADO must forward formal changes in a state's intergovernmental project review process to the Department of Transportation (DOT) Assistant Secretary for Administration. All affected DOT offices must implement the process changes submitted by the state within 90 days of receipt from the state.
e. Establishment of State Process. States, in consultation with local elected officials, have the option to establish their own process for reviewing and commenting on Federal programs and activities.
f. Treatment of Comments. The ADO has the option to accept the comments, reach a mutually agreeable solution with the state or local agency, or reject the comments. While the ADO is not required to accept comments or discuss another solution, the ADO has the option to provide a written explanation of the final decision as a courtesy to the single point of contact at the state (preferably at least 15 days before the project begins). If no single point of contact for the state exists, the ADO has the option to send the written explanation to the parties that initially provided comments. When 49 USC § 47106(c)(1)(A) is triggered, the ADO must send the MPO a written explanation of the final decision. When the ADO provides a written explanation of the final decision to a state or MPO, the ADO must also send an informational copy to the DOT Assistant Secretary for Administration.

3-19. Consultation with Airport Users.

Per 49 USC § 47105(a)(2), a sponsor must consult with the airport users that will be affected by the project. The consultation process does not require users to provide input or agree with the proposal. Other consultation requirements are included in Table 3-13.

Table 3-13 Airport User Consultation Requirements

Requirements per FAA policy include…	
a.	The affected parties must be given a reasonable opportunity to provide input to proposals for airport development.
b.	The consultation must take place prior to submittal of the grant application. Since consultation is part of planning project, separate pre-grant consultation is not required.
c.	The consultation must include all project considerations that bear on the decision to proceed and which impact users' charges or operations.
d.	At a minimum, the consultation must cover the general nature of the development proposed, its estimated cost, and its estimated start and stop dates.

Section 7. FAA Environmental Finding Complete.

3-20. Environmental Finding Requirements.

Per 49 USC § 47106(c), any airport project funded with AIP funds requires an environmental finding (Categorical Exclusion, Finding of No Significant Impact, or Record of Decision) prior to initial grant programming. The requirements for environmental analysis and findings are included in the current version of FAA Order 5050.4, National Environmental Policy Act (NEPA) Implementing Instructions for Airport Projects.

Per FAA policy, the ADO must not program a project until the environmental finding is complete.

Section 8. Usable Unit of Work Obtained.

3-21. Usable Unit Requirements (and Phased Project Conditions).

AIP grants that are given must result in a complete project. Partial construction or incomplete acquisition does not result in a complete project and therefore is not a usable unit of work. The required usable unit of work by project type is included in the project requirement appendices for that project.

There is one exception to this, and it is often referred to as a phased project. The FAA may issue a grant for a portion of a project when conditions in Table 3-14 are met.

Examples of acceptable and unacceptable grant descriptions are listed in Table 3-15.

Table 3-14 Requirements for Grants that will Not Result in a Usable Unit of Work

The project must meet all of the following requirements…
a. The ADO must include a special condition in the grant that requires the sponsor to complete a safe, useful, and usable unit of development that is, per 49 CFR 47106(a)(4), completed in a reasonable timeframe.
a. The grant description must clearly define the specific portion of the work being done in the grant, not the work that will be completed in all of the phases. The ADO can accomplish this by referencing the dimensions of the work or the specific contracts being funded.
b. Where the grant is for reimbursement of work, the requirements that the grant describe the work specifically in each phase must be met.

Table 3-15 Examples of Acceptable and Unacceptable Grant Descriptions

The description is…	For the following grant description for a multi-phase terminal building project…
a. Unacceptable.	Construct Terminal (Phase 1 – Building) Construct Terminal (Phase 2 – Building) Construct Terminal (Phase 3 – Building) Construct Terminal (Phase 4 – Building) Construct Terminal (Phase 5 – Building) Construct Terminal (Phase 6 – Building)
b. Acceptable.	Construct Terminal (Phase 1 – Site work) Construct Terminal (Phase 2 – Building- Foundation) Construct Terminal (Phase 3 – Building –Structure) Construct Terminal (Phase 4 – Building –Electrical, HVAC, Plumbing) Construct Terminal (Phase 5 – Building – Finishes, Interior and Exterior) Construct Terminal (Phase 6 – Building) – Passenger Boarding Bridges)

Section 9. FAA Standards Met.

3-22. Mandatory FAA Standards.

a. General Requirement. Per 49 USC § 47105(b)(3), a project must be planned, designed and constructed in accordance with current FAA standards unless the FAA has approved a

modification to the standard for the specific project. Mandatory FAA standards include airport design, construction, and equipment standards and specifications.

b. Safe Approaches for Runway Projects (Clear Approaches). The FAA has interpreted 49 USC § 47105(b)(3) to mean that safe approaches are part of the FAA standards that must be met for runway projects. Per FAA policy, the ADO must not fund the rehabilitation, construction, or extension of any section of a runway that the ADO has determined will not be usable due to unsafe approaches using the latest version of Advisory Circular 150/5300-13, Airport Design.

c. List of Advisory Circulars. The FAA standards consist of the current version of the advisory circulars listed in the document titled Current FAA Advisory Circulars Required for Use in AIP Funded and PFC Approved Projects. This list (see Appendix B for link), is published to comply with Airport Sponsors Assurance 34, regulations, published guidance, and FAA policy.

d. Timing of Advisory Circulars. If an FAA standard changes while a project is in progress, the sponsor must contact the ADO to determine whether the new standard must be met. Generally:

(1) If a project *has not* been bid, it is the sponsor's responsibility to ensure that the finished design meets the latest published standard, unless the ADO and the sponsor agree that the latest published standard does not have to be included.

(2) If the project *has* been bid, the ADO will not normally require the sponsor to meet the revised standard. The ADO has the option to require the sponsor to meet the revised standard when:

(a) The requirements can be easily incorporated.

(b) The ADO has determined that the old standard will negatively impact the airport.

(c) The ADO and sponsor mutually agree to include the new standard.

e. Other Standards. The ADO may incorporate other standards into a project as a special condition in the grant agreement. These standards then become mandatory by their inclusion in the grant. The automated AIP system contains the currently available special conditions.

3-23. Modification to FAA Standards (or Specifications).

Where the FAA has published specifications for specific items, it is FAA policy that sponsors must use the specifications as written, with no changes from the specifications, except where explicitly allowed in the specification.

The sponsor must obtain an FAA modification to standards approval for any change that is not specifically allowed, no matter how minor it may seem to the sponsor. This is necessary to ensure an acceptable level of safety, capacity, efficiency, utility or access. Additionally, the FAA review will ensure the proposed modification will not unduly limit competition, eliminate

FAA approved vendors, compromise statutory or regulatory requirements, or negatively impact the project.

For AIP funding purposes, some modifications to FAA standards (such as those examples in Table 3-16) will not be considered because they violate 2 CFR part 200 or deviate from FAA design standards. The ADO or AAS-100 must not approve such requests for AIP funded projects. However, in the event of a pre-existing nonstandard airfield configuration, AIP funds may only be used to rehabilitate or reconstruct the affected airfield element if FAA has formally approved a modification to standards or the airfield element is brought up to standards.

The current version of FAA Order 5300.1, Modifications to Agency Airport Design, Construction, and Equipment Standards contains the requirements for modification to standards.

Table 3-16 Examples of Modifications of Standards that Must Not be Considered for AIP Funded Projects

Examples include…	
a.	For cost saving only without regard to level of performance and safety as provided by FAA standards.
b.	Standardization of equipment type.
c.	Local preference.
d.	Airfield lighting circuits that are not 6.6 amperes per current FAA standards.

3-24. Standards that Exceed those of the FAA.

FAA policy is that if the project meets the FAA standards, then the public need has been fully met. Therefore, a project that is designed or built to a more rigorous standard is considered to exceed FAA standards. Except in limited circumstances for select projects as outlined in Table 3-17, the ADO must not fund work exceeding FAA standards with AIP.

The ADO also has the option of allowing the sponsor to pay for the cost to exceed the FAA standards if the procurement requirements in Paragraph 3-39 are met for inclusion of ineligible and/or non-AIP work in a contract. Funding examples are provided in Table 3-18.

Per FAA policy, sponsors must obtain written ADO concurrence prior to either to designing or bidding AIP funded projects that will include work that exceeds FAA standards. The ADO must put a copy of their determination in the grant file.

Per FAA policy, if the ADO allows the sponsor to pay for the added cost of a project or equipment, the sponsor is not allowed to use the bid process to determine the non-AIP costs.

Table 3-17 Limited Circumstances Where Work Exceeding FAA Standards May be Funded with AIP

The limited circumstances include…
a. **Meeting a Local Standard**. 49 USC § 47110(b)(1) gives the ADO the option to consider funding a cost if the cost is necessary to allow the project to proceed. Therefore, if there is added cost to meet a local permitting standard, the ADO has the option to consider funding the added cost.
b. **Rehabilitating an Airfield Facility (or Piece of Equipment).** The ADO has the option of funding a project to rehabilitate (not reconstruct) an airfield facility (or piece of equipment) that exceeds FAA standards if the project meets the following criteria. **(1)** The project component is normally an eligible cost. **(2)** The sponsor has demonstrated a continuing need for the existing facility or equipment. This can either be based on past aeronautical activity or use, or to accommodate the aircraft of a current tenant based at the airport. **(3)** The ADO has determined that the added cost is reasonable compared to the benefit being obtained. The ADO has the option to request a life cycle cost analysis, benefit-cost analysis, or other applicable analysis to support this determination. Sponsor guidance on life cycle cost analysis is discussed in Paragraph U-15 and sponsor guidance on benefit-cost analysis is contained in the document titled FAA Airport Benefit-Cost Analysis Guidance (see Appendix B for link).

Table 3-18 Funding Examples for Work Exceeding FAA Standards

If a sponsor requests…	If the requirements of Table 3-17 have been met, the ADO has the option to…
a. A project to construct a parallel taxiway at 400 feet from the runway when the FAA standard (based on the critical aircraft and approach minimums) is 300 feet based. The extra costs for normal site preparation and pavement construction (there are no large extra expenses). In this case, no cost analysis would be required because the FAA has already determined that the long term benefit of locating the taxiway far outweighs the potential cost of relocating the taxiway in the future. This applies regardless of whether the airport shows the need for the 400 feet within the 20 year planning period.	Fund the added cost with AIP.
b. A project for reconstruction of a runway to a width wider or length longer than required by the critical aircraft. Because the project is reconstruction, it is considered similar to construction of a new runway.	Allow the sponsor to pay for the added cost if the procurement requirements in Paragraph 3-39 are met for inclusion of ineligible and/or non-AIP work in a contract.

Table 3-18 Funding Examples for Work Exceeding FAA Standards

If a sponsor requests…	If the requirements of Table 3-17 have been met, the ADO has the option to…
c. A project for rehabilitation or overlay of a runway or taxiway to a width wider or length longer than required by the current critical aircraft.	Fund all or a portion of the added cost with AIP.
d. A project for construction of a 75 foot wide taxiway when the justified width is 50 feet. This project is designed for a critical aircraft that will not be met for five or more years.	Allow the sponsor to pay for the added cost if the procurement requirements in Paragraph 3-39 are met for inclusion of ineligible and/or non-AIP work in a contract.
e. A project for construction of a 75 foot wide taxiway when the justified width is 50 feet. This project is designed for a critical aircraft that the ADO has determined will be met within five years.	Fund the added cost with AIP.
f. An apron construction project that includes fire hydrant installation that is required to receive a building permit determined that the cost of the fire hydrant installation is necessary to allow the project to proceed.	Fund the added cost with AIP.
g. A project that has an extended warranty period of 36 months, and the FAA standard is 12 months.	Allow the sponsor to pay for the added cost if the procurement requirements in Paragraph 3-39 are met for inclusion of ineligible and/or non-AIP work in a contract.
h. A project to rehabilitate an ARFF building that includes a weight training room that requires the ventilation system in the building be replaced. The weight training room is not required by FAA standards. The ADO has determined the weight training room and the ventilation system are ineligible costs.	Allow the sponsor to pay for the added cost if the procurement requirements in Paragraph 3-39 are met for inclusion of ineligible and/or non-AIP work in a contract.
i. A project to rehabilitate an ARFF vehicle that is larger than required by 14 CFR part 139 index. The ADO has determined that rehabilitation of the larger ARFF vehicle is less expensive than acquiring a new vehicle that is correctly sized.	Fund the added cost with AIP.
j. A project to remove obstructions, including land acquisition, to meet the clearance requirements for an approach category that is greater than the aircraft category (for example clearing to C standards where the airport is designated as a B-II airport on its ALP for the entire planning period.)	Allow the sponsor to pay for the additional costs, including the costs of the land acquisition. AIP cannot be used for the additional land or clearing because the work is not necessary.

3-25. Eligibility Differences between the Handbook and the Advisory Circulars.

Advisory circulars are written to cover a broad range of airport design, construction, and equipment standards. There are recommendations in many advisory circulars that exceed what is justified under AIP. However, just because an item is discussed in an advisory circular, this does not make it eligible or justified. This Handbook, not the advisory circular, provides the guidance for determining eligibility and justification for any project that is AIP funded.

3-26. Approval and Use of State Standards.

Per 49 USC § 47105(c), a sponsor may request to use state standards for nonprimary airport development that are different from FAA standards. Per 49 USC § 47114(d)(5), a sponsor may also request to use state highway construction and material specifications for full strength airfield pavement construction at a nonprimary airport. The requirements for these two uses of state standards are different, and are discussed in detail in the current version of Advisory Circular 150/5100-13, Development of State Standards for Nonprimary Airports.

In order for the ADO issue grants using any type of state standards on a project in the grant, the requirements in Table 3-19 must be met.

Table 3-19 Requirements for the Use of State Standards

In order for an ADO to permit the use of state standards on an AIP funded project, the following requirements must be met…
a. Modification to Standard Approved. AAS-1 must have approved the modification to standards according to the current version of FAA Order 5300.1, Modifications to Agency Airport Design Construction and Equipment Standards prior to the ADO issuing the grant. The ADO must put a copy of the written determination (or a reference to the location of the electronic determination) in the grant file.
b. Advisory Circular Requirements Met. The sponsor's request for use of the modification to standards must comply with all requirements contained in the current version of Advisory Circular 150/5100-13, Development of State Standards for Nonprimary Airports.
c. Additional Restriction #1 for Airfield Pavement Built Using State Highway Specifications Met. Per 49 USC § 47114(d)(5)(A), the runway cannot currently be greater than 5,000 feet or currently be serving aircraft that are greater than 60,000 pounds gross weight. **(1)** For those airports where all runways meet the 5,000 feet or less criteria, the sponsor may consider the use of state highway standards for all eligible airfield pavement. **(2)** For those airports with multiple runways, some of which exceed the 5,000-runway length limitation, the sponsor may only consider the use of state highway standards for airfield pavement exclusively serving a runway with a length of 5,000 feet or less and for apron and taxilanes that only serve aircraft less than 60,000 pounds gross weight.
d. Additional Restriction #2 for Airfield Pavement Built Using State Highway Specifications Met. Per 49 USC § 47114(d)(5)(A), the life of the pavement must not be less than the life of the pavement built using FAA standards. However, for funding purposes, AIP can only be used to fund to the life required by the FAA standards, which is 20 years.

Table 3-19 Requirements for the Use of State Standards

In order for an ADO to permit the use of state standards on an AIP funded project, the following requirements must be met…
e. Additional Restriction #3 for Airfield Pavement Built Using State Highway Specifications Met. Per 49 USC § 47114(d)(5)(B), the ADO must not issue another AIP grant to rehabilitate or reconstruct the airfield pavement for a period of 10 years after the pavement construction is completed. The only exception to this requirement is if AAS-1 has determined rehabilitation or reconstruction is required for safety reasons.
f. Additional Restriction #4 for Airfield Pavement Built Using State Highway Specifications Met. Because 49 USC § 47114(d)(5)(A) limits the runway length and aircraft weight, the airport layout plan must not show a future extension (in the 20 year planning period) that will result in a runway greater than 5,000 feet or serve aircraft that are greater than 60,000 pounds gross weight.

3-27. Projects with No FAA Standard.

Some eligible projects have no corresponding FAA standards, procedures, policy, plans, and/or specification.

The ADO must contact APP-520 for assistance on project eligibility and AAS-100/300 to obtain the FAA standards and requirements for the project. Until the FAA standard is published, APP-520 will provide eligibility of these projects and AAS-100/300 will provide the standards to which the project must be constructed on a case-by-case basis.

In some cases, the FAA has specifically adopted the standards of another Federal agency or of an industry group. The ADO can obtain a current list of these adopted standards from AAS-100/300 and APP-520.

3-28. ADO Review of Plans and Specifications.

Sponsors must prepare plans and specifications to meet FAA standards as discussed in this section of the Handbook. In addition, sponsors are required to prepare an engineer's report that contains the information in Table 3-20. The ADO must follow the FAA policy for reviewing plans and specifications outlined in the latest version of the Implementation Plan for FAA Review of Construction Plans and Specifications for AIP Funded Projects memorandum issued by AAS-1.

If the ADO reviews the plans and specifications and engineer's report, the ADO is not required to issue an approval. Instead, the ADO has the option to provide comments to the sponsor. In reviewing the plans and specifications and engineer's report, the ADO also has the option to request input from affected FAA lines of business. If the ADO provides a written response, the ADO must file a copy of the response (or a reference to the location of the electronic determination) in the grant file. The ADO must not fund any project the ADO has determined does not meet FAA standards.

The FAA's review of a sponsor's plans or specifications is for the benefit of the FAA. This review is not intended to relieve the sponsor of their responsibility to fully comply with AIP requirements and does not represent approval of the plans or specifications.

In addition, sponsor certification of plans and specifications does not relieve the sponsor of the requirement to obtain prior FAA approval for modifications to standards or to notify the ADO of any limitations to competition within the project.

Table 3-20 Required Content for Engineer's Reports

Engineer's reports must include…
a. Design Computations. The report must include a summary of the design computations used in the design of major development items. The sponsor is required to include pavement design information by either submitting FAA Form 5100-1, Airport Pavement Design or by submitting the first page of this form with the FAARFIELD design results. A summary of computations and a description of the method used to conduct the drainage design must be presented. Earthwork cross-sections and mathematical calculations for designs are not required to be included in the design report unless requested by the ADO.
b. Selections of Design Materials and Equipment and Proposed Modifications to Standards. The engineer's choices and recommended modifications will, in most cases, be influenced by service records for comparable construction and by cost comparisons. The report must include concise statements and cost comparisons that justify selections made and the proposed modifications to standards proposed in the project. The current version of FAA Order 5300.1, Approval Level for Modification of Agency Airport Design and Construction Standards, provides additional information on modifications to design and construction standards.
c. Sole-Source, Proprietary, or other Competition-Limiting Specifications or Design Elements. The report must list all such items, including the reason for the limitation, impacts of limiting competition, and the benefits to the Federal government for the proposal.
d. Other Elements. The report must outline related project work elements to be done without AIP assistance, including details on how the work is to be accomplished, and how it relates to the AIP work. Work to be done by utility companies must be described in sufficient detail to verify adequate funding for the work.
e. Support Data. The report must also include supporting data and itemized project cost estimates with source information. Any unique circumstances that may influence adjustments of existing project cost estimates must be explained.

Section 10. Project Procured Correctly.

3-29. Importance of 2 CFR §§ 200.317-200.326 (Formerly 49 CFR § 18.36).

Sponsors must follow 2 CFR §§ 200.317-200.326 when making procurements under an AIP grant. This regulation contains the policies and procedures for AIP project actions such as construction, equipment purchases, and selection for professional services. If a sponsor fails to

meet any of the procurement requirements for their AIP funded project, it may result in the ADO determining a normally allowable cost to be unallowable.

3-30. Sponsor Procurement Requirements.

The sponsor, not the ADO, is responsible for meeting all procurement requirements. The sponsor establishes, enforces, and administers the contract agreements and is responsible for all contractual matters, including evaluation and award of contract, resolution of claims and disputes, and settlement of litigation issues. The ADO is not a party to the contracts that a sponsor executes under an AIP grant.

Per 2 CFR § 200.318(k), the ADO cannot substitute their judgment for the sponsor unless the matter is primarily a Federal concern. However, the ADO still has a defined role in procurement oversight per 2 CFR §§ 200.317-200.326 as further defined in this chapter.

Sponsor procurement requirements are discussed in more detail in Appendix U.

3-31. Summary Table of Mandatory/Optional ADO Procurement Review.

There are only certain situations where the ADO is required by 2 CFR §§ 200.317-200.326 to review the sponsor's procurement process. Otherwise, 2 CFR § 200.324(c)(2) allows the ADO to accept sponsor certification that the sponsor is following 2 CFR §§ 200.317-200.326. This certification is included in the grant assurances signed by the sponsor and therefore, no additional action is required by the ADO.

There are also certain situations where FAA policy or legislation requires the ADO to review the sponsor's procurement process. Table 3-21 contains a summary of the mandatory and optional ADO procurement review responsibilities. The ADO always has the option of reviewing any sponsor procurement documents and systems at any time during the grant process.

Table 3-21 Summary Table of Mandatory/Optional ADO Procurement Review

For the following situation…	ADO review is…	The associated 2 CFR §§ 200.317-200.326 general reference is…	And the requirements are in Paragraph…
a. Bid Protests and Appeals.	Mandatory (but limited in nature)	2 CFR § 200.318(k)	3-32
b. Procurement Protests and Appeals after the Contract Award.	Mandatory (but limited in nature)	2 CFR § 200.318(k)	3-33
c. Bonding that Does Not Meet the Minimum Requirements.	Mandatory (or can rely on sponsor's written assurance)	2 CFR § 200.325	3-34

Table 3-21 Summary Table of Mandatory/Optional ADO Procurement Review

For the following situation…	ADO review is…	The associated 2 CFR §§ 200.317-200.326 general reference is…	And the requirements are in Paragraph…
d. Noncompetitive Proposals (Including Sole Source and Inadequate Number of Qualified Sources).	Mandatory	2 CFR § 200.320(f)	3-35
e. Limited Noncompetitive Proposal Situations (ALCMS Modifications, One Manufacturer, Sponsor Preferred, Prohibited LED Lighting).	Mandatory (for prohibited LED Lighting the notification review is mandatory and review of the procurement documents is optional)	2 CFR § 200.320(f) (N/A for prohibited LED lighting)	3-36
f. Change Orders, Supplemental Agreements, and Contract Modifications.	Mandatory (but not required until the ADO is issuing an amendment or closing the grant)	2 CFR § 200.320(f)	3-37
g. Contract Clauses and Contract Provisions Required for AIP Grants.	Optional (ADO responsibility is limited to notifying new sponsors of requirements)	2 CFR § 200.326	3-38
h. Contracts Containing Ineligible and/or Non-AIP Funded Work.	Mandatory	N/A	3-39
i. Contracts Containing Requirements that May Reduce the Number of Potential Bidders.	Mandatory	2 CFR § 200.319	3-40
j. Contracts Containing Work that Exceeds FAA Standards.	Mandatory	N/A	3-41
k. Consultant Contracts (Qualifications Based with Negotiated Price).	Optional with Sponsor Certification (unless sponsor deviates from requirements, then mandatory)	2 CFR § 200.320(d)	3-42
l. Design-Build and Construction Manager-at-Risk Contracts.	Mandatory	2 CFR § 200.320(d)	3-43

Table 3-21 Summary Table of Mandatory/Optional ADO Procurement Review

For the following situation…	ADO review is…	The associated 2 CFR §§ 200.317-200.326 general reference is…	And the requirements are in Paragraph…
m. Engineering Materials Arrestor System (EMAS).	Mandatory	2 CFR § 200.320(d)	3-44
n. Bid Alternates (Including Life Cycle Cost Analysis Alternates) and Bid Additives.	Optional with Sponsor Certification	2 CFR § 200.320(c)	3-45
o. Bidding Asphalt and Concrete Alternates.	Optional with Sponsor Certification	2 CFR § 200.320(c)	3-46
p. Buy American Requirements	Mandatory (if a waiver is required)	N/A	3-47
q. DOT Office of Inspector General (OIG) Notification of Potential Procurement/Bid Improprieties.	Mandatory	N/A	3-48
r. Escalator Clauses	Mandatory	N/A	3-49
s. Plans and Specifications Review.	As required in "Plans and Specifications Review Implementation Memorandum" published by FAA Office of Airport Safety and Standards.	2 CFR § 200.324(a)	3-50
t. Pre-award Review of Contracts.	Optional with Sponsor Certification	2 CFR § 200.324(b)	3-51
u. Sponsor's Procurement System.	Optional with Sponsor Certification	2 CFR § 200.324(c)	3-52
v. Force Account Work.	Mandatory	N/A	3-53
w. Value Engineering.	Mandatory	2 CFR § 200.318(g)	3-54
x. Indefinite Delivery (Task Orders) Extensions for *Construction* Services.	Mandatory	N/A	3-55

Table 3-21 Summary Table of Mandatory/Optional ADO Procurement Review

For the following situation…	ADO review is…	The associated 2 CFR §§ 200.317-200.326 general reference is…	And the requirements are in Paragraph…
y. Indefinite Delivery (Task Orders) Extensions for *Consultant* Services..	Mandatory	N/A	3-56
z. Suspension or Debarment of Persons or Companies.	Optional with Sponsor Certification (mandatory if a problem is identified)	2 CFR part 180 and 2 CFR part 1200	3-57

3-32. Bid Protests and Appeals.

The sponsor requirements for bid protests and appeals is contained in 2 CFR § 200.318(k) (see Paragraph U-10). Table 3-22 contains the ADO specific review requirements. Many bid protests result from a sponsor's improper modification of project specifications or solicitation package to include a sponsor's preference. In those situations, the ADO must not rely on the sponsor to resolve the protest, but must treat the protest as a Federal concern. Table 3-23 contains additional requirements for bid protests that are a Federal concern.

Table 3-22 ADO Review Requirements for Bid Protest and Appeals

The following applies…
a. Protest Sent Directly to the FAA by the Protester. If a protest is sent directly to the FAA, the FAA must send a copy of the protest to the sponsor per FAA policy. The ADO must notify the protester that the protest has been forwarded to the sponsor and they must deal directly with the sponsor. In addition, the ADO must request the sponsor to send a copy of the sponsor's protest procedures to the ADO. Per 2 CFR § 200.318(k), the sponsor is responsible for handling bid complaints and protests. The ADO's review responsibility at this point is limited to a cursory review of the protest to determine if there is a Federal concern and establishing that the sponsor has protest procedures in place. If there is a Federal concern, the ADO must notify the sponsor and request the sponsor immediately send a copy of the sponsor's proposed resolution. The ADO must not issue AIP funding until the ADO is satisfied the sponsor resolved the issue and correctly addressed any Federal concerns.
b. Copies of Protests Sent to the ADO by the Sponsor. After the sponsor's mandatory and timely submittal of the bid protests *and a copy of the sponsor protest procedures* to the ADO, the ADO's review responsibility at this point is limited to scanning the protest to determine if there is a Federal concern and establishing that the sponsor has protest procedures in place.

Table 3-22 ADO Review Requirements for Bid Protest and Appeals

The following applies…
c. Protests that are a Federal Concern. 2 CFR § 200.318(k) cautions that the Federal agencies (the ADO) not substitute their judgment for that of the sponsor unless the matter is a Federal concern. If there is a Federal concern, the ADO must notify the sponsor and request a resolution. The ADO must not issue AIP funding until the ADO is convinced the sponsor resolved the issue and correctly addressed any Federal concerns.
d. Cancelation of Prior Approval or Sponsor Certification. The receipt of the bid protest automatically cancels the ADO approval of the plans and specification or acceptance of the sponsor's certification.
e. Restrictions on AIP Funding Pending Resolution. The ADO must not issue AIP funding until the ADO has received the sponsor's written notification of how the issue was resolved and the ADO is satisfied the sponsor resolved the issue and correctly addressed any Federal concerns. By issuing the associated grant, the ADO is documenting their determination that the bid protest has been resolved.
f. Protester Appeals. Per FAA policy, a protester may pursue a protest with the Federal agency after exhausting all administrative remedies with the sponsor. Before taking any action, the ADO must have conducted a cursory review of the protest to determine if there is a Federal concern and established whether the sponsor has protest procedures in place. The ADO has the option to respond to the protester, but is not required to by 2 CFR §§ 200.317-200.326.

Table 3-23 Additional Actions for Bid Protests that are a Federal Concern

The following applies…
a. Determining a Federal Concern. Federal concerns include violation of Federal law or regulations. It includes allegations that the project plans or specifications have been altered to give preference to a manufacturer, to exclude a product, or otherwise limit competition. This is because limiting competition may violate 2 CFR § 200.319. Modification of specifications without receiving an FAA Modification of Standards is also a Federal concern.
b. Copies of Redlined Specifications and Solicitation Package Sent to the ADO by the Sponsor. The sponsor must send the ADO a copy of the as-bid specifications and the complete solicitation package, detailing where changes to the FAA standard specification have been made and which aspects of the solicitation are being protested.
c. Protests that Must Be Forwarded. If the bid protest involves another FAA line of business, such as the FAA Office of Civil Rights, the ADO must forward all documentation regarding the protest to the affected office. The ADO must notify the sponsor of the transfer and must advise the sponsor that the ADO will not issue AIP funding until the issue is resolved.

Table 3-23 Additional Actions for Bid Protests that are a Federal Concern

The following applies…
d. Cancelation or Rebidding a Project. If the ADO determines that the protest was a result of improper modification of the specifications or an otherwise defective solicitation package, the ADO must advise the sponsor that additional costs incurred fixing the package and soliciting the project are not eligible for reimbursement.
e. Documenting ADO Actions. Where the bid protest is a Federal concern, the ADO must document steps in the grant file that the ADO takes to ensure that the sponsor properly resolves the protest.

3-33. Procurement Protests and Appeals after the Contract Award.

The ADO review requirements for protest and appeals that occur after the contract is awarded is the same as the requirements for bid protests and appeals in Paragraph 3-32. However, since the project may already be under grant, the ADO must notify the sponsor that the sponsor must not request payments for the disputed costs.

3-34. Bonding that Does Not Meet the Minimum Requirements.

The sponsor requirements for bonding are contained in 2 CFR § 200.325 (see Paragraph U-23). Table 3-24 contains the ADO specific review requirements for bonding that does not meet the minimum requirements in 2 CFR § 200.325.

Table 3-24 ADO Review Requirements for Bonding that Does Not Meet the Minimum Requirements

For…	The following applies…
a. Bonding that Does Not Meet the Minimum Requirements.	The ADO is allowed to rely on the sponsor's written assurance that the Federal interests are adequately protected under the proposed bonding method. As long as the ADO has not issued a written negative determination, it is implicitly implied that the ADO has issued a favorable determination for all future procurement actions using the proposed bonding method.
b. Combined Payment and Performance Bonds.	The ADO is allowed to rely on the sponsor's written assurance that the Federal interests are adequately protected under the combined payment and performance bonding proposal. As long as the ADO has not issued a written negative determination, it is implicitly implied that the ADO has issued a favorable determination for all future procurement actions using the proposed bonding method.

3-35. Noncompetitive Proposals (Including Sole Source and Inadequate Number of Qualified Sources).

Sponsors are only allowed to use a noncompetitive procurement process for the limited circumstances outlined in 2 CFR § 200.320(f) (see Paragraph U-18). Some special noncompetitive proposal situations and their associated requirements are included in Paragraph 3-36.

Per FAA policy, the ADO must not issue a grant that includes noncompetitive proposals unless the ADO has reviewed the proposal and concurs that the requirements of 2 CFR § 200.320(f) have been met (see Paragraph U-18). The exception is for change orders, supplemental agreements, and contract modifications, which are discussed in Paragraph 5-35.

Except as otherwise noted in this section, the ADO has the option to document their concurrence either by notifying the sponsor in writing (with a copy to the grant file) or issuing the grant.

3-36. Limited Noncompetitive Proposal Situations (ALCMS Modifications, One Manufacturer, Sponsor Preferred, Prohibited LED Lighting).

Some limited noncompetitive proposal situations and their associated requirements are included in Table 3-25. These requirements are in addition to those in Paragraph 3-35.

Table 3-25 Procurement Rules for Limited Noncompetitive Proposal Situations

For the following limited noncompetitive situation…	The following applies…
a. Airfield Lighting Control and Monitoring System (ALCMS) Modifications	**(1) Only for ALCMS Modifications.** The following requirements only apply to ALCMS modifications. Sponsors must competitively procure new ALCMS installations. **(2) Separation into a Noncompetitive Procurement.** There are very specific requirements to separate the procurement into a separate noncompetitive procurement. Theses sponsor procurement requirements are contained in Paragraph U-18. **(3) ADO Review of Sponsor Notification.** The ADO must review the sponsor notification to verify if all of the requirements in Paragraph U-18 have been met. It is not necessary for the ADO to acknowledge the sponsor's notification. **(4) Filing of Sponsor Notification.** The ADO must keep a copy of the sponsor's notification and any ADO acknowledgement in the grant file. **(5) Equipment and/or Installation Eligibility.** The eligibility for the purchase and/or installation of this equipment is contained in Paragraph 3-93.

Table 3-25 Procurement Rules for Limited Noncompetitive Proposal Situations

For the following limited noncompetitive situation…	The following applies…
b. Certified Airfield Lighting Equipment with Only One Manufacturer	**(1) Separation into a Noncompetitive Procurement.** There are very specific requirements to separate the procurement into a separate noncompetitive procurement. Theses sponsor procurement requirements are contained in Paragraph U-18. **(2) ADO Review of Sponsor Notification.** The ADO must review the sponsor notification to verify if all of the requirements in Paragraph U-18 have been met. It is not necessary for the ADO to acknowledge the sponsor's notification. **(3) Filing of Sponsor Notification.** The ADO must keep a copy of the sponsor's notification and any ADO acknowledgement in the grant file. **(4) Equipment and/or Installation Eligibility.** The eligibility for the purchase and/or installation of this equipment is contained in Paragraph 3-93.
c. Sponsor Preferred Airfield Lighting Equipment	**(1) Separation into a Noncompetitive Procurement.** There are very specific requirements to separate the procurement into a separate noncompetitive procurement. Theses sponsor procurement requirements are contained in Paragraph U-18 **(2) ADO Review of Sponsor Notification.** The ADO must review the sponsor notification to verify if all of the requirements in Paragraph U-18 have been met. It is not necessary for the ADO to acknowledge the sponsor's notification. **(3) Filing of Sponsor Notification.** The ADO must keep a copy of the sponsor's notification and any ADO acknowledgement in the grant file. **(4) Installation Eligibility.** The eligibility for the purchase and/or installation of this equipment is contained in Paragraph 3-93. **(5) Not Force Account.** The ADO must not consider this situation as equivalent to sponsor force account or donated materials. **(6) Cannot be Used for Sponsor's Share.** Sponsors are prohibited from using the costs of sponsor-preferred airfield lighting equipment as part of the sponsor's share of a grant. **(7) Limited to Airfield Lighting Equipment.** By FAA policy, the use of AIP for certain costs associated with the use of non-AIP funded sponsor furnished equipment is limited to a sponsor's preferred airfield lighting manufacturer's equipment.

Table 3-25 Procurement Rules for Limited Noncompetitive Proposal Situations

For the following limited noncompetitive situation…	The following applies…
d. Certified Airfield Light Emitting Diode (LED) Lighting Equipment that is Prohibited from AIP Funding	**(1) Prohibited Equipment**. The list of LED lighting that is prohibited from AIP funding is included in Paragraph C-2. **(2) ADO Review of Sponsor Notification.** The ADO must review the sponsor notification to verify separation of prohibited LED lighting procurement from AIP funded procurement per Paragraph U-7. It is not necessary for the ADO to acknowledge the sponsor's notification. **(3) Filing of Sponsor Notification.** The ADO must keep a copy of the sponsor's notification and any ADO acknowledgement in the grant file. **(4) ADO Review of Sponsor Procurement Documents.** The ADO has the option to review the sponsor's procurement documents on AIP funded projects to validate that the sponsor has separated AIP funded procurement and prohibited LED lighting procurement. **(5) Equipment and/or Installation Eligibility.** The eligibility for the purchase and/or installation of this equipment is contained in Paragraph 3-93.

3-37. Change Orders, Supplemental Agreements, and Contract Modifications.

The requirements for change orders, supplemental agreements, and contract modifications are contained in Paragraph 5-35.

3-38. Contract Clauses and Contract Provisions Required for AIP Grants.

The sponsor requirements for AIP required contract clauses and provisions are contained in Appendix II of 2 CFR part 200 (as referenced in 2 CFR § 200.326) as well as other regulations and statutes (see Paragraph U-24). The ADO responsibility is limited to making sure that new sponsors are aware of these requirements.

3-39. Contracts Containing Ineligible and/or Non-AIP Funded Work (Including Proration).

The sponsor requirements for contracts containing ineligible and/or non-AIP funded work (including how to determine the low bidder) are contained in Paragraph U-12. Table 3-26 contains the ADO specific review requirements.

Table 3-26 ADO Review Requirements for Contracts Containing Ineligible or Non-AIP Funded Work

For…	The following applies…
a. Contracts Containing Ineligible Work or Work not Funded with AIP	It is FAA policy that a sponsor must not combine ineligible work and/or non-AIP funded work within the same contract unless the sponsor provides a compelling reason documenting that it is in the Federal governments best interest to the ADO and the ADO has concurred with the sponsor's request in writing. Examples of situations that may be in the best interest of the Federal government are included in Table 3-27. The FAA does not consider the fact that including ineligible of non-AIP funded work is at *no additional cost to the Federal government* to be a benefit to the Federal government.
b. ADO Concurrence	In order to concur with the sponsor's request, the ADO must determine that including the work is in the best interest of the Federal government, and that this will not result in an increase to the cost of the AIP funded work and that the cost of ineligible and/or non-AIP funded work can be easily identified. This is because 2 CFR § 200.302(a) requires that the ADO know what was paid for under the grant. The ADO must put a copy of their determination in the grant file. If the field of potential bidders will be reduced by the inclusion of the ineligible or non-AIP funded work, this may reduce competition and affect the cost. Therefore, the ADO cannot conclusively determine that there will be no increase in cost. Paragraph 3-40 includes examples of where potential bidders may be reduced.
c. ADO Determination of Federal Participation	The ineligible and/or non-AIP funded work must be clearly separated from the AIP funded work. This is the preferred method for the ADO to determine Federal participation. If the ADO determines the ineligible and/or non-AIP funded cannot be feasibly separated from the AIP funded work, the ADO can prorate the work to determine Federal participation. **Example of Prorating:** A project will extend an off-airport drainage box culvert through the airport. This box culvert will also serve the neighborhood adjacent to the airport. The airfield runoff is 25 acres and the neighborhood runoff is 75 acres. The eligible Federal participation would be one fourth (25 acres divided by 100 acres) of the total cost to extend the culvert through the airport (including associated design, inspection, etc.).

Table 3-27 Examples of Being in the Federal Government's Best Interest

Examples include…
a. The inclusion of ineligible and or non-AIP work will result in an overall reduction in the amount of construction workers and vehicles on the airfield. This is of benefit to the FAA because it reduces the potential risk of runway incursions.
b. The inclusion of ineligible and or non-AIP work will result in the runway being closed for construction for a significantly shorter period of time. This is of benefit to the FAA because it maintains system capacity.
c. The inclusion of a significant amount of non-AIP pavement will reduce the overall unit cost of the pavement, thus reducing the AIP project costs.
d. The inclusion of the ineligible portion of a hydrant fueling system in an AIP funded apron project that includes hydrant fueling pits will allow a functioning fueling system to be completed.

3-40. Contracts Containing Requirements that May Reduce the Number of Potential Bidders.

Per 2 CFR § 200.319, sponsor solicitations of AIP funded projects must not unduly restrict competition. It is FAA policy that a sponsor must not include requirements that reduce the number of potential bidders unless the sponsor must provide a compelling reason to the ADO and the ADO has concurred with the sponsor's request in writing. Table 3-28 contains examples where the number of potential bidders may be reduced.

Table 3-28 Examples Where the Number of Potential Bidders May be Reduced

Examples include…
a. A project that has a warranty requirement to store spare parts in a manufacturer's warehouse within 15 miles of the airport that has been in operation for at least one year.
b. A project specifying highway compliant snow removal equipment.
c. An ARFF vehicle that is required to be equipped with specialized extraction equipment that is only available as standard equipment on one manufacturer's vehicles.
d. A requirement for equipment to support remote maintenance monitoring.

3-41. Contracts Containing Work that Exceeds FAA Standards.

It is FAA policy that a sponsor must not include work that exceeds FAA standards in a contract unless the sponsor provides a compelling reason to the ADO and the ADO has concurred with

the sponsor's request in writing. The requirements for ADO concurrence (as well as the associated funding rules) are contained in Paragraph 3-24.

3-42. Consultant Contracts (Qualifications Based with Negotiated Price).

The sponsor requirements for competitive proposals (which includes consultant contracts) are contained in 2 CFR § 200.320(d) (see Paragraph U-16). The current version of Advisory Circular 150/5100-14, Architectural, Engineering, and Planning Consultant Services for Airport Grant Projects, provides sponsor requirements for consulting contracts, including the unique contract methods listed in Table 3-29.

The ADO review of procurement of these types of proposals is optional if the sponsor has submitted the associated sponsor certification.

However, if the sponsor is proposing to deviate from the sponsor procurement requirements per the above advisory circular, the ADO must not issue the associated grant unless the ADO has reviewed the contract and concurs with the deviations. The ADO has the option to document their concurrence either by notifying the sponsor in writing (with a copy to the grant file) or issuing the grant.

Table 3-29 Unique Consultant Contract Methods

Some unique contract methods include…	
a.	Retainers
b.	Cost-plus-a-fixed-fee
c.	Cost-plus-a-percentage-of-cost (note that is prohibited by 2 CFR § 200.323(d) and must not be used)
d.	Indefinite delivery (also called task orders and work authorizations)

3-43. Design-Build and Construction Manager-at-Risk Contracts.

The sponsor procurement requirements for these types of competitive proposals are contained in Paragraph U-16).

Mandatory ADO pre-review and concurrence with the sponsor's use of design-build proposal for AIP funded projects is based on requirements found in 49 USC § 47142(a)(2). ADO pre-review and concurrence is also required by FAA policy for any AIP-funded project where construction manager at risk or other competitive proposal methods that involve selection based on factors other than price are proposed.

In order for the ADO to concur with the proposal, the ADO must be satisfied that the requirements of 2 CFR § 200.320(d) have been met (see Paragraph U-16) prior to the sponsor awarding the contract.

The ADO documents their concurrence by issuing the grant.

3-44. Engineering Materials Arrestor System (EMAS).

Prior to April 2012, there was only one manufacturer whose product met the requirements of the current version of Advisory Circular 150/5220-22, Engineered Materials Arresting Systems (EMAS) for Aircraft Overruns. As of the date of Change 1 of this Handbook, two manufacturers meet these requirements. Therefore, the sponsor must currently procure the EMAS project under the competitive proposal procurement method per 2 CFR § 200.320(d) as discussed in Paragraph U-16. If only one manufacturer responds to the Request for Information (RFI), then the sponsor may proceed with noncompetitive procurement per 2 CFR § 200.320(f).

The competitive proposal procurement process for EMAS is outlined in Table 3-30. The ADO has the option to contact AAS-100 or APP-500 for assistance.

For existing EMAS, if the Sponsor and ADO concur that an existing bed must be replaced, then the procurement requirements for new EMAS installation apply. The sponsor must follow the competitive procurement process to select the vendor.

If the ADO determines that a bed must be retrofitted, the sponsor must determine whether the bed can only be modified or retrofitted by the original vendor, and whether the cost benefit of replacing the bed outweighs the cost benefit of retrofit.

Table 3-30 Typical Steps for an RSA Project with EMAS

An RSA project with EMAS will typically follow the following steps…	
a.	Frequently, the EMAS installation is only a part of a larger Runway Safety Area (RSA) project. Therefore, the EMAS design is incorporated into the overall project. The EMAS Request for Proposal (RFP) will require that the selected EMAS vendor work with the overall RSA design consultant to incorporate the specific features of the selected EMAS into the overall RSA project.
b.	The sponsor conceptually considers EMAS during the planning and environmental phase of the RSA project, and selects a RSA design consultant (RSA designer).
c.	The sponsor and RSA designer identify the requirement for EMAS. The requirements will include the proposed RSA limits, the limits of the EMAS footprint, any navigational aids within the RSA and nearby, and any unique surrounding elements that may be adversely affected by the size of the EMAS bed exceeding a certain height, length or width.
d.	The sponsor issues a Request for Information (RFI) to obtain conceptual designs from EMAS vendors. The RFI is issued solely for informational purposes and is not a solicitation. Similarly, responses to RFI's are not offers from the EMAS vendors.
e.	The sponsor prepares the preliminary design and a Request for Proposal (RFP) that is used to select the EMAS vendor.
f.	The sponsor coordinates the RFP package with the ADO.

Table 3-30 Typical Steps for an RSA Project with EMAS

An RSA project with EMAS will typically follow the following steps…	
g.	After receiving ADO concurrence with the RFP package, sponsor completes the RFP process, and selects an EMAS vendor.
h.	Prior to the sponsor's final selection and award, the ADO has the option to review the sponsor's evaluation and rating.
i.	The sponsor, RSA designer, general contractor and EMAS vendor complete the RSA design and construction.

3-45. Bid Alternates (Including Life Cycle Cost Analysis Alternates) and Bid Additives.

The sponsor requirements for contracts containing bid alternates (including the use of life cycle cost analysis) and additives are contained in Paragraph U-15. The ADO has the option to request and review the bid package to ensure that the sponsor has correctly established how the award will be made within the bid package (commonly referred to as the basis for award). Otherwise, the ADO has the option to accept sponsor certification.

The ADO has the option to document their determination either by notifying the sponsor in writing (with a copy to the grant file) or issuing the grant.

3-46. Bidding Asphalt and Concrete Alternates.

Bidding of both asphalt and concrete options is an example of the use of bid alternates, therefore, the requirements in Paragraph 3-45 apply.

A sponsor has the option to design and bid both asphalt and concrete alternatives for a project. However, only one design is normally allowable (the selected option). Design costs of the non-selected option are limited to the lesser of 1) the difference in the bid schedule amounts between the selected and non-selected low bidders and 2) the non-selected option design costs. The design contract must clearly delineate the design costs of the two alternatives.

If the life cycle cost analysis and selection of the pavement structure is conducted at the conceptual 30 percent design stage, the above funding restrictions on the design do not apply.

3-47. Buy American Requirements.

The Buy American Preferences under 49 USC § 50101 require that all steel and manufactured goods used in AIP funded projects are produced in the United States. Detailed sponsor and ADO requirements are included in Appendix X.

3-48. DOT Office of Inspector General (OIG) Notification of Potential Procurement/Bid Improprieties.

The ADO must contact the OIG through the DOT OIG hotline (see Appendix B for link) if they suspect any of the activities listed in Table 3-31 on an AIP project. As of January 2015, the ADO is no longer required to notify OIG in every instance where there are insufficient bidders, only where the ADO suspects inappropriate activity.

Insufficient bidders were previously defined as either a) five or fewer bidders on a construction project where the low bid was greater than the engineer's estimate and the bid was $500,000 or more or b) there was only a single bidder on a construction contract and the bid was $250,000 or more. This former notification requirement had been implemented based on a 1983 OIG finding and a subsequent meeting between the OIG and the FAA Office of Airports. The 1983 values were adjusted for inflation by the FAA.

The ADO can find more discussion on contract fraud in a paper called Suggestions for the Detection and Prevention of Construction Contract Bid Rigging (see Appendix B for link).

Table 3-31 Circumstances Requiring OIG Notification

ADO must contact the OIG if they suspect any of the following on an AIP project...
a. Contract and Grant Fraud
b. Environmental, Health, and Safety Violations
c. Computer Crimes
d. Product Substitution and Suspect/Counterfeit Parts
e. Bribery, Kickbacks, and Gratuities
f. False Statements and False Claims
g. Conflicts of Interest and Ethics Violations
h. Travel Fraud
i. Theft or Abuse of Government Property
j. Violation(s) of Criminal Law and/or the Civil False Claims Act in Connection with a Federal Contract
k. Other Violations of Federal Laws and Regulations

The above requirement was originally implemented based on a 1983 OIG finding and a subsequent meeting between the OIG and the FAA Office of Airports (the 1983 values have been adjusted for inflation by the FAA). The ADO can find definitions and more discussion on bid rigging, collusion, and unbalanced bidding in a paper called Suggestions for the Detection and Prevention of Construction Contract Bid Rigging (see Appendix B for link).

3-49. Escalator Clauses.

Per FAA policy, the FAA will not fund any costs in a contract that are subject to an escalator clause unless specifically approved by APP-1. Generally, APP-1 has not approved AIP funding for escalator clauses because AIP project grant amendments are limited by 49 USC § 47108(b)(3) and because the construction projects are usually of short duration.

Per FAA policy, sponsors must send their request to the ADO and obtain written APP-1 approval before awarding contracts containing an escalator clause (see Paragraph U-21).

If APP-1 does not approve the sponsor's request, the ADO has the option of allowing the sponsor to keep the escalator clause in the contract as a non-AIP funded work item provided that the requirements in Paragraph 3-39 are met.

The ADO must provide a copy of the written determination to the sponsor and place a copy in the grant file.

3-50. Plans and Specifications Review.

Per 2 CFR § 200.324(a), the ADO has the option to review the sponsor's technical specifications (including plans and specifications, engineer's report, and any other items within the procurement package) at any time during the process. However, the FAA policy on ADO review is discussed further in Paragraph 3-28.

3-51. Pre-award Review of Contracts.

2 CFR § 200.324(b) gives the ADO the option to conduct a pre-award review for the situations contained in Table 3-32. Otherwise, the ADO has the option to accept sponsor certification.

It is FAA policy that sponsors notify the ADO when any of these situations exist. If the ADO conducts the review, the ADO has the option to provide the sponsor with a written response containing the ADO finding. If the ADO provides a written response, the ADO must file a copy of the response in the grant file.

Table 3-32 Situations Where the ADO has the Option to Conduct a Pre-Award Review

Situations include…	
a.	A sponsor's procurement procedures or operation fails to comply with the procurement standards in 2 CFR §§ 200.317-200.326.
b.	The procurement is expected to exceed the simplified acquisition threshold (provided in Table U-7) and is to be awarded without competition, or only one bid or offer is received in response to a solicitation.
c.	The procurement, which is expected to exceed the simplified acquisition threshold (provided in Table U-7), specifies a *brand name* product.

Table 3-32 Situations Where the ADO has the Option to Conduct a Pre-Award Review

Situations include…
d. The proposed award is more than the simplified acquisition threshold (provided in Table U-7) and is to be awarded to other than the apparent low bidder under a sealed bid procurement.
e. A proposed contract modification changes the scope of a contract or increases the contract amount by more than the simplified acquisition threshold (provided in Table U-7). Note that although the ADO is not required to conduct a pre-award review, the ADO must conduct a review prior to the grant being amended or closed as discussed in Paragraph 5-35.

3-52. Sponsor's Procurement System.

Per 2 CFR § 200.324(c) (see Paragraph U-22), the ADO must review a sponsor's procurement system unless the sponsor has submitted a sponsor certification that the system meets the requirements of 2 CFR §§ 200.317-200.326.

If the ADO must conduct a review, the ADO has the option to provide the sponsor with a written response containing the ADO findings and/or keep a copy available for future reference.

3-53. Force Account Work.

Sponsor force account work is planning, engineering, or construction work done by the sponsor's employees. Unlike other such work, it is done without the benefit of a construction or consultant contract obtained through the normal procurement process rules in 2 CFR §§ 200.317-200.326. Force account work is allowable per 2 CFR part 200 Subpart E (OMB Circular A-87, Cost Principles for State, Local, and Indian Tribal Governments).

Per FAA policy, in order for the sponsor to use force account work, the sponsor must request the use of force account work in writing and the ADO must have approved the request *in advance of the grant offer*. In addition, it is in the best interest of the sponsor to obtain ADO approval *prior to the sponsor starting the work* to ensure that the work is allowable. The sponsor's written request must meet the requirements in Table 3-33.

Per FAA policy, the sponsor must provide the ADO with detailed documentation of all force account costs incurred as outlined in Table 3-34. In addition, the sponsor must follow the additional requirements in Table 3-35. The ADO must provide a copy of the written determination to the sponsor and place a copy in the grant file.

The ADO must not approve the use of force account for environmental work if the FAA is responsible for performing or procuring the work per the current version of FAA Order 5050.4, National Environmental Policy Act (NEPA) Implementing Instructions for Airport Projects.

Table 3-33 Sponsor Force Account Submittal Requirements

Sponsors must include the following in their written request…
a. Project Scope. The sponsor must provide adequate details showing the nature and extent of the work to be performed using force account.
b. Justification. The sponsor must provide justification for doing the work by force account rather than by contract. The sponsor must clearly show that the benefits, including benefits to the Federal government, of using force account override the Federal policy of competitive bidding or negotiated contracts.
c. Personnel Qualifications. The sponsor must provide information on the ability of their personnel to perform the force account work.
d. Detailed Cost Estimate. The sponsor must provide estimate of costs, including wage rates, non-salary expenses, indirect costs, and comparison of costs between the sponsor's force account and normal procurement methods.
e. Sponsor's Resources. The sponsor must provide information on sponsor's resources (labor, material, equipment, and financing) and workload as they affect capacity to do the work, date by which the work will be complete, or dates within which the work will take place. Enough funds must be available to the sponsor to carry payrolls and any necessary purchases of materials and rental equipment.
f. Cost Analysis. The sponsor must prepare a cost analysis per 2 CFR § 200.323 (see Paragraph U-21) and submit a copy to the ADO. The cost analysis can be used by the ADO to determine is the costs are reasonable.

Table 3-34 Sponsor Force Account Documentation Requirements

Sponsors must document actual costs as follows…
a. Personnel. Because sponsor employees often work on multiple projects, or on activities outside the project in the AIP grant, sponsors must submit timesheets (or a suitable report from an automated payroll accounting system) to the ADO to support these salaries and wages. A sponsor must base their charges upon actual payroll information documented under their agency's generally accepted practice. This payroll information must be reviewed and approved by the sponsor's responsible official. The timesheets must properly document all of the hours worked by the employees, regardless if they were on the AIP project or not. These above requirements are discussed in more detail in 2 CFR § 200.430 (Attachment B, Paragraph 8, of OMB Circular A-87, Cost Principles for State, Local, and Indian Tribal Governments). The expense must be directly related to the AIP project. Arbitrary or prorated costs are not allowable.
b. Equipment. Equipment rental rates applicable to the construction on force account development vary widely. It is recommended that sponsors use the U.S. Army Corps of Engineers Construction Equipment Ownership and Operating Expense Schedule (EP-1110-1-8) to determine the equipment rates. The purchase price of equipment bought by the sponsor for use on a force account project is *not* allowable, only this calculated rental and operating rate.

Table 3-34 Sponsor Force Account Documentation Requirements

Sponsors must document actual costs as follows…
c. **Supplies and Material**. All supplies and materials must follow the procurement requirements in 2 CFR §§ 200.317-200.326 (see Appendix U) and the sponsor must keep records to document these costs.

Table 3-35 Other Sponsor Force Account Requirements

Other requirements include…
a. **Reporting.** Construction and project reporting requirements are the same as those under a traditional contract
b. **FAA Standards.** Force account work must meet the same engineering and construction standards that are required under a traditional contract.
c. **Labor Standards.** Cost of labor and supervision must be in accordance with state and local standards.
d. **Insurance.** It is the sponsor's responsibility to comply with state and local insurance requirements.
e. **Project Changes.** The sponsor must obtain prior ADO approval to change the scope of the force account work. Sponsors must make these requests in writing.

3-54. Value Engineering.

Value engineering is the systematic application of recognized techniques that identify the function of a project or service and provide the best function reliably at lowest overall cost.

2 CFR § 200.318(g) encourages sponsors to use value engineering. The sponsor requirements for value engineering are contained in Paragraph U-10, which, by FAA policy, is required for new primary airports. In addition, ADOs have the option to require sponsors to use value engineering for unusually complex projects of greater than average costs (or require cost-benefit studies, present worth analysis, the study of alternatives, tactical planning, or other forms of technical evaluation).

The ADO must have concurred in writing with the use and scope of services for the value engineering prior to the work commencing. The ADO must place a copy of the concurrence in the grant file.

ADO's are cautioned that significant advance preparation may be needed to comply with the current version of Advisory Circular 150/5300-15, Use of Value Engineering for Engineering and Design of Airport Grant Projects.

3-55. Indefinite Delivery (Task Orders) Extensions for *Construction* Services.

Per FAA policy, a sponsor may not extend a task order contract for construction services beyond a one-year duration (without re-advertising the contract) unless the ADO concurs with this action. This is because AIP funded construction must be based on current Davis-Bacon wage rates, which are updated at least on a yearly basis.

For the ADO to concur with the extension, the sponsor must provide compelling justification and the ADO must be able to agree that the economic conditions and wage rates and project costs have remained unchanged. Per FAA policy, the ADO must not concur with more than four extensions to the same task orders.

3-56. Indefinite Delivery (Task Orders) Extensions for *Consultant* Services.

The sponsor must define the proposed projects, services, and estimated schedule as part of the procurement process. The sponsor must limit the procurement to those projects and services that can reasonably be started within five years of the final procurement selection. Per FAA policy, a sponsor may not extend a task order contract for consultant services beyond a total overall contract duration (without re-advertising the contract) of more than five years. This time limitation has been established so that competition is not unduly restricted. Unless otherwise approved in writing by the ADO, the sponsor must not add additional projects or services to the contract.

3-57. Suspension or Debarment of Persons or Companies.

Suspension and debarment are actions that a Federal agency takes to prohibit certain person or company from bidding on projects, receiving contracts or grants, or participating in federally funded contracts or grants. If a person or company is suspended or debarred by a Federal agency, the suspension or debarment extends to all Federal programs and procurement.

Suspension and debarment applies to contractors and subcontractors at any level, including suppliers, fee appraisers, inspectors, real estate agents, consultants, architects, engineers, and attorneys. It also applies to any others that are associated with the suspended or debarred person or company.

Additional information on suspension and debarment is available on the FHWA Construction Program Guide/Suspension and Debarment and the current version of DOT Order 4200.5, Suspension and Debarment, and Ineligibly Procedures. These are based on 2 CFR part 180 and 2 CFR part 1200. Note APP-500 is the Suspension and Debarment Official for AIP.

Paragraph U-5 contains the requirements sponsors must follow regarding persons or companies that have been excluded from working on AIP funded projects. Table 3-36 contains the ADO requirements.

Table 3-36 ADO Requirements Regarding Suspension or Debarment

For the following…	The ADO requirements include…
a. The sponsor is awarding a contract.	Per FAA policy, the ADO has the option to accept sponsor certification that the sponsor did the appropriate checks to assure that contracts or subcontracts are not awarded to suspended, debarred, or excluded firms or individual. Per FAA policy, the ADO also has the option to request additional information from the sponsor so the ADO can conduct a more thorough review. If the ADO believes the sponsor requirements were met, no further action or documentation by the ADO is required. If the sponsor requirements were not met, the ADO must contact their regional contact in the FAA Office of the Chief Counsel – Airports and Environmental Law Division (AGC-600) to determine the course of action.
b. A person or company currently working on an AIP project is suspended or debarred.	If the ADO becomes aware of this situation, per FAA policy, the ADO must contact their regional contact in AGC-600 to determine the course of action.
c. It appears that a person or company might need to be suspended or debarred.	If the ADO becomes aware of this situation, per FAA policy, the ADO must contact their regional contact in AGC-600 to determine the course of action.

Section 11. Cost Allowable.

3-58. Allowable Cost Legislation and Policy.

The documents listed in Table 3-37 provide guidance to the ADO on how to determine what costs are allowable and necessary within AIP funded projects.

49 USC § 47110(b) contains the five basic requirements that must be met for an ADO to determine that a cost is allowable. These five basic requirements are discussed in further detail in the following sections, as listed in Table 3-38.

In addition, the FAA has made a number of policy decisions on specific project cost items, which are discussed in further detail in the rest of this section.

Table 3-37 Resources to Determine if a Project Cost is Necessary and Allowable

The resources include…
a. The Act. 49 USC § 47110(b) contains the basic five requirements that must be met for an ADO to determine that a cost is allowable.
b. 2 CFR part 200 Subpart E (OMB Circular A-87, Cost Principles for State, Local, and Indian Tribal Governments). 2 CFR part 200 Subpart E (OMB Circular A-87, Cost Principles for State, Local, and Indian Tribal Governments) provides the principles that the ADO must use to determine if a cost is allowable for AIP funded projects.
c. The Single Audit Act of 1984. The Single Audit Act of 1984, Public Law 98-502 (as amended in 1996, Public Law 104-156, as amended and recodified at 31 USC § 7501 et seq.) is implemented by 2 CFR part 200 Subpart F (OMB Circular A-133, Audits of State, Local Governments, and Nonprofit Organizations). Although it is not this document's primary purpose, the Single Audit Act of 1984 provides valuable information about how to make allowable cost determinations.

Table 3-38 Five Basic Requirements to Determine a Cost is Allowable

For the following basic requirement…	The requirements are in…
a. Costs Necessary (Allowable Cost Rule #1)	Section 12
b. Costs Incurred after Grant Executed (Allowable Cost Rule #2).	Section 13
c. Costs Reasonable (Allowable Cost Rule #3).	Section 14
d. Costs Not in Another Federal Grant (Allowable Cost Rule #4).	Section 15
e. Costs within Federal Share (Allowable Cost Rule #5).	Section 16

3-59. Unallowable Cost Table.

Appendix C contains tables that the ADO can use to help determine if the FAA has previously identified a project or cost to be ineligible or unallowable.

3-60. Administrative Costs.

The ADO may determine that administrative costs are allowable direct charges to a grant if the administrative costs are required to carry out the grant project. Examples of common administrative costs and their requirements are included in Table 3-39.

Administrative costs must not include planning, engineering, or construction work and are therefore not considered force account work . Administrative costs may include work done by a sponsor or by another entity, such as an attorney. Administrative costs must be supported by

vouchers, receipts, personnel activity reports, or other verifiable documentation. Administrative costs must not represent a pro-rated allocation of time or expenses.

By FAA policy, a line item for *estimated* administrative costs can be included in the grant application if the sponsor cannot accurately calculate the total administrative costs. However, these estimated administrative costs must not exceed 2% of the grant amount or $10,000, whichever is less.

Once a grant is issued, the payment requests for administrative costs must represent actual costs and must be supported by appropriate documentation. Claims may not represent an estimated, allocated, or prorated cost.

Table 3-39 Administrative Costs Examples and Requirements

For the following example…	The following requirements apply…
a. Sponsor Employee Time. The cost for a sponsor's employee's time directly related to administrative tasks that are required to complete an AIP project The cost for a sponsor's employee's time includes the employee hourly salary; and costs related to the hourly rate such as Medicare, Social Security, federal/state/local taxes	**(1)** The ADO must determine that the work that is going to be accomplished by the sponsor's employees is *required* to carry out the AIP project. This is required because 49 USC § 47110(b) limits reimbursement to costs that are, "necessarily incurred in carrying out the project in compliance with the grant agreement," and establishes that costs must be "reasonable in amount". **(2)** The sponsor must have a time tracking system in place that tracks all hours that its employees work. **(3)** Because sponsor employees often work on multiple projects, or on activities outside the project in the AIP grant, sponsors must submit timesheets (or a suitable report from an automated payroll accounting system) to the ADO. **(4)** The timesheets must properly document all of the hours worked by the employees, regardless if they were on the AIP project or not. **(5)** A sponsor must base their charges upon actual payroll information documented under their agency's generally accepted practice. This payroll information must be reviewed and approved by the sponsor's responsible official. **(6)** A copy of the sponsor's responsible official's written approval must be provided to the ADO. **(7)** These above requirements are discussed in more detail in 2 CFR § 200.430 (Attachment B, Paragraph 8, of OMB Circular A-87, Cost Principles for State, Local, and Indian Tribal Governments). **(8)** The expense must be directly required by and related to the AIP project. These are normally limited to project specific costs such as preparation of an independent fee estimate, legal review of a construction contract, and submission of FAA required project reports. Costs that are not directly related, or are prorated, are not allowable. **(9)** Costs to administer the AIP grant *program* are not allowable.
b. Overhead Costs. Anything more than direct employee's time. These normally consist of support services such as accounting, billing, building rent, and utilities that cannot be attributed to one specific project or activity.	**(1)** These are considered indirect costs, which are discussed in Paragraph 3-61.

Table 3-39 Administrative Costs Examples and Requirements

For the following example…	The following requirements apply…
c. Sponsor Employee Expenses (such as tolls, mileage, and parking).	**(1)** The expense must be reasonable, be directly related to the AIP project, and be supported by a receipt or voucher.
d. Legal Fees.	**(1)** The expense must be reasonable, be directly related to the AIP project, and be supported by an invoice.
e. Independent Fee Estimates.	**(1)** The expense must be reasonable, be directly related to the AIP project, and be supported by an invoice.
f. Newspaper Advertisements/ Announcements in Publications.	**(1)** The expense must be reasonable, be directly related to the AIP project, and be supported by an invoice.
g. Audit Fees.	**(1)** The expense must be reasonable, be directly related to an AIP project (in this grant or in a prior grant), and be supported by an invoice. **(2)** The audit must be required by, and performed in accordance with, the Single Audit Act, as implemented by 2 CFR part 200, Subpart F (OMB Circular A-133, Audits of States, Local Governments, and Non-Profit Organizations). **(3)** If the audit includes other Federal programs beyond AIP, the costs are prorated to include only the AIP portion. **(4)** It is the opinion of the FAA that sponsors that are issued subgrants under a state block grant are responsible for obtaining the single audit and for the payment of the audit costs. Therefore, the request for reimbursement of these costs is tied to the subgrant.

3-61. Indirect Costs.

The FAA's policy allows a sponsor's indirect costs to be charged to the sponsor's employee's hourly salary for time working on an AIP grant if the indirect cost rate (IDC) was calculated based on the requirements in Table 3-40. The FAA policy allows indirect costs to be applied only to the direct wages and salaries of a sponsor's employees (not to other project costs).

Table 3-40 Requirements for Indirect Costs

The following requirements apply…
a. Indirect or Overhead Costs. Costs incurred by a sponsor for other than employee's direct time. Allowable items of cost that make up indirect costs may include costs for support services such as accounting, billing, building rent, and utilities that cannot be attributed to one specific project or activity can be allocated via federally-sanctioned formula to the grant.
b. Indirect Cost Rate Calculation. Indirect or overhead costs are potentially allowable only if the sponsor meets one of the following two criteria for calculation of the indirect cost rate. **(1)** The sponsor has a Cost Allocation Plan approved by the cognizant Federal agency. In addition, the sponsor has and an executed indirect cost rate agreement developed in accordance with 2 CFR part 200 Subpart E (OMB Circular A-87, Cost Principles for State, Local, and Indian Tribal Governments). These two documents are needed by the ADO to determine what percentage of the costs, if any, can be allocated to of modified total direct cost (MTDC). **(2)** If a sponsor does not have a Cost Allocation Plan, the sponsor has the option to charge a de minimis rate of 10% of modified total direct cost (MTDC) per 2 CFR § 200.414(f).
c. Modified Total Direct Cost (MTDC). Per FAA policy, the allowable MTDC is the cost for a sponsor's employee's time directly related to administrative tasks that are required to complete an AIP project The cost for a sponsor's employee's time includes the employee hourly salary; and costs related to the hourly rate such as Medicare, Social Security, federal/state/local taxes.
d. Cognizant Federal Agency. The cognizant agency of the Federal government that must approve or disapprove the Cost Allocation Plan. This agency is generally the Federal agency that has the greatest dollar involvement with a given sponsor. The ADO must contact APP-500 if the ADO has a question regarding whether the FAA is the cognizant agency for a sponsor. For the most part, the FAA is the cognizant agency for airport authorities. The Federal Highway Administration is the cognizant agency for many state departments of transportation and in that role, negotiates the indirect cost rate on behalf of the FAA.
e. FAA Determinations. For those sponsors for which the FAA is the cognizant agency, responsibility for approving or disapproving cost allocation plans and negotiating and executing the indirect cost rate agreement is delegated to the regional division manager. The ADO has the responsibility for review of the cost allocation plan, for signature by the regional division manager, and must use the following documents to make their recommendation: **(1) 2 CFR part 200 Subpart E** (OMB Circular A-87. Cost Principles for State, Local and Indian Tribal Governments). **(2) ASMB C-10**. Cost Principles and Procedures for Establishing Cost Allocation Plans and Indirect Cost Rates for Agreements with the Federal Government (developed by the United States Department of Health and Human Services and dated April 8, 1997). **(3) Financial Assistance Guidance Manual**. This DOT guidance, dated March 2009, replaces DOT Order 4600.17A, Financial Assistance Management Requirements.

Table 3-40 Requirements for Indirect Costs

The following requirements apply…
f. Application of Rate. The rate approved under the cost allocation plan (also referred to as the indirect cost allocation plan rate, or ICAP rate) is applied only to the costs associated with sponsor's employees' hourly rate, inclusive of employer paid costs, such as Medicare, Social Security, and federal, state, and local taxes. For example, if the employee earns $10/hour (including employer paid taxes or benefits) and the rate is 14%, the allowable overhead is $10/hour multiplied by 14%.
g. Indirect Cost Rate Documentation. Sponsors that intend to claim reimbursement for indirect costs must include a signed copy of the approved indirect cost rate and the indirect cost proposal for the grant year in the grant application.

3-62. Architectural Enhancements Costs.

It is FAA policy to support projects that contribute to the architectural and cultural heritage of local communities. In accordance with this policy, sponsors are encouraged in their early planning procedures to use design, art, and architecture to reflect local customs and history of the community or other cultural emphasis as long as this can be accomplished without impairing function, safety, and efficiency of the facility.

Architectural treatment of the inside and outside of buildings to reflect local custom, style, or cultural attitudes is an allowable cost. The work must be architectural in nature (it cannot be for the sole purpose of aesthetic enhancement) and must be in an area accessible by the public. Allowability examples for architectural treatments is contained in Table 3-41.

Table 3-41 Allowability Examples for Architectural Treatments

The cost to…	Is…
a. Apply an adobe finish on the exterior and public interior walls of a terminal in the Southwest.	**Allowable.**
b. Acquire and install terrazzo floors (depicting local scenes) in a non-public area of the terminal.	**Not Allowable.** The type of work is allowable, but because it is not in a public area, it is unallowable.
c. Purchase and install a free standing sculpture in the terminal.	**Not Allowable.** This is a work of art for the sole purpose of aesthetic enhancement. It is not an architectural treatment.

3-63. Benefit-Cost Analysis (BCA) Costs.

Per FAA policy, the costs incurred to prepare a BCA are only allowable as a grant formulation cost for the specific project (not as a stand-alone grant). In addition, these costs cannot be reimbursed until after the BCA shows that the project is justified.

3-64. Construction Costs.

Construction costs are only allowable if they are necessary to complete the project according to the plans and specifications.

3-65. Construction Project Signs Costs.

Project signs at an airport construction sites are not required, but if erected may be an eligible cost if the construction includes at least $200,000 of Federal funds and will be underway for at least three months. The allowable cost of the sign is limited to $1,000. The sign must contain a brief description of the project and the following statement: Part of the funding for this project is being provided by a grant from the Airport Improvement Program, which is administered by the Federal Aviation Administration and financed through the Airport and Airway Trust Fund.

3-66. Computer Software and Data Subscription Costs.

The ADO may approve sponsor requests, on a case-by-case basis, to include a specifically allocated portion of the costs of software acquisition, licensing and/or subscription. The ADO may only approve the portion of the cost that is directly attributable to a specific, FAA-approved AIP project, only for the duration of the approved AIP project, and only for the entity that is actually doing the work for which the software is required.

These costs may include customized commercially available software, but only if the customized software becomes public domain and the sponsor makes it available to any user without cost beyond handling costs.

It is anticipated that the costs of this software will normally be incurred by the sponsor's consultant because the consultant is performing the technical work. The cost for sponsor acquisition of software is not allowable unless it is approved by the ADO for force account work (see Paragraph 3-53).

The costs of ongoing data subscription services, such as those needed for a noise monitoring program, are not allowable. The sponsor is also responsible for the costs of any ongoing vendor service costs that may be needed to access FAA surveillance tracking data.

3-67. Disadvantaged Business Enterprise (DBE) Plan Updates.

The requirement for a sponsor to have a DBE plan is discussed in Paragraph 5-9. A sponsor is required to update their overall DBE program goals within this plan every three years. The cost for this DBE plan update is eligible as project formulation costs in the sponsor's first AIP grant after the update. A sponsor with multiple airports is only required to have one DBE plan (which

covers its airports). Therefore, the sponsor is allowed to apply the cost to update the plan to a grant at any of the airports it owns.

The cost to set the project specific DBE goal is also an eligible project formulation cost for that project.

3-68. Drainage Costs.

The drainage improvements are allowable to the extent the work serves eligible areas and facilities. If the drainage improvement will serve both eligible and ineligible areas/facilities, the allowable cost is limited to prorated share for the eligible portion. The ADO will determine the method of proration. Table 3-42 contains a proration example. In addition, the requirements for including ineligible or non-AIP funded work in the contract in Paragraph 3-39 must be met.

Drainage projects are eligible as stand-alone projects as discussed in Appendix D.

Table 3-42 Drainage Proration Example

For the following situation…	The allowable prorated amount would be…
A project will extend an off-airport drainage box culvert through the airport. This box culvert will also serve the neighborhood adjacent to the airport. The airfield runoff is 20 acres and the neighborhood runoff is 100 acres.	One fifth of the total cost to extend the culvert through the airport (including associated design, inspection, etc.).

3-69. Duct Bank Costs for Ineligible Facilities.

Normally, the cost to install, modify, or enlarge duct banks to support an existing or future ineligible facility is not allowable. There is one exception. These costs are allowable as part of an AIP funded pavement project only if the ADO has determined that they will reduce the need to disturb the AIP funded pavement at a later date.

The acquisition and installation cost of the ineligible utilities and equipment remains unallowable.

3-70. Energy Efficiency (Green/Sustainable) Improvement Costs.

Per 49 USC § 47110(b)(7), the costs to improve the energy efficiency of a building, sometimes referred to as green or sustainable improvements, are allowable. Energy efficiency improvement costs must meet the criteria in Table 3-43.

Note that the requirements for a project for improving the energy efficiency of airport *power sources* are discussed in Section 7 of Chapter 6.

Table 3-43 Criteria for Energy Efficiency Improvement Costs

In order for an energy efficiency improvement cost to be allowable…
a. The cost must be incurred on a measure to improve the efficiency of an airport building (such as a measure designed to meet one or more of the criteria for being considered a high-performance green building as set forth under section 401(13) of the Energy Independence and Security Act of 2007 (42 USC 17061(13))).
b. Any increases in initial project costs must be offset by expected savings over the life cycle of the project. The sponsor must follow the published FAA guidance for calculating the life cycle cost.
c. For building projects, the cost must be incurred on an otherwise eligible and justified airport building project (improving energy efficiency cannot be the justification). A project to improve a building's energy efficiency is not eligible as a stand-alone project.
d. The cost must only include costs which are necessary for the project, such as those for design, construction, testing, and inspection (not for obtaining LEED or similar certification or credits – which is not a necessary cost of the project).
e. For a building which contains eligible and ineligible areas, all costs associated with the measure (such as design, construction, testing, and inspection) must be prorated accordingly. In addition, the requirements for including ineligible or non-AIP funded work in the contract in Paragraph 3-39 must be met.
f. The sponsor must submit the initial project costs, the expected savings over the life of the project, the life cycle cost calculations, and the proration calculations (for building contains eligible and ineligible areas) to the ADO.
g. The costs to redesign or to modify ongoing construction to incorporate energy efficiency measures into the project are only allowable to the extent that the previously incurred design costs are removed from the AIP-funded project.

3-71. Engineering and Architectural (A/E) Costs.

Engineering and architectural costs are only allowable if they are necessary to complete an AIP eligible project. If only part of the project is eligible, the engineering and architectural costs are limited to the prorated eligible amount. Table 3-44 provides examples of some engineering and architectural costs that may be necessary for an AIP project.

Table 3-44 Examples of Engineering and Architectural Costs

Some examples include costs to…
a. Prepare plans and specifications (stand-alone design grants are discussed in Appendix D)
b. Establish and report on *project specific* DBE goals

Table 3-44 Examples of Engineering and Architectural Costs

Some examples include costs to…
c. Conduct initial field investigations
d. Conduct preliminary design
e. Conduct testing
f. Prepare construction management programs and the final test and quality control reports required for projects with pavement costs of $500,000 or more
g. Provide engineering cost estimates
h. Prepare bid documents
i. Evaluate bid proposals
j. Conduct construction inspection
k. Provide technical consulting services
l. Surveying and data collection (see Paragraph 3-77 for guidance on Geographic Information System (GIS) data collection)

3-72. Environmental Finding Costs.

Environmental finding costs are only allowable if they are necessary to complete the project per the current version of FAA Order 5050.4, National Environmental Policy Act (NEPA) Implementing Instructions for Airport Projects.

3-73. Equipment Leasing (instead of Purchase) Costs.

The Act only allows eligible equipment to be purchased, not leased. The exception is when equipment is leased for temporary use to complete an AIP eligible project (either by a contractor or through ADO approved sponsor force account).

In the case of lease/purchase agreements, only the purchase portion of the arrangement is an allowable AIP cost, and the ADO cannot issue the grant for the equipment until after the sponsor executes the option to purchase the equipment.

3-74. Facility Impeding an AIP Development Project – Costs to Rebuild or Relocate in Another Location.

The definition of allowable costs is expenses necessary to complete the project (49 USC § 47110 (b)). Normally, only *demolition* of facilities impeding an AIP development project is considered necessary.

However, there are situations where the cost of rebuilding an impacted facility (or paying to physically relocate it to another location) is an allowable cost. This depends on the ownership and type of the impacted facility. Table 3-45 provides detailed guidance and Table 3-46 provides examples.

For purposes of eligibility, impeding an AIP development project means physical interference with the AIP funded development project. It does not include rebuilding or relocating the facility to mitigate inconveniences to the facility.

In addition, if a facility is eligible for AIP funds, the ADO must also determine that there is no reasonable alternative and the sponsor is not knowingly impacting the facility to justify the participation of AIP funding. By issuing the grant, the ADO is documenting their determination.

Table 3-45 Allowability of Costs to Rebuild or Relocate Facility Impeding an AIP Development Project

If the impacted facility is…	The cost to rebuild or relocate the facility in a new location is…
a. FAA-owned NAVAID or federally owned (other than FAA-owned NAVAID) and is *on airport* property.	**Allowable** only if all of the following criteria are met: **(1)** The ADO has determined: **(a)** The new building or piece of equipment is the same size and function of the original; **(b)** It is not feasible to relocate the original facility or equipment; and **(c)** The allowable cost to construct a new facility to existing construction standards (per 49 USC § 47110(b)(1) does not exceed the cost of relocation of the existing facility. **(2)** If the facility is FAA-owned, the ADO must complete all required coordination with FAA Technical Operations (AJW). As part of the coordination, if AJW determines that the facility is no longer required, it is not eligible for relocation with AIP. It may be eligible to be demolished as an obstruction. Sponsors are advised to consider this possibility during the planning process. **(3)** If the ADO determines that the relocation of the facility is feasible: **(a)** The allowable costs are limited to the relocation costs, the site preparation, and utility installation at the new location. **(b)** AIP participation must not include refurbishing, enhancing or upgrading the impacted facility. **(4)** For FAA facilities, the relocation costs or costs of a new building or piece of equipment must demonstrate a passing (greater than 1.0) benefit-cost ratio.

Table 3-45 Allowability of Costs to Rebuild or Relocate Facility Impeding an AIP Development Project

If the impacted facility is…	The cost to rebuild or relocate the facility in a new location is…
b. Not sponsor or federally owned and is *on airport* property.	**Not allowable (Rebuild).** AIP cannot be used to rebuild the facility in a new location (this is the responsibility of the owner). **Allowable (Purchase).** AIP can be used to purchase the facility at market value. The costs associated with its demolition and removal are also allowable, minus any salvage value. **Allowable (Relocate).** The relocation of the structure or facility to another location on the airport in lieu of purchase is eligible up to the market value of the facility. Nominal incidental costs of the relocation (such as extinguishing a lease) may be included.
c. Not sponsor or federally owned and is *off airport* property.	**Allowable.** Detailed guidance on allowable costs is provided in the current version of Advisory Circular 150/5100-17, Land Acquisition and Relocation Assistance for Airport Improvement Program Assisted Projects. Unless otherwise specified in this advisory circular, relocated facilities (such as roads or utilities) must have an equivalent type and functionality as the existing facility.
d. Sponsor-owned, is *on airport*, and is an AIP eligible stand-alone project.	**Allowable** if the new facility is justified in the same way as if it were a stand-alone project. In other words, if the impacted facility is eligible and justified under AIP regardless of the impacting project, it is allowable to rebuild the facility in another location to the current size justified. Although obstruction removal is an eligible stand-alone project, the facility is only eligible for demolition. The ADO must follow the same funding rules for the demolition that exist for the associated development project. In addition, the cost to rebuild the facility in a new location must follow the funding rules (and any other AIP requirements) that would exist if this were a stand-alone project.

Table 3-45 Allowability of Costs to Rebuild or Relocate Facility Impeding an AIP Development Project

If the impacted facility is…	The cost to rebuild or relocate the facility in a new location is…
e. Sponsor-owned, is *on airport*, is not an AIP eligible stand-alone project, and is required by an FAA change to FAA design standards per 49 USC § 47110(d).	**Allowable** only if all of the following criteria are met: **(1)** This is not a change in category of FAA design standard for the airport due to increased traffic or other circumstances. Rather, this is a change in the actual physical dimension that is required for an airport to meet FAA design standards. **(2)** APP-500 has advised the ADO and regional offices that a change has been made to FAA design standards that may trigger the provisions of 49 USC § 47110(d). Advisory circulars contain both FAA design standards and recommendations. This provision only applies to changes in FAA design standards, not updated or new recommendations. **(3)** The ADO determines that the relocation or replacement is required due to a change in the FAA design standards that were published after February 14, 2012 (the date of enactment of FAA Modernization and Reform Act of 2012, Public Law 112-95). **(4)** The ADO determines that the change is beyond the control of the airport sponsor. **(5)** The ADO determines that the new FAA design standard clearly infringes on the sponsor's facility. **(6)** Only passenger entitlements, state apportionment, or nonprimary entitlements are used. **(7)** If the facility is replaced (rather than relocated), the new facility must have an equivalent type and functionality as the existing facility. **(8)** The change must not be simply a sponsor's preferred alternative. For example, a change in FAA design standards requires reconfiguration of an apron and the sponsor's *preferred alternative* impacts a sponsor-owned hangar. If the ADO determines that there are other design alternatives that will not impact a sponsor-owned hangar (whether or not those are the sponsor's preferred alternative), the cost to rebuild is not allowable. **(9)** The ADO must also determine that there is no other reasonable way to avoid rebuilding the facility and that the sponsor is not trying to knowingly impact a facility so that AIP funds can be used to rebuild it.

Table 3-45 Allowability of Costs to Rebuild or Relocate Facility Impeding an AIP Development Project

If the impacted facility is…	The cost to rebuild or relocate the facility in a new location is…
f. Sponsor-owned, is *on airport*, is not required by a change to FAA design standards, and is *not* an AIP eligible stand-alone project.	**Not allowable.** The only costs that are allowable are the removal or demolition of the facility (minus salvage value) and lease extinguishments in very rare cases. Extinguishment of leases without termination clauses may invoke relocation requirements per 49 CFR § 24.2(9). Extinguishment of non-terminal building leases for leases executed before the date of Change 1 of this Handbook that do not have a termination clause are allowable. For leases executed after the date of Change 1 of this Handbook or that have a termination clause, costs to extinguish the lease are not allowable. For tenant-owned improvements within a sponsor owned terminal, the demolition of the tenant improvements is the only allowable cost. The reason that the cost to rebuild the impacted tenant space is not allowable is because the sponsor has control of airport development and is therefore responsible if a tenant area is in the way of new development. The sponsor also has the option to physically move the facility to another location on the airport up to, but not exceeding, the demolition costs of the facility.

Table 3-46 Examples of Allowability of Costs for Facilities Impeding an AIP Project

For the following impacted facility…	The following costs are allowable…
a. An FAA-owned air traffic control tower with a cab that accommodates six controller positions. The existing structure cannot be dismantled and relocated.	The costs to rebuild the cab based on the current square foot per controller standards needed to accommodate six controller positions up to the cost of relocating the existing facility. Even though this may result in a larger cab, this cost is allowable because the facility has to be built to the same functionality. However, if the FAA Air Traffic Organization (ATO) wants to upgrade the facility above the current functionality, the ATO is allowed to pay for the increase in cost. (This combination of AIP and ATO funding is allowable.) Note that all air traffic control tower relocations must be sited through the Airport Facilities Terminal Integration Laboratory (AFTIL) based on the current version of FAA Order 6480.4, Air Traffic Control Tower Siting Process.

Table 3-46 Examples of Allowability of Costs for Facilities Impeding an AIP Project

For the following impacted facility…	The following costs are allowable…
b. An existing FAA-owned approach lighting system equipment shelter. The ADO has determined that the shelter can be relocated. ATO wants to take the opportunity to also refurbish the interior electrical system of the shelter.	The cost to relocate the equipment shelter. ATO is responsible for any upgrades to the shelter as a separate project.
c. An existing FAA-owned Visual Approach Slope Indicator (VASI). ATO proposes that the ADO pay to replace the VASI with a precision approach path indicator (PAPI). The ADO has determined that it *is* feasible to relocate the existing VASI.	The cost to relocate the VASI or the cost to install the new ATO-provided precision approach path indicator PAPI (up to but not exceeding the cost of the VASI relocation cost). If a new ATO-provided PAPI is installed, any cost above the VASI relocation cost (per engineering estimates) must be paid for directly by ATO. (This combination of AIP and ATO funding is allowable.) The sponsor must obtain the PAPI from ATO through a reimbursable agreement. This is because the PAPI may not be supported by ATO if the sponsor uses the normal procurement process.
d. An existing FAA-owned VASI. ATO proposes that the ADO pay to replace the visual approach slope indicators (VASI) with a precision approach path indicator (PAPI). The ADO has determined that it is *not* feasible to relocate the existing VASI.	The cost to purchase and install a new PAPI. Even though the PAPI is an upgrade, because the FAA no longer purchases and installs VASIs, a PAPI is the only option to provide equivalent functionality and is therefore allowable. The sponsor must obtain the PAPI from ATO through a reimbursable agreement. This is because the PAPI may not be supported by ATO if the sponsor uses the normal procurement process.
e. An airport administration office in the sponsor-owned terminal.	The cost to demolish the office area. The terminal is airport owned and the airport administration office is not AIP eligible, therefore rebuilding the office in a new location is not allowable.
f. A passenger holding area at a non-exclusive use gate in the sponsor-owned terminal.	The cost to demolish the passenger holding area and rebuild it in another location. The costs can include an area up to the size the ADO would consider eligible if it were a stand-alone project.
g. A sponsor-owned T-Hangar at a GA airport. The ADO has determined that the AIP project impacting the T-Hangar could be located elsewhere on the airport.	The cost to demolish the T-Hangar. The sponsor is choosing to unnecessarily impact the T-Hangar, so the cost to rebuild the T-Hangar in another location is unnecessary and is not allowable.

Table 3-46 Examples of Allowability of Costs for Facilities Impeding an AIP Project

For the following impacted facility…	The following costs are allowable…
h. A sponsor-owned T-Hangar at a GA airport. The ADO has determined that the AIP project impacting the T-Hangar could not be located elsewhere on the airport and that the sponsor is not trying to knowingly impact the building so that AIP funds can be used to rebuild it.	The cost to demolish the T-Hangar and rebuild (or relocate) it in a new location up to the size and specifications the ADO would consider to be eligible if it were a stand-alone project. However, since this is a revenue-producing aeronautical support facility, only non-primary entitlements can be used to rebuild the T-Hangar. In addition, the sponsor is restricted from using all but non-primary entitlements for that fiscal year as well as the next two fiscal years.
i. An ARFF building. The existing building does not meet the current construction standards for earthquake protection, nor, based on the ADOs calculations, is it big enough to address the existing 14 CFR part 139 requirements. The ADO has also determined that there is no other reasonable way to avoid rebuilding the facility and that the sponsor is not trying to knowingly impact the building so that AIP funds can be used to rebuild it.	The costs to demolish the ARFF building, rebuild it in a new location, enlarge it to meet the 14 CFR part 139 requirements, and bring it up to the current construction standards for earthquake protection.
j. A sponsor-owned T-Hangar at a primary airport that is directly impacted by a change in FAA design standards. The ADO has determined that the only reason the T-Hangar must be relocated is due to a change in FAA dimensional design standards issued after February 14, 2012. Note that a change in an FAA *recommended design practice* is not a change in FAA design standard.	The cost to demolish the T-Hangar and rebuild (or relocate) it in a new location if all of the other requirements in Table 3-45 for this type of project have been met.

3-75. Flight Check.

If a flight check is required by the FAA to commission an AIP-funded NAVAID, the cost of one flight check under a reimbursable agreement with the FAA, and the associated costs for the contractor to participate, is allowable. In the instance that FAA cancels a flight check and the sponsor incurs costs from having the contractor on site for the flight check, these costs may also be allowable. However, the cost for failed flight checks are not allowable.

3-76. Force Account Costs.

Sponsor force account work is planning, engineering, or construction work done by the sponsor's employees. These costs are only allowable if they are necessary to complete the project and have been approved by the ADO as discussed in Paragraph 3-53.

3-77. Geographic Information System (GIS) Data Collection.

GIS data collection is an allowable costs if it meets the requirements in Table 3-47. The Airports GIS surveying and data collection efforts that allowed surveying beyond that allowed in the table are no longer in effect.

Table 3-47 GIS Data Collection Cost Requirements

For GIS work within the following type of project…	The following restrictions apply…
a. AIP funded development.	**(1)** The scope of the field survey, data collection, and uploading to the Airports GIS program must be directly required by the AIP funded development project. **(2)** The costs must be limited to that required to complete the AIP funded development project. **(3)** The field survey, data collection, and uploading to the Airports GIS program is in accordance with FAA surveying standards.
b. AIP funded planning.	**(1)** Because a planning study is expected to result in an FAA-approved airport layout plan that reflects future conditions for the entire airport, the scope of the grant may include Airports GIS-compliant surveying for the entire airport consistent with the FAA's established surveying standards for Airports GIS—regardless of whether the airport sponsor chooses to characterize the planning study as a master plan or master plan update, or some other type of planning study. **(2)** In extraordinary circumstances, a planning study may be conducted in phases, in which case it is permissible to include the full-airport survey work in a Phase 1 planning grant—i.e., a grant whose scope does not include the final master plan or ALP documents. However, in such cases, the grant must include a special condition (the automated AIP system contains the current available special conditions). **(3)** State or metropolitan system planning studies are used to study the performance and interaction of an entire aviation system in a specific geographic area. As such, AIP-funded system planning grants may not generally include whole-airport surveys unless specifically approved by APP-400 and APP-500. **(4)** The field survey, data collection, and uploading to the Airports GIS program must be in accordance with FAA surveying standards.

3-78. Heated Airfield Pavement.

The cost of a heating system for airfield pavement, as defined in the current version of Advisory Circular 150/5370-17, Airside Use of Heated Pavement Systems, is eligible under AIP. However, the sponsor must justify the costs with a positive benefit-cost analysis. In addition, the ADO must remove the pavement from subsequent snow removal calculations when determining AIP eligible snow removal equipment.

3-79. Historic Building Costs.

If a structure is being impacted as part of an eligible AIP project (including land acquisition and noise mitigation) and the structure is on (or eligible for listing on) the National Register, as amended, the associated costs required by Section 106 of the National Historic Preservation Act of 1966, Public Law 89-665 (codified as amended at 16 USC § 470h-2) are allowable.

3-80. Hydrant Fuel Lines and Pit Costs.

The incidental cost of installing aircraft fuel lines and pits as part of an aircraft apron project is an allowable cost. Per FAA policy, the costs must be prorated to include only the portion of the lines and pits physically under the AIP funded apron project. These costs are allowable because they will reduce the need to disturb the AIP funded apron at a later date. The requirements for including ineligible or non-AIP funded work in the contract in Paragraph 3-39 must be met.

3-81. Land Acquisition Costs.

It is FAA policy that costs associated with a land acquisition (such as appraisals, legal fees, etc.) are not allowable until *after* the sponsor has submitted evidence satisfactory to the ADO that the sponsor will obtain good title to the land. Typical examples of this evidence are a binding purchase agreement that will convey good title, evidence of a condemnation deposit, a condemnation award, or a court settlement. Until the sponsor meets this requirement, there is no guarantee that the land acquisition will be completed. Therefore, while the ADO may issue a grant for land acquisition before the sponsor submits satisfactory evidence that good title will be acquired, sponsors must not submit payment requests until these conditions are met.

Some of the common allowable land costs and their associated restrictions are listed in Table 3-48. All of these costs need to be necessary and reasonable in amount. The ADO must only fund cost allowed under 49 CFR part 24 and may contact APP-400 for assistance.

Table 3-48 Common Allowable Land Costs and Associated Restrictions

For the following cost…	The following restrictions apply…
a. Appraisals	One appraisal of each property to be acquired is allowed unless the ADO concurs that a second, full appraisal is justified. Generally, a property with potential fair market value over $500,000 may require a second appraisal. Complex appraisal assignments may also require two appraisals to ensure adequate market research and analysis is secured to support appraised values. The sponsor must ensure all appraisal reports to establish the just compensation offer to the property owner are reviewed by qualified review appraiser and approved as required under 49 CFR part 24.
b. Title Evidence	The reasonable and necessary cost of title evidence (title search and acquisition closing procedures to ensure marketable clear title to property is conveyed to the airport) is allowable. The sponsor's attorney must certify to ADO that good title has been acquired and may rely on title insurance (title company commitment of insurance of marketable title), or title abstract or an attorney's certificate of title. Per FAA policy, AIP reimbursement of the title insurance costs must not exceed $1000 per parcel.
c. Exhibit A Update	Per FAA policy, the sponsor is required to maintain a current Exhibit A (property inventory map). The cost to update the Exhibit A is both a required and an allowable cost in a land project. An airport property map is not a substitute for an Exhibit A.
d. Condemnation Awards	The ADO may accept the cost of land or property interest established by the courts in a condemnation proceeding as a reasonable cost, even though it is above current appraised value. Reasonable attorney fees, delay interest, and acceptable incidental expenses included in a court award to land owners in a condemnation action are allowable costs. If the sponsor and their legal counsel determine that the award was excessive or unreasonable, they must evaluate whether to appeal the award. The sponsor and their legal counsel are encouraged to appeal an unfavorable award if there is good reason to believe that the amount of the award will be significantly reduced on appeal or retrial.

Table 3-48 Common Allowable Land Costs and Associated Restrictions

For the following cost…	The following restrictions apply…
e. Relocation Assistance Costs	Relocation assistance and eligible payment requirements are described in 49 CFR part 24. These are required both for all FAA assisted projects and programs where acquisition or relocation is required or contemplated, and for projects to reimburse the sponsor for prior acquisition or relocation. The cost incurred by the sponsor to meet the requirements of 49 CFR part 24 is allowable. Examples include, but are not limited to: **(1)** Moving expenses. **(2)** Reestablishment expenses. **(3)** Replacement housing payments. **(4)** Related non-residential expenses. **(5)** Rent supplements. **(6)** Down payments. **(7)** Mortgage interest differentials or mortgage buy downs. **(8)** Incidental expenses in connection with the acquisition of replacement housing. **(9)** Advisory services. **(10)** Preparation of feasibility studies and relocation plans.
f. Appraisal (Highest and Best Use) for Acquisition of an Airport not in the NPIAS	The acquisition of a private airport by a public sponsor will normally include acquiring all of the airport property, including improvements. The appraised highest and best use of the land may either be continued airport use, or market development of the land to a more valuable land use, but not a mix of the two. The ADO must contact APP-400 for additional guidance on the appraisal requirements for the acquisition of a private owned airport.
g. Facilities on AIP Acquired Land	When land is acquired using AIP funding and there are existing facilities on the land, the ADO must determine if the cost for these facilities is allowable. Table 3-49 provides the allowability requirements the ADO must use to make these allowability determinations.

Table 3-49 Allowability of Costs for Facilities on AIP Acquired Land

If the facility will be …	Then the cost of acquiring the facility is…
a. Demolished	**Allowable.**
b. Used for an AIP eligible purpose (such as a general aviation terminal)	**Allowable** up to the justified size or use of the AIP eligible purpose (all other project and project related funding requirements apply).
c. Demolished at a later date (not to exceed three years)	**Allowable.** The sponsor may use the structure for any incidental purposes it deems desirable provided it does not interfere with the purpose of the airport. However, any revenue at fair rental value received during the period between acquisition and demolition of the structure constitutes airport revenue and is to be used according to grant assurances. If a decision is ultimately made not to demolish the structure, then the ADO must contact ACO-100 to determine the next course of action.
d. Used for a purpose that is not AIP eligible (such as administrative offices)	**Not Allowable.**
e. Relocated from its present site	**Partially Allowable.** This cost is only allowable up to the lesser of the relocation costs or the demolition costs.

3-82. Legal Fees and Settlement Costs.

Legal fees and settlement costs are allowable if the ADO has determined that all of the criteria in Table 3-50 have been met. The ADO has the option to request the assistance of their regional legal counsel in making these determinations. The ADO also has the option to request the assistance of APP-400 for environmental or land related legal fees and settlement costs.

The ADO cannot find associated administrative expenses or consultant fees to be allowable if the ADO has determined that the legal fees or settlement costs are unallowable.

The ADO has the option to either implicitly concur with the legal fees and/or settlement costs by issuing the grant or make a written determination. In either case, the ADO must place the documentation used to support this determination in the grant file.

Table 3-50 Requirements for Legal Fees and Settlement Costs

All of the following criteria must be met for the costs to be allowable…
a. The legal fees and/or settlement costs are a necessary part of the project or are needed to avoid shutdown of the project. Examples include legal costs to file the title at the courthouse, legal costs to review contracts before they are signed by the sponsor, and settlement costs required by a court finding to avoid a project being shut down.
b. The costs are not associated with defending a specification or Federal provisions. This is because the cost to defend a Federal provisions or specification is not a necessary part of the project and is not needed to avoid shutdown of the project.
c. The costs are reasonable.
d. The costs are documented in an invoice.
e. The costs can be paid for within the existing grant (or any proposed amendment). A separate grant cannot be issued if the costs are more than the amendment limit.
f. If the total legal fees and/or settlement costs within the grant (and any proposed amendments) will exceed $100,000, the ADO has provided their recommendation up through the regional office and APP-500 to APP-1, and APP-1 has provided written concurrence.
g. The ADO has determined that costs are not due to negligence on the part of the sponsor or consultant (including bidding defective plans or improper payments) and the sponsor did not violate contract provisions.
h. The ADO has determined that the costs are not associated with the recoveries of improper payments. Under 49 USC § 47110(b)(1), all costs paid with AIP funds must be *necessary* to carry out the project. It is the sponsor's responsibility to recover improper payments without using AIP funding to carry out the work effort.
i. The sponsor has exhausted all other avenues available to pay for the costs or resolve the issue.

3-83. Lighted X's and Other Runway Closure Markings Costs.

The cost for a contractor to furnish runway closure markings during a project is an allowable cost. However, a sponsor *cannot* require the contractor to purchase lighted X's and then turn it over to the airport as part of the project. If a sponsor would like to acquire a lighted X, they must request this as a separate AIP project and justify the need to the ADO (see Appendix J).

3-84. Nonroad Diesel Engines.

In 2004, EPA issued a final rule adopting Tier 4 emission standards for nonroad diesel engines. The Tier 4 standards (40 CFR part 1039), are intended to reduce harmful emissions and to improve air quality. The EPA required all manufacturers to be fully compliant with the first model year after December 31, 2014. The standards include a hardship provision (40 CFR part 1039.635) that would delay compliance with Tier 4 emission standards for up to

two model years from the 2014 date for small-volume manufacturers (40 CFR part 1068.250). What this means is that in certain cases, a manufacturer may provide a Tier 3 engine in a Tier 4 proposal.

A sponsor has the option to bid only the Tier 4 standards for nonroad diesel engines, which will only allow Tier 4 engines to be bid, or to allow the Tier 4 hardship program engines, which will allow Tier 3 or Tier 4 engines.

3-85. Normally Unallowable Costs that are Necessary to Carry Out the Project.

The ADO has the option of finding a normally unallowable cost allowable if the associated project cannot proceed without it. However, the ADO also has the option to require the sponsor to pay for these costs. Examples of these types of costs are included in Table 3-51. If no precedent for these costs exists, the ADO must consult APP-500.

Table 3-51 Examples of Unallowable Costs Necessary to Carry Out a Project

Some examples include…
a. Planting trees that are required as an environmental mitigation measure in an FAA approved environmental finding. Landscaping is normally an unallowable cost, but in this case it would be allowable.
b. Fire hydrant installation required to obtain a local building permit for an apron project. Otherwise, fire hydrants are not a necessary for an apron project and would not be allowable.

3-86. Project Formulation Costs.

Project formulation costs must be directly related to the project. These are costs that are normally incurred before the project starts and would not have been incurred otherwise. Table 3-52 contains some examples of project formulation costs.

Indirect costs for project formulation must not be approved except as allowed in Paragraph 3-61.

Table 3-52 Examples of Project Formulation Costs

Some examples include…
a. Field surveys
b. Soil borings
c. Plans and specifications (if not a stand-alone design grant)
d. Project related airport layout plan revisions

Table 3-52 Examples of Project Formulation Costs

Some examples include…
e. Land acquisition
f. Aeronautical studies
g. Grant administrative expenses for the projects in the grant
h. Benefit-cost analyses
i. Safety risk management (SRM) analysis for the specific project
j. Environmental studies (if not a stand-alone environmental study grant)
k. Land appraisals and review appraisals, title examination, and relocation plans
l. Construction and equipment procurement costs such as bid advertisement
m. Disadvantaged Business Enterprise (DBE) plan updates and project specific DBE goal formulation

3-87. Reimbursable Agreements with Other Federal Agencies.

The cost for reimbursable agreements between the sponsor and a Federal agency is allowable if the cost is necessary for the project and the other Federal agencies statutes allow this action. For instance, 49 USC § 106(l)(6) allows the FAA to enter into reimbursable agreements in order to carry out the functions of the FAA. An example of this is a reimbursable agreement between a sponsor and the FAA Air Traffic Organization (ATO) for the purpose of having the ATO relocate an FAA-owned navigational aid that is required by an AIP funded project (as allowed under 49 USC § 44502(a)(2)).

3-88. Safety Management System (SMS) and Safety Risk Management (SRM) Costs.

An SMS manual and implementation plan covers a wide range of projects and operations at a specific airport. The requirements an ADO must follow to issue a grant for an SMS manual and implementation plan are contained in Appendix E.

In addition, the sponsor may be required to participate in an SRM panel for specific projects or operations. If the specific project is one that will be funded by AIP, then certain costs are potentially allowable per Table 3-53.

Table 3-53 Allowable SRM Costs

The following are allowable SRM costs…
a. SRM Panel Costs. SRM panel costs are only allowable if they are specifically for the project in the grant and are required and conducted per the current version of FAA Order 5200.11, FAA Airports (ARP) Safety Management System. Allowable costs are limited to the reasonable costs of a consultant to support the SRM, including the costs to obtain a third party facilitator, prepare presentations, and provide meeting notes. The costs for airport employees, tenants, or FAA employees are not allowable.
b. SRM Project Costs. The recommendations from an SRM panel are not automatically eligible or justified. The reason is that many SRM panel recommendations will be operational or involve work that is funded under another Federal program. The ADO must review these recommendations on a case by case basis to determine if the recommendation is a project or project cost that meets the eligibility and justification requirements outlined in this Handbook. The ADO may determine that the recommendation is either a stand-alone project or is an allowable cost under another eligible and justified project.

3-89. Secondary Electrical Power Supply Costs.

The primary electrical power supply is an allowable cost for any eligible project as outlined in Paragraph 3-97. In *extremely* limited circumstances the ADO also has the option to find the cost for a secondary, or redundant, power supply allowable.

The ADO may find a secondary power supply allowable if the primary power supply for the eligible areas/facilities of the airport is extremely unreliable due to any of the reasons listed in Table 3-54.

The secondary power supply must be in the form of an electrical service provided by a power company. Generators are not considered secondary electrical power supplies under this paragraph. (Generators are discussed in Appendix M.)

Table 3-54 Reasons for an ADO to find a Primary Power Supply Extremely Unreliable

Reasons include…
a. An extensive, documented, history of cable cuts.
b. Extraordinary meteorological conditions.
c. An extensive, documented, record of commercial utility interruptions.

3-90. Seismic Standards.

On June 14, 1993, the DOT published a final rule, 49 CFR part 41 implementing the provisions of Executive Order 12699, Seismic Safety of Federal and Federally-Assisted or Regulated New Building Construction, effective July 14, 1993. The result of the final rule is that that any building constructed with AIP funds must be designed and constructed in accordance with seismic standards of 49 CFR § 41.120. Therefore, the costs to include required seismic standards in an AIP project are allowable.

3-91. Site Preparation Costs for Ineligible Work.

a. Prorating Ineligible Site Preparation Costs. In some cases, a sponsor may determine that it is beneficial to undertake site preparation for both eligible and ineligible development through one construction contract. The sponsor cannot include this ineligible site preparation work unless the sponsor has obtained approval from the ADO in advance (see Paragraph 3-39 for the rules regarding ADO approval of contracts containing ineligible costs).

b. Funding Incidental Site Preparation Costs. There is only one situation where site preparation for ineligible facilities is allowable. This situation is when clearing, grading, grubbing, or related work for an eligible AIP project inadvertently overlaps the site preparation area for an ineligible facility. Examples are included in Table 3-55.

Table 3-55 Allowability Examples of Site Preparation for Ineligible Facilities

For the following situation…	The extra site preparation costs are…
a. A project to improve a runway safety area overlaps the grading work needed for an FAA-owned approach lighting system.	**Allowable.** This is because the sites overlap.
b. A project to build an eligible apron is adjacent to the proposed site for an exclusive use maintenance facility. The sponsor has requested minor site preparation for the maintenance facility be included in the apron project.	**Not allowable.** The sites do not overlap.

3-92. Spare Part Costs.

FAA policy allows sponsors to acquire spare parts in very limited circumstances. The cost for spare part is allowable if the criteria in Table 3-56 can be met.

Table 3-56 Spare Part Requirements

All of the following criteria must be met…	
a.	The spare parts are for eligible airport visual aids listed in the current version of Advisory Circular 150/5340-26, Maintenance of Airport Visual Aid Facilities.
b.	The spare parts are included in the same grant that installs the airport visual aid.
c.	The cost of the spare parts does not exceed 10% of the total cost of the airport visual aid.
d.	The total cost for the spare parts does not exceed $10,000.
e.	The spare parts are minor components of the airport visual aid.
f.	The sponsor can replace the spare parts using their own staff.
g.	The ADO believes the sponsor will be able to store or accurately account for the spare parts inventory.

3-93. Sponsor Furnished Materials or Supplies.

The sponsor requirements for using sponsor furnished materials or supplies within an AIP funded project are contained in Paragraph U-3.

The ADOs ability to concur with the use of sponsor furnished materials or supplies and use AIP funding on these items (and/or associated installation) depends on whether the material or supplies have been procured per 2 CFR §§ 200.317-200.326 (see Appendix U) and meet all of the requirements shown in Table 3-57. The ADO has the option of relying on the sponsor's written statement regarding the sponsor's ability to meet these requirements. The ADO also has the option of requiring the sponsor to provide additional support documentation.

The ADO must provide a copy of the written determination (including the approval of force account work, if applicable) to the sponsor and place a copy in the grant file. As discussed in Paragraph 4-12, per 2 CFR § 200.434 (Paragraph 12 in Attachment B of OMB Circular A-87, Cost Principles for State, Local, and Indian Tribal Governments), sponsors are prohibited from using sponsor furnished materials or supplies against the sponsor's share of a grant, unless approved as part of force account work.

Table 3-57 Rules for Sponsor Furnished Materials or Supplies

If the sponsor furnished materials or supplies…	The following can be funded with AIP…	Examples that potentially meet these requirements include…
a. Meets all of the following: **(1)** Meets the procurement requirements of 2 CFR §§ 200.317-200.326. **(2)** Meets all required Federal contract provisions for equipment procurement, including Buy American. **(3)** Meets all applicable FAA technical standards for material or supply. **(4)** Is approved by the ADO for force account work (see Paragraph 3-53).	The materials or supplies and the associated installation, testing and inspection of the equipment are AIP eligible (provided all AIP requirements are met).	ALCMS modifications. Certified airfield lighting equipment with only one manufacturer.
b. *Only* meets the applicable FAA technical standards for material or supply.	Installation, testing, and inspection only (the cost of the materials or supplies is not eligible).	Sponsor preferred airfield lighting equipment. Sponsor preferred access control cameras.
c. *Does not* meet all applicable FAA technical standards for material or supply.	Neither the materials or supplies nor the associated installation testing, and inspection (all ineligible). In addition the materials may not be used on the project.	Materials or supplies with unapproved modifications to FAA standards.
d. Are prohibited from Federal funding (even if it meets FAA technical standards).	The equipment, installation testing, and inspection (and any other associated cost) are not eligible. Installation of cans and conduit are allowable as part of an AIP funded pavement project only if the ADO has determined that they will reduce the need to disturb the AIP funded pavement at a later date.	Certified airfield light emitting diode (LED) lighting equipment that is prohibited from AIP funding.

3-94. Temporary Construction Costs.

If the ADO makes a determination that uninterrupted operation of the airport is necessary and that such operation could not be continued without temporary construction, costs of temporary construction are allowable even though a portion of the work cannot be salvaged. The costs of the temporary construction must be determined by the ADO to be both necessary and reasonable. Costs that are unreasonable are not allowable and the ADO has the option of requiring the sponsor to use lesser cost alternatives if these alternatives meet the project need. In general, temporary construction that includes new airfield pavement such as a temporary visual runway or a runway extension is unallowable without extraordinary and significant justification. The ADO must coordinate with, and obtain APP-400 and APP-500 approval, to include new airfield pavements as temporary construction measures.

Examples of allowable temporary construction are included in Table 3-58.

Temporary construction often results in pavement, facilities, or NAVAIDs that may have value to the airport once the construction is complete. The ADO has the option to concur with a sponsor's request to keep the temporary improvement in place (or relocate it to another location on the airport). However, relocation, rehabilitation, maintenance, and/or replacement of the improvement is not automatically justified for AIP funding unless the improvement would have been eligible and justified as a stand-alone project.

For items that have salvage value, such as NAVAIDs, the sponsor must follow the disposal requirements outlined in Paragraph 5-67. In addition, the ADO has the option of requiring the sponsor (normally through a special condition in the grant agreement) to transfer the item to an airport that is eligible for the item. The automated AIP system contains the current available special conditions.

Table 3-58 Examples of Allowable Temporary Construction

Some examples include…	
a.	Temporary measures required to protect air and water quality.
b.	The acquisition and installation of interim non-Federal NAVAIDs if the ADO determines they are necessary to provide visual or instrument capability during an extended period of time during the construction of the AIP project.
c.	The acquisition and installation of interim Federal NAVAIDs if the FAA Air Traffic Organization (ATO) determines they are necessary to provide visual or instrument capability during an extended period of time during the construction of the AIP project. These costs are normally included in the reimbursable agreement between the ATO and the sponsor.
d.	Construction of a haul road to avoid runway and/or taxiway crossings.

Table 3-58 Examples of Allowable Temporary Construction

Some examples include…	
e.	Measures to designate a taxiway as temporary runway in accordance with the current version of FAA Order 7110.19, Designation Taxiways as Temporary Runways.
f.	An interim terminal facility if there is no other reasonable way to accomplish the project. The interim facilities must be only that necessary to keep the operations in motion. The facilities must only be built for this interim use. Costs to develop the facility into a follow on use are not allowable.

3-95. Thermoplastic Markings.

The FAA standard specifications allow a sponsor to select and use thermoplastic markings instead of paint for airfield markings. However, as of the publication date of this Handbook, thermoplastic materials cost more than paint, both on a first cost and a life cycle cost basis (based on a life cycle for paint of approximately 3 years and thermoplastic markings of up to 7 years). In order to determine that the use of thermoplastic markings meet the statutory requirement for reasonable costs, the sponsor must provide a life cycle cost comparison that demonstrates that the costs are reasonable and verification that there are more than one manufacturer of thermoplastic markings. The ADO must retain a copy of the sponsor's successful life cycle cost analysis in the grant file.

3-96. Used Equipment Costs.

The acquisition of used equipment is allowable provided it meets FAA specifications and has an acceptable useful life based on the proposed purchase price.

The GSAXcess program is an excellent source for free used equipment. The GSAXcess website and the current version of Advisory Circular 150/5150-2, Federal Surplus Personal Property for Public Airport Purposes, are good resources for a sponsor to learn more about this program.

3-97. Utility Costs.

The installation, improvement, reconstruction, or repair of water, gas, and electric (primary power supply only) is allowable to the extent the work serves eligible areas and facilities and the utility is an allowable cost for the facility. For instance, gas, water, and electric are needed for a terminal building, whereas only electric is needed for a general aviation aircraft storage hangar.

If the utility installation will serve both eligible and ineligible areas/facilities, the allowable cost is limited to prorated share for the eligible portion. The ADO will determine the method of proration. Table 3-59 contains an example of prorated utility costs. If the utility work is required for the AIP portion of the airport, as well as for other non-AIP portions of the airport, the ADO can presume that the determination of the best interest of the Federal government required in Paragraph 3-39 has been met. However, the other requirements for including ineligible or non-AIP funded work in the contract in Paragraph 3-39 must be met.

Per FAA policy, utility projects are not eligible as stand-alone projects.

Table 3-59 Utility Costs Proration Example

For the following situation…	The allowable prorated amount would be…
A project to run electrical lines to a T-Hangar area also contains an ineligible office building. The T-Hangars are estimated to use 2/3 of the electrical load and the ineligible office building will use the remainder.	Two thirds of the total cost of the electrical line installation (including associated design, inspection, etc.).

3-98. Value Engineering.

The cost for value engineering is allowable if all of the sponsor requirements in Paragraph U-10 and the ADO requirements in Paragraph 3-54 are met.

Section 12. Costs Necessary (Allowable Cost Rule #1).

3-99. Requirements for Costs to be Necessary.

Per 49 USC § 47110(b)(1), the ADO must only approve costs that are directly necessary to accomplish the project. All other costs are considered unallowable.

Section 13. Costs Incurred after Grant Executed (Allowable Cost Rule #2).

3-100. Rules for Reimbursing Project Costs Prior to the Grant (or LOI) Execution Date.

Unless specifically allowed in the Act, 49 USC § 47110(b)(2) requires that all project costs must be incurred after the grant execution date. Table 3-60 list the entire set of rules regarding when project costs can be incurred in relationship to the grant execution date, the type of funding, and the type of project.

Table 3-60 Rules for Reimbursing Project Costs Prior to the Grant Execution Date

For…	The following rules apply…
a. Allowable costs using any or all of the following types of funds: • Passenger Entitlement • Cargo Entitlement • Nonprimary Entitlements	Per 49 USC § 47110(b)(2)(C), project costs must have been incurred after 9/30/1996. All allowable costs after this date may be reimbursed with these types of funds, regardless of whether they were incurred before the grant was executed as long as all other applicable AIP requirements have been met.

b. Allowable costs using any or all of the following types of funds: • Discretionary • State Apportionment (including Insular) • Alaska Supplemental	Per 49 USC § 47110(b)(2)(A), project costs must have been incurred after the grant execution date. The only exception for these three types of funding are (these exceptions are statutory and are the only exceptions allowed): **(1) 14 CFR part 150 Projects.** Per 49 USC § 47110(b)(2)(B), if the project is specifically contained in an FAA approved 14 CFR part 150 program (including schools and medical buildings), all of the project costs can be reimbursed. If a school or medical building is being mitigated outside an FAA approved 14 CFR part 150 program, it cannot be reimbursed. **(2) Project Formulation (Development Projects).** Per 49 USC § 47110(c), project formulation costs must be directly related to the project. These are costs that are normally incurred before the project starts and would not have been incurred otherwise. Examples of allowable project formulation costs are included in Paragraph 3-86. Per FAA policy, only land acquisition may be reimbursed under a stand-alone grant. **(3) Project Formulation (Planning Projects).** Per 49 USC § 47110(c), costs necessary and directly incurred in developing the work scope of a planning project can be reimbursed. **(4) Land Acquisition. Per 49 USC § 47110(c),** land acquisition is considered a project formulation cost and can therefore be reimbursed with all types of funding. The sponsor must have purchased the land after May 13, 1946. Per FAA policy, land acquisition may be reimbursed under a stand-alone grant for land acquisition. **(5) Letters of Intent.** Per 49 USC § 47110(e), all costs incurred after the LOI execution date, and only project formulation costs incurred before the LOI execution date, may also be reimbursed with any type of funding. **(6) Design-Build Projects.** The FAA believes that under 49 USC § 47142(b), the design and construction costs may be reimbursed with these types of funds if this contracting method is approved in advance by the ADO and all other applicable AIP requirements have been met. ADO approval is not a commitment of funds. Approval in advance by the ADO does not guarantee that the project will be considered or given priority for discretionary by the ADO. Therefore, the sponsor must have an alternative funding source available to fund the project without discretionary funding. **(7) Certain MAP Projects.** Per 49 USC § 47118(f)(2), the FAA has the option to use discretionary to reimburse approved MAP projects if the sponsor incurred the costs during fiscal years 2003 and 2004. **(8) Climate-Related Conditions.** In very limited circumstances, 49 USC § 47110(b)(2)(D) provides the FAA with the option to allow reimbursement for a project if the project meets all of the conditions in Table 3-61 through Table 3-66.

Table 3-61 Sponsor Assumption of Risk

The sponsor acknowledges that it assumes all risk by…
Sponsor Assumes All Risk. The sponsor must include a statement in the request for FAA acknowledgement of its request to be considered for reimbursement that includes the following sponsor assumption of risk: *"Because the FAA cannot guarantee the availability of any types of AIP funding on the project, the sponsor must be prepared to complete the project using other sources of funds even if the sponsor meets all of the requirements for discretionary reimbursement. There are no circumstances under which the sponsor can infer that the project will be funded with discretionary funds."*

Table 3-62 Legislative Requirements that Must be Met for FAA to Consider Reimbursement Based on Climate-Related Conditions

The ADO has determined that the sponsor has met all of the following legislative requirements…
a. Per 49 USC § 47110(b)(2)(D), construction of the project must have started in the same fiscal year as execution of the grant agreement. A construction project for which construction started in a prior fiscal year cannot be reimbursed with discretionary funding.
b. Per 49 USC § 47110(b)(2)(D)(i), the airport must be in an area that experiences a shortened construction season due to climatic conditions, which the FAA has determined to mean cold weather. To make this determination, the FAA reviewed reports from the American Association of State Highway and Transportation Officials (AASHTO) and the Federal Highway Administration on construction impacts due to weather and found that shortened construction season was understood to be related to work such as earthwork that is shut down or suspended during the winter cold weather.
c. Per 49 USC § 47110(b)(2)(D)(ii), all other applicable AIP requirements have been met.
d. Per 49 USC § 47110(b)(2)(D)(iii), the sponsor must notify the Airports District Office or regional office (ADO) in advance of starting the work of the sponsor's intent to request discretionary funding for this project. The sponsor must complete FAA Form 5100-142, Sponsor Request for FAA Acknowledgement for Cold Weather Early Start, at least 30 calendar days prior to issuing a Notice to Proceed. The ADO must forward the sponsor's request to APP-500 for processing.
e. Per 49 USC § 47110(b)(2)(D)(iv), the sponsor must have an alternative funding source available to fund the project. Because the sponsor has agreed to fully fund the complete project if AIP discretionary funding is not provided, the sponsor's alternative funding plan may include AIP future year entitlement funding or Passenger Facility Charge funding. If the sponsor's alternative funding plan does include future AIP entitlement funding which then impacts other future project requests, the sponsor will need to consider other options of funding those future projects.
f. Per 49 USC § 47110(b)(2)(D)(v), the sponsor's decision to proceed with the project in advance of execution of the grant agreement does not raise the priority assigned to the project by the FAA.

Table 3-62 Legislative Requirements that Must be Met for FAA to Consider Reimbursement Based on Climate-Related Conditions

The ADO has determined that the sponsor has met all of the following legislative requirements…
g. Per 49 USC § 47120, the FAA will give lower priority to discretionary project requests if the sponsor is using its entitlement funds for projects that have a lower priority than the projects for which discretionary funds are being requested. Therefore, this cold weather provision cannot be requested in a year when the sponsor is using its entitlement funds on a lower priority project.

Table 3-63 Implementation Requirements that Must be Met for FAA to Consider Reimbursement Based on Climate-Related Conditions

The requirements that APP-500 will consider are…
a. **The request is not due to short-term disruptions.** Short-term disruptions that prevent construction from occurring, including but not limited to rain, wind, tropical weather, fog, snowfall, ice, or high temperatures do not satisfy the requirement of a shortened construction season due to climatic conditions. This is because construction project specifications, including the FAA standard specifications, include provisions for inclement weather and temporary shutdowns.
b. **The request is not due to operational considerations.** Operational or coordination considerations, such as the desire to reopen before winter, to allow planned construction sequencing, or to meet a particular aeronautical chart publication date do not satisfy the requirement of a shortened construction season due to climatic conditions.
c. **The request is for a project that may be impacted.** The FAA has generally identified paving projects or pavement rehabilitation projects as those that are most likely to be impacted by a shortened construction season due to climatic conditions. In reviewing the request, APP-500 will consider the type of construction included in the project, the duration of the construction activities that may be impacted by a shortened construction season and the date by when the sponsor indicates that construction must begin to avoid impacts of a shortened construction season.
d. **The airport is in an impacted area.** Generally, the APP-500 will consider issuing an acknowledgement if there is at least one month in the average calendar year with an average high temperature below 40 degrees Fahrenheit and specific construction activities required for the project would be impacted by the cold temperatures.
e. **An early start may be justified.** The sponsor has demonstrated that the project requires an early start in order to fit the construction schedule into the construction season by providing the length of the construction project, date by which construction must begin in order to avoid being negatively impacted by cold weather conditions. **(1)** For example, this provision would not likely be justified for a 90-day paving project where the ADO anticipates that a grant could be issued in May. **(2)** The ADO may determine that this provision is justified for a 180-day paving project and grants are not expected to be able to be issued until July.

Table 3-64 Alternative Funding Requirements that Must be Met for FAA to Consider Reimbursement Based on Climate-Related Conditions

The sponsor's alternative funding plan includes…
a. The sponsor may include future year entitlements in the alternative funding plan. However, if the sponsor's Capital Improvement Program (CIP) previously identified projects that the sponsor planned to fund with those entitlements, the sponsor must revise their CIP accordingly.
b. If the sponsor proposes using future year entitlements, in those future years, the requested reimbursement may impact the sponsor's ability to fund other projects that year with discretionary funds, based on the requirement to fund the highest priority projects first with the sponsor's entitlement funds.
c. If the sponsor has started construction and discretionary funding is not provided in the year in which the construction started, the project is ineligible for discretionary funding in this, or future years.
d. For phased projects, these requirements must be applied individually to each phase or grant request. Funding of one phase of a phased project does not establish eligibility for funding either prior or subsequent phases.

Table 3-65 Request Requirements that Must be Met for FAA Consideration of Reimbursement Based on Climate-Related Conditions

The requirements are…
a. The sponsor must submit the written request to the ADO before contract award and before issuing Notice to Proceed to the selected contractor.
b. The sponsor must allow at least 30 calendar days following the submittal of a complete and accurate submittal to the ADO to receive a determination from APP-500.
c. Upon receipt of a sponsor's request for consideration, the ADO must review the request for completeness. If the request is incomplete, the ADO must return the request to the sponsor for correction. If the request is complete, the ADO must forward the request to APP-500. The ADO must submit the completed sponsor request, with ADO Staff Recommendation to APP-500 within nine business days of receiving the sponsor request.

Table 3-66 APP-500 Acknowledgement Process for Requests for Reimbursement Based on Climate-Related Conditions

The requirements are…
a. APP-500 will notify the ADO whether or not the proposed project can be considered for reimbursement based on climate related conditions.

Table 3-66 APP-500 Acknowledgement Process for Requests for Reimbursement Based on Climate-Related Conditions

The requirements are…
b. After APP-500 notifies the ADO whether or not the proposed project can be considered under this limited exception, the ADO must advise the sponsor of the determination. The ADO notification to the sponsor may be in writing or by e-mail. The determination is *solely* a determination as to whether the sponsor has met the necessary requirements for the FAA to be able to consider AIP discretionary funding subsequent to contract award or NTP, and does not in any way represent an actual commitment of discretionary funds.
c. APP-500 will attempt to respond to a sponsor's request within 30 days after receipt of the request. However, only actual receipt by a sponsor of an APP-500 determination that the project will be acknowledged by the FAA as having been requested for consideration for discretionary funding for a Cold Weather Construction Project constitutes FAA acknowledgement. The sponsor cannot consider lack of a response within 30 days is the equivalent of APP-500 acknowledgement.

Section 14. Costs Reasonable (Allowable Cost Rule #3).

3-101. Sponsor Requirements.

Per 2 CFR § 200.323(a), sponsors must perform a cost or price analysis in connection with every procurement action in excess of the Simplified Acquisition Threshold (provided in Table U-7). However, the ADO must determine that costs are reasonable to comply with 49 USC § 47110(b)(3). Therefore, all noncompetitive procurement actions (including change orders, supplemental agreements, and contract modifications) require a cost or price analysis regardless of cost. Table 3-67 lists the type of analysis that the sponsor must perform and the documents the sponsor must submit for various procurement scenarios. Paragraph U-21 contains guidance to sponsors on how to perform price and cost analyses. The requirements for change orders, supplemental agreements, and contract modifications are contained in Paragraph 5-35.

Table 3-67 Sponsor Requirements for Cost Reasonableness

For the following…	The sponsor must perform a…	And the sponsor must submit all of the following…
a. Land and easement acquisition	Cost Analysis	**(1)** Appraisals and review appraisals. **(2)** A statement signed by the sponsor that the cost analysis was performed that includes the sponsor's recommendation that the FAA accept the statement and analysis as evidence of cost reasonableness. **(3)** Negotiated agreements amount. **(4)** Copy of the signed negotiated agreement only if requested by the ADO. **(5)** Any other support documentation requested by the ADO.
b. Equipment acquisition and construction where there is adequate competition (two or more bidders by sealed bids)	Price Analysis (if the cost is in excess of the Simplified Acquisition Threshold (provided in Table U-7))	**(1)** Engineer's estimate. **(2)** A written statement signed by the sponsor that the cost is reasonable. If a price analysis is required, the sponsor must include in this statement that a price analysis was performed. **(3)** Bid tabulations. **(4)** Copy of the signed contract only if requested by the ADO. **(5)** Any other support documentation requested by the ADO.
c. Equipment acquisition and construction where there is not adequate competition (one bidder, sole source, design/build, small purchase, construction manager-at-risk, etc.)	Cost Analysis	**(1)** Engineer's estimate. **(2)** A statement signed by the sponsor that the cost analysis was performed that includes the sponsor's recommendation that the FAA accept the statement and analysis as evidence of cost reasonableness. **(3)** Bid tabulation (one bidder), proposal (sole source, design/build, construction manager-at-risk), or winning quote (small purchase). **(4)** Copy of the signed contract (or full set of quotes for small purchase) only if requested by the ADO. **(5)** Any other support documentation requested by the ADO.

Table 3-67 Sponsor Requirements for Cost Reasonableness

For the following…	The sponsor must perform a…	And the sponsor must submit all of the following…
d. Negotiated professional services (such as consultant costs or contract modifications to a professional services contract)	Cost Analysis	**(1)** Independent fee estimate. **(2)** A statement signed by the sponsor that the cost analysis was performed that includes the sponsor's recommendation that the FAA accept the statement and analysis as evidence of cost reasonableness. **(3)** Amount of contract. **(4)** Copy of the signed contract only if requested by the ADO. **(5)** Any other support documentation requested by the ADO.
e. Non-negotiated services (such as newspaper advertisements and rental of facilities for a public hearing)	Price Analysis (if the cost is in excess of the Simplified Acquisition Threshold (provided in Table U-7))	**(1)** Advertised pricing. **(2)** A written statement signed by the sponsor that the cost is reasonable. If a price analysis is required, the sponsor must include in this statement that a price analysis was performed. **(3)** Quote for services (or sponsor's estimate based on advertised price). **(4)** Any other support documentation requested by the ADO.
f. Non-negotiated service based on law or regulation (such as utility work by the utility company or a reimbursable agreement with the FAA Air Traffic Organization (ATO))	Price Analysis (if the cost is in excess of the Simplified Acquisition Threshold (provided in Table U-7))	**(1)** A written statement signed by the sponsor that the cost is reasonable. If a price analysis is required, the sponsor must include in this statement that a price analysis was performed. **(2)** Quote or signed contract. **(3)** Any other support documentation requested by the ADO.
g. Sponsor force account planning, engineering or construction	Cost Analysis	**(1)** All of the documentation required in Paragraph 3-53.

3-102. ADO Review Requirements.

In order to fund a project or make payment on a grant, 49 USC § 47110(b)(3) requires a cost reasonableness determination. Per FAA policy, the ADO, not the sponsor, makes the determination that the project costs are reasonable. This reasonableness determination is not an action that is covered by sponsor certification.

In order for the ADO to make a cost reasonableness determination, the ADO must review the documents submitted by the sponsor per Paragraph 3-101.

3-103. Documentation of ADO Determination.

Table 3-68 contains the documentation requirements for ADO cost reasonableness determinations. If an ADO determines that any of the costs are unreasonable, the ADO has the option to document this in writing to the sponsor and/or the grant file, however, this documentation is not mandatory.

Table 3-68 Documentation of ADO Cost Reasonableness Determinations

For…	The ADO must document its determination by…
a. Grants not based on estimates.	If the ADO finds the documentation acceptable, the ADO may issue the grant. By issuing the grant, the ADO is documenting that they have found the costs to be reasonable. In the specific instance of a state block grant that is not based on estimates, the ADO may rely on the state's signature of the grant application as documentation that the state has found all costs to be reasonable.
b. Grants based on estimates	In the rare instance that an ADO issues a grant or part of a grant based on estimates, the ADO must make the cost reasonableness determination before the sponsor receives a grant payment for the work. In this instance, the ADO must document their cost reasonableness determination in writing and place a copy in the grant file. In the specific instance of a state block grant that is based on estimates, the ADO may rely on the state's request for a grant payment for the work as documentation that the state has found all costs to be reasonable.
c. Change Orders, Supplemental Agreements, and Contract Modifications	Following the process outlined in Paragraph 5-35.

Section 15. Costs Not in Another Federal Grant (Allowable Cost Rule #4).

3-104. Requirement for Costs to Not be in Another Federal Grant.

Per 49 USC § 47110(b)(4), the cost must not be incurred in a project for airport development or airport planning for which other Federal assistance has been granted. Per FAA policy, AIP must not be used for a project cost that has already been covered in another Federal grant. In other words, the costs must not be paid for by the Federal government more than once, and may not cause the Federal share percentage of the project to exceed the Federal share allowed in 49 USC § 47109. Note that this requirement does not prohibit another Federal agency from providing funding to a sponsor to be used for the local share if that Federal agency permits its funds to be used for local share.

Section 16. Costs within Federal Share (Allowable Cost Rule #5).

3-105. Allowable Federal Share Requirement.

Per 49 USC § 47110(b)(5), the total allowable Federal costs cannot exceed the maximum Federal cost that is in the grant agreement (except as allowed within the amendment rules per, Section 7 of Chapter 5).

Section 17. No Unreasonable Delay in Completion.

3-106. Requirement for No Unreasonable Delay in Project Completion.

Per 49 USC § 47106(a)(4), the ADO cannot issue a grant to a project if the ADO is aware of circumstances that will unreasonably delay project completion. For instance, the ADO might delay putting a project under grant if there are runway closure timing issues that have not been adequately worked out with the airlines.

This page has been intentionally left blank.

Chapter 4. What AIP funding is available?

4-1. Legislation Needed to Issue AIP Grants (Authorization/Appropriation).

49 USC § 47104(a) allows the Administrator to issue grants for airport planning and development in the United States. In order to be able to issue grants and operate the AIP grant program, the FAA normally needs both an authorization and an appropriation.

a. Authorization. The authorization is often referred to as the FAA *Bill* or *Reauthorization* and may be passed by Congress for one or more years. The authorization defines the annual funding level for AIP and gives the FAA contract authority to issue grants. The authorization updates 49 USC § 48103(a) to reflect the amount authorized for airport planning and airport development under 49 USC § 47104, airport noise compatibility planning under 49 USC § 47505(a)(2), and carrying out noise compatibility programs under 49 USC § 47504(c). At the time this Handbook was published, AIP was operating under the Consolidated Appropriations Act, 2018 (Public Law 115-141).

b. Appropriation. The appropriation is an annual budget that Congress establishes for the FAA. The appropriation allows the FAA to incur obligations and make payments for specific purposes. Congress may also use the appropriation to reduce the authorized AIP funding level from the levels set by the authorization for the current year.

4-2. Airport and Airway Trust Fund (Source of AIP).

49 USC § 48103 authorizes revenue for AIP from the Airport and Airway Trust Fund, which is commonly referred to as the Trust Fund. The Airport and Airway Revenue Act of 1970 created the Trust fund to provide a dedicated source of funding for the aviation system. 26 USC § 9502(c) (the Internal Revenue Code of 1986) authorizes funds to be made available from the Trust Fund for AIP.

The revenue sources of the Trust Fund can be found in Appendix V.

4-3. Calendar Year Used for Passenger Boardings, Entitlements, and Cargo Landed Weight.

49 USC § 47102(15) defines the time period for calculating the number of passenger boardings at an airport as *in the prior calendar year*. For example, the passenger boardings set at the beginning of FY 2014 are the passenger boardings in calendar year 2012. These passenger boardings are used to calculate passenger entitlements.

Although not defined in 49 USC § 47102(10), the time period for calculating the landed cargo weight at an airport is also *in the prior calendar year*.

4-4. Categories of AIP Funding (Including Calculations and Legislative References).

Once an authorization and an appropriation are in place, the approved AIP funding is split into defined categories and types according to formulas in the Act. A detailed summary of the AIP fund categories, fund types, and associated calculation methods in Table 4-1. Table 4-2 shows

the actual percentage of AIP funding by fund type in fiscal year 2011. The calendar year used to determine the passenger boardings, entitlements, and cargo landed weight is discussed in Paragraph 4-3.

Table 4-1 AIP Funds by Category, Type, and Calculation

Fund Type and Legislative Reference	How Calculated if less than $3,200,000,000 in AIP is Available in the Fiscal Year	How Calculated if $3,200,000,000 or More in AIP is Available in the Fiscal Year
Passenger Entitlement		
a. Passenger Entitlement 49 USC § 47114(c)(1)	Per 49 USC § 47114(c)(1)(A): $7.80 for each of the first 50,000 passenger enplanements. $5.20 for each of the next 50,000. $2.60 for each of the next 400,000. $0.65 for each of the next 500,000. $0.50 for each passenger enplanement > 1 million enplanements. Per 49 USC § 47114(c)(1)(B), the annual minimum is $650,000 and the annual maximum is $22 million per airport. Per 49 USC § 47114(f), the amount of entitlement funds for large and medium hub airports collecting a PFC are reduced based on the PFC collection level approved for the airport. If the airport is collecting at $3.00 or less, the amount of entitlements is reduced by 50%. If the airport is collecting more than $3.00, the amount of entitlements is reduced by 75%. In Hawaii, this calculation is modified based on the percent of inter-island passengers. **Special Rule for Fiscal Year 2012 and 2013:** Per 49 USC § 47114(c)(1)(F), an airport that was a primary airport in 2007, but in calendar year 2009 and/or 2010, the annual number of passenger boardings	Per 49 USC § 47114(c)(1)(C): $15.60 for each of the first 50,000 passenger enplanements. $10.40 for each of the next 50,000. $5.20 for each of the next 400,000. $1.30 for each of the next 500,000. $1 for each passenger enplanement > 1 million enplanements. Per 49 USC § 47114(c)(1)(C), The annual minimum is 1 million and the annual maximum is $26 million per airport. Per 49 USC § 47114(f), the amount of entitlement funds for large and medium hub airports collecting a PFC are reduced based on the PFC collection level approved for the airport. If the airport is collecting at $3.00 or less, the amount of entitlements is reduced by 50%. If the airport is collecting more than $3.00, the amount of entitlements is reduced by 75%. In Hawaii, this calculation is modified based on the percent of inter-island passengers. **Special Rule for Fiscal Year 2012 and 2013:** Per 49 USC § 47114(c)(1)(F), an airport that was a primary airport in 2007, but in calendar year 2009 and/or 2010, the annual number of passenger boardings was less than 10,000; an amount equal to the amount apportioned for that airport in fiscal year 2009 may be apportioned during fiscal years 2012 and 2013.

Table 4-1 AIP Funds by Category, Type, and Calculation

Fund Type and Legislative Reference	How Calculated if less than $3,200,000,000 in AIP is Available in the Fiscal Year	How Calculated if $3,200,000,000 or More in AIP is Available in the Fiscal Year
	was less than 10,000; an amount equal to the amount apportioned for that airport in fiscal year 2009 may be apportioned during fiscal years 2012 and 2013.	
Cargo Entitlement		
b. Cargo Entitlement 49 USC § 47114(c)(2)	3.5% of total AIP available for grants to airports with a total annual landed weight of more than 100 million pounds of all cargo only aircraft. Each airport's cargo entitlements are calculated based on their percentage of the total landed weight (e.g., an airport with 5% of the cargo weight would receive 5% of the available cargo entitlements).. Per 49 USC § 47114(c)(2)(C), not more than 8% of the total cargo entitlements may be apportioned for any one airport.	3.5% of total AIP available for grants to airports with a total annual landed weight of more than 100 million pounds of all cargo only aircraft. Each airport's cargo entitlements are calculated based on their percentage of the total landed weight (e.g., an airport with 5% of the cargo weight would receive 5% of the available cargo entitlements).

Table 4-1 AIP Funds by Category, Type, and Calculation

Fund Type and Legislative Reference	How Calculated if less than $3,200,000,000 in AIP is Available in the Fiscal Year	How Calculated if $3,200,000,000 or More in AIP is Available in the Fiscal Year
Amounts Apportioned for General Aviation Airports Split between Nonprimary Entitlements and State Apportionment.		
c. Nonprimary Entitlement 49 USC § 47114(d)(3)(A) 49 USC § 47114(d)(7)	None. The exception is if, per 49 USC § 47114(d)(7), $650,000 for an airport that meets both of the following criteria: **(1)** Received scheduled or unscheduled air service from a large certificated air carrier (as defined in 14 CFR part 241 or such other regulations as may be issued by the Secretary under the authority of 49 USC § 41709) in the calendar year used to calculate the apportionment. **(2)** Had more than 10,000 passenger boardings in the calendar year used to calculate the apportionment.	Per 49 USC § 47114(d)(3)(A), the lesser of $150,000 or 1/5 of an airport's 5-year development cost listed in the biennial NPIAS report to Congress. The exception is if, per 49 USC § 47114(d)(7), $1,000,000 for an airport that meets both of the following criteria: **(1)** Received scheduled or unscheduled air service from a large certificated air carrier (as defined in 14 CFR part 241 or such other regulations as may be issued by the Secretary under the authority of 49 USC § 41709) in the calendar year used to calculate the apportionment. **(2)** Had more than 10,000 passenger boardings in the calendar year used to calculate the apportionment.
d. State Apportionment (including Insular) 49 USC § 47114(d)(2) 49 USC § 47114(d)(3)(B)	Per 49 USC § 47114(d)(2), 18.5% of total AIP available for grants minus the total nonprimary entitlements. Per 49 USC § 47114(d)(2), a total of 99.34% of the funds remaining after the deduction of nonprimary entitlement is apportioned for airports based on an area/population formula within the 50 States, the District of Columbia, and Puerto Rico. The remaining 0.66% is apportioned for airports in the insular areas (Guam, American Samoa, the Commonwealth of the Northern Mariana Islands, and the U.S. Virgin Islands).	Per 49 USC § 47114(d)(3), 20% of total AIP available for grants minus the total nonprimary entitlements. Per 49 USC § 47114(d)(3)(B), 99.38% of the funds remaining after the deduction of nonprimary entitlement is apportioned for airports based on an area/population formula within the 50 States, the District of Columbia, and Puerto Rico. The remaining 0.62% is apportioned for airports in the insular areas (Guam, American Samoa, the Commonwealth of the Northern Mariana Islands, and the U.S. Virgin Islands).

Table 4-1 AIP Funds by Category, Type, and Calculation

Fund Type and Legislative Reference	How Calculated if less than $3,200,000,000 in AIP is Available in the Fiscal Year	How Calculated if $3,200,000,000 or More in AIP is Available in the Fiscal Year
Alaska Supplemental		
e. Alaska Supplemental 49 USC § 47114(e)	Per 49 USC § 47114(e)(1), Alaskan airports are apportioned at least as much money as they were apportioned in fiscal year 1980 under Section 15(a)(3)(A) of the Airport and Airway Development Act of 1970. This amount is $10,672,557.	Per 49 USC § 47114(e)(4), Alaskan airports are apportioned at least double as much money as they were apportioned in fiscal year 1980 under Section 15(a)(3)(A) of the Airport and Airway Development Act of 1970. This doubled amount is $21,345,114.
Small Airport Fund This is a calculation, not a set aside fund.		
f. Small Airport Fund 49 USC § 47116	The Small Airport Fund is not an actual stand-alone set-aside fund. It is merely a calculation to ensure that a required level of discretionary is used on small airports. A total of 87.5% of the amount of passenger entitlement funds reduced from large and medium hub airports (per 49 USC § 47114(f)) is used to calculate the Small Airport Fund. The Small Airport Fund is divided by airport type as follows: 1/7 to small hub. 2/7 to general aviation and reliever airports, as well as and certain public use airports with restrictions (see Table 4-3). 4/7 to nonhub primary and non-primary commercial service.	The Small Airport Fund is not an actual stand-alone set-aside fund. It is merely a calculation to ensure that a minimum level of discretionary is used on small airports. A total of 87.5% of the amount of passenger entitlement funds reduced from large and medium hub airports (per 49 USC § 47114(f)) is used to calculate the Small Airport Fund. The Small Airport Fund is divided by airport type as follows: 1/7 to small hub. 2/7 to general aviation and reliever airports, as well as and certain public use airports with restrictions (see Table 4-3). 4/7 to nonhub primary and non-primary commercial service.

Table 4-1 AIP Funds by Category, Type, and Calculation

Fund Type and Legislative Reference	How Calculated if less than $3,200,000,000 in AIP is Available in the Fiscal Year	How Calculated if $3,200,000,000 or More in AIP is Available in the Fiscal Year
Discretionary **Includes Discretionary Set Asides and Remaining Discretionary** Remainder of AIP after above distributions.		
Discretionary Set Asides		
g. Noise and Environmental Set Aside 49 USC § 47117(e)(1)(A)	At least 35% of discretionary, but not more than $300 million.	At least 35% of discretionary, but not more than $300 million.
h. MAP Set Aside 49 USC § 47117(e)(1)(B)	At least 4% of discretionary.	At least 4% of discretionary.
i. Reliever Set Aside 49 USC § 47117(e)(1)(C)	None.	At least 0.66% (2/3 of 1%) of discretionary.
Remaining Discretionary **Includes Discretionary that Remains after Calculating the Discretionary Set Asides** 49 USC § 47115(a)		
j. Capacity/ Safety/ Security/ Noise (C/S/S/N) 49 USC § 47115(c)	75% of remainder of AIP after above distributions and set-asides, and 75% of 12.5% of the returned entitlements that are not allocated to the Small Airport Fund.	75% of remainder of AIP after above distributions and set-asides, and 75% of 12.5% of the returned entitlements that are not allocated to the Small Airport Fund.
k. Pure Discretionary 49 USC § 47115(b)	25% of remainder of AIP after above distributions and set-asides, and 25% of 12.5% of the returned entitlements that are not allocated to the Small Airport Fund.	25% of remainder of AIP after above distributions and set-asides, and 25% of 12.5% of the returned entitlements that are not allocated to the Small Airport Fund.
l. Discretionary from Converted Entitlements/ Apportionments 49 USC § 47117(f)	No calculation. This funding is obtained from carrying over entitlements and apportionments to the next year. This funding is not subject to the set aside calculation requirements.	No calculation. This funding is obtained from carrying over entitlements and apportionments to the next year. This funding is not subject to the set aside calculation requirements.

Table 4-2 Fiscal Year 2017 Final Funding Breakdown by Fund Type

Fund Type	Percentage
a. Passenger Entitlement	27.01%
b. Cargo Entitlement	3.50%
c. Nonprimary Entitlements	12.01%
d. State Apportionment	7.99%
e. Alaska Supplemental	0.67%
f. Noise and Environmental Set Aside	3.37%
g. MAP Set Aside	0.39%
h. Reliever Set Aside	0.06%
i. Small Airport Fund	16.33%
j. Capacity/ Safety/ Security/ Noise (C/S/S/N)	4.36%
k. Pure Discretionary	1.45%
l. Discretionary from Converted Entitlements/Apportionments	22.85%

4-5. Types of Potential Funding by Airport Type (Including Airport Type Definitions).

As established in 49 USC § 47104, only public-use airports in the NPIAS are eligible for AIP funding. These airports are classified into various categories as shown in Table 4-3, along with the types of potential funding that an ADO can apply to these airport types.

Table 4-3 Airport Type Criteria and Potential Funding Types

Airport Type	And meets all of the following Airport Criteria	Types of Potential Funding (See Paragraphs 4-6 and 4-7 for additional restrictions by airport and project type)
a. Large Hub	**(1) Commercial Service Airport.** Publicly owned airport that has at least 2,500 passenger boardings each calendar year and receives scheduled passenger service. (*Note: Privately owned airports are not commercial service airports per 49 USC § 47102(7) even if the airport has at least 2,500 passenger boardings.*) **(2) Primary Airport.** A commercial service airport with more than 10,000 annual passenger boardings per 49 USC § 47102(16). **(3) Meets Large Hub Criteria.** 1% or more of annual passenger boardings per 49 USC § 47102(11).	Passenger Entitlement Discretionary Alaska Supplemental Cargo Entitlement State Apportionment – Per 49 USC § 47114(d)(4), State Apportionment may be used by any size public airport in Hawaii, Alaska or Puerto Rico.
b. Medium Hub	**(1) Commercial Service Airport.** Publicly owned airport that has at least 2,500 passenger boardings each calendar year and receives scheduled passenger service. (*Note: Privately owned airports are not commercial service airports per 49 USC § 47102(7) even if the airport has at least 2,500 passenger boardings.*) **(2) Primary Airport.** A commercial service airport with more than 10,000 annual passenger boardings per 49 USC § 47102(16). **(3) Meets Medium Hub Criteria.** At least 0.25%, but less than 1% or more of annual passenger boardings per 49 USC § 47102(13).	Passenger Entitlement Discretionary Alaska Supplemental Cargo Entitlement State Apportionment – Per 49 USC § 47114(d)(4), State Apportionment may be used by any size public airport in Hawaii, Alaska or Puerto Rico.

Table 4-3 Airport Type Criteria and Potential Funding Types

Airport Type	And meets all of the following Airport Criteria	Types of Potential Funding (See Paragraphs 4-6 and 4-7 for additional restrictions by airport and project type)
c. Small Hub	**(1) Commercial Service Airport.** Publicly owned airport that has at least 2,500 passenger boardings each calendar year and receives scheduled passenger service. (*Note: Privately owned airports are not commercial service airports per 49 USC § 47102(7) even if the airport has at least 2,500 passenger boardings.*) **(2) Primary Airport.** A commercial service airport with more than 10,000 annual passenger boardings per 49 USC § 47102(16). **(3) Meets Small Hub Criteria.** At least 0.05%, but less than 0.25% or more of annual passenger boardings per 49 USC § 47102(25).	Passenger Entitlement Small Airport Fund Discretionary Alaska Supplemental Cargo Entitlement State Apportionment – Per 49 USC § 47114(d)(4), State Apportionment may be used by any size public airport in Hawaii, Alaska or Puerto Rico.
d. Nonhub Primary	**(1) Commercial Service Airport.** Publicly owned airport that has at least 2,500 passenger boardings each calendar year and receives scheduled passenger service. (*Note: Privately owned airports are not commercial service airports per 49 USC § 47102(7) even if the airport has at least 2,500 passenger boardings.*) **(2) Primary Airport.** A commercial service airport with more than 10,000 annual passenger boardings per 49 USC § 47102(16). **(3) Meets Nonhub Criteria.** More than 10,000, but less than 0.05% or more of annual passenger boardings per 49 USC § 47102(14).	Passenger Entitlement Small Airport Fund Discretionary Alaska Supplemental Cargo Entitlement State Apportionment – Per 49 USC § 47114(d)(4), State Apportionment may be used by any size public airport in Hawaii, Alaska or Puerto Rico.
e. Virtual Primary (Scenario 1) Per 49 USC § 47114 (c)(1)(E)	**(1) Primary Airport in Last Fiscal Year.** A commercial service airport with more than 10,000 passenger boardings two calendar years preceding the current fiscal year	Passenger Entitlement Small Airport Fund Discretionary (except for C/S/S/N) Alaska Supplemental Cargo Entitlement

Table 4-3 Airport Type Criteria and Potential Funding Types

Airport Type	And meets all of the following Airport Criteria	Types of Potential Funding (See Paragraphs 4-6 and 4-7 for additional restrictions by airport and project type)
	(2) Meets Nonprimary Airport Criteria in Current Fiscal Year. Less than 10,000 annual passenger boardings in the calendar year before the current fiscal year. **(3) Reason for Fall of Passenger Boardings.** APP-400 must determine that the cause of the shortfall in passenger boardings was a temporary but significant interruption in service by an air carrier to that airport due to an employment action, natural disaster, or other event unrelated to the demand for air transportation at the affected airport. **(a)** Examples of temporary but significant interruptions that have qualified for this provision: **(i)** Closure of a single-runway airport for three months for runway rehabilitation. **(ii)** FAA grounding of the air carrier serving the airport for several months. **(b)** Examples of shortfalls in passenger boardings that have not qualified for this provision: **(i)** Air carrier business decisions, such as canceling lightly-loaded flights. **(ii)** Air carrier business decision to reduce the number of seats available in the market by using smaller aircraft or removing seats from an aircraft. **(iii)** Nationwide issues such as pilot shortages or rising fuel costs. The provision is specific that the interruption is to "that" airport, which excludes issues affecting many airports.	State Apportionment – Per 49 USC § 47114(d)(4), State Apportionment may be used by any size public airport in Hawaii, Alaska or Puerto Rico. *Note: If APP-400 determines that the airport qualifies as a virtual primary, the current fiscal year passenger entitlement amount will be equal to entitlement amount in the preceding fiscal year.*

Table 4-3 Airport Type Criteria and Potential Funding Types

Airport Type	And meets all of the following Airport Criteria	Types of Potential Funding (See Paragraphs 4-6 and 4-7 for additional restrictions by airport and project type)
	(iv) The sponsor has not taken all reasonable measures to ensure that enplanements are correctly reported. **(4) Duration.** This virtual primary status is only good for one fiscal year.	
f. Virtual Primary (Scenario 2) Per Section 141(b) of the FAA Modernization and Reform Act of 2012 (Public Law 112-95)	**(1) Primary Airport in Fiscal Year 2009.** A commercial service airport with more than 10,000 passenger boardings in calendar year 2007. **(2) Meets Nonprimary Airport Criteria in Fiscal Years 2011 or 2012**. Less than 10,000 annual passenger boardings in either calendar year 2009 or 2010. **(3) Duration**. This virtual primary status is only good for fiscal years 2012 and 2013.	Passenger Entitlement Small Airport Fund Discretionary (except for C/S/S/N) Alaska Supplemental Cargo Entitlement State Apportionment – Per 49 USC § 47114(d)(4), State Apportionment may be used by any size public airport in Hawaii, Alaska or Puerto Rico. *Note: If APP-400 determines that the airport qualifies as a virtual primary, the current fiscal year passenger entitlement amount will be equal to entitlement amount in fiscal year 2009.*
g. Virtual Primary (Scenario 3) Per 49 USC § 47114 (c)(1)(F)	**(1) Primary Airport in Fiscal Year 2014.** A commercial service airport with more than 10,000 passenger boardings in calendar year 2012. **(2) Scheduled Service in Calendar Year 2015.** Had scheduled service at any point in calendar year 2015 (the year used to calculate the apportionment for fiscal year 2017). **(3) Meets Nonprimary Airport Criteria in Fiscal Year 2017**. Less than 10,000 annual passenger boardings in calendar year 2015. **(4) Duration**. This virtual primary status is only good for fiscal year 2017 and 2018, unless extended by Congress.	Passenger Entitlement Small Airport Fund Discretionary (except for C/S/S/N) Alaska Supplemental Cargo Entitlement State Apportionment – Per 49 USC § 47114(d)(4), State Apportionment may be used by any size public airport in Hawaii, Alaska or Puerto Rico. *Note: If APP-400 determines that the airport qualifies as a virtual primary, the current fiscal year passenger entitlement amount will be equal to entitlement amount in fiscal year 2009.*

Table 4-3 Airport Type Criteria and Potential Funding Types

Airport Type	And meets all of the following Airport Criteria	Types of Potential Funding (See Paragraphs 4-6 and 4-7 for additional restrictions by airport and project type)
h. Nonprimary Commercial Service (also referred to as Nonhub Nonprimary)	**(1) Commercial Service Airport.** Publicly owned airport that has at least 2,500 passenger boardings each calendar year and receives scheduled passenger service. (*Note: Privately owned airports are not commercial service airports per 49 USC § 47102(7) even if the airport has at least 2,500 passenger boardings.*) **(2) Not a Primary Airport.** Not a primary airport because the airport has less than or equal to 10,000 annual passenger boardings per 49 USC § 47102(16).	Nonprimary Entitlement State Apportionment Small Airport Fund Discretionary (except for C/S/S/N) Alaska Supplemental Cargo Entitlement
i. General Aviation	**(1) Public Airport.** Per 49 USC § 47102(8), a public airport that is located within a state. Per 49 USC § 47102(21), a public airport is an airport used or intended to be used for public purposes that is under the control of a public agency where the area used or intended to be used for the landing, taking off, or surface maneuvering of aircraft is publicly owned. **(2) Not a Commercial Service Airport.** Per 49 USC § 47102(8), the airport must either have no scheduled service, or scheduled service with less than 2,500 annual passenger boardings each year.	Nonprimary Entitlement State Apportionment Small Airport Fund Discretionary (except for C/S/S/N) Alaska Supplemental Cargo Entitlement

Table 4-3 Airport Type Criteria and Potential Funding Types

Airport Type	And meets all of the following Airport Criteria	Types of Potential Funding (See Paragraphs 4-6 and 4-7 for additional restrictions by airport and project type)
j. Reliever	**(1) Airport Designated as a Reliever by the FAA**. The criteria for the FAA to designate an airport as a reliever is as follows: **(a) Definition in Statute.** Per 49 USC § 47102(23), a reliever is an airport the Secretary designates to relieve congestion at a commercial service airport and to provide more general aviation access to the overall community **(b) How the FAA (Secretary) Designates Relievers.** Per the current version of FAA Order 5090-3, Field Formulation of the National Program of Integrated Airport Systems, reliever airports must have more than 25,000 annual itinerant operations or at least 100 based aircraft that is relieving a commercial service airport that serves a metropolitan area with a population of at least 250,000 persons or at least 250,000 annual enplaned passengers, and operates at 60% of its capacity, or would be operated at such a level before being relieved by one or more reliever airports, or is subject to restrictions that limit activity that would otherwise reach 60% of capacity.	Nonprimary Entitlement State Apportionment Small Airport Fund Discretionary Alaska Supplemental Cargo Entitlement *Note: To be eligible to receive the reliever set-aside, per 49 USC §* 471117(e)(1)(C), *the reliever airport must have more than 75,000 annual operations, a runway of greater than 5,000 feet, a precision instrument landing procedure, 100 based aircraft, and must relieve an airport with 20,000 hours of annual delays of commercial passenger aircraft operations.*

Table 4-3 Airport Type Criteria and Potential Funding Types

Airport Type	And meets all of the following Airport Criteria	Types of Potential Funding (See Paragraphs 4-6 and 4-7 for additional restrictions by airport and project type)
k. General Aviation Airport Eligible for Minimum Primary Entitlement (per 49 USC § 47114 (d)(7))	**(1) Received Large Certificated Air Carrier Service.** Per 49 USC § 47114(d)(7)(A), received scheduled or unscheduled air service from a large certificated air carrier (as defined in 14 CFR part 241, or such other regulations as may be issued by the Secretary of Transportation under the authority of 49 USC § 47109) **(2) Over 10,000 Passenger Boardings.** Had more than 10,000 passenger boardings in the calendar year used to calculate the apportionment, per 49 USC § 47114(d)(7)(B).	Nonprimary Entitlement State Apportionment Small Airport Fund Discretionary (except for C/S/S/N) Alaska Supplemental Cargo Entitlement *Note that these airports receive the amount of minimum primary entitlements, but as nonprimary entitlements.*
l. Privately-Owned, Public Use Airport meeting Statutory Limitations	**(1) Public Use Airport Meeting Statutory Limitations.** Per 49 USC § 47102(22)(B)(ii), a privately-owned airport used or intended to be used for public purposes that has at least 2,500 passenger boardings each year and receives scheduled passenger aircraft service. **(2) NPIAS Airport.** Designated by the FAA to be a NPIAS Airport.	Small Airport Fund Discretionary (except for C/S/S/N)

4-6. Airports that Can Use Each Fund Type (Funding Restrictions by Airport Type).

Table 4-4 provides a comprehensive list of airport limitations by fund type.

Table 4-4 Airports that Can Use Each Fund Type

Fund Type and Legislative Reference	Public Use NPIAS Airports that Can Use this Funding
a. Passenger Entitlement 49 USC § 47114(c)(1)	**(1)** Primary and virtual primary airports. **(2)** Airports in the Republic of the Marshall Islands, Federated States of Micronesia, and Republic of Palau are excluded per 49 USC § 47115(j).

Table 4-4 Airports that Can Use Each Fund Type

Fund Type and Legislative Reference	Public Use NPIAS Airports that Can Use this Funding
b. Cargo Entitlement 49 USC § 47114(c)(2)	**(1)** Airports that have more than 100,000,000 pounds of landed all-cargo weight annually. **(2)** Airports in the Republic of the Marshall Islands, Federated States of Micronesia, and Republic of Palau are excluded per 49 USC § 47115(j).
c. Nonprimary Entitlement 49 USC § 47114(d)(3)	**(1)** General aviation, reliever, and nonprimary commercial service airports. **(2)** Airports in the Republic of the Marshall Islands, Federated States of Micronesia, and Republic of Palau are excluded per 49 USC § 47115(j).
d. State Apportionment 49 USC § 47114(d)(2)	**(1)** General aviation, reliever, and nonprimary commercial service airports within the specific state or insular area (except for in Alaska, Hawaii and Puerto Rico, where the funds can be used on any airport type per 49 USC § 47114(d)(4)). **(2)** Primary and virtual primary airports only when the project is an integrated airport system planning project that encompasses one or more primary airports per 49 USC § 47114(d)(6). **(3)** Airports in the Republic of the Marshall Islands, Federated States of Micronesia, and Republic of Palau are excluded per 49 USC § 47115(j).
e. Alaska Supplemental 49 USC § 47114(e)	**(1)** Airports located in Alaska.
f. Small Airport Fund 49 USC § 47116	**(1)** Small hub, nonhub, virtual primary, nonprimary commercial service, and general aviation, and reliever airports, as well as and certain public use airports with restrictions (see Table 4-3). **(2)** 49 USC § 47116(c), also specifically allows an airport in block grant states to receive grants directly from the FAA with small airport funds as if the state were not within the program.
g. Discretionary: Noise and Environmental Set Aside 49 USC § 47117(e)(1)(A)	**(1)** **Airports.** Any airport eligible for one of the follow projects: **(a)** **Airport Noise Compatibility Planning.** Airport noise compatibility planning under section 49 USC § 47505(a)(2). **(b)** **Noise Compatibility Program Projects.** Airport noise compatibility program projects approved by the

Table 4-4 Airports that Can Use Each Fund Type

Fund Type and Legislative Reference	Public Use NPIAS Airports that Can Use this Funding
	FAA in a noise compatibility program under 49 USC § 47504(c). **(c) Noise Mitigation Projects in a Record of Decision.** Noise mitigation projects approved in an environmental record of decision for an airport development project. **(d) Compatible Land Use Planning/Projects.** Compatible land use planning and projects carried out by state and local governments under 49 USC § 47141. **(e) Americans with Disabilities Act of 1990 (ADA) Projects.** Airport development projects (including equipment) to comply with ADA per 49 USC § 47102(3)(F). **(f) Clean Air Act Projects.** Airport development projects (including equipment) to comply with the Clean Air Act (42 USC § 7401) per 49 USC § 47102(3)(F). **(g) Federal Water Pollution Control Act (commonly referred to as the Clean Water Act) Projects.** Airport development projects (including equipment) required to comply with the Federal Water Pollution Control Act (33 USC § 1251 et seq) per 49 USC § 47102(3)(F). In addition, water quality mitigation projects to comply with the Federal Water Pollution Control Act that are approved in an environmental record of decision for an airport development project may use this type of funding. **(h) Voluntary Airport Low Emissions (VALE) Projects.** Projects that meet the requirements of the VALE program per 49 USC § 47102(3)(K) and 49 USC § 47102(3)(L). These requirements are discussed in Section 5 of Chapter 6. **(2) Non-Airport Sponsors.** Any non-airport sponsors that is eligible for one of the follow projects: **(a) Airport Noise Compatibility Planning.** Airport noise compatibility planning under section 49 USC § 47505(a)(2). **(b) Noise Compatibility Program Projects.** Airport noise compatibility program projects approved by the FAA in a noise compatibility plan under 49 USC § 47504(c). **(c) Noise Mitigation Projects in a Record of Decision.** Noise mitigation projects approved in an

Table 4-4 Airports that Can Use Each Fund Type

Fund Type and Legislative Reference	Public Use NPIAS Airports that Can Use this Funding
	environmental record of decision for an airport development project. **(d) Compatible Land Use Planning/Projects.** Compatible land use planning and projects carried out by state and local governments under 49 USC § 47141. **(3) Sponsors and Airports Not Included**. Sponsors and airports in the Republic of the Marshall Islands, Federated States of Micronesia, and Republic of Palau are able to receive grants from the discretionary fund in 49 USC § 47115 and the Small Airport Fund in 49 USC § 47116 per 49 USC § 47115(j), which means that they are not able to receive grants from the Noise and Environmental Set Aside in 49 USC § 47117(e)(1)(A).
h. Discretionary: MAP Set Aside 49 USC § 47117(e)(1)(B)	**(1)** FAA designated Military Airport Program airports. These are former military airports closed or realigned and designated for conversion to civil or joint use. **(2)** Sponsors and airports in the Republic of the Marshall Islands, Federated States of Micronesia, and Republic of Palau are able to receive grants from the discretionary fund in 49 USC § 47115 and the Small Airport Fund in 49 USC § 47116 per 49 USC § 47115(j). **(3)** Per 49 USC § 47118(h), an FAA designated safety critical airport. **(4)** Sponsors and airports in the Republic of the Marshall Islands, Federated States of Micronesia, and Republic of Palau are able to receive grants from the discretionary fund in 49 USC § 47115 and the Small Airport Fund in 49 USC § 47116 per 49 USC § 47115(j), which means that they are not able to receive grants from the MAP Set Aside in 49 USC § 47117(e)(1)(B).

Table 4-4 Airports that Can Use Each Fund Type

Fund Type and Legislative Reference	Public Use NPIAS Airports that Can Use this Funding
i. Discretionary: Reliever Set Aside 49 USC § 47117(e)(1)(C)	**(1)** Only those reliever airports with more than 75,000 annual operations, a runway of greater than 5,000 feet, a precision instrument landing procedure, 100 based aircraft, and relieves an airport with 20,000 hours of annual delays of commercial passenger aircraft operations. **(2)** Sponsors and airports in the Republic of the Marshall Islands, Federated States of Micronesia, and Republic of Palau are able to receive grants from the discretionary fund in 49 USC § 47115 and the Small Airport Fund in 49 USC § 47116 per 49 USC § 47115(j), which means that they are not able to receive grants from the Reliever Set Aside in 49 USC § 47117(e)(1)(C).
j. Discretionary: Capacity/ Safety/ Security/ Noise (C/S/S/N) 49 USC § 47115(c)	**(1)** Only primary and reliever airports.
k. Pure Discretionary 49 USC § 47115(b)	**(1)** Any public-use NPIAS airport. **(2)** Midway Island Airport during fiscal years 2012-2018 per Section 186(d) of the Vision 100 – Century of Aviation Reauthorization Act (Public Law 108-176) as amended by Section 102 of Division M, Title I of the Consolidated Appropriations Act, 2018 (Public Law 115-141). This funding can only be issued through a reimbursable agreement between the FAA and the Secretary of the Interior and is limited to $2.5 million of pure discretionary per fiscal year.
l. Discretionary from Converted Entitlements/ Apportionments 49 USC § 47117(f)	**(1)** Any public-use NPIAS airport.

4-7. Project Restrictions by Fund Type.

Table 4-5 provides a comprehensive list of project restrictions by fund type.

Table 4-5 Project Restrictions by Fund Type

Fund Type	Project Restrictions by Fund Type
a. Passenger Entitlement	**(1) Non-Revenue Producing Public Parking Lots.** Not allowed for any airport type except a nonhub primary airport (only if associated with a commercial service terminal building) per 49 USC § 47119(a)(2) and 49 USC § 47119(c)(1). **(2) Revenue Producing Aeronautical Support Facilities.** Not allowed. (The Act does not authorize this funding for this purpose.)
b. Cargo Entitlement	**(1) Terminal Buildings.** Not allowed (see Paragraph N-11 for details). **(2) Non-Revenue Producing Public Parking Lots.** Not allowed (the Act does not authorize this funding for this purpose). **(3) Revenue Producing Aeronautical Support Facilities.** Not allowed (the Act does not authorize this funding for this purpose). **(4) Relocation of Sponsor Owned Facilities Caused by a Change in FAA Design Standards.** Not allowed (see Paragraph 3-74 for details).
c. Nonprimary Entitlement	**(1) Non-Revenue Producing Public Parking Lots.** Not allowed for any airport types except nonprimary commercial service airports (only if associated with a commercial service terminal building) or general aviation and reliever airports (only if associated with a general aviation terminal building) per 49 USC § 47119(a)(2) and 49 USC § 47119(c)(5).
d. State Apportionment	**(1) Terminal Buildings.** Not allowed (see Paragraph N-11 for details). **(2) Non-Revenue Producing Public Parking Lots.** Not allowed (the Act does not authorize this funding for this purpose). **(3) Revenue Producing Aeronautical Support Facilities.** Not allowed (the Act does not authorize this funding for this purpose).
e. Alaska Supplemental	**(1) Terminal Buildings.** Not allowed (see Paragraph N-11 for details). **(2) Non-revenue Producing Public Parking Lots.** Not allowed (the Act does not authorize this funding for this purpose). **(3) Revenue Producing Aeronautical Support Facilities.** Not allowed (the Act does not authorize this funding for this purpose). **(4) Relocation of Sponsor Owned Facilities Caused by a Change in FAA Design Standards.** Not allowed (see Paragraph 3-74 for details). **(5) Contract Air Traffic Control Towers.** Not allowed. Funding is restricted by airport and fund type per 49 USC § 47124(b)(4)(A).

Table 4-5 Project Restrictions by Fund Type

Fund Type	Project Restrictions by Fund Type
f. Small Airport Fund	**(1) Terminal Buildings.** Not allowed for any airport type other than small hub primary airports with exactly .05% of the annual passenger boardings and nonhub primary airports (see Paragraph N-11 for details). **(2) Non-Revenue Producing Public Parking Lots.** Not allowed for any airport types except nonhub primary airports (only if associated with a commercial service terminal building) per 49 USC § 47119(a)(2) and 49 USC § 47119(c)(3). **(3) Projects without Small Airport Fund Notification.** The ADO must not use these funds on any project unless the ADO notifies the sponsor in writing that the project is being funded, all or in part, by the Small Airport Fund per 49 USC § 47116(f). **(4) Revenue Producing Aeronautical Support Facilities**. Not allowed (the Act does not authorize this funding for this purpose). **(5) Relocation of Sponsor Owned Facilities Caused by a Change in FAA Design Standards.** Not allowed (see Paragraph 3-74 for details). **(6) Contract Air Traffic Control Towers.** Not allowed. Funding is restricted by airport and fund type per 49 USC § 47124(b)(4)(A).

Table 4-5 Project Restrictions by Fund Type

Fund Type	Project Restrictions by Fund Type
g. Noise and Environmental Set Aside	**(1) Projects that are not Noise, Air Quality, or Environmental.** The ADO must not use these funds on projects except eligible noise, air quality, and specific environmental projects. Energy efficiency studies and projects are **not** included (see Section 7 of Chapter 6). Per 49 USC § 47117(e)(1)(A), the eligible projects are restricted to: **(a) Airport Noise Compatibility Planning.** Airport noise compatibility planning under section 49 USC § 47505(a)(2). **(b) Noise Compatibility Program Projects**. Airport noise compatibility program projects approved by the FAA in a noise compatibility program under 49 USC § 47504(c). **(c) Noise Mitigation Projects in a Record of Decision**. Noise mitigation projects approved in an environmental record of decision for an airport development project. **(d) Compatible Land Use Planning/Projects**. Compatible land use planning and projects carried out by state and local governments under 49 USC § 47141. **(e) Americans with Disabilities Act of 1990 (ADA) Projects**. Airport development projects (including equipment) to comply with ADA per 49 USC § 47102(3)(F). **(f) Clean Air Act Projects**. Airport development (including equipment) projects to comply with the Clean Air Act (42 USC § 7401) per 49 USC § 47102(3)(F). **(g) Federal Water Pollution Control Act (commonly referred to as the Clean Water Act) Projects.** Airport development projects (including equipment) required to comply with the Federal Water Pollution Control Act (33 USC § 1251 et seq) per 49 USC § 47102(3)(F). In addition, water quality mitigation projects to comply with the Federal Water Pollution Control Act that are approved in an environmental record of decision for an airport development project may use this type of funding. **(h) Voluntary Airport Low Emissions (VALE) Projects**. Projects that meet the requirements of the VALE program per 49 USC § 47102(3)(K) and 49 USC § 47102(3)(L). These requirements are discussed in Section 5 of Chapter 6 **(i) Zero Emission Vehicle and Infrastructure Projects.** Projects that meet the requirements of this pilot program per 49 USC § 47136a(a). This is further discussed in Section 6 of Chapter 6.

Table 4-5 Project Restrictions by Fund Type

Fund Type	Project Restrictions by Fund Type
h. MAP Set Aside	**(1) Projects that are not approved under MAP or 49 USC § 47118(h).** The ADO must not use these funds on projects that are not approved under MAP (see Section 3 of Chapter 6 for details) or as an FAA designated safety critical project under 49 USC § 47118(h) (see Paragraph 2-3 for details).
i. Reliever Set Aside	**(1) Terminal Buildings.** Not allowed (see Paragraph N-11 for details). **(2) Non-Revenue Producing Public Parking Lots.** Not allowed (the Act does not authorize this funding for this purpose). **(3) Revenue Producing Aeronautical Support Facilities.** Not allowed (the Act does not authorize this funding for this purpose). **(4) Relocation of Sponsor Owned Facilities Caused by a Change in FAA Design Standards.** Not allowed (see Paragraph 3-74 for details). **(5) Contract Air Traffic Control Towers.** Not allowed. Funding is restricted by airport and fund type per 49 USC § 47124(b)(4)(A).
j. Remaining Discretionary (C/S/S/N, Pure Discretionary, and Discretionary from Converted Entitlements/ Apportionments)	**(1) Terminal Buildings.** Only allowed in limited amounts at non-hub primary airports, nonprimary commercial service airports, and reliever airports and in limited circumstances where the airport has changed airport types (see Paragraph N-11 for details). **(2) Non-Revenue Producing Public Parking Lots.** Not allowed except for nonhub primary airports, nonprimary commercial service airports, and reliever airports per 49 USC § 47119(a)(2), 49 USC § 47119(c)(2), and 49 USC § 47119(c)(3). The non-revenue producing public parking lot is only allowable if it is associated with an eligible commercial service or general aviation terminal building. The same discretionary funding rules and amounts apply for non-revenue producing public parking lots as the associated terminal (see Item 1 above that discuss discretionary rules for commercial service and general aviation terminal buildings). **(3) Revenue Producing Aeronautical Support Facilities.** Not allowed (the Act does not authorize this funding for this purpose). **(4) Relocation of Sponsor Owned Facilities Caused by a Change in FAA Design Standards.** Not allowed (see Paragraph 3-74 for details). **(5) Use on Higher Priority Projects than Entitlement Projects.** To meet the requirements of 49 USC § 47120, the ADO must obtain prior approval from APP-520 to use these funds on a project if passenger, cargo, nonprimary, state apportionment, or Alaska supplemental will be used on lower priority projects. **(6) Consideration of Project Priority.** To comply with 49 USC § 47115(d)(2)(A), the ADO, prior to selecting a project for this type of funding, must determine if the decision will impact the ability to fund other projects with a higher national priority rating in the same fiscal year and obtain regional office approval. **(7) Consideration of Project Execution.** To comply with 49 USC § 47115(d)(2)(B), the ADO must consider whether the sponsor

Table 4-5 Project Restrictions by Fund Type

Fund Type	Project Restrictions by Fund Type
	can start the project in either the current fiscal year or six months after the grant is issued, whichever is later. Per FAA policy, starting the project means issuing a notice to proceed for construction projects; executing the purchase order for equipment projects; beginning design for projects that include design; or beginning planning for planning projects. **(8) Contract Air Traffic Control Towers.** Not allowed. Funding is restricted by airport and fund type per 49 USC § 47124(b)(4)(A).

4-8. Fund Expiration Time Frames by Airport and Fund Type.

49 USC § 47117(b) defines how long AIP funding is available. Once AIP funds are apportioned, the funds are only available for the number of fiscal years listed in Table 4-6.

Table 4-6 Expiration of AIP Funds

For the following airport type…	The following funds…	Are available for the fiscal year in which the funds are apportioned plus…
a. Small, Medium, or Large Hub Primary	Passenger Entitlement Cargo Entitlement	Two fiscal years immediately following the year in which the funds are apportioned, **or a total of three years.** *These funds continue to have a three year life even if the airport type changes after the funds have been allocated.*
b. Nonhub Primary	Passenger Entitlement Cargo Entitlement	Three fiscal years immediately following the year in which the funds are apportioned, **or a total of four years.** *These funds continue to have a four year life even if the airport type changes after the funds have been allocated.*
c. Nonprimary	Cargo Entitlement Nonprimary Entitlement	Three fiscal years immediately following the year in which the funds are apportioned, **or a total of four years.** *These funds continue to have a four year life even if the airport type changes after the funds have been allocated.*
d. N/A	State Apportionment (including Insular) Alaska Supplemental	Two fiscal years immediately following the year in which the funds were apportioned, **or a total of three years.**
e. N/A	Discretionary	Zero additional years, **or a total of one year**.

4-9. Federal Share by Airport Type (Including Exceptions).

The Federal share of allowable project costs is a fixed percentage of the allowable project costs. The Federal share by airport type, as well as the associated exceptions, is listed in Table 4-7.

Table 4-7 Federal Share by Airport Type (Including Exceptions)

Airport Type	Normal Federal Share	Exceptions
a. Large Hub **b.** Medium Hub	75%	**(1) Noise Projects.** 80% for noise projects per 49 USC § 47504(c)(4). *Note: Per 49 USC § 47505(b), the normal Federal share for noise compatibility planning projects remains at 75% unless the airport receives a different Federal share in one of the other exceptions listed here. In addition, the Federal share for non-noise compatibility projects that are funded through the environmental set-aside such as VALE, noise planning projects, and other non-noise related environmental projects also remain at 75%.* **(2) States with Large Amounts of Public Land.** 49 USC § 47109(b) increases the Federal share at some airports in states with large amounts of publicly owned land. These airports and their increased Federal shares are listed in Paragraph 4-10. **(3) Insular Areas.** Airports in American Samoa, Guam, the U.S. Virgin Islands, or the Northern Mariana Islands have a waiver of up to $200,000 of the sponsor's share per 33 USC § 2310. Therefore, a grant of up to $2,000,000 at the 90% participation rate needs no contribution from the sponsor. **(4) Special Rule for Transition from Small to Medium Hub.** The Federal share for a medium hub is at 90% for the two fiscal years following a status change from small to medium hub per 49 USC § 47109(e). **(5) Private Ownership Pilot Program.** 49 USC § 47109(a)(4) requires a 70% Federal share for projects funded with discretionary at airports in the private ownership pilot program under 49 USC § 47134. **(6) Airport Development Rights Pilot Program.** 49 USC § 47138(b)(2) allows any Federal share up to and including 90% for projects meeting the requirements in Section 8 of Chapter 6. **(7) Zero Emission Airport and Infrastructure Pilot Program**. 49 USC § 47136a(d) requires a 50% Federal share for projects meeting the requirements in Section 6 of Chapter 6. **(8) Fiscal Year 2002 Security Projects.** For fiscal year 2002, 49 USC § 47109(a)(5) allowed a 100% Federal share for certain security projects allowed under Public Law 107-71.

Table 4-7 Federal Share by Airport Type (Including Exceptions)

Airport Type	Normal Federal Share	Exceptions
c. Small Hub **d.** Nonhub Primary	90%	**(1) Temporary Increase to 95%.** Section 161 of Vision 100 (Public Law 108-176, December 12, 2003) added a Note to 49 USC § 47109 to temporarily increase the Federal share of allowable project costs from 90% to 95% for Fiscal Years 2004-2007. Although scheduled to sunset at the end of Fiscal Year 2007, Congress extended this temporary increase from Fiscal Years 2008-2011. The FAA Modernization and Reform Act of 2012 (Public Law 112-95) did not extend this temporary provision, and the Federal share reverted back to 90% except as listed below. **(2) States with Large Amounts of Public Land.** 49 USC § 47109 increases the Federal share at some airports in states with large amounts of publicly owned land. These airports and their increased Federal shares are listed in Paragraph 4-10. **(3) Nonhub Primary Airports in States with Large Amounts of Public Land**. The Consolidated and Further Continuing Appropriations Act, 2015, Section 119F, modifies the Federal share of certain nonhub primary airports. The bill amends 49 USC § 47109(c)(2). Specifically, if a primary non-hub airport located in a public land state is within 15 miles of another public land state, the Federal share increases to an average of the two states. If the average is less, the airport Federal share remains the same. APP-500 will publish the list of airports that meet these criteria at the beginning of each fiscal year. **(4) Economically Distressed Areas.** Per 49 USC § 47109(f), the Federal share for smaller airports (those that are not large or medium hubs) who are both receiving Essential Air Service (EAS) and are located in economically distressed areas (EDA) is 95%. APP-500 will obtain a list of the EAS airports from the DOT office administering the EAS program. APP-500 will use the EDA data published by the Federal Highway Administration to determine which EAS airports are in EDAs. APP-500 will publish the list of airports that meet these criteria at the beginning of each fiscal year and will not make mid-year changes based on new EAS or EDA data. **(5) Innovative Finance Grants**. A grant issued under the innovative finance demonstration program per 49 USC § 47135 may have a flexible Federal shares. **(6) Insular Areas**. Airports in American Samoa, Guam, the U.S. Virgin Islands, or the Northern Mariana Islands have a waiver of up to $200,000 of the sponsor's share per 33 USC § 2310. Therefore, a grant of up to $800,000 at the 75% participation rate needs no contribution from the sponsor.

Table 4-7 Federal Share by Airport Type (Including Exceptions)

Airport Type	Normal Federal Share	Exceptions
		(7) Turbine Powered Aircraft. 49 USC § 47116(d)(2) directs the FAA to give consideration to airport development projects to support operations by turbine powered aircraft if the non-Federal share of the project is at least 40%. For these projects, the Federal share must be less than 60%. **(8) Private Ownership Pilot Program.** 49 USC § 47109(a)(4) requires a 70% Federal share for projects funded with discretionary at airports in the private ownership pilot program under 49 USC § 47134. **(9) Airport Development Rights Pilot Program.** 49 USC § 47138(b)(2) allows any Federal share up to and including 90% for projects meeting the requirements in Section 8 of Chapter 6. **(10) Zero Emission Airport and Infrastructure Pilot Program**. 49 USC § 47136a(d) requires a 50% Federal share for projects meeting the requirements in Section 6 of Chapter 6 **(11) Fiscal Year 2002 Security Projects.** For fiscal year 2002, 49 USC § 47109(a)(5) allowed a 100% Federal share for certain security projects under Public Law 107-71.
e. Nonprimary Commercial Service **f.** General Aviation **g.** Reliever	90%	**(1) Temporary Increase to 95%.** Section 161 of Vision 100 (Public Law 108-176) added a note to 49 USC § 47109 to temporarily increase the Federal share of allowable project costs from 90% to 95% for Fiscal Years 2004-2007. Although scheduled to sunset at the end of Fiscal Year 2007, Congress extended this temporary increase from Fiscal Years 2008-2011. The FAA Modernization and Reform Act of 2012 (Public Law 112-95) did not extend this temporary provision, and the Federal share reverted back to 90% except as listed below. **(2) States with Large Amounts of Public Land.** 49 USC § 47109 increases the Federal share at some airports in states with large amounts of publicly owned land. These airports and their increased Federal shares are listed in Paragraph 4-10. **(3) Nonprimary Commercial Service Airports in States with Large Amounts of Public Land.** The Consolidated Appropriations Act, 2017, Section 119E, modifies the Federal share of certain nonprimary commercial service airports. The bill amends 49 USC § 47109(c)(2). Specifically, if a nonprimary commercial service airport located in a public land state is within 15 miles of another public land state, the Federal share increases to an average of the two states. If the average is less, the airport Federal share remains the same. APP-500

Table 4-7 Federal Share by Airport Type (Including Exceptions)

Airport Type	Normal Federal Share	Exceptions
		will publish the list of airports that meet these criteria at the beginning of each fiscal year. **(4) Nonhub Primary Airports in States with Large Amounts of Public Land**. The Consolidated and Further Continuing Appropriations Act, 2015, Section 119F, modifies the Federal share of certain nonhub primary airports. The bill amends 49 USC § 47109(c)(2). Specifically, if a primary non-hub airports located in a public land state is within 15 miles of another public land state, the Federal share increases to an average of the two states. If the average is less, the airport Federal share remains the same. APP-500 will publish the list of airports that meet these criteria at the beginning of each fiscal year. **(5) Economically Distressed Areas.** Per 49 USC § 47109(f), the Federal share for smaller airports (those that are not large or medium hubs) who are both receiving Essential Air Service (EAS) and are located in economically distressed areas (EDA) is 95%. APP-500 will obtain a list of the EAS airports from the DOT office administering the EAS program. APP-500 will use the EDA data published by the Federal Highway Administration to determine which EAS airports are in EDAs. APP-500 will publish the list of airports that meet these criteria at the beginning of each fiscal year and will not make mid-year changes based on new EAS or EDA data. **(6) State Block Grant Subgrants.** Per 49 USC § 47109(a)(2), states may issue state block grant subgrants at a different participation percentage than the associated state block grant. The subgrant participation rate must be equal or lower than the fiscal year Federal percentage rate of the associated state block grant. In FY 2004 and FY 2012, the Federal share for nonprimary airports changed. Per FAA policy, states must either clearly document when they are commingling funds of different Federal percentages within the same subgrant or issue separate subgrants to avoid confusion. **(7) Innovative Finance Grants**. A grants issued under the innovative finance demonstration program per 49 USC § 47135 may have a flexible Federal shares. **(8) Insular Areas**. Airports in American Samoa, Guam, the U.S. Virgin Islands, or the Northern Mariana Islands have a waiver of up to $200,000 of the sponsor's share per 33 USC § 2310. Therefore, a grant of up to $800,000 at the 75% participation rate needs no contribution from the sponsor. **(9) Private Ownership Pilot Program**. 49 USC § 47109(a)(4) requires a 70% Federal share for projects funded with

Table 4-7 Federal Share by Airport Type (Including Exceptions)

Airport Type	Normal Federal Share	Exceptions
		discretionary at airports in the private ownership pilot program under 49 USC § 47134. **(10) Airport Development Rights Pilot Program.** 49 USC § 47138(b)(2) allows any Federal share up to and including 90% for projects meeting the requirements in Section 8 of Chapter 6. **(11) Zero Emission Airport and Infrastructure Pilot Program**. 49 USC § 47136a(d) requires a 50% Federal share for projects meeting the requirements in Section 6 of Chapter 6. **(12) Fiscal Year 2002 Security Projects.** For fiscal year 2002, 49 USC § 47109(a)(5) allowed a 100% Federal share for certain security projects allowed under Public Law 107-71.

4-10. Federal Share Exception for States with Large Amounts of Public Land

49 USC § 47109(b) includes special language that increases the Federal share for airports in states that have more than 5% public or Indian land as defined by the Department of the Interior's Bureau of Land Management. 49 USC § 47109 requires that the FAA determine if an airport is in a public land state and whether the current Federal share is less than the Federal share was on June 30, 1975. On that date, the Federal share of most projects was 50% for *large* hub airports (not *large and medium* hub airports as exists in current legislation) and 75% for all other airport types, plus the bump-up for airports in the public land states.

Table 4-8 contains the increased Federal share for those states that have large amounts of public land. Unless otherwise noted in these tables, the Federal share percentages are based on 49 USC § 47109.

Background information on the calculation of the increased Federal share for states with large amounts of public land is found in Appendix Y.

Table 4-8 Federal Shares by Airport Classification in Public Land States

State	Large Hub Airports	Medium Hub Airports	Small or Nonhub Commercial Service airports*	Non-primary General Aviation and Reliever Airports
a. Alaska (AK)	75	87.76%	93.75%	93.75%
b. Arizona (AZ)	75	91.06%	91.06%	91.06%

Table 4-8 Federal Shares by Airport Classification in Public Land States

State	Large Hub Airports	Medium Hub Airports	Small or Nonhub Commercial Service airports*	Non-primary General Aviation and Reliever Airports
c. California (CA)	75	80.59%	90.66%	90.00%
d. Colorado (CO)	75	79.02%	90.00%	90.00%
e. Idaho (ID)	75	83.51%	93.75%	90.00%
f. Montana (MT)	75	79.47%	90.00%	90.00%
g. Nevada (NV)	75	93.75%	93.75%	93.75%
h. New Mexico (NM)	75	84.29%	93.75%	90.00%
i. Oregon (OR)	75	83.33%	93.75%	90.00%
j. South Dakota (SD)	75	78.55%	90.00%	90.00%
k. Utah (UT)	75	90.63%	90.63%	90.63%
l. Washington (WA)	75	77.31%	90.00%	90.00%
m. Wyoming (WY)	75	84.58%	93.75%	90.00%

* The Consolidated and Further Continuing Appropriations Act, 2015, Section 119F, modifies the Federal share of certain nonhub primary airports. Section 119E of the Consolidated Appropriations Act, 2017 extends the modification of the Federal share to certain non-primary commercial service airports. APP-500 will publish the list of airports that meet these criteria at the beginning of each fiscal year.

4-11. Transfer of Entitlement Funds between Airports.

49 USC § 47117(c) allows the FAA to transfer entitlements between airports. The intention of this statutory provision is to permit a sponsor to share its unused entitlements with another airport so that the funds do not expire or get carried over to future years. The conditions and required agreements for these transfers are outlined in Table 4-9. The Act does not allow the FAA to transfer state apportionment or Alaskan supplemental between states. The Act also does not allow the FAA to transfer entitlements to a state.

Because the FAA must know when entitlements are transferred and between which airports, the FAA requires that the sponsor sign a transfer agreement. This agreement is necessary even when the sponsor owns the airports between which the funds are being transferred.

This requirement *does not* apply to various location grants if each of the airports retains the rights to their specific entitlements per the state sponsorship agreement that is required for various location grants in Table 2-11. The transfer agreement requirement *does* apply to a

various locations grant if entitlements within the grant are being transferred between any of the airports. In this case, FAA Form 5100-110, Agreement for Transfer of Entitlements (see the AIP Forms link in Appendix B) is required for each of the transfers.

Table 4-9 Requirements to Transfer Entitlement Funds between Airports

If a sponsor wants to…	Only the following entitlements can be transferred…	If the following conditions are met…	And the following agreements are provided…
a. Transfer all or part of their entitlements between airports they own per 49 USC § 47117(c)(1).	Passenger	The airport that will receive the entitlements is in the NPIAS. The airport that will receive the entitlements is also owned by the sponsor. The sponsor requests use of the funding through the sponsor's capital improvement plan and/or a grant application.	The sponsor does not have to submit a waiver request or sign FAA Form 5100-110. The ADO does not need to track these actions separately.

Table 4-9 Requirements to Transfer Entitlement Funds between Airports

If a sponsor wants to…	Only the following entitlements can be transferred…	If the following conditions are met…	And the following agreements are provided…
b. Waive receipt of all or part of their entitlements and allowing the FAA to determine which airport will receive the entitlement per 49 USC § 47117(c)(2).	Passenger Cargo Nonprimary	The airport that will receive the entitlements is in the NPIAS. The airport that will receive the entitlements must be in the same state or geographical area. In this case, geographical area means the same or an adjacent Standard Metropolitan Statistical Area. The sponsor must make a written request to the ADO.	If the ADO agrees with the transfer, the ADO (not the sponsor) prepares FAA Form 5100-110. The ADO, sponsor, and sponsor's attorney must execute the agreement in order for the ADO to transfer the funds. The agreement must only specify entitlements of one airport. The ADO must prepare separate agreements if entitlements are being transferred from more than one airport. *Note: The sponsor receiving the transferred entitlements does not incur grant assurance obligations until the sponsor signs a grant that contains the transferred entitlements. The sponsor waiving receipt of the transferred entitlements is not tied to the grant assurances associated with this transferred entitlement.*

Table 4-9 Requirements to Transfer Entitlement Funds between Airports

If a sponsor wants to…	Only the following entitlements can be transferred…	If the following conditions are met…	And the following agreements are provided…
c. Waive receipt of all or part of their entitlements and request they be used at a specific airport per 49 USC § 47117(c)(2).	Passenger Cargo Nonprimary	The airport that will receive the entitlements is in the NPIAS. The airport that will receive the entitlements must be in the same state or geographical area. In this case, geographical area means the same or an adjacent Standard Metropolitan Statistical Area. The sponsor must make a written request to the ADO. The ADO must have concurred with transferring the entitlements to the airport the sponsor has requested. This is because the ADO, not the sponsor, has the decision authority regarding which airport will receive the transferred funds. If the ADO objects to the airport requested by the sponsor, the ADO will inform the sponsor and give the sponsor the option of withdrawing the waiver request. The sponsor is not selling, trading or bartering away their entitlement since this may be construed as using Federal funds in an inappropriate manner. In other words, a sponsor may not trade its entitlements for money or property that would not be eligible under AIP.	If the ADO agrees with the transfer, the ADO (not the sponsor) prepares FAA Form 5100-110, The ADO, the sponsor, and sponsor's attorney must execute the agreement in order for the ADO to transfer the funds. The agreement must only specify entitlements of one airport. The sponsor waiving funds and the sponsor receiving funds have the option to make separate agreements concerning the transfer. This agreement is between the two sponsors. The sponsors and/or their attorneys are responsible for ensuring the legality of the agreement. The FAA is not a party to the agreement, is not required to obtain the agreement, and is not responsible for enforcing the conditions of the agreement. *Note: The sponsor receiving the transferred entitlements does not incur grant assurance obligations until the sponsor signs a grant that contains the transferred entitlements. The sponsor waiving receipt of the transferred entitlements is not tied to the grant assurances associated with this transferred entitlement.*

4-12. Use of Donations (or Previously Acquired Land) as the Sponsor Share.

Per 2 CFR § 200.434, the ADO has the option of allowing a sponsor to use donated items or a credit for previously acquired land as a portion or for the entire sponsor share in a grant. The ADO must use the Table 4-10 to determine if and/or how to offset the sponsor share in a grant.

Table 4-10 Summary of Tables Containing Requirements for using Donations for the Sponsor's Share

The following table…	Contains the following requirements…
Table 4-11.	General requirements.
Table 4-12.	Value requirements.
Table 4-13.	Offset process.
Table 4-14.	Offset examples.

Table 4-11 General Requirements for Offsetting the Sponsor Share of a Grant

For the following items…	The following general requirements apply…
a. Land Donated to the Sponsor	**(1)** The land must be AIP eligible, but does not have to be required for the project. **(2)** The ADO must have concurred with the value of land. The ADO has the option to either implicitly concur with the value by issuing the grant or make a written determination. In either case, the ADO must place the documentation used to support this value in the grant file. **(3)** The sponsor must provide information documenting when the donation or acquisition was or will be made. **(4)** The sponsor must provide a copy of any agreements between the donor and the sponsor and document to the ADO that the donor has/will not receive an exclusive benefit or consideration as a result of the transaction. **(5)** The sponsor must provide the identity of the donor and outline the relationship between the sponsor and the donor. **(6)** The sponsor must document to the ADO that there are no reversion clauses tied to the donation other than reversion back to the donor if and when the land is no longer needed for airport purposes.

Table 4-11 General Requirements for Offsetting the Sponsor Share of a Grant

For the following items…	The following general requirements apply…
	(7) The sponsor must document to the ADO that the donor was not acting as an agent for the sponsor and is not a government or quasi-government entity in the same state as the sponsor. **(8)** The sponsor must add the donated land and document the value that has been credited toward the sponsor share on the Exhibit A. **(9)** The sponsor is bound to Airport Sponsors Assurance 31 for the donated land. **(10)** A description of the land donated as sponsor share must be included in the grant.
b. Land Previously Acquired by the Sponsor	**(1)** The land must be AIP eligible, but does not have to be required for the project. **(2)** The sponsor must document to the ADO that the requirements in Appendix Q have been met. **(3)** The ADO must have concurred with the value of land. The ADO has the option to either implicitly concur with the value by issuing the grant or make a written determination. In either case, the ADO must place the documentation used to support this value in the grant file. **(4)** The sponsor must document the value of the land that has been credited toward the sponsor share on the Exhibit A. **(5)** The sponsor is bound to Airport Sponsors Assurance 31 for the previously acquired land. **(6)** A description of the land donated as sponsor share must be included in the grant.
c. Labor, Materials, Equipment, and Services Donated *to the Sponsor*	**(1)** The ADO must determine that the labor, materials, and/or equipment costs are allowable and necessary project costs that would have normally been included in the grant. **(2)** The sponsor must request the use of the donated labor, materials, and/or equipment costs in writing, and the ADO must have approved the request and the value of the donated items in advance of the grant offer. The ADO must use the sponsor force account requirements provided in Paragraph 3-53 in making this determination. When applying the requirement in Paragraph 3-53, the ADO must simply substitute all references to the sponsor's labor, materials, equipment, or services with the donated labor, materials, equipment, or services.

Table 4-11 General Requirements for Offsetting the Sponsor Share of a Grant

For the following items…	The following general requirements apply…
	(3) The sponsor must provide a copy of any agreements between the donor and the sponsor and document to the ADO that the donor has/will not receive an exclusive benefit or consideration as a result of the transaction. This includes the benefit of the donor avoiding costs they would have normally incurred (for instance, if donor donates excess fill to avoid paying for disposal of the fill, the donor would gain a benefit by not having to pay for the disposal.) **(4)** The sponsor must provide the identity of the donor and outline the relationship between the sponsor and the donor. **(5)** The sponsor must document to the ADO that there are no reversion clauses tied to the donation of equipment or materials. **(6)** The sponsor must document to the ADO that the donor was not acting as an agent for the sponsor and is not a government or quasi-government entity in the same state as the sponsor.
d. Labor, Materials, Supplies, Equipment, and Services Provided *by the Sponsor*	**(1)** These costs are not considered donations under 2 CFR § 200.434. Therefore, a sponsor cannot use these costs against the sponsor's share. **(2)** Instead, the ADO has the option of approving these costs as force account work if all of the requirements for force account work in Paragraph 3-53 are met. Note that force account materials and supplies have the added requirement of needing to be procured per 2 CFR §§ 200 317-200.326

Table 4-12 Value of Items Used to Offset the Sponsor Share

For the following items…	The ADO must determine the value as follows…
a. Land Donated to the Sponsor	**(1)** The ADO must use the fair market value of the land at the time it was donated to the sponsor by an unrelated third party. Per 2 CFR § 200.434, governmental or quasi-governmental organizations located within the same state are not considered unrelated third parties for this purpose. In this case, the ADO must use the fair market value at the time it was first donated by an unrelated third party to a governmental or quasi-governmental organization. **(2)** The ADO must only include the cost of the land. Per 2 CFR § 200.434(b), only the value of the land can be used towards a sponsor's matching share, so costs to acquire the land (title fees, attorney fees, appraisal fees, etc.) are not allowed. **(3)** If the value of the land exceeds the amount needed to cover the sponsor share, the ADO has the option to allow the sponsor to use the unused value for the sponsor share on future grants. In that case, the ADO must correctly describe the amount of land being included as sponsor share and the amount that is being set aside for future sponsor share.
b. Land Previously Acquired by the Sponsor	**(1)** For a public sponsor, the ADO must use the fair market value of the land at the time of purchase, not the current fair market value. **(2)** For a sponsor of a privately-owned airport, 49 USC § 47109(d) requires that the ADO use the current fair market value of the land at the time of the project. **(3)** The ADO must only include the cost of the land. Per 2 CFR § 200.434(b), only the value of the land can be used towards a sponsor's matching share, so costs to acquire the land (title fees, attorney fees, appraisal fees, etc.) are not allowed. **(4)** If the value of the land exceeds the amount needed to cover the sponsor share, ADO has the option to allow the sponsor to use the unused value for the sponsor share on future grants. In that case, the ADO must correctly describe the amount of land being included as sponsor share and the amount that is being set aside for future sponsor share

Table 4-12 Value of Items Used to Offset the Sponsor Share

For the following items…	The ADO must determine the value as follows…
c. Labor, Materials, Equipment and Services Donated to the Sponsor	**(1)** The ADO must use the current fair market value of the donated labor, materials, equipment, and services at the time they are donated. **(2)** The ADO must determine the current market value of the donation by following the sponsor force account requirements provided in Paragraph 3-53. When applying the requirement in Paragraph 3-53, the ADO must simply substitute all references to the sponsor's labor, materials, equipment, or services with the donated labor, materials, equipment, or services.

Table 4-13 Process to Offset the Sponsor Share of a Grant

For the…	The following applies…
a. Donation Value (or Previously Acquired Land Value) Needed for the Grant	The ADO calculates this value using the following formula: = (Project Cost x Sponsor Share %) ÷ Federal Share % As the formula indicates, the calculated value is not a dollar to dollar credit against the sponsor share. If the state is participating, the sponsor share percent used above is the percent the sponsor would be paying (the non-Federal share percent minus the state share percent).
b. Credit Remaining for Future Grants	The ADO calculates this using the following formula: = Land Value – Donation Value (or Previously Acquired Land Value) Applied to the Grant
c. Application Amount	The sponsor must use the following formula to calculate the amount they must show on the grant application: = Project Cost + Donation Value (or Previously Acquired Land Value) Applied to the Grant
d. Application Project Description	The sponsor must list the proposed project as the project to be accomplished under the grant. The sponsor must also show the previously purchased land or donated labor, materials, equipment and/or services as an item that will be used as a full or partial credit against the sponsor share.
e. Grant Amount	The ADO calculates this using the following formula: = Application Amount x Federal Share %

Table 4-13 Process to Offset the Sponsor Share of a Grant

For the…	The following applies…
f. Maximum Obligation in Grant	The ADO shows the entire grant amount under the category of the project (example: $1,000,000 for airport development), not the category of the donated item.
g. Remaining Sponsor Share	The ADO calculates this using the following formula: = Application Amount – Federal Share Amount – Donation Value (or Previously Acquired Land Value)
h. Grant Description	The ADO must use the following format: *[Insert Normal Grant Description]* including a credit of *$[Insert Value of Donation (or Value of Previously Acquired Land) Applied to the Grant]* for the *[Insert either complete or partial]* sponsor share for the *[Insert either complete or partial] [Insert donated if applicable]* value of *[Insert brief description of item being credited – include the parcel numbers for land].*

Table 4-14 Example Calculations for Offsetting the Sponsor Share of a Grant

Examples Include…

EXAMPLE 1: Donated Land, No State Participation, Value of Land Exceeds Sponsor Share.

A general aviation sponsor has a $1,000,000 runway extension project. A local businessman donated a piece of land to the sponsor five years previously, and the appraised fair market value *at the time of donation* was $2,000,000. All other requirements for the donation have been met. The non-Federal share is 10%. In this case, the state is not contributing toward the non-Federal share, therefore the sponsor share is 10%.

Project Cost = $1,000,000 **Federal Share %** = 90% **Sponsor Share %** = 10%

Donation Value Needed for this Grant = Project Cost x Sponsor Share % ÷ Federal Share %
= $1,000,000 x 10% ÷ 90%
= $111,112

Donation Value Remaining for Future Grants = Land Value – Donation Value Applied to the Grant
= $2,000,000 – $111,112
= $1,888,888

Application Amount = Project Cost + Donation Value Applied to the Grant
= $1,000,000 + $111,112
= $1,111,112

Application Project Description: The sponsor must list the runway extension as the project to be accomplished under the grant, and show the land as a donated item that will be used as a credit against the sponsor share.

Grant Amount = Application Amount x Federal Share %
= $1,111,112 x 90%
= $1,000,000

Maximum Obligation in Grant = $1,000,000 for airport development (*$0 for land*).

Grant Description = Extend Runway 9/27 (150’ x 1,000’) including a credit of $111,112 for the complete sponsor share for the partial donation value of Parcel 48.

Participation Breakdown = The FAA contributes $1,000,000 and the sponsor *virtually* contributes $111,112 as a credit, which adds up to the $1,111,112 application amount. This allows the FAA to issue a grant for $1,000,000 to cover both the Federal share of the project costs ($1,000,000 x 90% = $900,000) as well as the sponsor share ($1,000,000 x 10% = $100,000).

Table 4-14 Example Calculations for Offsetting the Sponsor Share of a Grant

Examples Include…

EXAMPLE 2: Previously Acquired Land, State Participation, Value of Land Exceeds Sponsor Share

A general aviation sponsor has a $1,000,000 runway extension project. The sponsor used local funds to purchase a parcel of land, and the appraised fair market value *at the time of acquisition* was $2,000,000. All other requirements for previously acquired land have been met. The non-Federal share is 5%. In this case, the state contributes half of the non-Federal share, or 5% toward the non-Federal share, therefore the sponsor share is also 5%.

Project Cost = $1,000,000 **Federal Share %** = 90% **Sponsor Share %** =5%

Land Value Needed for this Grant = Project Cost x Sponsor Share % ÷ Federal Share %

= $1,000,000 x 5% ÷ 90%

= $55,556

Land Value Remaining for Future Grants = Land Value – Land Value Applied to the Grant

= $2,000,000 – $55,556

= $1,944,444

Application Amount = Project Cost + Land Value Applied to the Grant

= $1,000,000 + $55,556

= $1,055,556

Application Project Description: The sponsor must list the runway extension as the project to be accomplished under the grant, and show the previously purchased land as an item that will be used as a credit against the sponsor share.

Grant Amount = Application Amount x Federal Share %

= $1,055,556 x 90%

= $950,000

Maximum Obligation in Grant = $950,000 for airport development (*$0 for land*)

Grant Description = Extend Runway 9/27 (150’ x 1,000’) including a credit of $55,556 for the complete sponsor share for the partial value of Parcel 48.

Participation Breakdown = The FAA contributes $950,000, the state contributes $50,000, and the sponsor *virtually* contributes $55,556 as a credit, which adds up to the $1,055,556 application amount. This allows the FAA to issue a grant for $950,000 to cover both the Federal share of the project costs ($1,000,000 x 90% = $900,000) as well as the sponsor share ($1,000,000 x 5% = $50,000).

Table 4-14 Example Calculations for Offsetting the Sponsor Share of a Grant

Examples Include…

EXAMPLE 3: Donated Labor/Materials, No State Participation, Value Less than Sponsor Share

A general aviation sponsor has a $1,000,000 runway extension project. A local businessman is willing to donate the sodding required for the project. The ADO approves the request and concurs with the donation value of $10,000. All other requirements for the donation have been met. The non-Federal share is 10%. In this case, the state is not contributing toward the non-Federal share, therefore the sponsor share is 10%.

Project Cost = $1,000,000 **Federal Share %** = 90% **Sponsor Share %** = 10%

Application Amount = Project Cost + Donation Value
= $1,000,000 + $10,000
= $1,010,000

Application Project Description: The sponsor must list the runway extension as the project to be accomplished under the grant, and show the donated sodding as an item that will be used as a partial credit against the sponsor share.

Grant Amount = Application Amount x Federal Share %
= $1,010,000 x 90%
= $909,000

Maximum Obligation in Grant = $909,000airport development

Remaining Sponsor Share = Application Amount – Federal Share Amount – Donation Value
= $1,010,000 - $909,000- $10,000
= $91,000

Grant Description = Extend Runway 9/27 (150’ x 1,000’) including a credit of $10,000 for the partial sponsor share for the complete donated value of required sodding.

Participation Breakdown = The FAA contributes $909,000, the sponsor *virtually* contributes $10,000 as a credit, and the sponsor contributes $91,000 for the remaining sponsor share, which adds up to the $1,010,000 application amount. This allows the FAA to issue a grant for $909,000 to cover both the Federal share of the project costs ($1,000,000 x 90% = $909,000) as well as a portion of the sponsor share ($10,000 x 90% = $9,000), leaving the sponsor to pay for the remaining $91,000 of the sponsor Share (($1,000,000 x 10%) - $9,000).

4-13. Budget Augmentation (Combining Funds between Different Federal Programs).

Each Federal program is supported by appropriations, and the funding limits set out in the relevant legislation are the limits of that program. Combining Federal funding is considered improper budget augmentation unless *specific authority* is contained in the legislation to do so. The Handbook calls out those rare instances where legislative authority has been granted for budget augmentation within an AIP grant. These instances are included in Table 4-15.

More information on the rules regarding Federal budget augmentation is contained in the Government Accountability Office's (GAO) Principles of Federal Appropriations Law, Third Edition, commonly referred to as the Red Book. APP-520 is also available for further guidance.

Table 4-15 Instances of Allowable Budget Augmentation

Some examples Include…	
a.	Economic development agency and Appalachian regional commission grants, which have specific authority to give grants for local matching share of other Federal programs.
b.	Costs for instrument landing systems to be transferred to the FAA under appropriation statutes.
c.	The incidental costs for clearing, grading and grubbing for an AIP project that may also provide site preparation for FAA facilities.

Chapter 5. How does the grant process work?

Section 1. Basic Grant Steps.

5-1. Basic Grant Steps.

Table 5-1 captures the basic steps in the grant process as outlined in the following sections of this chapter.

Table 5-1 The Basic Steps in the Grant Process

The basic steps are…
a. Pre-Grant Actions.
b. Grant Programming.
c. Grant Application, Offer, and Acceptance.
d. ADO Grant Oversight.
e. Grant Payment.
f. Grant Amendment.
g. Grant Closeouts.
h. Grant Suspension and/or Termination.
i. Post-Grant Actions.

Section 2. Pre-Grant Actions.

5-2. Introduction.

There are many actions that need to be taken before an AIP eligible project is ready to be considered for inclusion in a grant. Table 5-2 captures these major actions. The subsequent explanations in this section discuss which actions apply to which types of projects.

Table 5-2 The Major Pre-Grant Actions

The major actions include…
a. Identification of Potential Projects by Sponsors and ADO.
b. Early Coordination between ADO and Sponsor.
c. ADO Verification of Sponsor Eligibility.
d. ADO Verification that All Project Requirements Will Be Met.
e. ADO Verification that Airport Layout Plan is Current.
f. ADO Notification to New Sponsors of Flood Insurance Requirements.
g. ADO Notification and Verification of Sponsor Civil Rights Requirements.
h. ADO Verification that Risk Level Determination is Current.
i. ADO Review of Open Grant Status.
j. ADO Verification that Competition Plan is Current.

5-3. Identification of Potential Projects by Sponsors and ADO.

Sponsors normally develop 20-year airport development plans and often engage in other planning efforts. From these activities, the sponsor develops their capital improvement plan and submits it to the ADO. The ADO then uses this information, as well as other pertinent information available in house, to identify projects that meet the applicable requirements in Chapter 3.

The FAA Office of Airports uses this data to create a five year National Plan of Integrated Airport Systems (NPIAS) Report outlining the projects that are eligible and justified for AIP funding. The Secretary of Transportation is required to publish this plan every two years per 49 USC § 47103. The FAA Office of Airports then creates an Airports Capital Improvement Plan (ACIP) to identify the projects that may be funded with AIP over the next three years.

FAA inclusion of the project in the NPIAS or the ACIP is not a guarantee of funding, nor is the value of the project considered a final determination by the FAA.

Detailed information on the NPIAS and ACIP processes are found in the current versions of FAA Order 5100.39, Airports Capital Improvement Plan and FAA Order 5090.3, Field Formulation of the National Plan of Integrated Airport Systems.

It is important that during this process the ADO discuss the projects listed in Table 5-3 with the sponsor and determine when the projects will be addressed. This is because these items have

been determined by Congress to be of special interest, are required by rule or regulation, or if not implemented, can affect the utility of the airport in the future.

Table 5-3 Important Potential Projects for ADO/Sponsor Discussion

Important projects include…
a. Clear Runway Approaches. Per 49 USC § 47107(a)(9), the sponsor must take appropriate action to ensure that terminal airspace required to protect instrument and visual operations to the airport (including operations at established minimum flight altitudes) will be cleared and protected by mitigating existing, and preventing future, airport hazards. (*Note: 49 USC § 47107(a)(9) uses the term "operations to the airport", which includes departures and approaches. Because design surfaces are typically described in terms of approach surfaces or missed approach surfaces, the term "approaches" describes the clearance surfaces required to protect operations to or from a runway.*)
b. Compatible Land Use Issues. Per 49 USC § 47107(a)(10), the sponsor must take appropriate action (to extent reasonable) to restrict the use of land next to or near the airport to uses that are compatible with normal airport operations. For example, if there are residential uses surrounding the airport, acquisition of the properties or soundproofing the houses may be appropriate.
c. Congressionally Mandated Items. 49 USC § 47101(f) lists high priority projects at commercial service airports (to be given consideration to the extent possible with available money and considering other safety needs). The items on this list include: **(1)** Electronic or visual vertical guidance on each runway. **(2)** Grooving or friction treatment of each primary and secondary runway. **(3)** Distance-to-go signs for each primary and secondary runway. **(4)** A precision approach system, a vertical visual guidance system, and a full approach light system for each primary runway. **(5)** A non-precision instrument approach for each secondary runway. **(6)** Runway end identifier lights on each runway that does not have an approach light system. **(7)** A surface movement radar system at each category III airport (per FAA policy, not eligible for AIP). **(8)** A taxiway lighting and sign system. **(9)** Runway edge lighting and marking. **(10)** Radar approach coverage for each airport terminal area (per FAA policy, not eligible for AIP). **(11)** Runway and taxiway incursion prevention devices, including integrated in-pavement lighting systems for runways and taxiways (per FAA policy, may have limited eligibility).
d. 14 CFR 139 Violations. 14 CFR part 139 requires certificated airports to meet certain standards, including required safety and signage. The ADO is encouraged to review the latest 14 CFR part 139 inspection report to determine if there are any AIP eligible equipment or development items that need to be addressed.

5-4. Early Coordination between ADO and Sponsor.

The ADO has the option to give the sponsor some preliminary indication (for planning purposes only) of the likelihood of the FAA being able to consider funding for a given project, focusing not just on eligibility and justification but also on whether and when funds might become available (including all categories of AIP funds). In such cases, the ADO must make it clear to the sponsor that such early indications do not represent a decision or commitment, and that many factors, including national, regional and local issues may affect the ultimate decision. The ADO must also make it clear that it is the sponsor's decision whether and when to initiate any steps that might be required in order to be ready if and when the FAA is ultimately able to award a grant. Finally, the ADO must ensure that such early indications, as well as any early actions by the sponsor, cannot be misconstrued as pre-decisional, particularly if environmental review processes are still underway.

The ADO also has the option to notify the sponsor of the favorable potential for receiving Federal funding in the upcoming fiscal year. This is not a commitment nor a guarantee of funds but simply a notice that funding for the project appears favorable and that the sponsor has the option to initiate actions that require long lead times in order to avoid potential delays in the grant process.

In addition, the sponsor must develop a realistic project schedule that will ensure that the grant can proceed in a timely manner. The ADO may request sponsor coordination of this schedule. The schedule must set realistic sponsor deadline dates for key steps in the grant process because a sponsor's failure to complete these steps in a timely manner may seriously impact or delay project funding. Table 5-4 contains common key steps.

Table 5-4 Common Key Steps in the Grant Process

Common key steps include…	
a.	Submission of a benefit-cost analysis (for projects such as certain NAVAIDS, projects requesting $10 million or more in discretionary funding over the life of the project, new airport projects, capacity projects).
b.	Submission of environmental review documents.
c.	Selection of sponsor's engineer.
d.	Completion of final plans and specifications and engineer's report.
e.	Submission of aeronautical study to coordinate the project with other FAA lines of business and other Federal agencies.
f.	Submission of construction safety phasing plan.
g.	Completion of safety management system (SMS) coordination.
h.	Submission of disadvantaged business enterprise (DBE) plan.

Table 5-4 Common Key Steps in the Grant Process

Common key steps include…	
i.	Completion of necessary land acquisition and relocation of displaced persons.
j.	Adoption of a zoning ordinance or other compatible land use measures.
k.	Submission of title evidence or attorney certification of title.
l.	Coordination with planning agencies.
m.	Notice of intent to use entitlement funds (to meet the deadline published in the annual Federal Register Notice).
n.	Receipt of current wage rates.
o.	Advertisement for bids.
p.	Opening of bids.
q.	Submission of Application for Federal Assistance.
r.	Acceptance of grant offer.
s.	Award of contract.
t.	Completion of the pre-construction conference.

5-5. ADO Verification of Sponsor Eligibility.

The ADO must verify that all of the sponsor requirements in Chapter 2 have been met.

5-6. ADO Verification that All Project Requirements Will Be Met.

The ADO must verify that all of the sponsor requirements in Chapter 3 and the appropriate project requirement appendix will be met by the required time in the grant process.

5-7. ADO Verification that Airport Layout Plan is Current.

Per 49 USC § 47107(a)(16), the sponsor must maintain a current layout plan of the airport in order to receive an airport design, construction, or equipment grant as defined under 49 USC § 47102(3). The ALP that is on file with the ADO must reflect the current and proposed conditions at the airport and all proposed and existing access points used to taxi aircraft across the airports property boundary.

5-8. ADO Notification to New Sponsors of Flood Insurance Requirements.

Per the Flood Disaster Protection Act of 1973, sponsors with an airport in a Federal Emergency Management Agency (FEMA) identified area having a special flood hazard must participate in the National Flood Insurance Program.

The ADO is responsible for advising new sponsors of this requirement and advising that there are additional details available at the FEMA website (see Appendix B for link). Sponsor will be certifying in the grant assurances that they comply with this requirement for acquisition and construction projects.

5-9. ADO Notification and Verification of Sponsor Civil Rights Requirements.

Sponsors (including block grant states) receiving AIP funding must follow all applicable civil rights requirements in Table 5-5. Sponsors must work directly with the FAA Office of Civil Rights (ACR) to ensure that all of these requirements have been met.

The ADO is responsible for advising new sponsors to contact ACR to discuss these requirements.

The ADO is also responsible for coordinating with ACR before a grant is issued to verify that the DBE plan, goals and monitoring (and ACDBE plan, goals and monitoring if the airport is a commercial service airport) have been accepted by ACR.

Table 5-5 Sponsor Civil Rights Requirements

Civil rights requirements for sponsors include…
a. **Disadvantaged Business Enterprise (DBE) Program.** 49 CFR part 26; Airport Sponsors Assurances #1 and #37; Planning Agency Sponsors Assurances #1 and #13; Non-Airport Sponsors Undertaking Noise Compatibility Program Projects Assurances #1 and #22; and 49 USC § 47113. The sponsor must have a DBE program if they will be receiving $250,000 or more in AIP funding during a Federal fiscal year. Contracts solely for the purpose of land are excluded. Block grant states must submit either a single overall goal or multiple goals that cover all of the subgrants funded during a fiscal year.
b. **Airport Concessions Disadvantaged Business Enterprise (ACDBE) Program.** 49 CFR part 23; Airport Sponsors Assurance #1 and #37; and 49 USC § 47107(e).
c. **Americans with Disabilities Act (ADA).** Titles II & III. Section 504 of the Rehabilitation Act of 1973; Airport Sponsors Assurances #1, #30, and #34; Planning Agency Sponsors Assurance #1 and #9; Non-Airport Sponsors Undertaking Noise Compatibility Program Projects Assurances #1 and #17; 49 USC § 47123 and § 47107; 49 CFR parts 27, 37, and 38; and 28 CFR parts 35 and 36.

Table 5-5 Sponsor Civil Rights Requirements

Civil rights requirements for sponsors include…
d. Air Carrier Access Act of 1986 (ACAA). 14 CFR part 382.
e. Title VI of Civil Rights Act of 1964. 42 USC § 2000d, et seq. As a condition of receiving any Federal funding assistance, all sponsors are subject to and agree to comply with the Standard Title VI/Non-Discrimination Assurances. In addition, the Standard Title VI/Non-Discrimination Assurances are also binding on subrecipients, subgrantees, contractors, successors, transferees, and/or assignees.

5-10. ADO Verification that Risk Level Determination is Current.

Based on a DOT Office of Inspector General (OIG) audit and findings related to the FAA's administration of AIP, the FAA has implemented a risk base oversight system to minimize the risk of misuse of funds by sponsors. The FAA uses a tiered ranking system to assign a risk level to each sponsor. The risk level defines the level of oversight needed. Current detailed guidance on how to assign sponsor risk a level is contained in the Airport Improvement Program (AIP) Grant Oversight Risk Model Policy (see Appendix B for link).

At this point in the process, the ADO must verify that a risk level has been assigned to the sponsor and is still current. If not, it is FAA policy that the ADO must complete the original determination or redo the risk level assignment.

5-11. ADO Review of Open Grant Status.

Per FAA policy, the ADO must determine if the sponsor has any open grants older than four years or that have not had a payment request for 18 months or more. If so, the ADO must obtain the reason why and the sponsor's plans to address the situation.

This is because 49 USC § 47106(a)(4) requires that the sponsor carry out and complete AIP funded projects without unreasonable delay, and a history of old and/or inactive grants may be an indicator that the sponsor may not be able to comply with this requirement.

5-12. ADO Verification that Competition Plan is Current.

For certain medium and large hub airports, the ADO must verify that all required competition plans and updates are approved. The competition plan requirements are discussed in detail in Appendix W.

Section 3. Grant Programming.

5-13. Introduction.

Once the ADO has completed the pre-grant actions in the previous section, there are four major steps before the grant application can be processed.

a. Project Evaluation Report and Development Analysis (PERADA)

b. Grant Programming

c. Congressional Notification

d. Sponsor Notification

5-14. Project Evaluation Report and Development Analysis (PERADA) Completion.

FAA Form 5100-109, Project Evaluation Report and Development Analysis (see the AIP Forms link in Appendix B), is an optional checklist that the ADOs may use to ensure that certain important statutory, regulatory and grant requirements listed in this Handbook have been considered prior to a grant being programmed. If the ADO's PERADA review identifies any items that are not met at the time of programming, this checklist can act as a useful tool for the ADO in following up on these items at the appropriate time during the grant process. For example, if a required aeronautical case was not approved prior to the ADO programming the grant, the ADO must follow up and make sure the aeronautical case was approved prior to the issuance of the grant offer.

While it is mandatory for the ADO to review the items on the PERADA checklist, the use of the checklist itself is not mandatory. By issuing the grant, the ADO confirms that all of the applicable requirements as detailed in this Handbook have or will be met.

5-15. Grant Programming.

Grant programming is defined as the ADO action of creating a proposed grant in the automated AIP system. At this point, the ADO may enter the project into the automated AIP system based on estimates found in the sponsor's capital improvement plan or in cost estimate updates provided by the sponsor. In the past, sponsors provided these costs to the ADO in a preapplication. Formal preapplications are no longer required.

After this is done, the grant is then reviewed at various levels within the FAA Office of Airports. If the grant is approved, it is then ready to begin the congressional notification process.

5-16. Congressional Notification.

If the FAA Office of Airports approves the grant, the grant then is forwarded to the FAA Office of Government and Industry Affairs (AGI). AGI reviews the grant and forwards it electronically to the DOT Office of the Secretary (OST).

After reviewing the grant, OST notifies the appropriate congressional office that the congressional office can publicly announce the grant. The OST process varies depending on the type and amount of funding involved and current legislative requirements. OST electronically notifies the FAA when this process is complete (often referred to as the OST release date).

The FAA can share specific grant information with the public (including the sponsor) only *after* the OST release date is entered in the automated AIP system.

5-17. Sponsor Notification.

After the congressional notification process is complete, the FAA Office of Airports posts the grant on the FAA Office of Airports website (see AIP Grant History link in Appendix B for link). This is considered the official FAA notification to the sponsor that the ADO has authority to issue a grant for the project. The ADO has the option of also directly notifying the sponsor.

Section 4. Grant Application, Offer, and Acceptance.

5-18. Introduction.

The ADO and sponsor must complete the steps listed below as part of the grant application, offer, and acceptance process.

a. Grant Application Package Submittal

b. Grant Application Review

c. Funds Reservation

d. Grant Offer

e. Grant Acceptance

f. The FAA Office of Finance and Management, FAA Accounts Payable Section B (AMK-314) Notification

5-19. Grant Application Package Submittal.

a. Timing of Submission. Sponsors must submit a complete and correct grant application package prior to the ADO issuing a grant offer.

b. Grant Application Package Contents. Table 5-6 outlines what a sponsor must submit in a grant application package. The ADO will advise the sponsor how many original and/or copies must be submitted to the ADO.

Table 5-6 Grant Application Contents

For the following…	The sponsor submittal requirement is…
a. Application for Federal Assistance (Standard Form 424)	**Mandatory**. Sponsors must sign and submit the latest version this form as part of all grant application packages (see the AIP Forms link in Appendix B). The signed grant application is contractually referenced in the grant agreement and a signed copy must be included in the ADO grant file.
b. Application for Development Projects (Parts II through IV) (FAA Form 5100-100)	**Mandatory.** FAA Form 5100-100, or its equivalent, must be submitted for all projects (see the AIP Forms link in Appendix B). The term *its equivalent* is intended to allow sponsors to create their own documents that contain the exact information requested in FAA Form 5100-100, but allows them to include sponsor-specific information or data. This form provides supporting grant information such as the source of the sponsor share, detailed cost breakdowns, project specific information (such as narratives and justifications), and confirmation that items such as coordination with on airport users has been accomplished. Per FAA policy, contingency costs are not allowed because the ADO has the option to amend an AIP grants, dependent on eligibility and availability of funding, to reflect final costs. Therefore, sponsors must leave Part III, Budget Information Item 18 (Contingencies) blank. **Optional for the State Block Grant Applications**. The ADO has the option to request this information, but states do not normally include this in a state block grant application. The state must collect this information for subgrants in accordance with their State Block Grant Program Memorandum of Agreement.
c. Application for Planning Projects (Parts II through IV) (FAA Form 5100-101)	**Mandatory for Planning Projects if FAA Form 5100-100 is Not Used.** For planning projects, sponsors can submit FAA Form 5100-101, or its equivalent, instead of FAA Form 5100-100 (see the AIP Forms link in Appendix B). The term *its equivalent* is intended to allow sponsors to create their own documents that contain the exact information requested in FAA Form 5100-101, but allows them to include sponsor-specific information or data. **Optional for the State Block Grant Applications**. The ADO has the option to request this information, but states do not normally include this in a state block grant application. The state must collect this information for subgrants in accordance with their State Block Grant Program Memorandum of Agreement.

Table 5-6 Grant Application Contents

For the following…	The sponsor submittal requirement is…
d. Detailed Project Narratives and/or Cost Breakdowns (beyond that provided in either FAA Form 5100-100 or FAA Form 5100-101)	**At the Request of the ADO.** Sponsors must provide an additional detailed narrative summary statement and/or a detailed project cost breakdown (beyond that provided in either FAA Form 5100-100 or FAA Form 5100-101) if requested by the ADO. The detailed summary will normally include a description and justification for *each* of the projects in the grant. The detailed project cost breakdowns will normally be in sufficient detail for the ADO to determine whether the project costs for *each* of the projects are reasonable. **Optional for State Block Grant Applications**. The ADO has the option to request this information (especially for discretionary projects), but states do not normally include this in a state block grant application. The state must collect this information for subgrants in accordance with their State Block Grant Program Memorandum of Agreement.
e. Project Sketches	**At the Request of the ADO**. Sponsors must provide an 8 ½" x 11" or larger sketch for each of the projects if requested by the ADO. This sketch must clearly identify the limits of the proposed project and its location on the airport. For land acquisition projects, the sketch must show the boundaries of currently owned land and the boundaries and proposed property rights of each parcel of land or easement to be acquired, and include parcel numbers and acreage. **Optional for State Block Grant Applications**. The ADO has the option to request this information (especially for discretionary projects), but states do not normally include this in a state block grant application. The state must collect this information for subgrants in accordance with their State Block Grant Program Memorandum of Agreement.
f. Project Documentation Needed For ADO Reasonableness Determination	**Mandatory**. Sponsors must provide all of the documentation necessary for the ADO to make a cost reasonableness determination for the costs contained in the grant application. The sponsor and ADO requirements are discussed in detail in Section 14 of Chapter 3. It is FAA policy that a sponsor must submit the grant application incorporating actual bid or negotiated agreement amounts. The ADO has an option to accept a grant application based on estimates when actual bids or negotiated agreement amounts are not available, however this practice is suboptimal because it may unnecessarily tie up funding that could be used on other projects.

Table 5-6 Grant Application Contents

For the following…	The sponsor submittal requirement is…
g. Exhibit A	**Mandatory (If A Current Approved Version is Not On File in the ADO).** The ADO must have a current approved Exhibit A (property inventory map) on file prior to issuing a grant at that airport because it is contractually referenced in the grant agreement. If the airport is a first time sponsor, or the Exhibit A is not up to date, the ADO must require the sponsor to submit an Exhibit A. Otherwise, the ADO may allow the sponsor to include the Exhibit A on file by reference in Part II, Section C of FAA Form 5100-100 (or equivalent). The following documents contain guidance on Exhibit A requirements: **(1)** The current version of Advisory Circular 150/5100-17, Land Acquisition and Relocation Assistance for Airport Improvement Program Assisted Projects **(2)** The current version of FAA Order 5190-6, FAA Airport Compliance Manual **(3)** The current version of FAA Order 5100.37, Land Acquisition and Relocation Assistance for Airport Projects **Optional for State Block Grant Applications**. The ADO has the option to request this information, but states do not normally include this in a state block grant application. The state must collect this information for subgrants in accordance with their State Block Grant Program Memorandum of Agreement.
h. Title Certificate or Long Term Lease Agreement	**At the Request of the ADO**. Sponsors must have good title for the land on which they will be constructing the project. The ADO has the option of requiring copies of the title certificates or long term lease agreement for the grant file. **Optional for State Block Grant Program**. The ADO has the option to request this information, but states do not normally include this in a state block grant application. The state must collect this information for subgrants in accordance with their State Block Grant Program Memorandum of Agreement.

5-20. Grant Application Review.

The ADO must review the application and supporting documents for accuracy and completeness. The ADO may adjust the depth and intensity of the review in accordance with the complexity of the project, the amount of the grant, the size of the airport, and past experience with that sponsor. The ADO may also request that the sponsor provide any additional information needed for the ADO to complete this review. By issuing the grant offer, the ADO is officially approving the projects in the grant application.

a. Minimum Grant Amount. Per FAA policy, the ADO must not process applications for grants totaling less than $25,000 in Federal funding unless the ADO has received APP-520 concurrence that it is clearly advantageous to the Federal government. The ADO documents this determination of this being clearly advantageous by issuing the grant. Note that the sponsor has the option to include multiple projects in the grant application to meet or exceed this $25,000 requirement.

b. All Pre-Grant Actions Complete. Before the ADO can issue a grant, the ADO must verify that all of the pre-grant actions in Section 2 of this chapter (verification of sponsor eligibility, current ALP, etc.) have been completed.

c. Determination of Reasonableness of Grant Amounts. Before the ADO can issue a grant, the ADO must determine that all of the applicable requirements for costs are reasonable as required in Section 14 of Chapter 3. This is an important and mandatory part of the ADO grant application review process. The ADO's reasonableness determination is not covered by sponsor certifications and the ADO cannot delegate this responsibility.

5-21. Reservation of Funds.

If the ADO finds the grant application to be in order, the ADO must reserve the funds in the automated AIP system. The system generates an electronic FAA Form 1413-1, Request for Change in Reservation/Obligation. The ADO has the option of printing a copy of this form and placing it in the grant file, however, this is not mandatory because the form is retained in the automated AIP system. This is reviewed in the system at the regional level and if approved, the system forwards the request to the FAA Office of Finance and Management, FAA Accounts Payable Section B (AMK-314) for AMK-314's acceptance. Once AMK-314 accepts the reservation in the system, the funds are officially reserved.

Project and funding changes may be made by the ADO after the congressional notification process. Normally this is due to differences between the estimated costs and the actual bid amounts. Occasionally this occurs because the sponsor wants to change, add, or delete a project. In these instances, the ADO must ensure that this is not a substitute for proper planning or estimating. Project and funding changes after congressional notification may require APP approval or additional congressional notification as follows.

a. APP-520 Approval. The ADO must obtain APP-520 approval for the following two types of program changes to projects that have gone through congressional notification:

(1) Replacement of a Project Receiving Discretionary Funds. Replacement of a project that is receiving discretionary funding with another project.

(2) New Lower Priority Entitlement Project at an Airport Receiving Discretionary Funds. Replacement of a project that has a lower priority than a project the airport has or will receive discretionary funds in the same fiscal year. This is because discretionary distributions are based in part on how an airport is using its entitlements.

b. Additional Congressional Notification. If the grant amount is increased after congressional notification, the ADO may be required to send the grant back through the

congressional notification process. APP-520 provides the criteria for sending a grant back through congressional notification process based on legislation and DOT Office of the Secretary (OST) requirements.

5-22. Grant Offer.

There are multiple items that are part of a grant offer package. The ADO must include all of these items in the grant file and is only required to send some of these items to the sponsor.

a. Grant Offer Package Components. The grant offer package consists of the components listed in Table 5-7. All of these components must be filed by the ADO in the applicable grant file.

b. Items Sent to Sponsor. The grant offer sent to the sponsor must contain items a-f in Table 5-7 (the ADO has the option of sending the sponsor certifications to the sponsor before the sponsor receives the grant offer). The ADO also has the option of attaching any of the other components.

Table 5-7 Grant Offer Package

The following items are components of the grant offer package…
a. Grant Cover Letter.
b. Grant Agreement.
c. Applicable Special Conditions.
d. Grant Assurances.
e. Sponsor Certifications.
f. Current FAA Advisory Circulars Required for Use in AIP Funded and PFC Approved Projects.
g. Applicable State Agency Agreements.
h. The Entire Grant Application (see Paragraph 5-19 for requirements).

c. Grant Cover Letter. Traditionally, the grant cover letter highlights important grant information to the sponsor. This may include when the grant needs to be returned, how many copies the ADO requires, and reference to any special conditions the ADO wants to emphasize. The ADO must use the grant cover letter template provided in the automated AIP system. Per 49 USC § 47116, the ADO must include the following sentence in all grant offer letters except those for medium or large hub: *Please note that this grant offer may be funded all or in part, with funds from the Small Airport Fund.*

d. Grant Agreement. A fully signed and executed grant agreement is a binding agreement obligating the sponsor and the FAA to the terms and conditions of the grant agreement. There are three basic types of grant agreements. These are the traditional, the multi-year, and the state block grant. Table 5-8 contains general requirements that apply to all three types of grants, and Table 5-9 contains specific requirements for each of the types of agreements. Table 5-10 includes examples of grant descriptions.

Table 5-8 Requirements for All Grant Agreement Types

The following requirements apply…
a. Grant Description. The ADO must write the grant description in sufficient detail to clearly identify and define each project (see Table 5-10 for examples).
b. Grant Agreement. The ADO must use the grant agreement templates provided in the automated AIP system. Sample traditional, multi-year, state block grant agreements are available on the FAA Office of Airports website (see the AIP Forms link in Appendix B).
c. Standard Conditions. The ADO must not modify the standard grant conditions found in the grant templates. These may only be updated by APP-500.
d. Funding Level. If the grant application is based on actual bid or negotiated agreement amounts, the ADO must issue the grant based on these amounts (not the programmed amount). In addition, the ADO cannot write the grant agreement for more than what is requested in the signed grant application from the sponsor. However, the ADO can write the grant agreement for less than the grant application without requesting an updated application from the sponsor as long as the project components in the grant are included in the signed application and a note is made in the grant file explaining the reduced grant amount.

Table 5-9 Specific Requirements by Grant Agreement Type

For this type of grant agreement…	The following applies…
a. Traditional	**(1) Grant Agreement Format.** The ADO must use the grant agreement template (FAA Form 5100-37, Grant Agreement) provided in the automated AIP system. A sample traditional grant agreement is available on the FAA Office of Airports website (see the AIP Forms link in Appendix B). **(2) Type of Funding.** The ADO must only use current year funding and funding carried over from prior years.

Table 5-9 Specific Requirements by Grant Agreement Type

For this type of grant agreement…	The following applies…
b. Multi-Year	**(1) Applicability.** 49 USC § 47108(a) allows the ADO to issue multi-year grants when the FAA AIP authorization is for multiple years. **(2) Grant Agreement Format.** For a multi-year grant, the ADO must begin with the traditional grant agreement. The ADO must use the grant agreement template provided in the automated AIP system. **(3) Additional Condition.** The multi-year agreement must contain the following extra condition: This project is part of a multi-year grant, which is more fully described in the Special Conditions. The total United States share of the project is $[Enter total estimated Federal cost of multi-year project], and the project is planned to be funded in Fiscal Years [List the fiscal years from Year 1 - End Year]. For the fiscal years in which this project is being funded, the FAA will establish that fiscal year's maximum obligation in a letter to the Sponsor. When the FAA can calculate the funding and incur the obligation, the FAA will issue this letter to the Sponsor. Funding which will be subject to the restriction on the use of such apportionments imposed on FAA by existing and future Appropriations Acts. This commitment does not in itself obligate, preclude, or restrict the FAA in the use of any funds made available for discretionary use to further aid the Sponsor in meeting the cost of this project. **(4) Special Condition.** The ADO must also include a special condition regarding the subsequent multi-year amendments to the grant. The automated AIP system contains the current available special conditions. **(5) Type of Funding.** Under this type of grant, the ADO allows the sponsor to commit the sponsor's future year entitlement funds (passenger, cargo, or nonprimary) within the grant. However, the ADO can only commit funds to a multi-year grant for years within the current program authorization. For example, The FAA Modernization and Reform Act of 2012 (Public Law 112-95) reauthorization was in effect from fiscal year 2012 through the end of fiscal year 2015. The ADO could have written a multi-year grant written in FY2013 that committed the sponsor's fiscal year 2013 – 2015 entitlements. The ADO could not have committed the sponsor's fiscal year 2016 entitlements because it is outside of the authorization period. **(6) Initial Year Requirements.** The initial year of a multi-year grant must include sponsor entitlement funds (passenger, cargo, or nonprimary) and may include other types of funds such as discretionary. The initial year funding is shown as the grant amount in the initial grant (the total multi-year grant amount is captured in the additional clause discussed above). **(7) Future Year Requirements.** Only sponsor entitlement funds (passenger, cargo, or nonprimary) can be used for the future years of a multi-year grant. The future year funds are added to the initial grant by a multi-year amendment (see multi-year amendments under Paragraph 5-55). **(8) Total Multi-Year Funding Amount.** The total multi-year funding amount is the sum of the initial year and future years. This amount is captured in the additional clause discussed above.

Table 5-9 Specific Requirements by Grant Agreement Type

For this type of grant agreement…	The following applies…
c. State Block Grant	**(1) Grant Agreement Format.** The ADO must use the state block grant agreement provided in the automated AIP system. **(2) Type of Funding.** The ADO must only use current year funding and funding carried over from prior years. **(3) Number of Grants per Fiscal Year.** The ADO may write as many state block grants during a fiscal year as it deems prudent. For example, although one grant could be issued for the year, it may be beneficial to write one grant for state apportionment, one for non-primary entitlement, and one or more for specific discretionary projects. **(4) Passenger, Cargo, and Nonprimary Entitlements.** If the state block grant contains entitlements, the ADO must list the airport name, city, and associated entitlement type and amount. (Note that if passenger entitlements are included in the state block grant, these are the passenger entitlements allocated to virtual primary airports under 49 USC 47114(c)(1).) **(5) Discretionary Funds.** If the state block grant contains discretionary funds, the ADO must list the airport name, airport city, the discretionary funding amount, and a brief description of the project (see Table 5-10). The ADO has the option to issue these discretionary projects under a separate state block grant, which may be preferable for timing and/or tracking purposes. **(6) Special Conditions.** Special conditions are normally included by the state in the specific subgrants. However, the ADO has the option of adding special conditions to the state block grant if the ADO deems it appropriate. The automated AIP system contains the current available special conditions.
d. Grant Amendments	**(1) Grant Amendments.** The requirements for grant amendments are included in Section 7 of this chapter.

Table 5-10 Examples of Grant Descriptions

For the following projects involving…	The following description information is appropriate…	And examples include…
a. Runways	**(1)** The runway number. **(2)** The length, width, and location on the runway where the work is being accomplished.	Reconstruct Runway 13/31 (9,000' x 150'). Rehabilitate Runway 10/28 between Taxiway A1 and A2 (500' x 150'). Extend Runway 9/27 (200' x 150' northeast).
b. Runways (Phased over three grants)	**(1)** The runway number. **(2)** The length, width, and location on the runway where the work is being accomplished.	Reconstruct Runway 13/31 Phase 1 Design (9,000' x 150'). Reconstruct Runway 13/31 Phase 2 (South 4,000' x 150'). Reconstruct Runway 13/31 Phase 3 (North 5,000' x 150').
c. Taxiways	**(1)** The taxiway number. **(2)** The length, width, and location on the taxiway where the work is being accomplished.	Reconstruct Taxiway A (9,000' x 75'). Rehabilitate Taxiway B between Taxiway A1 and A2 (500' x 50'). Extend Taxiway C (200' x 50' to the end of Runway 9).
d. Aprons	**(1)** The name of the apron (or reference by location). **(2)** The length, width, and location on the apron where the work is being accomplished.	Rehabilitate the General Aviation Ramp (5000 square feet). Expand the South Terminal Apron (40,000 square feet).
e. Land Acquisition	**(1)** The tract or parcel number. **(2)** The acreage. **(3)** The type of acquisition (easement, fee simple). **(4)** The purpose of the acquisition (RPZ for runway end XX, approach for runway end XX, new airport, future development). **(5)** A short description of any building relocation.	Acquire Parcel A (40 Acres, Fee Simple) for the Runway Protection Zone of Runway 4. Acquire an easement for Parcel 54 (20.3 Acres) for approach protection for Runway 12. Acquire Parcel 84A (5 Acres, Fee Simple) Including Relocation Costs (3 residences, 1 barbershop) for future airport development.

Table 5-10 Examples of Grant Descriptions

For the following projects involving…	The following description information is appropriate…	And examples include…
f. Obstruction Removal or Marking	**(1)** The object being removed. **(2)** If clearing and grubbing is being accomplished, the acreage. **(3)** The runway end on which the obstruction is located.	Remove antenna tower off Runway 4. Clear and grub Runway 18 runway protection zone (40 acres). Install obstruction lighting on Hangar 6.
g. Noise Mitigation	**(1)** The type of noise mitigation (such as residential soundproofing, school soundproofing, blast fence). **(2)** The associated noise contour, if applicable. **(3)** If known, the number of houses/schools or people/students affected.	Provide residential sound insulation (approximately 20 residences) in the DNL 70 dB. Sound insulate Roosevelt High School (230 students) in the DNL 65 dB.
h. State Block Grant (No Discretionary)	**(1)** If the ADO chooses to write the grant for a specific project or projects, the appropriate information for that project. **(2)** If the grant will not be project specific, a general statement is appropriate.	**For a project specific grants:** See above examples. **For non-project specific grants**: Various airport developments under the State Block Grant Program.

e. Special Conditions. Special conditions highlight extra steps the sponsor must take as part of accepting the grant offer and included in the actual grant document. Special conditions are tailored to the type of project, special sponsor circumstances, and/or unique situations and are binding as part of the grant agreement. The automated AIP system contains the current available special conditions. If the ADO determines that an additional special condition is needed, the ADO must receive APP-520 approval to include the special condition in the grant. If appropriate, APP-520 has the option to amend the special condition list to include this additional special condition in the list of special conditions.

f. Grant Assurances. The requirements for the grant assurances are listed in Paragraph 2-4.

g. Sponsor Certifications. 49 USC § 47105(d) allows the FAA to require sponsors to certify that they will comply with statutory and administrative requirements in carrying out an AIP funded project. There are eight certifications as shown in Table 5-11 (see the AIP Forms link in Appendix B). Certifications are considered to be part of the Grant Package.

(1) Sponsor Certification History. It is FAA policy that the sponsor has primary responsibility for complying with AIP requirements.

(2) Sponsor Certification Purpose. The grant agreement and the associated grant assurances are the official, legal-binding documents that obligate the sponsor to AIP policies, regulations and standards. The sponsor's certifications are an additional measure used by the ADO to focus a sponsor's attention on certain grant obligations. These certifications are intended to enhance a sponsor's knowledge and ensure their compliance with the grant obligations.

(3) Sponsor Certification Timing. Per FAA policy, all applicable certifications must be signed by the sponsor on or before the date the sponsor signs the associated grant agreement offer. The ADO normally accomplishes this by sending the applicable sponsor certifications with the grant agreement offer. The ADO has the option of requesting these sponsor certifications at an earlier date, for instance, at the same time as the grant application. If the ADO believes changes have occurred on the project that may affect the sponsor certification on file, the ADO has the option to require the Sponsor re-submit a certification form when it completes the applicable actions that pertain to a specific certification statement. For example, the ADO has the option to require resubmittal of the Construction Project Final Acceptance certification as part of the closeout submittal for the project.

(4) FAA Sponsor Certification Responsibility. The ADO retains the responsibility of maintaining a broad overview of AIP projects and being reasonably assured that the sponsor is meeting all of its obligations. The ADO's acceptance of a sponsor certification does not limit the ADO from reviewing the appropriate documentation to validate the certification.

(5) False Sponsor Certification. If the ADO determines that the sponsor has not adhered to the certifications, the ADO must review the associated project costs to determine if the costs are still allowable under AIP. In addition, if the sponsor knowingly makes false statements, further penalties may apply under 49 USC § 47126.

(6) Items Specifically Not Covered by Sponsor Certification. The use of sponsor certifications is limited. Table 5-12 contains examples of Federal actions that cannot be covered by sponsor certification.

Table 5-11 Summary of Sponsor Certifications

The following document…	Requires the sponsor to…
a. FAA Form 5100-134, Selection of Consultants	Certify that they have properly followed or will properly follow key consultation selection requirements.
b. FAA Form 5100-132, Project Plans and Specifications	Certify that they have or will prepare the plans and specifications in accordance with key requirements.
c. FAA Form 5100-131, Equipment/Construction Contracts	Certify that they have properly followed or will properly follow key Federal procurement requirements.
d. FAA Form 5100-133, Real Property Acquisition	Certify that they have properly followed or will properly follow key land acquisition requirements.
e. FAA Form 5100-129, Construction Project Final Acceptance	Certify that they have or will complete key requirements prior to final project acceptance.
f. FAA Form 5100-130, Drug-Free Work Place	Certify that the work place will be drug-free as required under the Drug-Free Work Place Act of 1998 and 49 CFR part 32.
g. FAA Form 5100-135, Certification and Disclosure Regarding Potential Conflict of Interests	Certify that there are no conflicts of interest to the FAA or to the state (for state block grant subrecipients). The new requirement for this certification is contained in 2 CFR § 200.112 and became effective for AIP on December 19, 2014. Per FAA policy, this is accomplished by the sponsor completing a Conflict of Interest certification.
h. Certification Regarding Lobbying	Certify that no federally appropriated funds have been used to influence a federal employee or member of Congress in connection with the grant. Further details of requirements are found in Appendix A to 49 CFR part 20. Note that for AIP purposes, this is not a separate certification. This certification has been rolled into the grant application forms.

Table 5-12 Examples of Actions Specifically Excluded from Sponsor Certification

Some examples of inappropriate actions for sponsor certification…
a. Review of projects for inclusion in the NPIAS.
b. Entry or deletion of airports from the NPIAS.
c. Determination of AIP eligibility or justification.
d. Review of impacts to the National Airspace System architecture.
e. Review and approval of modifications to standards.
f. Review and approval of aeronautical study.
g. Designation of instrument runways.
h. Determination of AIP project cost reasonableness.
i. Disadvantaged Business Enterprise program approval (this is the responsibility of the FAA Office of Civil Rights (ACR)).
j. Approval of environmental studies.
k. Approval of airport layout plans.
l. Review and approval of construction safety phasing plans.
m. Review and approval of various safety determinations (such as compliance with 14 CFR part 139 requirements and airfield safety determinations by Flight Standards).
n. Issuing waivers to the Buy American Preference requirements.
o. Review and approval of Project Labor Agreements.

h. Advisory Circular List. The FAA publishes a list of certain advisory circulars that set out the applicable policies, standards, and specifications that sponsors must carry out on an AIP funded project. The ADO includes this list directly in the grant agreement, which officially incorporates it as part of the grant conditions. This list, FAA Advisory Circulars Required for use in AIP Funded and PFC Approved Projects, is available online (see Appendix B for link).

i. Applicable State Agency Agreements. Some grants must be cosigned by the state agency. In these cases, the ADO must obtain the state agency agreement with the sponsor and retain this documentation in the ADO office files.

j. The Entire Grant Application. The requirements for the grant application are listed in Paragraph 5-19.

5-23. Grant Acceptance.

If the sponsor(s) agrees with the grant offer, the steps and requirements for the sponsor(s) to accept the grant offer are included in Table 5-13. Once the ADO receives a copy of the executed grant, the ADO must record that the grant was signed by the sponsor(s) in the automated AIP system. The ADO has the option of printing the FAA Form 5100-107, Airport Improvement Program Form (also called AIP Grant Status Report) generated by the automated AIP system and placing the form in the file. However, this is not mandatory because a current version of the form containing the grant history is retained in the automated AIP system.

Table 5-13 Steps and Requirements for Sponsor Grant Acceptance

The steps and requirements include…	
a.	The sponsor(s) cannot alter the grant agreement. The grant agreement can only be changed by a grant amendment issued by the ADO.
b.	The sponsor(s) must sign the grant in one of the two sponsor signature locations.
c.	If the sponsor(s) signs where a notary is required, the notary must sign and stamp (or seal) the grant at the same time. Therefore, the notary date must be the same date as the sponsor signature date.
d.	Each sponsor's attorney must sign the grant agreement after the sponsor. Therefore, the attorney's signature date must be on or after the sponsor's signature date.
e.	The sponsor(s) must keep one original executed grant agreement for its files and send the remaining executed grant(s) back to the ADO by the date required by the ADO.

5-24. The FAA Office of Finance and Management, FAA Accounts Payable Section B (AMK-314) Notification.

The ADO must send the pages of the grant offer that contain the grant description, grant amount, and signatures to AMK-314.

Section 5. ADO Grant Oversight.

5-25. ADO Oversight (and Required Sponsor Documentation) Based on Sponsor Risk Level.

Based on a DOT Office of Inspector General (OIG) audit and findings related to the FAA's administration of AIP, the FAA has implemented a risked base oversight system to minimize the risk of misuse of funds by sponsors. The FAA uses a tiered ranking system to assign a risk level

to each sponsor. The risk level defines the level of oversight required by the ADO and lists the sponsor documentation that the ADO must retain in the grant file. Current detailed guidance on how to assign sponsor risk levels and the associated oversight requirements is contained in the Airport Improvement Program (AIP) Grant Oversight Risk Model Policy(see Appendix B for link).

5-26. Requirement to Include a Copy of FAA Determinations in the Grant File.

If a written ADO determination is required by this Handbook or other FAA policy, the ADO must include a copy in the associated grant file. The ADO also has the option of adding a reference to the grant file of the location (physical or electronic) of the written determination instead of including a written copy in the grant file. The reference must be specific enough for authorized personnel to readily find the document.

5-27. Statutory Requirement for ADO Project Oversight.

AIP is a grant program, and under 31 USC § 6304 and § 6305 (Federal Grant and Cooperative Agreement Act of 1977) Federal agencies must use a grant agreement, rather than a cooperative agreement when limited involvement between the sponsor and the Federal government is expected. ADO involvement in an AIP project is generally limited to the oversight necessary to protect the Federal interests as specified in 31 USC § 6304.

In addition to the other ADO oversight requirements listed throughout this Handbook, the ADO has the following oversight requirements and options during the life of the project.

5-28. Safety Risk Management (SRM) Panels.

ADOs must participate in safety risk management panels associated with the project when it is required by a triggering action listed in the current version of FAA Order 5200.11, FAA Airports (ARP) Safety Management System. There is a separate tracking system for SRM, therefore the ADO is not required to document the ADO's participation in the grant file.

5-29. Construction Safety Phasing Plans.

The current version of Advisory Circular 150/5370-2, Operational Safety on Airports during Construction, outlines when a sponsor is required to submit a construction safety phasing plan. The ADO must review and approve or disapprove all required construction safety phasing plans in writing. This ADO responsibility cannot be delegated and is not covered by sponsor certification.

5-30. Predesign, Prebid, and Preconstruction Conferences.

Sponsors have the option to hold predesign, prebid, and preconstruction as discussed in the current version of Advisory Circular 150/5370-12, Quality Management for Federally Funded Airport Construction Projects. The ADO has the option to participate in these conferences.

5-31. Equipment Photographs.

The ADO has the option to require a sponsor to submit a picture of the actual delivered equipment unless the sponsor's risk level makes submitting a photograph mandatory. The ADO must file any submitted photographs in the grant file.

5-32. Construction Photographs.

The ADO has the option to require a sponsor to submit pictures of the project site before, during, and/or after a construction project unless the sponsor's risk level makes submitting a photograph mandatory. The ADO must file any submitted photographs in the grant file.

5-33. Construction Management Programs.

In 1990, the FAA enacted a construction management plan policy for projects with a total pavement construction contract value over $250,000 to satisfy an DOT Office of Inspector General (OIG) Audit on Airport Construction Materials Conformance finding. The FAA has since raised the dollar value to $500,000. It is FAA policy that a sponsor must submit a construction management program to the ADO prior to the start of construction for projects with a total pavement construction contract value over $500,000. The pavement construction contract value is calculated by totaling the costs of the total pavement structure (including subgrade, base and subbase courses, and surface course). If these costs exceed $500,000, a construction management program is required.

When construction of a project requiring a construction management program is complete, the sponsor is required to submit a summary of the quality assurance test results and the disposition of any problem test results.

The ADO has the option of requiring the sponsor to provide the plan for lower dollar value pavement projects. The ADO also has the option to review and/or comment on the construction management program.

The ADO must place a copy of the construction management program, the summary of the quality assurance test results, and a copy of the ADO comments (if applicable) in the grant file.

5-34. Notices to Proceed.

Once all contract documents have been executed, the sponsor will issue a notice to proceed to the contractor. The sponsor must send a copy of the notice to proceed to the ADO if requested by the ADO.

5-35. Change Orders, Supplemental Agreements, and Contract Modifications.

Sponsors have the option to change contracts through change orders, supplemental agreements, and contract modifications as discussed in Table 5-14.

All change orders, supplemental agreements, and contract modifications must eventually be reviewed by the ADO. This is because these actions are considered noncompetitive proposals

per 2 CFR § 200.320(f) (see Paragraph U-18). The notification, submittal, and determination documentation requirements vary as discussed in Table 5-15. As discussed in Paragraph 3-101, the Simplified Acquisition Threshold exception does not apply to change orders, supplemental agreements, and contract modifications.

Unless specifically requested by the ADO, the sponsor does not have to obtain prior ADO approval for contract changes. However, if a sponsor proceeds with a contract change without FAA prior approval, it is at the sponsor's risk. The ADO review at a later date could determine that the costs in the contract change cannot be paid for under the grant. Sponsors have the option to request prior ADO review of contract changes.

The exception is if the change order includes steel or manufactured goods that are less than 100% domestic materials. In this case, each change order requires separate Buy American review by the ADO before the sponsor proceeds with the change order.

The ADO cannot approve costs that the ADO has determined are due to errors and omissions in the plans and specifications that were foreseeable at the project design. In addition, the ADO must only approve costs that are directly necessary to accomplish the project. Examples of change orders that the ADO can approve and cannot approve are discussed in Table 5-16. Examples of changes to professional services agreements that the ADO can approve and cannot approve are discussed in Table 5-17.

Table 5-14 Types of Contract Changes

For the following type of contract…	The following types of contract changes are used…	And guidance is contained in the current version of…
a. Construction and equipment contracts	Change orders or supplemental agreements	The current version of Advisory Circular 150/5370-10, Standards for Specifying Construction of Airports
b. Negotiated professional service agreements	Contract modifications or supplemental agreements	The current version of Advisory Circular 150/5100-14, Architectural, Engineering, and Planning Consultant Services for Airport Grant Projects

Table 5-15 Sponsor and ADO Requirements for Contract Changes

If the sponsor proposes to…	The sponsor must…	And the ADO…
a. Execute change orders, supplemental agreements, and contract modifications	**(1)** Conduct a cost analysis. Paragraph U-21 contains guidance to sponsors on how to perform price and cost analyses. **(2)** If there is a change in scope, notify the ADO. Otherwise notify the ADO upon ADO request. **(3)** If requested by the ADO, submit the following documentation: **(a)** Change order or supplemental agreement. **(a)** Justification for the change. **(b)** A statement signed by the sponsor that the cost analysis was performed that includes the sponsor's recommendation that the FAA accept the statement and analysis as evidence of cost reasonableness. **(c)** Any other support documentation requested by the ADO.	Has the option to request that the sponsor submit associated documentation. Has the option to conduct a pre-award review. Has the option, if the ADO chooses to conduct a review, to provide the sponsor with a written response containing the ADO finding and/or keep a copy available for future reference.
b. Request a grant amendment	**(1)** Have conducted a cost analyses for all change orders, supplemental agreements, and contract modifications. Paragraph U-21 contains guidance to sponsors on how to perform price and cost analyses. **(2)** Submit (or have submitted) the following documentation: **(a)** All associated change orders, supplemental agreements, and contract modifications. **(b)** Justification for the changes. **(c)** A statement signed by the sponsor that a cost analysis was performed for all change orders, supplemental agreements, and contract modifications that includes the sponsor's recommendation that the FAA accept the statement and analysis as evidence of cost reasonableness. **(d)** Any other support documentation requested by the ADO.	Must review the project costs to ensure that *all* of the requirements in Chapter 3 have been met, including cost reasonableness. By signing the grant amendment, the ADO is documenting that the associated project costs in the amendment meet the requirements in Chapter 3.

Table 5-15 Sponsor and ADO Requirements for Contract Changes

If the sponsor proposes to…	The sponsor must…	And the ADO…
c. Submit the grant closeout package	**(1)** Have conducted a cost analyses for all change orders, supplemental agreements, and contract modifications. Paragraph U-21 contains guidance to sponsors on how to perform price and cost analyses. **(2)** Submit (or have submitted) the following documentation: **(a)** All associated change orders, supplemental agreements, and contract modifications. **(b)** Justification for the changes. **(c)** A statement (or statements) signed by the sponsor that a cost analysis was performed for all change orders, supplemental agreements, and contract modifications that includes the sponsor's recommendation that the FAA accept the statement and analysis as evidence of cost reasonableness. **(d)** Any other support documentation requested by the ADO.	Must review the project costs to ensure that all of the requirements in Chapter 3 have been met, including cost reasonableness. By signing the FAA final project report, the ADO is documenting that the final project costs in the grant meet the requirements in Chapter 3.

Table 5-16 Examples of Change Orders that Can and Cannot be Approved by the ADO for AIP Participation

For the following change order…	The ADO…
a. To revise quantities of items to reflect actual quantities used for the project.	Has the option to approve the request for adjustment (increase/decrease) in construction cost.
b. To address differing site conditions or materials that were *not* found during the site investigation.	Has the option to approve the request.
c. To remove subsurface materials *that were shown* in the soil borings taken during the site investigation.	Has the option to approve the request. Even though this work must be accomplished to finish the project, the existing field condition was readily apparent but was overlooked. (The difference between this and the preceding entry is that while the construction costs may be allowable, the costs to redesign are not allowable as discussed in the next table.)

Table 5-16 Examples of Change Orders that Can and Cannot be Approved by the ADO for AIP Participation

For the following change order…	The ADO…
d. To make changes in a terminal building using the proration that was used to determine initial AIP participation.	Must not approve the request unless the ADO has determined that the initial AIP proration is valid for the work included in the change order. If the initial AIP proration is not valid, the ADO must not approve the change order until the change order amount is calculated based on actual cost information.
e. For construction costs to add work outside of the grant description.	Must not approve the request unless the ADO has coordinated the steps needed to add work to a project.

Table 5-17 Examples of Changes to Professional Services Agreements that Can and Cannot be Approved by the ADO for AIP Participation

For the following request…	The ADO…
a. To revise contract documents to rebid a package because of a bid protest that was upheld by the ADO.	Must not approve the request.
b. To revise contract documents because the project specifications were deficient. This includes failure to use FAA standards, unapproved modifications, unduly restrictive requirements.	Must not approve the request.
c. To rebid a project as a result of a non-competitive bid environment or high bids due to factors outside of the sponsor's control.	Has the option to approve the request for additional professional services fees provided the sponsor's actions were not the cause of the non-competitive environment or high bids.
d. To address, via redesign, differing site conditions or materials that were *not* found during the site investigation.	Has the option to approve the request.
e. To address, via redesign, the removal of subsurface materials *that were shown i*n the soil borings taken during the site investigation.	Must not approve the request. Even though this work must be accomplished to finish the project, and the construction costs may be allowable, the existing field condition was readily apparent but was overlooked during the design phase. (The difference between this and the preceding entry is that while the construction costs may be allowable, the costs to redesign are not allowable.)
f. To add work outside of the grant description.	Must not approve the request unless the ADO has coordinated the steps needed to add work to a project.

5-36. Periodic Inspections.

The ADO has the option of conducting periodic inspections of the worksite.

5-37. Construction Progress and Inspection Report.

Per the current version of Advisory Circular 150/5370-12, Quality Management for Federally Funded Airport Construction Projects, the sponsor's engineer must complete FAA Form 5370-1, Construction Progress and Inspection Report, or the equivalent for all AIP funded construction projects. The sponsor must submit the requested reports to the ADO at least quarterly (or more frequently at the ADO's request).

5-38. Meetings for Planning and Environmental Study Grants.

Sponsors (and sometimes the ADO) are often required to hold meetings in association with planning and environmental study grants. The ADO has the option of attending these meetings unless otherwise required by an FAA order or other FAA policy. For instance, the current version of FAA Order 5050.4, National Environmental Policy Act (NEPA) Implementing Instructions for Airport Projects, requires that the ADO not only attend required EIS meetings (not optional), but also organize and lead the meetings. The specific requirements for these meetings are discussed in the current versions of the following documents.

a. Advisory Circular 150/5070-7, The Airport System Planning Process

b. Advisory Circular 150/5070-6, Airport Master Plans

c. FAA Order 5050.4, National Environmental Policy Act (NEPA) Implementing Instructions for Airport Projects

5-39. Forecasts in Planning or Environmental Projects.

If the grant contains planning or environmental projects that require forecasts, the sponsor is required to submit the forecast to the ADO. The ADO must approve or disapprove the forecast before it is used as part of the project. This ADO responsibility cannot be delegated and is not covered by sponsor certification.

5-40. Performance Report (formerly called Quarterly Performance Report).

2 CFR § 200.328 requires sponsors of Federal grants to submit performance reports. Table 5-18 provides the performance report requirements for AIP projects by project type. Note that this performance reporting provides project schedule and dates, and is not the same thing as the Standard Form 425, Federal Financial Report.

Table 5-18 Performance Report Requirements by Project Type

For the following type of project…	The FAA policy is…
a. Non-construction	**(1)** Per 2 CFR § 200.328, the sponsor must submit FAA Form 5100-140, Performance Report (see the AIP Forms link in Appendix B) at least annually, but not more than quarterly, until the non-construction project is completed. The ADO has the option of requiring the performance report quarterly. **(2)** The sponsor must submit each performance report within 30 days of the end of quarter if required quarterly or semiannually; and within 90 days of the end of the fiscal year if required annually. Sponsors must not submit the performance reports in batches or at the end of the project. **(3)** If a major project or schedule change occurs between performance reports, the sponsor must submit an out of cycle performance report to the ADO. **(4)** Guidance on the current ADO review requirements is contained in the Airport Improvement Program (AIP) Grant Payment and Sponsor Financial Reporting Policy (see Appendix B for link).
b. Construction	**(1)** The FAA has determined that sponsor submittal of FAA Form 5370-1, Construction Progress and Inspection Report, satisfies the performance reporting requirement. **(2)** FAA Form 5370-1 (see the AIP Forms link in Appendix B) is discussed in more detail in the current version of Advisory Circular 150/5370-12, Quality Management for Federally Funded Airport Construction Projects. **(3)** 2 CFR § 200.328 establishes general reliance on inspection reports and certified percentage of completion for Federal monitoring of construction project status. Per FAA policy, the sponsor must submit FAA Form 5370-1 to the ADO at least quarterly, however, the ADO has the option to require the sponsor submit these reports on a more frequent basis. Per FAA policy, the quarterly frequency for this report will generally provide adequate ADO monitoring for construction projects. **(4)** The sponsor must submit FAA Form 5370-1 to the ADO for each fiscal quarter until the construction project is completed. **(5)** The sponsor must submit each FAA Form 5370-1 within 30 days of the end of the quarter (not in batches or at the end of the project). **(6)** The sponsor must include the certified percentage-of-completion information on FAA Form 5370-1. If not, the ADO must require the sponsor to resubmit the form with this information. **(7)** If a major project or schedule change occurs between the reporting cycles, the sponsor must submit an out of cycle FAA Form 5370-1 to the ADO. **(8)** Guidance on the current ADO review requirements is contained in the Airport Improvement Program (AIP) Grant Payment and Sponsor Financial Reporting Policy (see Appendix B for link).

5-41. Annual Reporting of Residential Population Benefits.

The ADO must report the residents and students that benefit from noise compatibility projects. This reporting is done on a yearly basis by APP-400 with the assistance of the regional offices and ADOs.

5-42. Final Inspection.

For construction projects, the sponsor must provide the ADO with documentation confirming that the project was completed in accordance with the terms and conditions of the contract(s). The ADO must include a copy of this documentation in the grant file.

The ADO has the option of attending the final inspection. If the ADO does not attend the final inspection, then the ADO has the option to rely on the sponsor Construction Project Final Acceptance certification and the sponsor final inspection report as confirmation that the work has been completed in accordance with the approved plans and specifications.

Section 6. Grant Payments.

5-43. Summary of Payment Request Requirements and Limitations.

The requirements and limitations for grant payment requests are summarized in Table 5-19. These items are discussed in more detail in the following paragraphs.

Table 5-19 Grant Payment Request Requirements and Limitations

The grant payment requirements and limitations include…	
a.	The sponsor and ADO must process all grant payment requests through the currently approved Department of Transportation (DOT) grant payment system unless otherwise approved by the ADO.
b.	The sponsor must submit payment requests at least annually unless the ADO requires more frequent payment requests.
c.	The sponsor must base payment requests on costs incurred (based upon invoices, billing statements, or other appropriated payment support provided to the ADO by the sponsor).
d.	The ADO must not approve any payment requests for the last 10% of the Federal share of the grant (or the last 10% of the estimated Federal share of the grant after amendment, whichever is less) unless the requirements in Paragraph 5-46 are met. The ADO has the option of excluding a state block grant from this requirement only if the state is following this requirement for all of the subgrants within the state block grant and the ADO is confident that the state will submit the state block grant closeout documentation in a timely manner.
e.	The ADO is allowed to determine the timing and amount of the payment and may reduce or withhold the payment if the ADO follows the applicable requirements.

Table 5-19 Grant Payment Request Requirements and Limitations

The grant payment requirements and limitations include…
f. The sponsor must stay within the contract retainage limitations.
g. The sponsor must stay within the disputed cost limitations.
h. The sponsor must stay within the land acquisition cost limitations.
i. The sponsor must not request a payment that is improper.
j. The sponsor must document and/or report their payment requests on) the following forms (see the AIP Forms link in Appendix B) as required in the Airport Improvement Program (AIP) Grant Payment and Sponsor Financial Reporting Policy (see Appendix B for link). **(1)** Standard Form 425, Federal Financial Report. **(2)** Standard Form 271, Outlay Report and Request for Reimbursement for Construction Programs (or ADO approved equivalent) or Standard Form 270, Request for Advance or Reimbursement (for non-construction projects in lieu of Standard Form 271or ADO approved equivalent).
k. The sponsor must maintain all of the documentation supporting the grant payment for the required time period and must make this information available upon request.

5-44. Requirements and Process for Using the Current DOT Electronic Payment System.

a. Sponsor Payment Requests. Sponsors must submit all grant payment requests and related supporting documentation electronically through the currently approved Department of Transportation grant payment system. Sponsors that are unable to use the DOT system must submit a waiver request to the ADO for review by the DOT. Guidance and help desk contact information for the current DOT electronic payment system is available on the FAA Office of Airports website (see AIP Grant Payments link in Appendix B). Note that it is the sponsor's responsibility to keep their banking information up to date.

b. ADO Payment Approval. The sponsor's risk level determines the level of payment review required by the ADO within the currently approved DOT grant payment system. Current detailed guidance on ADO review responsibilities and how the ADO is to use the electronic system is contained in the Airport Improvement Program (AIP) Grant Payment and Sponsor Financial Reporting Policy (see Appendix B for link).

c. Method of Payments. Once ADO and AMK-314 approve the payment request, AMK-314 will request the U.S. Treasury to transfer funds to the sponsor's bank through an electronic funds transfer. If a sponsor requires a Treasury check, the sponsor must work with AMK-314 to determine the process.

5-45. Requirements for Frequency of Payment Requests and Expenditure Rate.

Per 2 CFR § 200.400, the sponsor must efficiently and effectively administer the grant by applying sound management practices. In addition, 49 USC § 47106(a)(4) requires that a project be completed without unreasonable delay. The ADO ensures compliance with these requirement by monitoring Performance Reports as required in Paragraph 5-40 and ensuring that regular grant payments are being made to support project accomplishments.

a. Frequency of Sponsor's Payment Requests. Per FAA policy, sponsors must submit payment requests at least every twelve months starting from the date of the grant acceptance. An ADO also has the option to require the sponsor to submit payment request as often as every three months (quarterly). This mirrors the financial reporting frequency provided in 2 CFR § 200.327. This does not limit the sponsor from submitting payment requests more frequently than every three months.

b. Requirements for Payment Request Frequencies Exceeding 12 Months. If a sponsor has not submitted a payment request for more than 12 months, it is FAA policy that the ADO must notify the sponsor in writing of this delinquency and request the sponsor to submit a payment request or, if applicable, close the grant. If the sponsor is unable to submit a payment request or close the grant, the sponsor must provide the ADO with the reason for the delay and the sponsor's proposed resolution. If the ADO finds the reason for the delay or the proposed resolution unacceptable, the ADO has the option to suspend the grant as outlined in Section 9 of this chapter and/or, upon further coordination with ACO-100, delay issuing any future grants to the sponsor until the issue is resolved.

c. Expenditure Rate. If the sponsor is drawing down the grant funding at a pace that is not consistent with the project progress or completing the project in a timely manner, the ADO has the option of asking the sponsor to submit the reason for the delay and the proposed resolution to the ADO in writing. If the ADO finds the reason for the delay or the proposed resolution unacceptable, the ADO has the option to suspend/terminate the grant as outlined in Section 9 of this chapter and/or, upon further coordination with ACO-100, delay issuing any future grants to the sponsor until the issue is resolved.

5-46. Requirements for Approving Payment within the Last 10% of the Federal Share.

Per 49 USC § 47111, no more than 90% of the Federal share of a project's estimated allowable costs may be made before the project is complete. The language in this section of the statute has been misinterpreted in the past to only apply to advance payments. The intent and origination of this language has been researched by the FAA, and it has been determined that this requirement applies to all types of payment requests, not just advance payments.

Per FAA policy, the ADO has the option to approve payment requests for a portion of the remaining 10% for a project that the ADO determines meets all of the requirements in the latest version of the Airport Improvement Program (AIP) Grant Payment and Sponsor Financial Reporting Policy (see Appendix B for link).

5-47. Requirements for Payment Requests to be Based on Incurred Costs.

Per 2 CFR § 200.305, the advance payment method is the standard method used by the Federal government to pay a sponsor. In order for an ADO to allow a sponsor to be paid in this manner, the sponsor must meet the conditions in Table 5-20.

When a sponsor is not able to satisfy the advance payment method requirements in Table 5-20, then the ADO must require the sponsor to submit payment requests under the reimbursement method. The ADO must document the reasons a sponsor has been placed on the reimbursement method of payment in the sponsor's file. The ADO has the option to revisit this decision if conditions with the sponsor change that may warrant the sponsor returning to the advance payment method.

If the FAA has determined that the sponsor lacks sufficient working capital to even operate on an advance payment basis, 2 CFR § 200.305(b)(4) allows sponsors to request cash advances prior to receiving invoices and billing statements. Under this procedure, the FAA advances cash payments to the sponsor to cover its initial capital start up needs for the grant. After this initial advancement(s), normal payment requirements apply. This is a very unusual situation requiring adequate justification, and APP-520 must approve or disapprove all requests of this nature.

Table 5-20 Conditions the Sponsor Must Meet for Advance Payments

The following conditions must be met for a sponsor to receive advance payments…
a. The Advance Payment Request is Based on Invoices and Billing Statements. Per FAA policy, the sponsor must provide documentation showing that the advance payment is based upon invoices, billing statements, or other appropriated payment support. For direct or indirect sponsor costs such as administrative costs, force account costs, or costs not supported by a contract, the sponsor must be able to provide documentation that supports the amount and validity of the cost. This ensures that the advance payment is based upon *defined* costs as opposed to *estimated* amounts.
b. The Sponsor Provides Prompt Payment to the Vendor. Per 2 CFR § 200.305(b)(1), the sponsor must maintain or demonstrate the willingness to maintain both written procedures that minimize the time elapsing between the transfer of funds and disbursement by the non-Federal entity, and financial management systems that meet the standards for fund control and accountability.
c. The Sponsor Meets Payment Requirements in Their Contracts and in Local/State Law. Per FAA policy, the sponsor must not withhold payment from their vendors beyond the time frame addressed in their contract or by local and state law, regardless of the timing of the grant or advance payment.

5-48. Requirements for Reducing or Withholding Payments.

Under 49 USC § 47111, the ADO is allowed to decide when and in what amounts payments under the grant may be made. The unique situations where the ADO would reduce or withhold a sponsor payment request are discussed in Table 5-21.

Table 5-21 Situations Where an ADO Would Reduce or Withhold a Sponsor Payment Request

For the ADO to…	The ADO must…
a. Approve less than the sponsor payment request due to unallowable, unreasonable, or unjustified costs	**(1)** Determine that the payment request contains unallowable, unreasonable, or unjustified costs. **(2)** Notify the sponsor of the adjusted amount and the reason behind the adjustment. **(3)** Reject the payment back to the sponsor and require the payment to be resubmitted.
b. Withhold a sponsor payment request pending satisfactory backup	**(1)** Determine that there is insufficient information in the payment request for the ADO to determine the reasonableness, allowability, and necessity of the claimed costs. **(2)** Reject the payment back to the sponsor and require the payment to be resubmitted.
c. Withhold a sponsor payment request from a sponsor who is indebted to the U.S. Government	**(1)** Have been notified by the FAA Office of Finance and Management, FAA Accounts Payable Section B (AMK-314) that the sponsor owes money to a Federal agency. **(2)** Determine if withholding payments will significantly impact the progress on the AIP project. **(3)** Notify the sponsor of the indebtedness and request documentation of resolution. **(4)** Reject the payment back to the sponsor and require the payment to be resubmitted once the indebtedness has been resolved.
d. Withhold payment requests for a sponsor in noncompliance with a grant assurance (or other egregious violation)	**(1)** Have been notified by ACO-100 that ACO-100 has found the sponsor to be in noncompliance with a grant assurance (or other egregious violation). **(2)** Coordinate with ACO-100 to determine whether to withhold payments. **(3)** Not withhold payment for proper charges for more than 180 days unless the sponsor has been notified and given an opportunity for a hearing (if required by either 49 USC § 47106(d) or 47111) and ACO-100 concurs with this action.

5-49. Limitations for Contract Retainage.

The current version of Advisory Circular 150/5370-10, Standards for Specifying Construction of Airports, allows a sponsor to retain a percentage of a contractor's invoices until the contractor satisfactorily completes the work. A summary of these retainage requirements and the associated limitations for the sponsor to include them in payment request is included in Table 5-22.

Table 5-22 Contract Retainage Limitations

If the sponsor opts to…	The sponsor is required to…	And the sponsor's payment request…
a. Hold retainage, but not in an escrow account.	**(1)** Include a clause in the contract obligating prime contractors to make prompt and full payment of any retainage to their subcontractors. **(2)** Ensure that the retainage percentage that the prime contractor sets for the subcontractor does not exceed the retainage percentage the sponsor sets for the prime contractor. **(3)** Ensure prompt and full payment of retainage from the prime contractor to the subcontractor within 30 days after the subcontractor's work is satisfactorily completed (as required in 49 CFR § 26.29).	Must not include the retainage amount. This is because the sponsor does not incur a cost when withholding retainage. The sponsor incurs the cost when retainage is released.
b. Hold retainage in an escrow account	**(1)** Include a clause in the contract obligating prime contractors to make prompt and full payment of any retainage to their subcontractors. **(2)** Ensure that the retainage percentage that the prime contractor sets for the subcontractor does not exceed the retainage percentage the sponsor sets for the prime contractor. **(3)** Ensure prompt and full payment of retainage from the prime contractor to the subcontractor within 30 days after the subcontractor's work is satisfactorily completed (as required in 49 CFR § 26.29).	May include the retainage amount. This is because the sponsor is responsible for paying these costs and does so by placing the retainage in an escrow account.
c. Not hold retainage	**(1)** Ensure that the prime contractor does not set a retainage percentage for the subcontractor. **(2)** Require a contract clause obligating prime contractors to make prompt and full payment of any retainage kept by prime contractor to the subcontractor within 30 days after the subcontractor's work is satisfactorily completed.	Must not deduct a retainage amount from the payment request. All costs are based on actual paid costs.

5-50. Limitations for Contractor Disputed Costs.

When the sponsor and the contractor do not agree on the amount owed to the contractor, and the dispute is likely to go to court, the sponsor is still allowed to submit a payment request for any undisputed costs.

5-51. Limitations for Land Acquisition Costs.

It is FAA policy that costs associated with a land acquisition (such as cost of land, appraisals, legal fees, etc.) are not allowable until *after* the sponsor has submitted evidence satisfactory to the ADO that the sponsor will receive good title to land. The sponsor must submit a binding purchase agreement that will convey good title, evidence of a condemnation deposit, a condemnation award, or a court settlement. Until the sponsor meets this requirement, there is no guarantee that the land acquisition will be completed. Therefore, sponsors must not submit payment requests until these conditions are met.

5-52. Requirements for Avoiding Improper Payments.

a. Background, Definition, and Examples. The Improper Payments Elimination and Recovery Improvement Act of 2012 (Public Law 112-248) outlines Federal requirements regarding improper payments. An improper payment occurs when the funds go to the wrong sponsor, the sponsor receives an incorrect amount of funds, or the sponsor uses the funds in an improper manner. Sponsors must avoid requesting and the ADO must avoid approving improper payments. Examples of improper payments are listed in Table 5-23

Table 5-23 Examples of Improper Payments

Some examples include payments that are made…
a. To the wrong AIP sponsor.
b. To an ineligible sponsor.
c. To the wrong AIP grant.
d. For an ineligible or unallowable work (see Chapter 3 for requirements).
e. That duplicates previous payments.
f. For costs that have not been paid (unless the ADO has approved an advance payment).
g. For an incorrect amount (either over or under the correct amount).
h. Where the sponsor cannot provide documentation to support that the payment was made correctly.

b. Identification and Remediation of Improper Payments. Improper payments may be identified through a number of avenues. This may include audits under the Single Audit Act, by the DOT Office of Inspector General (OIG), by state or local authorities, by the U.S. General Accountability Office. Improper payments may also be identified by the ADO or the sponsor. In all cases, the ADO must take action as outlined in Table 5-24 and the sponsor must take action as outlined in Table 5-25.

c. Costs Incurred to Recover Improper Payments. By FAA policy, the costs incurred by a recipient to recover improper payments are not allowable as either direct or indirect costs.

Table 5-24 ADO Remediation Actions for Improper Payments

The ADO must…
a. Notify the OIG if the ADO has reason to believe the improper payment was a deliberate attempt to defraud the FAA. The OIG hotline may be used for this purpose (see Appendix B for link).
b. Notify the sponsor in writing of the improper payment, including a description of the error or problem that was found (unless otherwise directed by the OIG).
c. Work with the sponsor to determine how the error or problem will be corrected (unless otherwise directed by the OIG).
d. Document the steps that will be taken to resolve the improper payment and include the documentation in the grant file.

Table 5-25 Sponsor Remediation Actions for Improper Payments

If the sponsor…	The sponsor must…
a. Has not received the payment.	Withdraw and resubmit the payment request that contains the improper payment.
b. Has received the payment.	Per 31 CFR § 901.2(b)(3), pay the improper payment within 30 days of the initial ADO notification using the established process for returning AIP funds electronically through the currently approved Department of Transportation grant payment system. Any alternate forms of returning funds to the FAA must be coordinated with the ADO and the FAA Office of Finance and Management, FAA Accounts Payable Section B (AMK-314).

5-53. Requirements for Financial Reporting (Standard Forms 425, 271, and 270).

Sponsors are required to submit certain financial reports to summarize grant expenditures and the status of project funds. Sponsors must submit the following financial reporting forms as required in the current version of Airport Improvement Program (AIP) Grant Payment and Sponsor Financial Reporting Policy (see Appendix B for link). The forms are also available on this website (see the AIP Forms link in Appendix B). 2 CFR § 200.327 requires sponsors to report at least annually, but not more than quarterly.

a. Standard Form 425, Federal Financial Report, or ADO approved equivalent (see the AIP Forms link in Appendix B). This requirement is found in 75 Federal Register 54215 (September 3, 2010). Per this Federal Register Notice, the Standard Form 272 is replaced by the Standard Form 425 (Federal Financial Report) and outlines the timing of the sponsor submittal.

b. Standard Form 271, Outlay Report and Request for Reimbursement for Construction Programs (see the AIP Forms link in Appendix B), or ADO approved equivalent. The ADO may allow the use of a Standard Form 270, Request for Advance or Reimbursement (see the AIP Forms link in Appendix B), for non-construction projects in lieu of Standard Form 271.

5-54. Requirements for Retaining/Providing Supporting Documentation.

The sponsor is responsible for maintaining all of the documentation supporting a grant payment and making this information available upon request.

Per 2 CFR §§ 200.333- 200.337, the sponsor is required to keep these records for at least three years from the date the sponsor submits the last payment request. If any litigation, claim, negotiation, audit or other action involving the records has been started before the end of the three year period, the sponsor must retain the records until the completion or resolution of the action, or the three year period, whichever is later.

Section 7. Grant Amendments.

5-55. Criteria for Amending a Grant.

49 USC § 47108 allows the ADO to amend a grant once it has been issued. The ADO is allowed to issue an amendment as long as the ADO adheres to the criteria in Table 5-26 through Table 5-28. The appropriate amendment formats are described in Table 5-29.

Table 5-26 Criteria for an ADO to Amend a Grant

If the grant description…	The ADO can amend the grant if the following criteria are met…
a. Remains the same (regular amendments)	**(1)** If the grant amount will be increased, the sponsor must make the request in writing and fully document the amount and justification. **(2)** Decreases to the grant amount can be requested by the sponsor in writing or can be initiated by the ADO. The standard practice is for the sponsor to submit a written request fully documenting the amount and reason for the decrease, which the ADO must include in the grant file. However, the ADO has the option to decrease a grant, even if the sponsor is in disagreement, as long as the ADO documents the decision in the grant file. **(3)** The ADO must determine that it is advantageous to the Federal government. **(4)** The ADO must not increase the grant amount for planning projects. This restriction is based on 49 USC § 47108(b)(3) which only allows increasing the grant amount for airport development or land acquisition projects. **(5)** Normally, the ADO only amends a grant at closeout to adjust the grant amount to reflect final costs. However, the ADO has the options to amend the grant more than once and at times other than at closeout. **(6)** In the rare case where a grant is based on estimates, the ADO must amend the grant to remove excess funds as soon as the actual costs are known. **(7)** The ADO has confirmed that the applicable requirements in Chapter 3 have been met. **(8)** The ADO has confirmed that the amendment increase is within the limits found in Table 5-27.
b. Remains the same (amendment to correct the Federal share percentage)	**(1)** Unless the grant is a multi-year grant (see multi-year amendment below) or the ADO needs to correct a mistake in the Federal share percentage, the Federal share percentage must remain the same throughout the life of the grant. The ADO must not amend a grant to change the Federal share unless the amendment is needed to correct a mistake in the Federal share percentage.
c. Remains the same (adding future year funds to a multi-year amendment)	**(1)** Unless otherwise required by the ADO, the sponsor is not required to submit a written request. **(2)** The multi-year amendment will not increase the total Federal share for the multi-year agreement beyond the amount listed in the original grant agreement. **(3)** The ADO is only allowed to include sponsor entitlement funds (passenger, cargo, or nonprimary) in the multi-year amendment. **(4)** If the Federal participation rate changes during the course of the multi-year grant, the ADO must write the amendment using the current fiscal year rate (not the rate that was in affect when the grant was issued).

Table 5-26 Criteria for an ADO to Amend a Grant

If the grant description…	The ADO can amend the grant if the following criteria are met…
d. Remains the same (adding additional funds to a multi-year amendment)	**(1)** If the Federal share of the eligible project costs exceeds the total multi-year amendment amount established in the initial grant agreement, the ADO has the option to issue a regular amendment. **(2)** The ADO must follow the amendment rules for increases in Table 5-27 and use the total multi-year amendment amount as the basis of these calculations. **(3)** The total multi-year funding amount is the sum of the initial year and future years.
e. Is changed to clarify a project	**(1)** If the ADO is clarifying the project with no change in funding, then the ADO can initiate this action. Unless requested by the ADO, the sponsor does not need to request the change in writing or provide additional information. **(2)** The change to the grant description must simply provide a corrected grant description for the originally intended project. For this situation, work can only be added to the description if the ADO inadvertently omitted it from the original grant description. For example, the ADO might change the grant description to add relocation of a PAPI associated with a runway extension if the PAPI was always intended to be included in the project. **(3)** If the ADO wants to also adjust the funding for final project costs in the same amendment, then all of the criteria in Item a of this table also apply. **(4)** To avoid the risk of an improper payment, the ADO must issue the clarifying amendment prior to the start of the affected work.

Table 5-26 Criteria for an ADO to Amend a Grant

If the grant description…	The ADO can amend the grant if the following criteria are met…
f. Is changed to add a project and increase funding in the grant	**(1)** FAA policy is to avoid adding both a new project and funding to a grant. The ADO must only consider using this option in rare circumstances. The standard accepted practice is to issue a new grant. An example of a suitable situation to add both a new project and funding is when it will help rapidly implement an emergency fix related to the original grant scope (i.e., during a runway rehabilitation, to replace a failure of a taxiway lighting system on the taxiway that is used to move aircraft around the closed runway). In this example, replacement of a taxiway lighting system would normally be a separate grant. This work is closely related to the current project, and the taxiway lighting system must be operational in order to support existing night operations on the airport. **(2)** The sponsor must make the request in writing and fully document the amount and justification. **(3)** The ADO must determine that it is advantageous to the Federal government. **(4)** FAA policy is that the ADO must have requested, and received separate regional approval from the 610 branch in advance of adding a new project to the grant. **(5)** The ADO must determine that the need for the additional project is closely related to a project contained in the original grant. **(6)** If there is enough sponsor entitlement in the grant to cover the new project, then the sponsor can begin the work on the new project before the amendment is issued. Otherwise, the ADO must follow the reimbursement rules in Paragraph 3-100, replacing *grant execution date* with *grant amendment execution date*. **(7)** The ADO has confirmed that the applicable requirements in Chapter 3 have been met. **(8)** All other statutory and regulatory requirements (such as environmental clearance, aeronautical study determination, ALP) that may apply to the new project have been or will be met.

Table 5-26 Criteria for an ADO to Amend a Grant

If the grant description…	The ADO can amend the grant if the following criteria are met…
g. Is changed to add a project (with no increase in funding over the original grant amount)	**(1)** The sponsor must make the request in writing and fully document the amount and justification. **(2)** The ADO must determine that it is advantageous to the Federal government. **(3)** The sponsor must document that all work in the existing grant has been completed or have progressed to the point that all costs in the existing grant projects are known. **(4)** The ADO must determine that the need for the additional project is closely related to a project contained in the original grant. **(5)** The ADO must not add the project to the grant for the purpose of using excess funds remaining in the grant. The reason for this prohibition is that it delays the timely closeout of the grant and in the case of discretionary funding, bypasses the discretionary funding competition process. **(6)** If there is enough sponsor entitlement in the grant to cover the new project, then the sponsor can begin the work on the new project before the amendment is issued. Otherwise, the ADO must follow the reimbursement rules in Paragraph 3-100, replacing grant execution date with grant amendment execution date. **(7)** FAA policy is that the ADO have requested, and received separate regional approval from the 610 branch in advance of adding a new project to the grant. **(8)** The ADO has confirmed that the applicable requirements in Chapter 3 have been met. **(9)** All other statutory and regulatory requirements (such as environmental clearance, aeronautical study determination, ALP) that may apply to the new project have been or will be met.

Table 5-26 Criteria for an ADO to Amend a Grant

If the grant description…	The ADO can amend the grant if the following criteria are met…
h. Is changed to delete a project (not land)	**(1)** Deletion of a project from a grant can be requested by the sponsor in writing or can be initiated by the ADO. The standard practice is for the sponsor to submit a written request, and ADO initiation of an amendment to delete a project is normally only done when the sponsor does not agree with the amendment. Unless the deletion is initiated by the ADO based on information the ADO has in house, the sponsor must fully document the amount and reason for the deletion. **(2)** The ADO must determine that it is advantageous to the Federal government to delete the project. **(3)** The ADO must adjust the grant amount by the Federal share of the deleted project. **(4)** The amendment must not prejudice the interests of the United States. This is a rare occurrence and APP-500 will notify the ADO if the situation exists. **(5)** To avoid the risk of an improper payment, the ADO must issue the amendment so that the sponsor does not inadvertently draw down funding for the deleted work.
i. Is changed to delete a land project from the grant	**(1)** Deletion of land acquisition from a grant can be requested by the sponsor in writing or can be initiated by the ADO. The standard practice is for the sponsor to submit a written request, and ADO initiation of an amendment to the land project is normally only done when the sponsor does not agree with the amendment. Unless the deletion is initiated by the ADO based on information the ADO has in house, the sponsor must fully document the amount and reason for the deletion. **(2)** The ADO must determine that it is advantageous to the Federal government to delete the land project. **(3)** The ADO must adjust the grant amount by the Federal share of the deleted land project. **(4)** The amendment must not prejudice the interests of the United States. This is a rare occurrence and APP-500 will notify the ADO if the situation exists. **(5)** Because AIP cannot pay twice for the same costs, if the sponsor has received payment on any incurred land acquisition cost, the sponsor must repay those costs or provide written confirmation to the ADO that the costs for performing that work again will be locally funded. **(6)** To avoid the risk of an improper payment, the ADO must issue the amendment so that the sponsor does not inadvertently draw down funding for the deleted work.

Table 5-26 Criteria for an ADO to Amend a Grant

If the grant description…	The ADO can amend the grant if the following criteria are met…
j. Is changed to modify a project	**(1)** The sponsor must make the request in writing and fully document the amount and justification for the modification. **(2)** If a portion of a project is deleted, the ADO must determine a usable unit will still be obtained. **(3)** If the project scope is being increased, the ADO must determine that the need for the additional work is closely related to the original project. **(4)** The ADO must determine that it is advantageous to the Federal government. **(5)** FAA policy is that the ADO must have requested, and received separate regional approval from the 610 branch in advance of modifying a project within the grant. **(6)** Examples of a project modification are increasing a runway extension from 400' to 500' or reducing scope of a fencing project. **(7)** To avoid the risk of an improper payment, the ADO must issue the amendment to modify the project prior to the start of the affected work. **(8)** The ADO has confirmed that the applicable requirements in Chapter 3 have been met.
k. Is changed to substitute a project	**(1)** The sponsor has made the request in writing and has fully documented the amount and justification for the substitution. **(2)** All of the criteria for adding and deleting a project have been met. **(3)** If the cost of the substituted project is less than the deleted project, the ADO decreases the Federal share of the grant accordingly. **(4)** The ADO must determine that the funding rules for the projects do not prohibit the substitution. **(5)** FAA policy is that the ADO must have requested, and received separate regional approval from the 610 branch in advance of substituting a project within a grant. The regional office must provide a higher level of scrutiny if the existing project is funded with discretionary and the new project is of a lower priority. **(6)** To avoid the risk of an improper payment, the ADO must issue the amendment to substitute a project prior to the start of the affected work. **(7)** The ADO has confirmed that the applicable requirements in Chapter 3 have been met.

Table 5-27 Grant Amendment Limits for Increases

Type of Grant	Primary Airport Rules	Nonprimary Airport Rules
a. Land Acquisition	Not more than 15% of the grant amount.	Up to the greater of: ▪ 15% of the grant amount *for land* (Federal share is used here, not project cost). ▪ 25% of the total increase in allowable land costs (project cost is used here, not Federal share). This is currently the only instance where the ADO has the option to amend the original grant amount by more than 15%. See Table 5-28 for example calculations.
b. Airport Development	Not more than 15% of the grant amount.	Not more than 15% of the grant amount.
c. Planning	May not be increased above the grant amount.	May not be increased above the grant amount.
d. Noise Compatibility Projects (implementation, not planning)	Not more than 15% of the grant amount.	Not more than 15% of the grant amount.
e. Design Only Grants	Not more than 15% of the grant amount.	Not more than 15% of the grant amount.
f. Mixed Project Types	Not more than 15% of the grant amount after the planning portion of the grant is deducted.	Not more than 15% of the grant amount after the planning portion of the grant is deducted. If the increase includes land, also take into account the above rules for land and see Table 5-28 for example calculations.

Table 5-27 Grant Amendment Limits for Increases

Type of Grant	Primary Airport Rules	Nonprimary Airport Rules
g. State Block Grants	Not applicable.	As of the publication date of this Handbook, it is FAA policy that the ADO must not amend a state block grant to increase the grant amount. If the ADO does not issue all of the available funds to the state in the first grant of the fiscal year, the ADO must issue the remaining funds in one or more separate grants. If the state chooses to cover an eligible project overrun with AIP funds, the state must only do this with unused entitlements (following all applicable transfer rules per Paragraph 4-11), state apportionment, or discretionary from their open state block grants. Per FAA policy, states are prohibited from using unused discretionary for new projects. This policy aligns the use of discretionary between state block and non-state block grants. The only adjustment an ADO can make to the grant amount is a deobligation to remove any unused funds. Because the State Block Grant Program provides states with the flexibility to reobligate entitlement and state apportionment on new or existing projects, it will be rare for the ADO to deobligate these types of funds. However, for discretionary projects, if the state has not used unused discretionary toward existing projects, then the ADO must deobligate the unused discretionary at grant closeout. If the ADO needs to reduce the funding in the grant at closeout, a separate amendment is not required (the decrease is entered into the system when the closeout is initiated).

Table 5-28 Examples of Grant Amendments with Land Increases for a Nonprimary Airport

Some examples include…

Example 1

Nonprimary airport given a grant for development and land at 90% Federal share.

Item	Original Project Cost	Grant Amount	Final Project Cost
Development	$800,000	$720,000	$800,000
Land	$200,000	$180,000	$260,000
Total	$1,000,000.00	$900,000.00	$1,060,000.00

Development: No change in development cost. Therefore, grant amount portion remains at $720,000.

Land: Total cost of land increases by $60,000. The grant amount may be increased by 25% of the difference between the final total project cost and the original total project cost of the land (($260,000-$200,000) x 25% = $15,000), or by 15% of the original Federal share of the grant pertaining to the land ($180,000 x 15% = $27,000), whichever is greater. Consequently, the land portion of the original grant amount of $180,000 can be increased by $27,000 to $207,000.

Final Grant Amount: $720,000 + $207,000 = $927,000

Table 5-28 Examples of Grant Amendments with Land Increases for a Nonprimary Airport

Some examples include…

Example 2

Nonprimary airport given a grant for development and land at 90% Federal share.

Item	Original Project Cost	Grant Amount	Final Project Cost
Development	$800,000	$720,000	$950,000
Land	$200,000	$180,000	$400,000
Total	$1,000,000.00	$900,000.00	$1,350,000.00

Development: Development cost increases by $150,000. The development portion of the grant amount can be increased by a maximum of 15%. Therefore, the maximum increase is ($720,000 x 15% = $108,000). The amended grant amount for development is $828,000.

Land: Total cost of land increases by $200,000. The grant amount may be increased by 25% of the difference between the final total project cost and the original total project cost of the land (($400,000-$200,000) x 25% = $50,000), or by 15% of the original Federal share of the grant pertaining to the land ($180,000 x 15% = $27,000), whichever is greater. Consequently, the land portion of the original grant amount of $180,000 can be increased by $50,000 to $230,000.

Final Grant Amount: $828,000 + $230,000 = $1,058,000

Note: In this case, the amended total grant amount is increased by an amount which is more than 15% of the original grant amount.

Table 5-29 Appropriate Amendment Formats

The following format is appropriate…	When all of the following criteria apply…
a. Formal Amendment (FAA Form 5100-38) (See the AIP Forms link in Appendix B.)	**(1)** If one or more of the following conditions exist: **(a)** The amendment will change the grant assurances. **(b)** The amendment will change the grant conditions. **(c)** A project within the grant is controversial. **(d)** A project within the grant is in litigation. **(e)** The amendment reduces the grant by equal to or more than $25,000 or 5% of the current approved grant obligation, whichever is greater, and the grant is not being closed out. (For a grant reduction at closeout, a separate amendment is not required because the decrease is entered into the system when the closeout is initiated.)

Table 5-29 Appropriate Amendment Formats

The following format is appropriate…	When all of the following criteria apply…
b. Final Payment Notification and FAA Final Project Report (See Table 5-33)	**(1)** The ADO is basing the final grant amount upon the FAA final project report and completes the sponsor notification as outlined in Table 5-33. **(2)** The grant amount will be reduced, and the reduction is less than $25,000 or 5% of the current approved grant obligation, whichever is greater.
c. Multi-Year Amendment (Letter from the ADO to the sponsor)	**(1)** The sole amendment purpose is to add multi-year funding as described in the grant agreement.
d. Letter Amendment (Letter from the ADO to the sponsor)	**(1)** None of the above formats are applicable.

5-56. Procedure for the ADO to Process an Amendment.

After all of the criteria in Paragraph 5-55 have been met, the ADO processes the amendment using the steps in Table 5-30.

Table 5-30 Amendment Steps

The amendment steps are…
a. **Reductions as part of a closeout**. If the ADO is simply reducing the funding in the grant as part of the closeout and is not required to complete a formal or letter amendment per Table 5-29, the ADO must follow the steps in Table 5-33 instead of those in this table.
b. **Amendment Programming**. The ADO creates an amendment in the automated AIP system from an open grant. If the grant is closed, the ADO must reopen the grant following regional policy and/or approval. The amendment is then reviewed at the regional level. If the amendment is approved, it is then ready to begin the congressional notification process, if required. If congressional notification is not required, the amendment skips to the funds reservation step.
c. **Congressional Notification (if applicable).** If the grant amount is increased, the ADO may be required to send the amendment through the congressional notification process. APP-520 provides the criteria for sending an amendment through congressional notification process based on legislation and DOT Office of the Secretary (OST) requirements.

Table 5-30 Amendment Steps

The amendment steps are…
d. Funds Reservation (if applicable). If amendment is to increase funds, the ADO must reserve the funds in the automated AIP system. The system generates an electronic FAA Form 1413-1, Request for Change in Reservation/Obligation. This is reviewed in the system at the regional level and if approved, the system forwards the request to the FAA Office of Finance and Management, FAA Accounts Payable Section B (AMK-314) for AMK-314's acceptance. Once AMK-314 accepts the reservation in the system, the funds are officially reserved.
e. Recovery of Funds (if applicable). If the amendment is to decrease funds, the ADO must decrease the funds in the automated AIP system. The system generates an electronic FAA Form 1413-1, Request for Change in Reservation/Obligation. This is reviewed in the system at the regional level and if approved, the system forwards the request to AMK-314 for AMK-314's acceptance. Once AMK-314 approves the decrease, the system forwards the request to the FAA Office of Budget and Performance – Operations and Capital Execution Branch (ABP-410) for ABP-410 approval. Once ABP-410 approves the decrease in the system, the funds are officially recovered.
f. Amendment Offer. The ADO issues the amendment offer to the sponsor using the format required in Table 5-29.
g. Amendment Acceptance (if applicable). If a formal amendment is used, the sponsor and the sponsor's attorney must sign and return the executed amendment to the ADO. The sponsor's attorney *must* sign the amendment *after* the sponsor in order for the amendment to be properly executed. The amendment cannot be altered by the sponsor without ADO concurrence and issuance of another grant amendment. The sponsor must keep one executed amendment for its files.
h. AMK-314 Notification. If the funding amount has been changed, the ADO must send a scanned copy of the signed amendment to AMK-314.

Section 8. Grant Closeouts.

5-57. Grant Closeout Steps and Requirements.

In order for the ADO to close a grant, the ADO and sponsor must have completed three basic steps. These are:

a. Physically complete all projects in the grant (as discussed in Table 5-31).

b. Complete all grant administrative and financial requirements (as discussed in Table 5-32).

c. Complete the closeout processing steps (as discussed in Table 5-33).

2 CFR § 200.210 requires Federal agencies to identify a period of performance for Federal grants. The FAA has established this period of performance as a maximum of four years from the date of grant execution. 2 CFR § 200.331 also requires pass through entities such as block grant states to identify a period of performance for subgrants.

2 CFR § 200.343 requires that the sponsor submit all required closeout documentation to the ADO within 90 days after the period of performance ends. However, per 2 CFR § 200.343(a), APP-520 has the option to extend this time frame to beyond the 90 days.

Per 2 CFR § 200.343, the FAA has a maximum of one year from receipt and acceptance of the closeout documentation to complete all closeout actions. This includes all closeout actions from all FAA offices (including the FAA Office of Finance and Management, FAA Accounts Payable Section B (AMK-314)). APP-520 has the option to further define ADO specific closeout time frames within this one year period.

Table 5-31 Project Physical Completion Requirements

For the following type of project…	The project is not complete until the following requirements are met…
a. Planning	**(1)** The sponsor has submitted the final planning deliverable to the ADO. **(2)** The FAA has reviewed, accepted, or approved the planning document as applicable..
b. Land Acquisition	**(1)** The sponsor has obtained satisfactory property interest in all parcels included in the grant description. **(2)** The sponsor has submitted an updated Exhibit A to the ADO that properly reflects the land acquisition.
c. Equipment Acquisition	**(1)** The sponsor has full ownership of the equipment (must be delivered, installed, and tested in accordance with plans and specifications). **(2)** The FAA Air Traffic Organization (ATO) has completed all required commissioning, inspection, initial flight check, and/or acceptance requirements (if applicable to the project). **(3)** The sponsor has submitted any FAA required equipment inventory updates to the ADO.
d. Construction	**(1)** The ATO has completed all required commissioning, inspection, initial flight check, and/or acceptance requirements (if applicable to the project). **(2)** The sponsor has completed the final inspection and verifies that all punch list items have been addressed. **(3)** A complete and useable facility is fully available for its intended use (except in the case of phased projects). **(4)** The sponsor has received the as-built plans. The ADO has the option to require the sponsor to submit an electronic or paper copy of these plans to the ADO.

Table 5-32 Grant Administration Closeout Requirements

For the following item…	The ADO must verify that the following requirements are met prior to the ADO processing a grant closeout…
a. Standard Required Sponsor Documentation per 2 CFR § 200.343	**(1)** The sponsor has submitted all documentation required based on the sponsor's risk level and the type of project including the following closeout specific documentation: **(a)** The final Standard Form 425, Federal Financial Report (see the AIP Forms link in Appendix B), equivalent. This requirement for a final Standard Form 425 is included in the instructions for this form. **(b)** An advance paper copy of the final Standard Form 271, Outlay Report and Request for Reimbursement for Construction Programs (see the AIP Forms link in Appendix B), or equivalent, that summarizes the final project costs. The ADO may allow the use of a Standard Form 270, Request for Advance or Reimbursement (see the AIP Forms link in Appendix B), for non-construction projects in lieu of Standard Form 271. This advance copy provides the information that the ADO needs to determine the final allowable project cost. Note that the sponsor will still have to make a final payment request once the ADO completes their determination. **(c)** The final vendor invoices (unless the final vendor invoice is less than $1,000). For state block grants, the ADO has the option to only require a list of subgrants that shows the projects and final project amounts as long as the state has obtained the final vendor invoices.
b. Additional Sponsor Documentation Required by the ADO	**(1)** The ADO has the option to require the sponsor to submit any other documentation the ADO determines necessary to support the grant closeout. This may include a formal closeout package or separate items such as a final construction report that summarizes major project issues, a summary of project events, a project timeline, a summary of any Department of Labor issues, and the final DBE participation rates.
c. Additional Sponsor Documentation Required by the ADO for AWOS projects	**(1)** The FAA must have determined that the AWOS has been successfully commissioned, and the sponsor must have provided the ADO with the FAA initial inspection and successful commissioning documentation. **(2)** The sponsor must have provided the ADO with a copy of the Weather Message Switching Center reporting contract with the third party interface provider if the sponsor has a connection to the Weather Message Switching Center Replacement (WMSCR). (Note that AWOS-A, A/V, I and II are not eligible for reporting, so this is not required.)
d. Grant Special Conditions	**(1)** The sponsor has met all of the grant special conditions required to be accomplished during the grant.
e. Updated Airport Layout Plan	**(1)** The sponsor has updated the ALP to reflect that the project has been completed (vs. proposed). Not all projects are shown on the ALP (such as runway rehabilitation or equipment acquisition) and in those cases an ALP update is not required. This does not normally require an additional aeronautical study.

Table 5-32 Grant Administration Closeout Requirements

For the following item…	The ADO must verify that the following requirements are met prior to the ADO processing a grant closeout…
f. Exhibit A	**(1)** The sponsor has updated the Exhibit A to reflect that the property acquisition has been completed.
g. Noise Land Inventory and Reuse Plan	**(1)** The sponsor has updated the Noise Land Inventory and Reuse Plan to reflect that the property acquisition has been completed. Noise Land Management and Requirements for Disposal of Noise Land or Development Land Funded with AIP (see Appendix B for link) contains guidance for these plans.
h. Environmental Requirements	**(1)** All project related environmental requirements found in the environmental determination have been completed.
i. Program Income, Including Interest Earned	**(1)** The sponsor has identified any program income, including interest earned and liquidated damages on Federal grant funds, in the Program Income section of Standard Form 425 Federal Financial Report (or equivalent) (see the AIP Forms link in Appendix B). **(2)** The sponsor must have deducted this income from the Federal share of the grant.
j. Disputed Costs	**(1)** The sponsor has identified any disputed costs in the Remarks section of Standard Form 425, Federal Financial Report (or equivalent) (see the AIP Forms link in Appendix B). **(2)** If the sponsor and the contractor do not agree on the amount owed to the contractor, and the dispute is likely to go to court, the sponsor has only requested reimbursement for the amount that is not in dispute. **(3)** Following review of the sponsor's closeout documentation, the ADO may choose to continue with the project closeout or leave the grant open until all litigation is completed.
k. Overpayment	**(1)** If Standard Form 425, Federal Financial Report (or equivalent), indicates that payments have been made which exceed the Federal share of the allowable costs, the sponsor must repay this amount (see the AIP Forms link in Appendix B). **(2)** The ADO must notify the DOT Office of Inspector General (OIG) if the ADO has reason to believe the overpayment was a deliberate attempt to defraud the FAA. The OIG hotline is available for this purpose (see Appendix B for link). **(3)** The ADO must notify the FAA Office of Finance and Management, FAA Accounts Payable Section B (AMK-314) in writing of the overpayment. **(4)** The sponsor must send a check for the overpayment amount as directed in the Airport Improvement Program (AIP) Grant Payment and Sponsor Financial Reporting Policy (see Appendix B for link) which is based on DOT requirements. The overpayment processing must follow the DOT electronic grant payment system policy through the Delphi eInvoicing system.

Table 5-33 Closeout Processing Steps

The closeout processing steps are…
a. FAA Final Project Report. Once all of the project physical completion requirements in Table 5-31 and the grant administration closeout requirements in Table 5-32 have been met, the ADO must conduct a final project review that results in an FAA final project report. The report must contain information deemed necessary for a subsequent examination or evaluation of the project. The report will normally be prepared and signed by the ADO project manager. The report must then also be reviewed and signed by the regional division manager (the regional division manager may delegate the approval authority down, but the authority must remain at one level higher than the project manager in the chain of command). This constitutes a routine element of program checks and balances as required by 2 CFR §§ 200.343 and 200.303 (OMB Circular A-123, Management's Responsibility for Internal Control).
b. Final Payment Notification. Once the ADO completes the FAA final project report, the ADO must provide a written notification to the sponsor. This notification must include: **(1)** the maximum obligation amount calculated in the FAA final project report, **(2)** the reason for any differences between the maximum obligation amount and the sponsor's requested amount, and **(3)** the FAA final project report. The ADO must place a copy of this notification in the grant file. Until the ADO completes the FAA final project report and completes this sponsor notification, the ADO must follow the requirements in Paragraph 5-46 for payment within the last 10% of the Federal share of the grant (or the last 10% of the estimated Federal share of the grant after amendment, whichever is less). The ADO has the option of excluding a state block grant from this requirement only if the state is following this requirement for all of the subgrants within the state block grant and the ADO is confident that the state will submit the state block grant closeout documentation in a timely manner.
c. Amendments. If the ADO needs to change the work scope or increase the funding, the ADO must follow the amendment requirements and process listed in Paragraphs 5-55 and 5-56. If the ADO needs to reduce the funding in the grant, a separate amendment is not required (the decrease is entered into the system when the closeout is initiated).
d. Final Payment Request Approval. Once the ADO notifies the sponsor of the final payment amount and completes any necessary amendment actions, the sponsor must submit the final payment request through the currently approved Department of Transportation grant payment system.
e. Validation of Draw Downs. The ADO must not process a closeout in the automated AIP system until the sponsor has drawn down the entire final grant amount calculated in the ADO's final project report. The ADO must validate this by reviewing the draw downs on the grant in the current financial system being used by the FAA Office of Finance and Management, FAA Accounts Payable Section B (AMK-314).

Table 5-33 Closeout Processing Steps

The closeout processing steps are…
f. Initiating Closeout. After the ADO has validated the drawdowns, the ADO must initiate a closeout in the automated AIP system for the grant. The ADO can reduce the grant amount at this time to reflect the final project cost. The closeout is then reviewed at the regional level. If it is approved, the system will generate an electronic FAA Form 1413-1, Request for Change in Reservation/Obligation (if the grant is decreased) and will send the decrease (if applicable) and closeout request to AMK-314. The ADO has the option of printing this form and placing a copy in the grant file, however, this is not mandatory because the form is retained in the automated AIP system.
g. AMK-314 and the FAA Office of Budget and Performance – Operations and Capital Execution Branch (ABP-410) Review and Acceptance. Once AMK-314 makes any necessary funding adjustments in their financial system and approves the closeout; and all recoveries (if applicable) are approved in the automated AIP system by ABP-410; the grant is officially closed in the automated AIP system.
h. Grant Closeout Letter. After AMK-314 and ABP-410 review and acceptance is complete, the ADO must notify the sponsor of the grant closeout in writing. This closeout letter must include the grant closeout date and the final grant amount. The ADO must send a scanned copy of this letter to AMK-314 and include a copy in the grant file.
i. Printing FAA Form 5100-107, Airport Improvement Program Form (also called AIP Grant Status Report). At this point, the ADO has the option of printing the FAA Form 5100-107, Airport Improvement Program Form (also called AIP Grant Status Report) generated by the automated AIP system and placing the form in the grant file. However, this is not mandatory because a current version of the form containing the grant history is retained in the automated AIP system.

5-58. Block Grant Closeout.

In order for the ADO to close a block grant, the ADO and block grant sponsor must have completed three basic steps as shown in Table 5-34: The required state and ADO closeout time frames are discussed in Paragraph 5-57.

Table 5-34 Block Grant Closeout Requirements

In order for the ADO to close a block grant, the ADO and block grant sponsor must have…
a. Physically, administratively, and financially closeout all of the projects that were issued under the specific state block grant.
b. Followed the requirements in the block grant master agreement regarding which documents must be submitted to the ADO and which documents must be retained by the sponsor.
c. Completed the financial closeout steps in Table 5-33 for the specific state block grant.

Section 9. Grant Suspension and/or Termination.

5-59. Reasons for Possible Grant Suspension or Termination.

Table 5-35 includes examples of when the ADO would consider suspending or terminating a grant. Note that for civil rights violations and non-compliance issues, there are additional legislative requirements. The FAA Office of Civil Rights (ACR) and ACO-100 are responsible for providing the ADO with direction on meeting these requirements.

In addition, if the suspension or termination of the grant will involve withholding an existing grant payment request, the ADO must follow the requirements in Paragraph 5-48.

Table 5-35 Examples of Reasons for Grant Suspension or Termination

Some examples include…	
a.	The circumstances that justify the project no longer exist.
b.	The sponsor has not incurred any cost on the project and has requested that the grant be deferred.
c.	The ADO has determined that progress on the project has stopped.
d.	The ADO has determined that the project cannot be commissioned and accepted into the National Airspace System.
e.	The ADO has determined that the sponsor has not met the requirements of a grant special condition.
f.	ACO-100 has notified the ADO that the sponsor is in non-compliance and has advised the ADO to suspend or terminate the grant. The applicable compliance requirements are contained in 14 CFR part 16, Rules of Practice for Federally-Assisted Airport Enforcement Proceedings, and the current version of FAA Order 5190.6, FAA Airport Compliance Manual.
g.	The FAA Office of Civil Rights (ACR) has determined that the sponsor has violated a civil rights requirement and has advised the ADO to suspend or terminate the grant. This is because ACR, not the ADO, is the point of contact for civil rights enforcement procedures, while the ADO normally handles any required grant suspension or termination procedures.

5-60. Suspension of a Grant.

The ADO may suspend the grant in whole or in part if the sponsor fails to comply with conditions of the grant. The ADO does this through a written notice to the sponsor. Costs incurred by the sponsor on the grant project after the sponsor has received the suspension notice are not allowable, unless specifically authorized in writing by the ADO. The ADO may allow costs which are otherwise allowable and could not be avoided during the period of suspension. The notice of suspension must contain the following:

a. The reasons for the suspension and the corrective action necessary to lift the suspension.

b. A date by which the corrective action must be taken.

c. Notification that the sponsor has a right to request that the Associate Administrator for Airports (ARP-1) reconsider the suspension or termination.

d. Notification that the ADO will be giving consideration to terminating the grant if the sponsor does not take the corrective action by the required date.

In addition, if the suspension of the grant will involve withholding an existing grant payment request, the ADO must follow the requirements in Paragraph 5-48.

5-61. Termination for Cause.

The ADO may unilaterally terminate the grant for cause if the sponsor fails to comply with the conditions of the grant. This is done by written notice to the sponsor. The ADO must use the following procedures for termination:

a. First, the ADO must have already suspended the grant.

b. The ADO must only use factual and objective language in all correspondence which may lead to termination for cause.

c. The ADO must send a written notification of the proposed termination to APP-1 and ACO-100 at the earliest possible opportunity. The ADO must also forward a copy of the notice of suspension and the ADO assessment of the sponsor's action to remedy the situation to APP-500 and ACO-100.

d. Upon receipt, ACO-100 will acknowledge the proposed termination to the ADO via telephone or e-mail. Within 30 days of ACO-100's acknowledgement, ACO-100 will notify the ADO, in writing, of the procedures to be followed.

e. The ADO must notify the sponsor of the termination in writing. This notice must include the reasons for the termination and must inform the sponsor of their right to request the Associate Administrator (ARP-1) reconsider the suspension or termination.

f. The ADO must ensure that payments or recoveries of payments under the grant are in accordance with the legal rights and liabilities of all parties involved.

g. ACO-100 may require the ADO to provide further coordination and action as a result of the termination for cause in accordance with 14 CFR part 16, Rules of Practice for Federally-Assisted Airport Enforcement Proceedings, and the current version of FAA Order 5190.6, FAA Airport Compliance Manual.

h. The FAA Office of Civil Rights (ACR) may require the ADO to provide further coordination and action as a result of the termination for cause in accordance with the applicable civil rights requirements.

In addition, if the termination of the grant will involve withholding an existing grant payment request, the ADO must follow the requirements in Paragraph 5-48

5-62. Termination for Convenience.

The ADO has the option of terminating a grant for convenience if there is no beneficial reason to continue the project. This can be initiated by either the ADO or the sponsor. Termination for convenience requires:

a. A written agreement that details the termination conditions, including the effective date and, in the case of partial terminations, the portion to be terminated.

b. The termination agreement must state that the sponsor may not incur new obligations for the terminated portion of the grant after the effective date and must cancel as many obligations relating to the termination as possible.

c. The ADO can reimburse the sponsor for allowable project costs that were incurred prior to the effective cancellation date if, in the opinion of the ADO, incurring the costs was unavoidable and could not be canceled.

In addition, if the termination of the grant will involve withholding an existing grant payment request, the ADO must follow the requirements in Paragraph 5-48.

Section 10. Post-Grant Actions.

5-63. Sponsor Records Retention.

2 CFR §§ 200.333-200.337 requires that a sponsor retain all grant related documentation for three years after the sponsor submits the final payment request. If a sponsor becomes involved in litigation or other action involving the records, the sponsor must retain the records until the issue is resolved or the end of the three year period, whichever is later.

Sponsors are also required to provide copies of this documentation upon request to the FAA, the DOT Office of Inspector General (OIG), General Accountability Office and independent auditors acting on behalf of those offices, and independent auditors under the Single Audit Act of 1984.

Table 5-36 contains examples of documentation that the sponsor must retain.

Table 5-36 Examples of Documents that a Sponsor Must Retain

Some examples include…	
a.	Invoices and inspection reports for third party contracts and suppliers.
b.	Detailed employee pay records (including supporting labor distribution records) for force account work.
c.	Detailed labor distribution for project administration costs.
d.	Records of land purchases (including relocation costs).

5-64. ADO Records Retention.

The ADO must retain grant records according to the requirements of the current version of FAA Order 1350.14, Records Management.

5-65. Reopening Grants.

In extraordinary circumstances, a grant can be reopened by the ADO if the ADO finds that the sponsor has either not been reimbursed for allowable costs or has been reimbursed for costs that are not allowable. The ADO must notify APP-520 in writing before the ADO reopens any closed grant explaining the reason that this action is necessary.

5-66. Audit Requirements.

2 CFR part 200, Subpart F (OMB Circular A-133, Audits of States, Local Governments and Non-Profit Organizations), establishes audit requirements for states, local governments, and non-profit organizations receiving Federal funding, which includes AIP. Table 5-37 contains the guidance on when AIP audit are required by entity, including privately owned sponsors that do not fall under 2 CFR § 200.501 (OMB Circular A-133, Audits of States, Local Governments and Non-Profit Organizations).

A grant can be audited at any time whether the grant is open or closed. Audit standards and requirements are included in 2 CFR part 200) and in the Single Audit Act of 1984. Revenue use compliance reviews are also required as part of the ACO-100 requirements and are discussed in the current version of FAA Order 5190.6, FAA Airport Compliance Manual.

The ADO has the option of requesting that the DOT Office of Inspector General (OIG) conduct additional audits where the ADO determines a need exists. Examples of reasons for the ADO to request an additional audit include where there is evidence of financial discrepancies or evidence of an unusual financial situation.

Table 5-37 Requirements for AIP Audits by Entity

For the following entity…	The following audit requirements apply…
a. Publicly Owned Sponsor	If the sponsor expends Federal grants for more than $500,000 in a fiscal year in Federal funding, the sponsor must have a single or program-specific audit conducted for that fiscal year. This $500,000 requirement applies to all Federal funding, not just AIP.
b. Block Grant Subgrant Recipient	If the sponsor expends Federal grants for more than $500,000 in a fiscal year in Federal funding, the sponsor must have a single or program-specific audit conducted for that fiscal year. This $500,000 requirement applies to all Federal funding, not just AIP. For block grant states, it is the opinion of the FAA that the airport receiving the subgrant, not the state, is responsible for obtaining the single audit. The airport that received the subgrant must report the grants on their Schedules of Expenditures of Federal Awards (see 2 CFR § 200.331 (OMB Circular A-133, Audits of States, Local Governments and Non-Profit Organizations)). The airport must report the grant on their Schedules of Expenditures of Federal Awards as subrecipients.
c. Block Grant State	For block grant states, it is the opinion of the FAA that block grant states are responsible for ensuring the airports under the block grant obtain single audits, if required. For block grant states, both the state must report the grants on their Schedules of Expenditures of Federal Awards (see 2 CFR § 200.331 (OMB Circular A-133, Audits of States, Local Governments and Non-Profit Organizations)). The states must report the grants to airports as a pass through.
d. Privately Owned Sponsor	2 CFR part 200 Subpart F (OMB Circular A-133, Audits of States, Local Governments and Non-Profit Organizations) does not apply to privately owned sponsors. However, the ADO must require the privately owned sponsor to have an audit of the grant conducted for all but the most basic projects (such as acquisition of a snow removal vehicle). The ADO must include a special condition in the grant to require this. The automated AIP system contains the current available special conditions. This audit must be conducted at the completion of the project and must be done in accordance with accepted standard audit practices. The sponsor must provide copies to both the ADO and the OIG.

5-67. Disposal of AIP Funded Equipment.

The criteria for a sponsor to dispose of equipment that is no longer needed, is being replaced, or has exceeded its useful life (per Paragraph 3-12) are listed in Table 5-38. The criteria are consistent with 2 CFR § 200.33. A sponsor can determine the fair market value by advertising the equipment to determine the amount a willing purchaser would pay, or by hiring an accredited appraiser. Advertising is different than soliciting specific companies. Advertising opens up the arena to a large audience. Soliciting narrows that audience and therefore is not allowable.

Table 5-38 Criteria for Disposing or Replacing AIP Funded Equipment

If the equipment is…	And, per 2 CFR § 200.33, the fair market value is…	The following applies…
a. Retained by the airport (for any use) or donated or sold to any another entity	Less than $5,000.	No reimbursement to the FAA is required.
b. Retained and used for airport purposes	$5,000 or more.	No reimbursement to the FAA is required. No AIP funds may be used to provide building space for this equipment.
c. Retained and used for non-airport purposes	$5,000 or more.	Reimbursement to the FAA is required (for an amount equal to the fair market value multiplied by the current Federal share). The reimbursement to the FAA is accomplished by the ADO reducing the total project cost of the next grant received by the sponsor by an amount equal to the total fair market value of the equipment. No AIP funds may be used to provide building space for this equipment.
d. Donated at no cost to another sponsor and the equipment is both eligible and justified at the receiving airport	$5,000 or more.	The grant obligations for the equipment are transferred to the other sponsor. No reimbursement to the FAA is required.

Table 5-38 Criteria for Disposing or Replacing AIP Funded Equipment

If the equipment is…	And, per 2 CFR § 200.33, the fair market value is…	The following applies…
e. Sold (at fair market value or less) to another sponsor and the equipment is both eligible and justified at the receiving airport	$5,000 or more.	*This is not the preferred scenario. Donation of the equipment is a much more effective way to transfer the equipment.* The grant obligations for the equipment are transferred to the other sponsor. Reimbursement to the FAA is required (for an amount equal to the fair market value multiplied by the current Federal share). The reimbursement to the FAA is accomplished by the ADO reducing the total project cost of the next grant received by the sponsor by an amount equal to the total fair market value of the equipment. The purchasing airport may request a grant for the purchase price, provided the equipment meets FAA specification and has an acceptable useful life based on the purchase price.
f. Sold (at fair market value or less) or donated to a non-eligible entity	$5,000 or more.	Reimbursement to the FAA is required (for an amount equal to the fair market value multiplied by the current Federal share). This reimbursement amount is required even if the equipment was donated at no cost or sold for less than fair market value. The reimbursement to the FAA is accomplished by the ADO reducing the total project cost of the next grant received by the sponsor by an amount equal to the total fair market value of the equipment.

5-68. Disposal of Excess/Unneeded AIP Funded Land (and ADO/Sponsor Tracking).

49 USC § 47107(c)(2) requires a sponsor to promptly dispose of AIP funded land when the land is no longer needed for airport purposes. In this specific case, airport purpose includes land is needed for an existing or future aeronautical purpose (including runway protection zone) or that serves as noise buffer land.

If the ADO determines that the land is no longer need for these purposes, the sponsor has the choice of either selling or keeping the land for non-airport purposes. In either case, the sponsor must use the Federal share of the fair market value on projects in the order of precedence listed in Table 5-39 per 49 USC § 47107(c)(4). This is done outside of the grant process and requires a

land release approval from the ADO (see the current version of FAA Order 5190, FAA Airport Compliance Manual). The ADO must also review and approve or disapprove the sponsor's choice of how to apply the funding prior to the funds being used for sponsor's requested purpose.

The ADO and regional office may contact APP-400 and ACO-100 for assistance on the ADO and sponsor requirements for tracking and disposal of AIP, Federal Aid to Airports Program (FAAP), or Airport Development Aid Program (ADAP) acquired land.

Table 5-39 Order of Precedence for Applying Sale Proceeds of AIP Funded Land

Order of precedence to apply the Federal share of the fair market value is…
a. Reinvestment in an approved noise compatibility project.
b. Reinvestment in an approved project that is eligible for funding under 49 USC § 47117(e). The only projects in this section of the law are projects eligible for noise and environmental set aside funding. A complete list of projects eligible for noise and environmental set aside funding is contained in Paragraph 4-7.
c. Reinvestment in all other approved airport development projects at the airport.
d. Transfer to a sponsor of another public airport for a noise compatibility project at the other airport.
e. Send the ADO a check as directed by the FAA Office of Finance and Management, FAA Accounts Payable Section B (AMK-314) for deposit in the Airport and Airway Trust Fund.

This page has been intentionally left blank.

Chapter 6. What special AIP programs are available?

Section 1. Letters of Intent (LOI).

6-1. LOI Overview.

A Letter of Intent (LOI) is a formal document issued by the FAA that states an intention to provide future funding using appropriate entitlements or apportionments, discretionary or funds from the small airport fund. The LOI is limited to airport development projects, including project formulation costs, at primary and reliever airports. It is further limited to projects that enhance or preserve capacity. 49 USC § 47110(e) gives the FAA the authority to issue LOIs and describes the requirements and prescribes the limitations on the use of the LOI.

The LOI establishes a schedule for future AIP funding, subject to annual appropriations and availability of funds. A sponsor who has received an LOI may start the project without waiting for individual AIP grants. Allowable project costs are eligible for reimbursement, subject to the payment schedule set forth in the LOI.

The LOI process is rigorous and requires early coordination and a full understanding of the submission and evaluation criteria by all parties involved. This section of the Handbook discusses the regulatory requirements.

Historical LOI information is available on the FAA Office of Airports website (see Appendix B for link). However, this information is not a reliable guide for future award amounts and disbursement schedules.

6-2. LOI Funding Rules and Policy.

Table 6-1 contains the unique funding rules and policy that apply to LOIs.

Table 6-1 LOI Funding Rules and Policy

Unique LOI funding rules and policy include…
a. LOI Budget. Per 49 USC § 47110(e)(4), the FAA must reserve a reasonable amount of AIP funding for grants not covered by LOIs. APP-510 meets this requirement by annually establishing an LOI budget that it uses to establish future LOI payment schedules.
b. Scheduling LOI Payments beyond the Fiscal Year of the Current AIP Authorization. The Department of Transportation and Related Agencies Appropriations Act, 1989 (Section 334 of Public Law 100-457) allows the FAA to issue an LOI with payments scheduled beyond the statutory expiration of the current AIP authorization.

Table 6-1 LOI Funding Rules and Policy

Unique LOI funding rules and policy include…
c. Use of Airport Entitlements. It is FAA policy for a sponsor to commit all of the airport entitlements over the life of the LOI to the project unless APP-500 and the ADO agree otherwise. If during any given year a sponsor's entitlements vary from the amount approved in the LOI schedule for that year: **(1) Fiscal Year Entitlements Less than LOI Schedule**. The ADO cannot increase the discretionary funds to compensate for the shortfall. Instead, the sponsor is expected to make up the shortfall with entitlements from a future year or other funding source. **(2) Fiscal Year Entitlements More than LOI Schedule**. After consultation with the sponsor, the ADO has the discretion to apply the funds to other higher priority projects during that fiscal year, carry over the funds to the following fiscal year, or add them to that year's annual payment (reducing the entitlements that need to be applied to the LOI in future years).
d. Use of Discretionary. It is FAA policy that the total of discretionary funds in all LOIs subject to future obligation is limited to approximately 50% of the forecast discretionary funds available for that purpose. Depending on the size of airport, the discretionary funding may be drawn from the Capacity/Safety/Security/Noise fund, the Small Airport Fund, or the Remaining Discretionary fund.
e. Use of Passenger Facility Charges. Per 49 USC § 47110(e)(5), the FAA is restricted from requiring a sponsor to impose a passenger facility charge for the project in order to obtain a letter of intent.
f. Reimbursing with Discretionary. The ability to reimburse with discretionary funds under an LOI is discussed in Paragraph 3-100.
g. Change to Nonprimary Airport Status. Per 49 USC § 47108(e)(1), if a primary airport changes to a nonprimary airport when a development project approved under an LOI is underway, the project remains eligible for discretionary funds.
h. Insufficient Project Progress. In cases where significant final design, land acquisition, permitting or other requirements must still be completed, the FAA has an option to establish a disbursement schedule that defers the first year's disbursement until certain milestones have been achieved.
i. Interest Costs. Because interest from bonds or other forms of indebtedness is not an allowable cost, interest costs may not be included in project costs and will not be covered as part of an approved LOI.

6-3. LOI in the Context of an Airport's Overall Capital Program.

The proposed action is the primary project or program in a sponsor's LOI request. Typically, the proposed action is not the only capital project for the airport. The FAA's financial analysis will focus principally on the projects for which the LOI is requested, but it is also beneficial to consider major funding requests in the context of the airport's broader financial environment. Therefore, it is important to clearly define three overlapping sets of capital project data as shown in Table 6-2 and Figure 6-1.

Table 6-2 Three Overlapping Sets of Capital Data in the LOI Review

The three overlapping sets of capital data are…
a. Overall Capital Program. The sponsor must provide a complete financial picture of the airport in its LOI request. This includes both eligible and ineligible airport development needs. The FAA will assess whether any of these needs may impact the sponsor's ability to support the LOI, including other higher priority projects that may require use of entitlement funds. However, the FAA's evaluation will focus primarily on the proposed action.
b. LOI Proposed Action. The proposed action includes all work necessary to achieve the overall LOI objective whether or not the work is AIP eligible. It is important to include all of this work to capture the benefits and/or costs that will be calculated in the Benefit Cost Analysis (BCA) as further discussed in Paragraph 3-14. For example, if the proposed action involves a runway extension, then the proposed action may include multiple related projects such as associated facility relocations. The full cost of the proposed action must be reflected in the BCA and the associated funding plan.
c. LOI Projects. The LOI projects are the individual project elements that the ADO will place under grant if the LOI is approved. These projects must have clearly established AIP eligibility, and must be scheduled for implementation in advance of the requested LOI disbursement schedule.

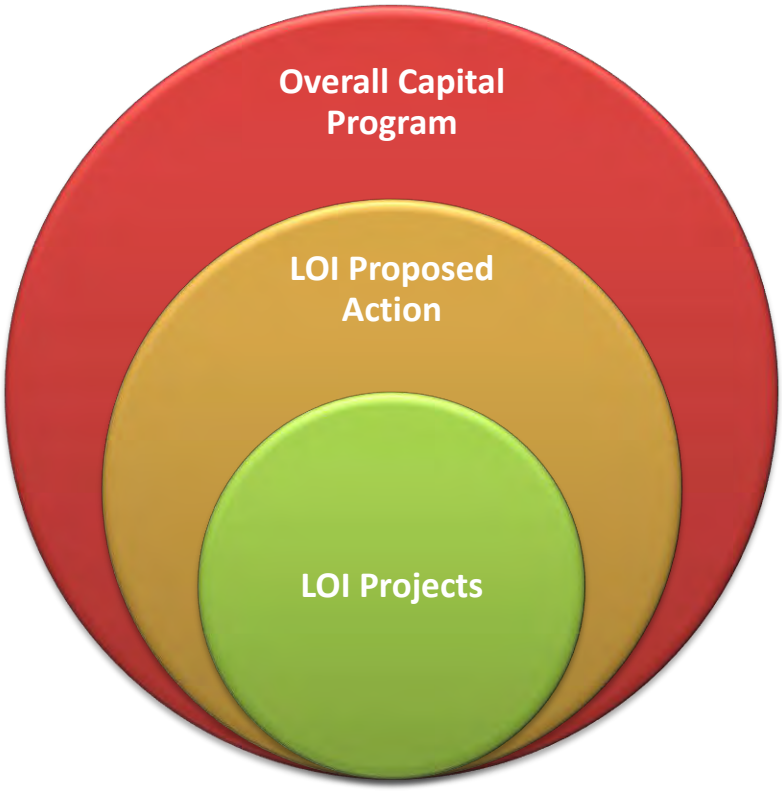

Figure 6-1. Three Overlapping Sets of Capital Data in the LOI Review

6-4. LOI Project Criteria by Airport Type.

49 USC § 47110(e) gives the FAA the authority to issue the LOI's for projects that enhance or preserve capacity at primary and reliever airports. By FAA policy, LOI projects must meet the criteria listed in Table 6-3. All of the other project funding requirements in Chapter 3 apply, including the restriction on using AIP funds for interest payments.

A project under an LOI must also satisfy all statutory and administrative requirements for an AIP project. Sponsors must proceed as though they had applied for and been awarded AIP funds and must fulfill all environmental, civil rights, bidding, procurement, and contracting requirements associated with an AIP grant, even though portions of the work may proceed in advance of receiving AIP funds.

Table 6-3 LOI Project Criteria by Airport Type

For the following type airport…	The following criteria apply…
a. Large and Medium Hub	**Capacity Enhancing Projects:** **(1) Airfield Capacity Enhancement.** The proposed project must enhance airfield capacity by increasing aircraft movements, increasing aircraft seating or cargo capacity (including a different aircraft design group), or reducing airfield delays. **(2) Supporting Infrastructure.** LOI projects must only include other AIP-eligible infrastructure that is logically necessary to complete the LOI project. In many cases this will be something that is physically required, such as acquiring land to complete a runway extension. However, in some cases, project components may not be physically required but logically necessary. For example, when extending a runway, it may also be necessary that the parallel taxiway be extended to ensure the full operational benefits of the runway extension are successfully realized. While the taxiway extension is not physically required, it is logically necessary because it links to the operational efficiency of the LOI project. **(3) Non-Supporting Infrastructure.** The LOI project must not include project components that, while completed concurrently because of convenience, are not logically necessary for the completion of the LOI project or for realizing the benefits of the LOI project. **(4) Aprons.** To qualify for LOI consideration, new apron areas must increase airfield capacity. However, aprons compete less favorably for LOIs than runway or taxiway projects. In addition, apron projects caused by terminal reconfiguration or relocations do not typically add capacity and are rarely eligible under an LOI. **(5) System Capacity**. Per 49 USC § 47110(e)(2)(C), APP-510 must determine that the project will significantly enhance system-wide airport capacity. **(6) Ineligible Rehabilitation or Reconstruction Projects.** Rehabilitation or reconstruction projects undertaken solely to extend the life of existing pavement does not satisfy the system capacity statutory requirement. **(7) Eligible Reconstruction Projects.** Reconstruction of an existing runway or taxiway must strengthen or relocate/shift the pavement and result in a capacity enhancement by: **(a)** Increasing aircraft movements, increased aircraft seating or cargo capacity (including accommodating a different aircraft design group), or reduced airfield delays. **(b)** Creating an added arrival stream or reducing dependency between arrival streams. **(c)** Eliminating intersecting runways. **(d)** Improving departure, approach, or missed approach procedures.

Table 6-3 LOI Project Criteria by Airport Type

For the following type airport…	The following criteria apply…
b. Small Hub, Non Hub, Reliever	**Airfield Capacity Enhancing Projects:** **(1) Airfield Capacity Enhancement.** The proposed project must enhance airfield capacity by increasing aircraft movements, increasing aircraft seating or cargo capacity (including a different aircraft design group), or reducing airfield delays. **(2) Supporting Infrastructure.** LOI projects must only include other AIP-eligible infrastructure that is logically necessary to complete the LOI project. In many cases this will be something that is physically required, such as acquiring land to complete a runway extension. However, in some cases, project components may not be physically required but logically necessary. For example, when extending a runway, it may also be necessary that the parallel taxiway be extended to ensure the full operational benefits of the runway extension are successfully realized. While the taxiway extension is not physically required, it is logically necessary because it links to the operational efficiency of the LOI project. **(3) Non-Supporting Infrastructure.** The LOI project must not include project components that, while completed concurrently because of convenience, are not logically necessary for the completion of the LOI project or for realizing the benefits of the LOI project. **(4) Aprons.** To qualify for LOI consideration, new apron areas must increase airfield capacity. However, aprons compete less favorably for LOIs than runway or taxiway projects. In addition, apron projects caused by terminal reconfiguration or relocations do not typically add capacity and are rarely eligible under an LOI. **Airfield Capacity Preservation Projects** **(1) Eligible Rehabilitation or Reconstruction Projects**. Rehabilitation or reconstruction projects must either enhance or preserve capacity. However, rehabilitation and reconstruction projects to preserve capacity have historically competed less favorably for LOIs than those that will enhance capacity.
c. New or Replacement Airports	**(1) Additional Capacity Considerations.** In addition to the above criteria, new and replacement airports must provide a net capacity gain that would fulfill an unmet civil aeronautical need, with due consideration of the proposed facility's functional and operational position relative to other existing or proposed airport facilities.

6-5. LOI Approval/Disapproval Process.

The FAA's process for evaluating LOI requests is principally a financial planning process rather than grant administration. Formal grant applications will still be required for each year once an LOI is awarded, based on the LOI payment schedule and subject to the availability of funds. The current process, as of the publication date of this Handbook, is contained in Table 6-4. APP-510 also maintains a timeline diagram for the LOI process that is available upon request.

Table 6-4 LOI Approval/Disapproval Process

The steps in the LOI process include…
a. Early FAA/Sponsor Coordination. Any sponsor interested in pursuing an LOI must contact their ADO as early as possible, generally at least five to six months before the LOI request deadline of March 1. The ADO must then brief the sponsor on all aspects of LOIs, including the LOI request process, evaluation criteria and submission requirements. The ADO is the primary contact for the sponsor regarding an LOI.
b. Joint Meeting. The ADO has the option to hold a joint meeting so that the ADO, the regional office, APP-510, the sponsor, and the sponsor's consultant understand the purpose and scope of the project, FAA authority and policy, and sponsor financial needs, schedules, and responsibilities. This joint meeting will normally include a discussion of the evaluation criteria including the relationship between the FAA's Terminal Area Forecast (TAF) and the sponsor's forecast assumptions and level of effort to be used in their financial planning and Benefit-Cost Analysis.
c. Benefit-Cost Analysis. The FAA recommends that sponsors submit the Benefit-Cost Analysis (BCA) for the proposed action to the ADO as far in advance of the LOI request as possible, but no later than March 1. This is because the review of the BCA may take more than six months and could delay the LOI decision. The BCA process for capacity projects is contained in Paragraph 3-14.
d. ADO Notification to APP-510. Per FAA policy, APP-510 requests a list of LOI candidates from the regional offices early in the fiscal year. Regional offices must coordinate with the ADOs and provide the list to APP-510 in the time frame requested by APP-510. In addition, the ADO must notify the regional office, and the regional office must notify APP-510 promptly when a sponsor that is not on this list expresses interest in obtaining an LOI. Preliminary information provided to APP-510 must include a general description of the project, the estimated cost, the proposed schedules for construction and reimbursement, and an indication of whether the project is a good candidate for an LOI.
e. Sponsor Submits LOI Request. It is FAA policy for sponsors to submit LOI requests to the ADO on or before March 1. The LOI review committee will normally review and either approve or disapprove the request by end of the same fiscal year. If a sponsor submits an LOI request after March 1, the LOI review committee will normally not review the request until the following fiscal year. The LOI review committee also has the option to review incomplete or partial requests on a case by case basis.
f. ADO Review. The ADO and regional office will prepare an overview, assessment and preliminary recommendation for Headquarters consideration, within 30 days of receiving an LOI request unless an extension is requested of and approved by APP-510 in advance. The ADO and regional office must contact APP-510 to request the preferred format for this recommendation.

Table 6-4 LOI Approval/Disapproval Process

The steps in the LOI process include…
g. Committee Review. The FAA will establish a national-level committee each year to review LOI requests to ensure that all statutory requirements have been met, and to advise the FAA Associate Administrator for Airports (ARP-1) and the FAA Director of the Office of Airport Planning and Programming (APP-1) on the selection of LOI proposals. The committee will be composed of representatives of the FAA Office of Airports (ARP). The committee is chaired by APP-510 and may include ARP representatives from APP-510, APP-520, and an ARP regional division manager (or designee) with no LOI candidate in the current year. The committee may also include representation by the FAA Office of Aviation Policy and Plans (APO), the FAA Air Traffic Organization (ATO) and/or other FAA offices, as determined by the committee chair. The committee may recommend that APP-510 request additional information from the sponsor, and/or additional assessment from the ADO or regional office.
h. LOI Selection. After receiving the recommendations from the LOI Committee, ARP-1 makes the official selections.
i. LOI Programming. After ARP-1 selects the sponsors that will receive LOIs, APP-500 coordinates the LOI sign-off package within Headquarters including the FAA Office of Government and Industry Affairs (AGI). The LOI package contains a draft of the LOI documents, a memorandum from APP-500 to the regional division manager containing documentation of the FAA's review and proposed LOI approval, and the unsigned congressional notification letters.
j. DOT Office of the Secretary (OST) Coordination. APP-500 forwards the LOI sign-off package electronically to OST including the unsigned congressional notification letter.
k. Congressional Notification. For new or amended LOIs that exceed $10,000,000, OST must send the signed congressional notification letter to the Committees on Appropriations of the Senate and the House of Representatives; the Committee on Commerce, Science, and Transportation of the Senate; and the Committee on Public Works and Transportation of the House of Representatives of the proposed LOI. This requirement is contained in a note in the Department of Transportation and Related Agencies Appropriations Act, 1993 (Public Law 102-388, title III § 320). The FAA interpretation of this requirement is that OST must notify these parties of the new or amended LOI and may proceed if no legislation is passed to prohibit the LOI within 30 days after notification. OST electronically notifies the FAA when this process is complete.
l. LOI Decision Memorandum. When the congressional notification process is complete, APP-510 will officially prepare a memorandum that establishes the LOI funding level and provides supporting information for the decision.
m. LOI Offer. The ADO will issue the LOI to the sponsor when APP-510 has provided the ADO with the LOI Decision Memorandum. The same official who normally signs a grant offer for the FAA will be the official who signs the LOI offer.
n. ADO Issues Initial LOI Grant. APP-520 normally schedules the initial LOI grant for the fiscal year following the year in which the application was received unless the approval of the LOI is delayed beyond the end of the fiscal year. However, as allowed by 49 USC § 47110(e)(6), APP-500 has the option to schedule the initial LOI grant during the same fiscal year that the LOI is approved.

6-6. Sponsor LOI Submission Requirements.

Per FAA policy, sponsors must submit one hard copy and one electronic copy of the documentation listed in Table 6-5to the ADO.

Table 6-5 Sponsor LOI Submission Requirements

The sponsor must provide…
a. Executive Summary. This summary must include an overview of the existing airport's facilities and operating environment, along with an overview of the proposed capital project or program to be supported by the requested LOI.
b. Description of the Existing Problem. This description must focus on the capacity constraints of the existing facilities relative to existing or projected demand.
c. Description of System-Wide Airport Capacity Enhancement (required for Large and Medium hub airports). This description must include how the proposed action will meet the requirement for a significant system-wide capacity enhancement. Sponsors must not construe this to refer solely to throughput capacity for major airline hubs. Sponsors may rely upon any one or more of several factors that the FAA may then consider in making this determination. Examples include, but are not limited to, physical airport improvements that result in or support one or more of the following. Reduction of required minimums will not generally be considered sufficient evidence, on its own, to represent a significant system-wide airport capacity enhancement. **(1)** Capacity increase in annual operations, either in Visual Flight Rules (VFR) or Instrument Flight Rules (IFR) conditions or both. **(2)** Increase in airport service volume by the addition of a new runway, elimination of runway intersections or other airfield operational constraints. For large hub airports, sponsors will need to demonstrate that the capacity benefits are real, measurable and significant. **(3)** Increase in hourly *call rates* (i.e., local tower acceptance rates in terms of hourly arrivals and departures). **(4)** Delay reduction relative to existing or forecast levels, either at the individual airport or among multiple airports serving the same geographic area. **(5)** Projected delay savings as a percentage of existing delays at the airport, or as a percentage of all national delays. **(6)** Delay reduction that can be shown to enhance airline schedule reliability, even if the project does not lead to substantial increases in operations. **(7)** Creation of an additional arrival stream or reduced dependency between arrival streams. **(8)** Regional distribution of demand from one or more capacity-constrained or significantly delayed airports. **(9)** Elimination of a demonstrable capacity constraint for an airport serving a region or metropolitan area where population or economic growth has exceeded growth in available departing seats or cargo capacity. **(10)** Increase in the maximum stage-length that can be served from the airport.

Table 6-5 Sponsor LOI Submission Requirements

The sponsor must provide…
d. Description of the Sponsor's Forecast. This description must include both summary and detailed information on enplanements and operations. If applicable, the description must also include details of the fleet mix, the peak hour airfield mix by class, and the airline load factors. The sponsor must provide a clear discussion of how the forecasts were derived and their key assumptions.
e. Description of the Proposed Action. This description must focus on how the proposed action will provide additional capacity. For large and medium hub airports, this description must also explain how the proposed action will enhance system-wide airport capacity.
f. Description of the Capital Cost Estimates. This description must delineate the level of planning or design data on which the estimates are based, the source of quantities and unit costs, and the levels of contingency assigned. The ADO has the option to request that the sponsor secure the services of an independent consultant to conduct a formal cost estimate review, including unbiased quantity calculations, estimates of unit costs and determination of appropriate contingency levels based on the level of design information available.
g. Status of and Schedule for the ALP Approval. If the sponsor has not submitted an ALP depicting the proposed action by March 1, the sponsor must provide a schedule to the ADO that clearly demonstrate that the FAA will be able to approve the ALP by September 30. This schedule must include sufficient time for full aeronautical study and determination and all required coordination.
h. Status of Environmental Decision and Required Federal/State Permits. Both approval of the proposed action on the airport layout plan and issuance of the LOI are considered Federal actions subject to the requirements of the National Environmental Policy Act (NEPA). If the FAA has not completed the environmental decision or the sponsor has not obtained the required federal/state permits, the sponsor must provide a status/schedule of when this will be accomplished. The schedule must demonstrate the FAA has sufficient time to issue an environmental decision by August 1. If the schedule suggests a date later than August 1, the sponsor must consider deferring the LOI request to the following year.
i. LOI Application Financial Template and Supporting Documentation. The sponsor must include the requested LOI amounts (payment schedule) and all other proposed sources and amounts for the proposed action in the FAA Form 5100-139, LOI Application Financial Template (see the AIP Forms link in Appendix B). If additional approvals or other actions are required for any funding type (such as for Passenger Facility Charges or General Airport Revenue Bonds) the sponsor must include the status. Using the LOI Application Financial Template, the sponsor must clearly outline all sources and amounts of financing for the proposed project as well as for all other anticipated capital projects during the life of the LOI request. The Finance Template also provides an opportunity for sponsors to discuss alternative LOI disbursement schedules and how those alternatives might impact the overall financial plan.

Table 6-5 Sponsor LOI Submission Requirements

The sponsor must provide…
j. Description of the Financial Plan for Other Capital Needs. The sponsor must discuss other significant capital costs identified in the LOI Application Financial Template beyond the proposed action to enable the FAA to identify whether the funding plan for the proposed action is viable. The FAA does not normally review the impact on rates and charges, landing fees, cost per enplanement, or the ability to attract or retain airline service, which is driven by many factors including underlying market strength, the competitive environment, revenue potential, and other operating expenses beyond airport rates and charges The FAA will also not generally consider current or projected Cost Per Enplanement (CPE) or landing fee projections as a means of comparing one airport to another. CPE is highly dependent upon a number of factors, including the ownership and operation of passenger terminals, the nature of each airport's use and lease agreement, and the structure of each airport's rates and charges. However, the FAA may consider analyses and conclusions prepared by other industry experts or stakeholders, including municipal bond rating agencies, bond insurers, institutional investors and the airlines themselves, particularly in cases where the airlines have already approved the issuance of bonds in support of the proposed action. Therefore, it can be beneficial for sponsors to provide such analyses or documentation as part of the LOI request.
k. Benefit-Cost Analysis (BCA). If not submitted previously, the sponsor must include a BCA that was prepared in accordance with the FAA Airport Benefit-Cost Analysis Guidance (see Appendix B for link). This information must include all data necessary to explain the assumptions regarding existing and proposed facilities and operational parameters. **(1) Detailed Simulation Modeling.** For a project over $50 million dollars, it may also be beneficial for the sponsor to conduct detailed simulation modeling. The FAA has the option to require this if they feel the complexity of the project warrants it. **(2) Financial Data for Required Proposed Action Components.** Sponsors must recognize that the total project cost used in the BCA may be more than that of the proposed LOI project. This is necessary if the additional project components are required to realize the benefits of the proposed action. For example, for an LOI for a new runway, the BCA may need to include taxiway and other airfield improvements to realize the benefits of the new runway. **(3) Sensitivity Analysis**. For the purposes of the LOI financial analysis, sponsors are also encouraged to consider evaluating the effects of more conservative growth assumptions, to minimize the potential for overestimating future airport activity levels and capacity benefits, as well as other funding sources including PFCs and entitlements. This may be accomplished by the sponsor through sensitivity analyses designed to quantify the overall effect of slower growth rates or alternative assumptions regarding demand.
l. Additional Information for New and Replacement Airports. The FAA may require additional information about any aspect of the proposed development, including phasing of the new or replacement airport, the facility's functional and operational position relative to other existing or proposed airport facilities, population and demographic patterns, air service (including passenger and cargo) and underlying economic activity.
m. Additional Information for High Federal Participation. Sponsors seeking the highest levels of Federal participation may be required to provide additional documentation of forecast demand levels, sensitivity analyses, and/or more heavily backend loaded disbursement schedules.

6-7. LOI Evaluation Criteria.

49 USC § 47115(d)(1) contains the six criteria that the FAA must use when selecting system-wide capacity enhancement projects for discretionary funding. The FAA interprets 49 USC § 47110(e) to require the FAA to use these criteria, which are listed in Table 6-6, for LOI evaluation.

The FAA will also consider the sponsor's requested rate of Federal participation relative to comparable projects, airport revenue diversion or other compliance issues, and grandfathered payments to other governmental offices.

The ADO and regional office must contact APP-510 to request the preferred format for the ADO and region office evaluation and recommendation to ensure a consistent review process throughout the FAA Office of Airports.

Table 6-6 Evaluation Criteria for LOI Requests

The criteria, which are used by the FAA to evaluate LOI requests, are….	
a.	The effect that the project will have on overall national transportation system capacity.
b.	The benefit and cost of the project, including, in the case of a project at a reliever airport, the number of operations projected to be diverted from a primary airport to the reliever airport as a result of the project, as well as the cost savings projected to be realized by users of the local airport system.
c.	The financial commitment from non-United States Government sources to preserve or improve airport capacity.
d.	The airport improvement priorities of the States to the extent such priorities are not in conflict with items a and b in this table.
e.	The projected growth in the number of passengers or aircraft that will be using the airport at which the project will be carried out.
f.	The ability of the project to foster United States competitiveness in securing global air cargo activity at a United States airport.

6-8. LOI Offer Package.

An LOI Offer Package is normally comprised of two documents, the cover letter and the LOI Offer. Both documents are developed by APP-510 and signed by the ADO. Per FAA policy required contents of this LOI Offer are included in Table 6-7.

In addition, the ADO has the option to include any additional guidance or information that the ADO deems necessary. For example, the ADO may wish to include a spreadsheet with a detailed cost breakdown that shows the project component costs that are included in the proposed action and/or a project sketch that clearly shows the approved project components.

Table 6-7 LOI Offer Contents

APP-510 must include the following information in the LOI Offer…
a. LOI Number. Currently this is based on the regional office's three letter code, the fiscal year of issuance, and a sequential number (for example: AGL-88-02 is the second LOI issued by AGL in FY 1988). APP-510 is in the process of converting this to the following format, which must be used by the ADO once officially adopted: 3-AA-BBBB-LCC-YYYY *Where:* 3 = The program code for AIP. AA-BBBB = The NPIAS code for the airport. L = A single letter designator indicating this is an LOI. CC = The sequential number of LOIs issued for that airport. YYYY = The fiscal year in which the LOI is executed.
b. Airport Name.
c. Project Description. A brief, but complete, project description.
d. Maximum Federal Funding. The maximum amount of Federal funds which will be made available for the project.
e. Funding Schedule. A schedule of reimbursements by fiscal year and type of funds (apportionment and/or discretionary).
f. Sponsor Compliance Statement. A statement that the sponsor must be in compliance with all statutory and administrative requirements.
g. *Intent* to Obligate Statement. A statement that the LOI is not considered an obligation of the United States, must not be deemed an administrative commitment for funding, but only an intention to obligate from future budget authority as such funds become available.
h. Amendment Statement. A statement that the LOI, with sufficient justification, may be amended to adjust the maximum Federal obligation, the payment schedule, or both.
i. Requirements before Proceeding Statement. A statement that if a sponsor proceeds without satisfying all of the *statutory and administrative requirements* associated with an actual grant, the commitment to reimburse the sponsor under the LOI may be voided.
j. Failure to Comply with Federal Requirements Statement. A statement that a sponsor's failure to comply with all Federal requirements could lead to a requirement to repay paid amounts and jeopardize later reimbursements.

6-9. LOI Grant Administration.

Once an LOI is approved, the ADO is responsible for issuing and administering the associated grants according to the approved LOI payment schedule. This includes ensuring that all of the sponsor (Chapter 2), project (Chapter 3), funding (Chapter 4), and grant (Chapter 5) requirements have been met.

The ADO has the flexibility to determine which phases of the LOI project will be included in each grant as long as the ADO is able to accurately track what is being funded.

The sponsor is required to maintain a current record of the physical and financial status of the project. The ADO has the option to request this information in the format and frequency the ADO determines is necessary.

6-10. LOI Amendments.

There must be ongoing ADO involvement as each project phase is completed, as subsequent phases come to bid, and as successive grants are issued under the LOI. In extremely limited circumstances, the FAA may amend an LOI in future years to adjust the total maximum Federal obligation, the schedule of payments, or both. Circumstances that warrant an amendment include, but are not limited to, a change in project cost related to unforeseen Federal or state regulatory requirements, changes in project timing or scope, or changes in future obligating authority. APP-510 approval is required prior to an ADO amending an LOI.

The sponsor has a responsibility to estimate and manage costs as accurately as possible. In cases where the sponsor faces unexpected increases in costs driven solely by economic conditions, sponsors must not view a possible LOI amendment as the first solution to be considered, particularly since the FAA's overall participation rate will generally represent a small percentage of overall funding.

The sponsor must either consider cost reduction or deferral measures, and/or pursue the full range of funding sources available. The FAA has the option to issue an amendment, but such amendments will be the exception rather than the rule and may result in the FAA extending the LOI payment schedule beyond the term of the original schedule and/or revising the level of Federal participation.

In cases where an amendment would exceed $10 million or 20% of the original LOI discretionary funding amount, APP-510 has the option to require the sponsor to submit updated information. If such an amendment is approved, APP-510 must initiate an DOT Office of the Secretary (OST) and congressional notification process as if a new LOI were being awarded.

An LOI is amended by the FAA issuing an LOI amendment letter. The LOI amendment is not subject to grant amendment rules.

The LOI amendment may or may not affect the individual grants previously issued under the LOI. If an individual grants is affected, the amendment rules in Section 7 of Chapter 5 will apply.

6-11. LOI Closeout.

Once all of the associated LOI grants are closed, the ADO must officially close the LOI in the automated AIP system.

6-12. Revising, Suspending, or Terminating an LOI.

If a sponsor proceeds without satisfying all of the *statutory and administrative requirements* associated with an actual grant, the FAA has the option to suspend or terminate the LOI. In the rare instance a sponsor proposes a substantial revision to the approved project, the ADO must contact APP-500 to determine the appropriate course of action. Sponsors must fully understand that failure to comply with all Federal requirements could lead to a requirement to repay paid amounts and jeopardize later reimbursements.

Section 2. State Block Grant.

6-13. General.

The State Block Grant Program allows states to assume the administrative responsibilities that are traditionally performed by the ADO for nonprimary airports. These functions are specifically defined by a state block grant agreement that is executed between the state and the FAA once the state is chosen for participation in the program.

6-14. Limited State Flexibility.

The State Block Grant Program provides participating states with some flexibility in the administration of the state apportionment and sponsor entitlement for the airports in their program. The limitations on this flexibility are outlined in the Memorandum of Agreement that is signed by both the state and the FAA. Unless specifically waived in the Memorandum of Agreement, the state must ensure that all applicable statutory and regulatory requirements discussed in this Handbook are met.

6-15. Responsibilities Retained by the FAA.

The FAA has determined that there are key functions that must be retained by the FAA. The ADO cannot delegate these functions to the state. The current version of Advisory Circular 150/5100-21, State Block Grant Program, contains a list of the specific functions that must be retained by the FAA.

6-16. Legislative History and List of Participants.

49 USC § 47128 authorizes the FAA to allow no more than ten states to administer block grants for the nonprimary airports in the state. Table 6-8contains the history of the State Block Grant Program and Table 6-9contains a list of the approved State Block Grant participants.

Table 6-8 History of the State Block Grant Program

Date	Major Milestones
December 30, 1987	The Airport and Airway Safety and Capacity Expansion Act of 1987 was passed. Section 116 of this Act amended the Airport and Airway Improvement Act of 1982, by adding new section 534 entitled State Block Grant Pilot Program.
October 20, 1988	14 CFR part 156, State Block Grant Pilot Program, was published in 53 Federal Register 41303 (October 20, 1988).
October 1, 1989	This State Block Grant Pilot Program became effective and allowed three states to apply for the program.
October 31, 1992	The Airport and Airway Safety, Capacity, Noise Improvement, and Intermodal Transportation Act of 1992 extended the State Block Grant Program until 1996. This Act also authorized the issuance of block grants for fiscal years 1993 through 1996 in four additional states (for a total of seven).
October 9, 1996	The Federal Aviation Reauthorization Act of 1996 authorized one new state block grant participant (for a total of eight) and made the State Block Grant Program a permanent feature of AIP.
April 4, 2000	The Wendell H. Ford Aviation Investment and Reform Act for the 21st Century (AIR-21) authorized one new state block grant participant in fiscal years 2000 and 2001 (for a total of nine) and an additional state block grant participant after fiscal year 2001 (for a total of ten).

Table 6-9 State Block Grant Participants

State	Fiscal Year Selected	Fiscal Year Exited Program
(1) Illinois	1989	N/A
(2) Missouri	1989	N/A
(3) North Carolina	1989	N/A
(4) Michigan	1993	N/A
(5) New Jersey (no longer in program)	1993	2003
(6) Texas	1993	N/A
(7) Wisconsin	1993	N/A
(8) Tennessee	1997	N/A
(9) Pennsylvania	1997	N/A
(10) New Hampshire	2008	N/A
(11) Georgia	2008	N/A

6-17. State Block Grant Program Application.

The FAA will accept applications for the State Block Grant Program at any time – there is no set application schedule. To do this, the state simply sends a letter of request with the information listed in Table 6-10 to the ADO.

States are encouraged to check with the FAA prior to submitting an application to determine if there are any available slots in the program. If a state is accepted into the program, the state can remain in the program until the state decides it wants to withdraw from the program or the FAA suspends or terminates its participation.

Table 6-10 State Block Grant Application Information

The state must describe…
a. The state's organization and capabilities to effectively administer a block grant program.
b. The state's airport system planning process.
c. The state's programming process.
d. The state's willingness and ability to comply with the State Block Grant Agreement.
e. The state's willingness and ability to comply with the National Environmental Policy Act of 1969, state and local environmental policy acts, Executive orders, agency regulations, and other Federal environmental requirements.
f. The state's willingness and ability to provide all program information that is requested by the FAA.
g. The state's process for determining which projects will be funded, including: **(1)** The state's process for ensuring that critical safety, and security, and other national aviation priority needs will be met. **(1)** The state's system for determining a project's priority and how this process is consistent with the FAA's national priority system.

6-18. FAA Selection of State Block Grant Participants.

49 USC § 47128 (b) and (c) describe the criteria that the FAA must use to select a state for the State Block Grant Program. These criteria are listed in Table 6-11. The ADO must review the state's request against the criteria in this table and make a recommendation to the regional office. The regional office must then make a recommendation to APP-520, who is responsible for the final determination. The ADO is responsible for notifying the sponsor of the FAA's official determination.

Table 6-11 State Block Grant Selection Criteria

In order for the FAA to select a state for the State Block Grant Program, the FAA must determine that…
a. The state has an organization capable of effectively administering a block grant program.
b. The state uses a satisfactory airport system planning process.
c. The state uses a programming process that is acceptable to the FAA.
d. The state is both willing and able to comply with the State Block Grant Agreement.
e. The state is both willing and able to provide all program information that is requested by the FAA.
f. The state is both willing and able to comply with the National Environmental Policy Act, state and local environmental policy acts, Executive orders, agency regulations, and other Federal environmental requirements.
g. The state uses a satisfactory process for determining which projects will be funded, including: **(1)** A satisfactory process for ensuring that critical safety, and security, and other national aviation priority needs will be met. **(2)** A satisfactory process for determining a project's priority that is consistent with the FAA's national priority system.

6-19. Memorandum of Agreement.

As of the publication date of this Handbook, it is FAA policy that the state and the FAA must enter into a State Block Grant Program Memorandum of Agreement in order for the state to qualify for grants under the program. The FAA officially documents that the selection criteria have been met by executing a State Block Grant Program Memorandum of Agreement (MOA) with the state. The ADO must retain a signed original of the executed State Block Grant Program MOA and forward a copy to APP-520.

This MOA outlines the responsibilities of the state and the FAA under the State Block Grant Program. The current version of Advisory Circular 150/5100-21, State Block Grant Program, contains the standard template that the ADOs must use for this MOA.

6-20. Grant Assurances.

The ADO must include Aviation Block Grant Program Assurances as part of all state block grants as well as a set of Airport Sponsors Assurances and Non-Airport Sponsors Undertaking Noise Compatibility Program Projects Assurances (see Appendix B for link to these assurances).

Per Aviation Block Grant Assurance #4, the state and or the associated airport owner receiving a subgrant are obligated to the Airport Sponsors Assurances or Non-Airport Sponsors Undertaking Noise Compatibility Program Projects Assurances as appropriate to the individual project. The state accomplishes this by attaching the applicable assurances to the subgrant agreement.

6-21. Criteria for an Airport to be in the State Block Grant Program.

Table 6-12contains the criteria for an airport to be in the State Block Grant Program.

The state and the FAA have the option to allow specific airports to remain outside of the State Block Grant Program. This would mean that the administrative responsibilities would remain in the ADO. Both the state and the FAA must agree with this action, otherwise the airport must stay within the State Block Grant Program. The ADO must include a list of these airports in the MOA and must include the process for these airports to compete for state apportionment. In addition, the ADO provides this list annually to APP-520.

Table 6-12 Criteria for an Airport to be in the State Block Grant Program

In order for an airport to be eligible to be in a State Block Grant Program, the airport must be…	
a.	In the National Plan of Integrated Airport System (NPIAS).
b.	Within the state boundaries of a block grant state.
c.	An existing (not planned) public-use airport.
d.	A general aviation, reliever, or nonprimary commercial service airport (primary airports are not eligible).
e.	Listed as a block grant airport in the State Block Grant Program Memorandum of Agreement between the state and the FAA.

6-22. ADO Right to Issue Grants Directly to Airports in the State Block Grant Program.

The ADO retains the right to issue a grant directly to an airport in the state block grant program. This grant would use small airport funds per 49 USC § 47116(c). This would be a rare occurrence and would normally only be done by the ADO to address an unusual circumstance.

6-23. Decision Authority for Discretionary Funds.

As of the publication date of this Handbook, it is FAA policy that the FAA retains the decision authority regarding which airport projects will be funded with discretionary funds within the block grant. The current APP-520 discretionary policy applies to these projects.

6-24. Grant Federal Share.

The Federal share rules for state block grants and their associated subgrants are included in Table 4-7.

6-25. Grant and Amendment Processes.

The ADO issues one or more grants to the state each year for the state's available nonprimary entitlement, state apportionment, and cargo funds (where applicable). The ADO also has the option of issuing additional grants to the state with discretionary funds at specific airports. The state then issues the individual subgrants to nonprimary airports in its state.

The grant and amendment processes for the State Block Grant Program are incorporated in the applicable sections of Chapter 6Chapter 5.

6-26. Transfer of AIP Funding between Airports.

The rules for transferring funding between airports within the State Block Grant Program are included in Table 6-13.

Table 6-13 AIP Funding Transfer Rules for the State Block Grant Program

For the following funding type…	The following transfer rules apply…
a. State Apportionment	None.
b. Passenger, Cargo, and Nonprimary Entitlement	The state must follow the transfer rules provided in Paragraph 4-11.
c. Discretionary	Per FAA policy, states are prohibited from transferring ADO assigned discretionary to another airport or project, or using unused discretionary for new projects. This policy aligns the use of discretionary between state block and non-state block grants.

6-27. Project Eligibility and Allowable Costs.

AIP requirements for airport project eligibility and allowable cost (see Chapter 3) are the same for states receiving a block grant as they would be if the ADO were administering the project. The ADO has the final call in eligibility determinations where there are disagreements with the states interpretation.

6-28. Project Administrative Costs.

The state can charge for *project administrative* costs that would otherwise be an allowable cost for the *project* (normally done by a consultant or other hired company). Paragraph 3-60 outlines the requirements for the cost for a state's employee's time as well as overhead or indirect costs (overhead or indirect costs include anything more than direct employee's time).

6-29. Program Administration Costs.

State *program administration* costs are unallowable. These are costs that would be incurred by the ADO if the FAA were administering the grant. Per FAA Policy, exemptions from this prohibition are not considered.

6-30. Required Timeframe to Issue Subgrants.

It is FAA policy that the state must issue all funding to subgrants in a manner that allows them to meet the period of performance and closeout deadlines contained in Paragraph 5-57. If the state does not do this, the ADO has the option to unilaterally deobligate the funds and close the grant.

6-31. Grant/Project Oversight.

Unless otherwise stated in the State Block Grant Program Memorandum of Agreement, all of the project and grant oversight requirements in Section 5 of Chapter 5 apply.

6-32. Grant Payments.

The rules for grant payments for state block grants are included in Section 6 of Chapter 5.

6-33. Grant Closeout.

The rules for grant payments for state block grants are included in Section 8 of Chapter 5.

6-34. Program Review by the FAA.

The FAA has the option of reviewing a state's administration of the State Block Grant Program. The state must provide all documentation requested by the FAA.

6-35. Accounting and Audits.

States must have an accounting system that accurately reflects expenditures of all funding within a state block grant. State block grants and subgrants are subject to the same audit requirements as any other AIP grant.

6-36. Suspension/Termination of a Grant Issued under the State Block Grant Program.

The FAA has the option to suspend and/or terminate any state block grant. The procedures are listed in Section 9 of Chapter 5. The ADO must assume the administrative responsibilities

associated with the suspended grant. This is not the same as suspending a state from the program, which is covered in Paragraph 6-37.

6-37. Suspension of a State from the State Block Grant Program.

The FAA has the option to suspend a state from the State Block Grant Program if the FAA determines the State fails to comply with mandatory requirements. The FAA must use the criteria used for admitting the state to the program (see Paragraph 6-18) and the conditions in the State Block Grant Memorandum of Agreement to make this decision. The FAA must also work with the state to determine a course for corrective action and a time frame in which it will be completed by the state.

If a state is suspended, the ADO must assume the administrative responsibilities associated with the program. Prior to suspension, the ADO must obtain copies of all subgrants (open or closed).

6-38. Removal or Voluntary Withdrawal from the State Block Grant Program.

States may voluntarily withdraw from the State Block Grant Program. In addition, failure of states to comply with block grant conditions or regional agreements may result in the FAA removing the state from the program.

a. APP-1, APP-500, and ACO-100 Coordination/Concurrence. The ADO must coordinate and obtain concurrence from APP-1, APP-500, and ACO-100 prior to initiating withdrawal or removal of a state from the State Block Grant Program.

b. Negotiations on Transfer of Responsibilities from State to ADO. Unless the FAA determines otherwise, the ADO and the state have the option to negotiate the transfer of responsibilities from the state to the ADO. For instance, the ADO might request to phase out the state's participation in the program starting with selected categories of airports or projects.

c. Amendment to Memorandum of Agreement. The State Block Grant Program Memorandum of Agreement must be amended to reflect the transfer of responsibilities to the ADO. The memorandum must list all open and closed subgrants and must indicate what documentation must be transferred to the ADO. The ADO must obtain APP-500 and ACO-100 concurrence with the memorandum before it is executed by the ADO.

d. State Reapplication after Termination. A terminated state can reapply to be in the State Block Grant Program under the same application procedures for a new applicant.

Section 3. Military Airport Program.

6-39. General.

The Military Airport Program (MAP) allows the FAA to give grants to civil sponsors of joint-use military airfields or former military airports.

6-40. AIP Funding.

49 USC § 47117(e)(1)(B) designates a 4% set-aside of AIP discretionary funds that the FAA may use towards projects at MAP designated airports. The FAA normally directs MAP funding towards those specific projects that will allow a MAP designated airport to successfully transition from military to civilian use.

6-41. Designation Authority.

49 USC § 47118(a) allows the FAA to designate up to 15 current or former military airfields in the Military Airport Program. These airports can receive grants to help convert them to civilian use or to reduce congestion. Per 49 USC § 47118(g), three of the 15 airports may be general aviation airports and the remaining twelve must be commercial service or reliever airports.

6-42. Original MAP Designation Duration.

The FAA has the option to designate an airport as a MAP airport for one to five years per 49 USC § 47118(d). Per FAA policy, the FAA must evaluate the conversion needs of the airport in the sponsor's capital development plan to determine the appropriate length of designation.

6-43. Redesignation Duration.

Previously designated airports may apply for redesignation of additional terms not to exceed a five year per term per 49 USC § 47118(d). Those airports must meet current MAP requirements and, per FAA policy, have remaining MAP eligible projects that were not funded by the FAA. The FAA's goal is to graduate MAP airports to regular AIP participation by successfully converting these airports to civilian airport operations.

6-44. Requirements.

Sponsors must submit documentation that clearly shows they meet the 49 USC § 47118 and FAA policy requirements listed in Table 6-14.

Table 6-14 MAP Requirements

For the following requirement…	The following criteria apply…
a. System Benefits	Per 49 USC § 47118(c), the proposed projects will accomplish at least one of the following: **(1)** Reduce delays at an airport with more than 20,000 hours of annual delays in commercial passenger aircraft takeoffs and landings. **(2)** Enhance airport and air traffic control system capacity in a metropolitan area or reduce current and projected flight delays. **(3)** Preserve or enhance minimum airfield infrastructure facilities at former military airports to support emergency diversionary operations for transoceanic flights in locations where both of the following criteria are met: **(a)** The location is within United States jurisdiction or control. **(b)** The location has a demonstrable lack of diversionary airports within the distance or flight-time required by regulations governing transoceanic flights.
b. Current or Former Military Airport	Per 49 USC § 47118(a), the airport is either a current or former military airport under at least one of the following conditions: **(1)** The airport was closed or realigned under Section 201 of the Defense Authorization Amendments and Base Closure and Realignment Act, and/or Section 2905 of the Defense Base Closure and Realignment Act of 1990 (Installations Approved for Closure by the Defense Base Realignment and Closure Commissions). Only public agencies qualify under these acts. **(2)** The airport was closed or realigned under 10 USC § 2687 as excess property. These are bases announced for closure by the Department of Defense after September 30, 1977 (this is the date of announcement for closure and not the date the property was deeded to the sponsor). Only public agencies qualify under this regulation. **(3)** The airport is a commercial service or reliever airport that is a military installation with both military and civil aircraft operations (also called a joint use airport). Per 49 USC § 47118(g), a joint use airport that is not a commercial service or reliever airport is not eligible under MAP unless the airport meets conditions (1) or (2) above.
c. Public-Use Airport	Per 49 USC § 47105(b)(2), the airport is a public-use airport (see the definition Appendix A for the criteria) in the National Plan of Integrated Airport Systems.
d. MAP Slots are Available	Per 49 USC § 47118(a) and § 47118(g), three of the 15 airports may be general aviation airports and the remaining twelve must be commercial service or reliever airports.

Table 6-14 MAP Requirements

For the following requirement…	The following criteria apply…
e. Eligible Sponsor	The sponsor is an eligible sponsor per the requirements of the Act (see Chapter 2 for a listing of the requirements).
f. Airport Layout Plan	Per 49 USC § 47107(a)(16), the airport has an FAA approved airport layout plan.
g. Capital Improvement Plan	Per FAA policy, the sponsor has a five-year capital improvement plan that includes all eligible AIP projects that can be funded with MAP and AIP.
h. Environmental Requirements	Per FAA policy, the environmental review necessary to convey the property, enter into a long-term lease, or finalize a joint-use agreement must have been completed. The military department conveying or leasing the property, or entering into a joint-use agreement, has the lead responsibility for this environmental review. Per FAA policy, the environmental reviews for each specific MAP project are separate processes. These environmental reviews must meet the normal AIP requirements and timeframes.
i. Good Title	Per 49 USC § 47106(b), the sponsor has to have good title. Per FAA policy, good title requirements are as follows: **(1) Former Military Airport.** The sponsor must hold or will hold satisfactory title, a long-term lease in furtherance of conveyance of property for airport purposes, or a long term interim lease more than 20 years or longer to the property on which the civil airport is being located. This is because the lease term must be longer than the grant assurances for AIP construction projects. Documentation that an application for surplus or BRAC airport property has been accepted by the Federal government is sufficient to indicate the eligible sponsor holds or will hold satisfactory title or a long-term lease. In addition, the sponsor must possess all necessary property rights prior to accepting a grant for a proposed project. **(2) Current Military Airport**. The sponsor must have an existing joint-use agreement with the military department having jurisdiction over the airport. If the sponsor is a first time applicant, the sponsor must submit a copy of the existing joint-use agreement no later than the time of the application. This is necessary to permit the ADO to issue grants to the sponsor. In addition, the sponsor must possess all necessary property rights prior to accepting a grant for a proposed project.

Table 6-14 MAP Requirements

For the following requirement…	The following criteria apply…
j. Marketing Plan	For a commercial service airport to qualify for redesignation, it is FAA policy that the sponsor must provide a reanalysis of their original business/marketing plans (for example, a plan previously funded by the Department of Defense Office of Economic Adjustment or the original Master Plan for the airport) and prepare a report. If there is no existing business/marketing plan, the sponsor must develop a business/marketing plan or strategy. The report must contain all of the following information: **(1)** Whether the original business/marketing plan is still appropriate. **(2)** Whether the airport is continuing to work towards the goals established in the business/marketing plan. **(3)** How the MAP projects contained in the application contribute to the goals of the sponsor's marketing plan. **(4)** If the business/marketing plan no longer applies to the current goals of the airport, how the airport has altered the business/marketing plan. Specifically, how have they established a new direction for the facility, how projects contained in the MAP application aid in the completion of the new direction and goals, and by what date they anticipate completing the MAP projects.

6-45. Typical MAP Projects.

The FAA will normally only consider MAP funding for projects that aid in the conversion of a military or former military facility to civilian use. These projects can include revenue generating projects that may not normally be eligible at the airport. These projects can also include lower priority AIP project that would not compete well for regular discretionary funding. A list of the MAP project requirements is contained in Appendix T.

It is FAA policy to use regular discretionary or entitlement funding, not MAP funding, for projects that compete well for discretionary funding or are not necessary to convert the airport to civilian use. Some examples of projects that APP-520 would anticipate an ADO use regular AIP funding are in Table 6-15.

Table 6-15 Examples of Projects That May Not Be Suitable for MAP Funding

The following project…	May not be suitable for MAP funding because…
a. Runway rehabilitation	This type of project normally competes well for regular AIP funding.
b. Runway extension	This type of project is normally not necessary to convert the airport to civilian use (most military runways are a suitable length for civilian use).

6-46. Use of Regular AIP on a MAP Designated Airport.

MAP designated airport projects are not limited to MAP funding. They may also qualify for other AIP funding if they meet all associated project eligibility and justification requirements. In fact, it is FAA policy that the ADO not recommend an airport for the MAP program unless the ADO is willing to support the airport's needs for higher priority projects with regular discretionary funding (if necessary).

6-47. MAP Funding Limitations.

Per 49 USC § 47118(e), total MAP funding may not exceed $7 million per year per airport for terminal projects. Per 49 USC § 47118(f), total MAP funding may not exceed $7 million per year per airport for construction, improvement, or repair of airport surface parking lots, fuel farms, utilities, hangars and air cargo terminal building facilities, only if the hangar or air cargo terminal building facility is 50,000 square feet or less.

6-48. Reimbursement with Discretionary.

Per 49 USC § 47118(f)(2), the FAA has the option to use discretionary to reimburse approved MAP projects if the sponsor incurred the costs during fiscal years 2003 and 2004.

6-49. Application Process.

Every year, the FAA publishes the information that a sponsor must submit if it wants to be designated or redesignated into the MAP program. The publication also announces the number of available MAP slots and the factors that the FAA will use to evaluate the MAP candidates for that fiscal year.

Each fiscal year, APP-520 will provide the regional offices and ADOs with instructions for the current internal MAP application review process.

Section 4. Innovative Finance Demonstration Program.

6-50. Legislative History and References.

The legislative history of the innovative finance demonstration program is outlined in Table 6-16. This program has been retained without change in subsequent legislation under 49 USC § 47135.

Table 6-16 Innovative Finance Demonstration Program Legislative History

The following legislation…	Provided the following…
a. Section 148 of the Federal Aviation Reauthorization Act of 1996	Established the program and allowed the FAA to approve applications for 10 airport development projects.
b. Section 132 of AIR -21 (Wendell H. Ford Aviation Investment and Reform Act for the 21st Century)	Allowed the FAA to approve applications for 20 airport development projects during fiscal years 2000-2003.
c. Section 156 Vision 100 – Century of Aviation Reauthorization Act	Allowed the FAA to approve applications for 20 airport development projects beginning in fiscal year 2004 and beyond.

6-51. Program Rules.

The rules for the innovative finance demonstration program are included in Table 6-17.

Table 6-17 Innovative Finance Demonstration Program Rules

The current Innovative Finance Demonstration Program rules include…
a. Eligible Airports. Per 49 USC § 47135(a), the program is open to all airports except large and medium hub airports. Only 20 airport development projects may be approved beginning in fiscal year 2004.
b. No Guarantee of Debt Instruments. Per 49 USC § 47135(c)(1), FAA approval of the project does not (directly or indirectly) create a guarantee by the United States Government of any airport debt instrument.

Table 6-17 Innovative Finance Demonstration Program Rules

The current Innovative Finance Demonstration Program rules include…
c. Allowable Innovative Techniques. Per 49 USC § 47135(c)(2), the program is limited to the following innovative techniques. **(1)** Payment of interest. **(2)** Commercial bond insurance and other credit enhancement associated with airport bonds for eligible airport development. Per FAA policy, this may include underwriting fees. **(3)** Flexible non-Federal matching requirements. (A) This may include increased local and state shares using contribution from private sources. (B) The FAA has determined that this technique has been adequately tested; therefore, the FAA is less inclined to pursue future uses of these techniques. **(4)** Use of entitlement and state apportionment funds to pay principal and interest costs for terminal development if the costs were incurred before December 12, 2003 (the date of the enactment of Vision 100 – Century of Aviation Reauthorization Act). The FAA has determined that this technique has been adequately tested. Therefore the FAA is less inclined to pursue future uses of these techniques.
d. Justification. Per FAA policy, the sponsor must demonstrate that the innovative finance proposal will result in cost savings or improved performance of the national aviation system. For instance, it might show that the airport development would either not be built or would be built earlier than would have been possible without the program.
e. Application Deadline. Per FAA policy, sponsors may submit an innovative finance demonstration application to the ADO at any time unless otherwise established by APP-500.
f. Project Selections. Per FAA policy, ADOs must forward all applications to APP-500 for their review. APP-500 will approve or disapprove all project applications.
g. Normal AIP Requirements. Per FAA policy, all other applicable AIP sponsor, funding, project, and grant rules apply. Changes to FAA standards will not be considered under this program.
h. Additional Sponsor Reporting. Per FAA policy, sponsors must submit all additional documentation and reporting as required by the ADO.

Section 5. Voluntary Airport Low Emission Program (VALE).

6-52. Legislative History.

In fiscal year 2004, Sections 151, 158 and 159 of Vision 100 – Century of Aviation Reauthorization Act established a voluntary program to reduce airport ground emissions at commercial service airports located in nonattainment and maintenance areas designated by the U.S. Environmental Protection Agency.

6-53. Legislative References.

Table 6-18 contains the legislative references applicable to the VALE program.

Table 6-18 VALE Legislative References

The following…	Provides...
a. 49 USC § 47102(3)(K) and § 47102(3)(L)	The language that makes certain VALE projects eligible as airport development.
b. 49 USC § 47110(b)(6)	Guidance on VALE project funding restrictions.
c. 49 USC § 47117(e)(1)(A)	Guidance on the use of noise and environmental set aside funding.
d. 49 USC § 47139	Guidance on emission credits for air quality projects.
e. 49 USC § 47140	Guidance on the airport ground support equipment emissions retrofit pilot program.

6-54. Purpose and General Overview.

The goal of the Voluntary Airport Low Emission (VALE) Program is to improve airport air quality by providing commercial service airports with grants to acquire low emission vehicles and infrastructure. The VALE Program helps airport sponsors meet their general conformity obligations under the Clean Air Act (42 USC § 7401, et. Seq.). It also assists state planning to meet health-based national ambient air quality standards.

The airports must be located in nonattainment or maintenance areas designated by the Environmental Protection Agency (EPA) per 49 USC § 47140(b). Some of the key equipment requirements are that the equipment must provide cleaner technology then the conventional equipment, be airport-owned, provide the best achievable emissions reductions based on EPA standards, and rely exclusively on alternative fuels that are substantially non-petroleum based (as defined by the U.S. Department of Energy, not excluding hybrid systems). Typical projects include gate electrification, boiler pollution control devices, and new or retrofitted low emission vehicles and ground support equipment.

6-55. Available Guidance.

The authorizing legislation requires the FAA to publish program guidance in areas of project eligibility, how air quality benefits are demonstrated, and how sponsors receive appropriate airport emission reduction credits. Specific program guidance is contained in the VALE Program Technical Report (see Appendix B for link). Associated guidance on airport emission reduction credits is contained in the EPA Report, Guidance on Airport Emission Reduction Credits for Early Measures through Voluntary Airport Low Emission Programs, which is available on the same website.

6-56. Application and Grant Process.

Sponsors interested in applying for VALE grants must submit a project application as outlined in the VALE Technical Report. VALE requirements and special conditions supplement AIP requirements and grant assurances unless otherwise stated in VALE guidance. The automated AIP system contains the current available special conditions. Sponsors must submit VALE applications concurrently to the ADO, regional office and APP-400. VALE grants are processed similarly to other AIP grants.

APP-400 determines funding priority primarily on the basis of project cost-effectiveness, as defined by project lifetime emission reductions per dollar spent.

6-57. Project Funding Requirements.

Appendix S includes the funding requirements for environmental planning/mitigation projects, including VALE projects.

Section 6. Zero Emission Vehicle and Infrastructure Pilot Program.

6-58. Legislative History.

In fiscal year 2012, Section 511 of the FAA Modernization and Reform Act of 2012 (Public Law 112-95) added a pilot program for zero emission vehicles and infrastructure.

6-59. Legislative References.

Table 6-19 contains the legislative references applicable to the zero emission vehicle and infrastructure pilot program.

Table 6-19 Zero Emission Vehicle and Infrastructure Pilot Program Legislative References

The following…	Provides...
49 USC § 47117	Guidance on the use of set aside funding for these projects. (*Note: The only set aside discretionary funding that the FAA anticipates using toward these projects is Noise and Environmental Set Aside funding, even though 49 USC § 47117 includes MAP and Reliever Set Aside funding.*)
49 USC § 47136a	Guidance on zero emission airport vehicles and infrastructure. (Note that this section is *after* 49 USC § 47136, not part of it.)

6-60. Purpose.

The goal of the Zero Emission Vehicle and Infrastructure Pilot Program is to improve airport air quality by providing eligible airports with grants to purchase zero emission airport vehicles and infrastructure.

6-61. Available Guidance.

Specific program guidance is contained in the Zero Emissions Airport Vehicle and Infrastructure Pilot Program Technical Guidance (see Appendix B for link).

6-62. Application and Grant Process.

ADOs and regional offices must contact APP-400 for application information and APP-500 for grant information.

6-63. Project Funding Requirements.

Appendix S includes the funding requirements for environmental planning/mitigation projects, including zero emission airport vehicles and infrastructure projects. The Federal share for these projects is restricted to 50% per 49 USC § 47136a(d). These projects are eligible for noise and environmental set aside funding per 49 USC § 47136a(a), as further discussed in Paragraph 4-6.

Section 7. Program to Increase Energy Efficiency of Airport Power Sources.

6-64. Legislative History.

In fiscal year 2012, Section 512 of the FAA Modernization and Reform Act of 2012 (Public Law 112-95) added a program for certain projects that increase the energy efficiency of airport power sources. This legislation simply made these projects eligible for AIP. The legislation did *not* make these projects eligible for any special set aside funding (including the noise and environmental set aside).

6-65. Legislative References.

Table 6-20 contains the legislative references applicable to the program to increase the energy efficiency of airport power sources.

Table 6-20 Program to Increase the Energy Efficiency of Airport Power Sources Legislative References

The following…	Provides...
49 USC § 47140a	Guidance on increasing the energy efficiency of airport power sources. (Note that this section is *after* 49 USC § 47140, not part of it.)

6-66. Purpose.

The goal of the program to increase the energy efficiency of airport power sources.

6-67. Available Guidance.

As of the publication date of this Handbook, APP-400 was developing guidance for the program to increase the energy efficiency of airport power sources. Until this new guidance is published, ADOs and regional offices must contact APP-400 for guidance.

6-68. Application and Grant Process.

As of the publication date of this Handbook, APP-400 was developing guidance for the program to increase the energy efficiency of airport power sources. Until this new guidance is published, ADOs and regional offices must contact APP-400 for application information and APP-500 for grant information.

6-69. Funding and Federal Share.

Because 49 USC § 47117(e)(1)(A) limits the funding of the noise and environmental set-aside to specific projects, projects to increase the energy efficiency of airport power sources are *not* eligible for noise and environmental set aside funding. In addition, the airport's regular Federal share applies.

6-70. Project Funding Requirements.

Appendix S includes the funding requirements for environmental planning/mitigation projects, including airport energy assessments and projects to increase the energy efficiency of airport power sources.

Section 8. Airport Development Rights Pilot Program.

6-71. Legislative History.

In fiscal year 2004, Section 152 of Vision 100 – Century of Aviation Reauthorization Act created a pilot program for the purchase of development rights for up to 10 privately-owned public-use airports. The rules for this pilot program are provided for in 49 USC § 47138. This pilot program allows the FAA to issue a grant to a state (or a political subdivision of the state) for the purchase of airport development rights to ensure the airport property will continue to be available for use as a public use airport in perpetuity (in this case, *public use airport* means that the airport is open to the public). Through this pilot program, the FAA will evaluate the merits of purchasing airport development rights instead of the purchase of fee simple interests for the airports.

6-72. Rules of the Pilot Program.

The rules and requirements of the pilot program are outlined in Table 6-21.

Table 6-21 Rules for the Airport Development Rights Pilot Program

The requirements for…	Include…
a. The Number of Participants	**(1)** Per 49 USC § 47138(e), the FAA is only allowed to issue grants to purchase airport development rights at 10 airports under this pilot program.
b. The Airport and Airport Owner	**(1)** Per 49 USC § 47138(a), the airport must be a privately-owned public-use airport. **(2)** Per FAA policy, the airport owner must have filed a notice with the ADO in accordance with 14 CFR part 157, Notice of Construction, Alteration, Activation, and Deactivation of Airports, indicating that the airport status is privately-owned, public-use. **(3)** 49 USC § 47138 does not require the airport to meet the privately-owned public-use airport requirements in 49 USC § 47102(22)(B) or to be in the National Plan of Integrated Airports (NPIAS). **(4)** Per FAA policy, the airport owner must not have any existing grant obligations requiring the airport to remain open.
c. The Grant Sponsor	**(1)** Per 49 USC § 47138(a), the sponsor must be a state or a political subdivision of a state (such as a city, municipality, or state agency) in the same state as the airport.
d. The Grant Purpose	**(1)** Per 49 USC § 47138(b)(1)(A), the airport property must continue to be available for use as a public airport (in this case, public airport means that the airport is open to the public). **(2)** Per 49 USC § 47138(b)(1)(B), the airport must remain a public use airport in perpetuity.
e. Requesting Participation	**(1)** Per FAA policy, the FAA may contact potentially interested owners and/or sponsors at any time and informally invite them to express interest in the pilot program. **(2)** Per FAA policy, the sponsor must express interest in a letter to the FAA. If the airport owner does not cosign the letter, then the sponsor must indicate that the airport owner has agreed in the sponsor's letter.
f. The Selection	**(1)** Per FAA policy, the regional office will send a joint ADO/regional office recommendation to APP-500. APP-500 is the selecting office. Once an airport has been selected, the ADO will inform the sponsor of the selection and request a grant application.

Table 6-21 Rules for the Airport Development Rights Pilot Program

The requirements for…	Include…
g. The Grant Application	**(1)** 49 USC § 47138(c) requires that the FAA set the requirements for the grant application and approval procedures. **(2)** Per FAA policy, the sponsor must use the standard grant application as discussed in Paragraph 5-19. **(3)** Per FAA policy, grant application must include a property inventory map (Exhibit A) that is approved by both the sponsor and the airport owner and clearly shows the land and development subject to the agreement. **(4)** Per FAA policy, the airport owner must provide a letter to the FAA describing its concept for ownership and operation of the airport over the next ten years. **(5)** Per FAA policy, if the airport owner does not operate the airport, the airport owner must provide a copy of the associated lease or agreement. **(6)** Per FAA policy, the ADO must determine whether the costs of the proposed grant are less than buying the airport outright. The issuance of the grant documents a positive determination by the ADO. **(7)** Per FAA policy, the sponsor must provide a signed certification from their attorney as outlined in Table 6-22. **(8)** The FAA has the option of not issuing a grant for the purchase of airport development rights if the FAA determines that it is not in the best interest of the Federal government or that the requirements will not be met.
h. Option for FAA Site Visit	**(1)** Per FAA policy, airport owner must agree to allow a site inspection by the FAA and sponsor prior to the grant being issued.
i. FAA Coordination	**(1)** Per FAA policy, the ADO must discuss the terms and conditions of the pilot program with the airport owner as well as the sponsor to ensure both parties understand their obligations.
j. Acquisition	**(1)** Per FAA policy, the FAA, sponsor, and airport owner must follow the same policies and procedures for airport acquisition in fee simple as contained in Appendix Q. This includes meeting the requirements of the current version of FAA Order 5100.37, Land Acquisition and Relocation Assistance for Airport Projects, and in the current version of Advisory Circular 150/5100-17, Land Acquisition and Relocation Assistance for Airport Improvement Program Assisted Projects.
k. AIP Fund Types	**(1)** 49 USC § 47138(a) allows of all types of apportionment and entitlement funds available to the sponsor that are listed under 49 USC § 47114 to be used on this type of grant.
l. AIP Federal Share	**(1)** Per 49 USC § 47138(b)(2), the Federal share is limited to 90% of the costs to acquire the development rights.

Table 6-21 Rules for the Airport Development Rights Pilot Program

The requirements for…	Include…
m. AIP Grant Description and Amount	**(1)** Per FAA policy, the FAA can only compensate the airport owner for the market value of the development rights sold based on an acceptable before and after appraisal. Under this appraisal method, the market value of the development rights conveyed is appraised at the difference between the market value of the property for continued airport use and the current market value of the property for some other development. **(2)** Per FAA policy, planning costs to prepare the Exhibit A and/or associated documentation are allowable project formulation costs under the grant (not as a separate grant). **(3)** Per FAA policy, the property interests must be for a complete airfield or those combined parcels that collectively allow the airport to serve as a public-use airport. The property interests cannot be for only select areas of the airport (such as only the runway protection zones).
n. Grant Template	**(1)** The ADO must consult with APP-500 on how the standard grant template must be modified for a grant of this type.
o. Instrument Recording the Purchase of Airport Development Rights	**(1)** Per FAA policy, the instrument recording the purchase of airport development rights must include all of the terms and conditions listed in Table 6-23. The instrument recording the purchase of development rights is the document evidencing the purchase of the airport development rights by the sponsor, and the easement or covenant given by the airport owner that the airport must remain a public-use airport in perpetuity.
p. Grant Assurances	**(1)** Per FAA policy, the standard grant assurances must not be included in the grant. Instead, the requirements in Table 6-23 must be contained in the instrument recording the purchase of airport development rights, as discussed above.
q. Final Payment	**(1)** Per FAA policy, ADO must not allow the payment for the full amount of the grant until the instrument recording the purchase of development rights and easement has been recorded in the local registry of deeds and land transfers in compliance with local law.
r. Release of Purchase Rights and Covenant	**(1)** Per 49 USC § 47138(d), the state or political subdivision may not transfer or dispose of the development rights unless the FAA determines that it is in the best interest of the Federal government.
s. Advisory Circular for Airport Safety Self-Inspection	**(1)** Per FAA policy, the ADO has the option to provide the airport owner/operator with the current version of Advisory Circular 150/5200-18, Airport Safety Self Inspection.

Table 6-22 Required Sponsor's Attorney Certification Language

The following certification language must be completed and signed by the sponsor's attorney…
CERTIFICATE OF SPONSOR'S ATTORNEY I, _____ , acting as Attorney for the Sponsor do hereby certify that in my opinion the Sponsor is empowered to file the Application for Federal Assistance for the purchase of development rights in accordance with Title 49, United States Code, section 47138, under the laws of the State of _____and has the authority from its governing body. Further, the actions taken by said sponsor and sponsor's representative has been duly authorized and that the execution thereof is in all respects due and proper and in accordance with the laws of the said State. Dated at _____ (location) this _____ day of _____, _____. By: _____ (Signature of Sponsor's Attorney)

Table 6-23 Requirements for the Instrument Recording the Purchase of Airport Development Rights

Per FAA policy, the instrument recording the purchase of airport development rights must include the following terms and conditions…
a. Exhibit A (Property Inventory Map). Parcels of land obligated under the development rights agreement must be described on the Exhibit A. The Exhibit A must be approved by both the sponsor and the airport owner.
b. Notice to Airmen. The airport owner must promptly notify pilots of any condition affecting aeronautical use of the airport property.
c. Acquisition of Development Rights. The acquisition of development rights by the sponsor is for the right to develop and use the property depicted on the Exhibit A for a purpose other than as an airport open to the public or enhancing convenience of aviation activities. The purpose of the acquisition of development rights is to ensure that the airport will continue to be available as a public use airport (in this case, *public use airport* means that the airport is open to the public).
d. Hazardous Substance. The FAA and state (or political subdivision of the state) do not assume any right to control the means by which the airport owner complies with restrictions on airport property; and do not assume any liability for discharge of a hazardous substance.
e. Public-Use Airport in Perpetuity. The airport owner, for good and valuable consideration, must grant the sponsor an easement or covenant that the airport must remain open to the public for use as an airport in perpetuity. Such easement or covenant must be in effect in perpetuity unless modified or released with the approval of the FAA.
f. Modification or Release of Purchased Rights and Covenant. The sponsor must not modify, transfer, or disposal of the airport development rights unless the FAA has made a written determination that the action is in the best interest of the Federal government.

Table 6-23 Requirements for the Instrument Recording the Purchase of Airport Development Rights

Per FAA policy, the instrument recording the purchase of airport development rights must include the following terms and conditions…
g. Recordation. The sponsor must record the instrument evidencing the purchase of development rights and the granting of the easement or covenant that the airport must remain open to the public for use as an airport in perpetuity, in the local registry of deeds and land transfers in compliance with local law.
h. Sponsor's Obligation for Airport Operation. The sponsor may be obligated to operate and maintain the airport if it is closed during other than periods of temporary climatic conditions that interfere with safe operation and maintenance. The airport owner and sponsor agree that in the event the airport owner discontinues safe airport operation and maintenance, the sponsor, in consultation with the FAA, may be required to assume that obligation.
i. Airport Owner's Obligation for Airport Operation in Perpetuity. The airport owner or its successor is obligated to own the airport and operate it as an airport except for periods of temporary climatic conditions that interfere with safe operation and maintenance. In the event the airport owner discontinues safe airport operation and maintenance, the airport owner must notify the FAA within 24 hours.
j. Enforcement of Development Rights by the FAA. The instrument recording the purchase of development rights must grant the FAA third party beneficiary rights to enforce the easement or covenant that the airport must remain a public-use airport in perpetuity and the sponsor's obligation for airport operation.

Section 9. Redevelopment of Airport Properties Pilot Program.

6-73. Legislative History.

In fiscal year 2012, Section 822 of the FAA Modernization and Reform Act of 2012 (Public Law 112-95) created a pilot program to fund activities related to the redevelopment of airport properties purchased for airport noise compatibility. Note that the pilot program language was not incorporated into 49 USC Chapter 471, therefore the text of the pilot program can only be found in Section 822 of the FAA Modernization and Reform Act of 2012 (Public Law 112-95). As of the publication date of this Handbook, the current sunset date is September 30, 2018 per the Consolidated Appropriations Act, 2018 (Public Law 115-141).

6-74. Purpose.

The purpose of this pilot program is to expedite redevelopment of airport property purchased for noise mitigation by the airport with AIP or Passenger Facility Charge (PFC) funds.

6-75. Availability of Guidance.

Guidance for this pilot program is available in Pilot Program for Redevelopment of Airport Properties (Acquired Noise Land) (see Appendix B for link).

This page has been intentionally left blank

Appendix A. Definitions of Terms Used in this Handbook

A-1. Definitions of Terms Used in this Handbook.

Definitions are an extremely important part of this Handbook. As with any large program, there are many words and phrases that have specific, defined meanings within the program. Table A-1 contains an alphabetical listing of the definitions used in this Handbook. The following letters are links to the appropriate alphabetical sections in Table A-1.

A	B	C	D	E	F	G	H	I	J	L	M	N	O	P	R	S	T	U	W

Table A-1 Definition of Terms Used in This Handbook

Definitions
A
Access Road. See Terminal Development. A portion of an access road or an access road can be considered *access road improvement* instead *of terminal development* is when it does not go directly to or from a terminal building.
The Act. The contents of this Handbook are based on the AIP related legislation contained in the United States Code (USC). Throughout this Handbook, the AIP related legislation under Title 49 is referred to as the *Act.* Previously, AIP was authorized by the Airport and Airway Improvement Act of 1982 (Public Law 97-248), which Congress repealed in 1994 and recodified as Title 49 § 47101, et seq. (Public Law 103-272).
Administrative Cost. Administrative costs are costs incurred in support of the general management and administration of the project, including all executive, organizational, and clerical costs rather than the specific costs like construction, or manufacturing. There are two types of Administrative Costs, Direct Administrative Costs and Indirect Administrative Costs. Direct administrative costs can be allowable costs in an AIP project if 1) it can be specifically documented to the project and 2) the ADO has approved the administrative costs in advance of incurring the administrative cost. 2 CFR part 200 (OMB Circular A-87, Appendix C) establishes the procedures for calculating administrative costs. Indirect administrative costs cannot be readily identifiable with a particular project or cost objective. Indirect administrative costs can be allowed only if the ADO has an approved Cost Allocation Plan from the cognizant agency.
ADO. For the purposes of this Handbook, ADO means the local FAA Airports District Office. In regional offices that do not have ADOs, the use of the term ADO refers to the FAA Office of Airports branch within the regional office that deals directly with the sponsors. Where other FAA offices are discussed, those offices will be specifically identified.
Aeronautical Study (Commonly Referred to as an Airspace Study). An aeronautical study is a study conducted to determine the effect a proposal has on the operation of air navigational facilities and on the safe and efficient use of navigable airspace. Aeronautical studies are also used by the FAA Office of Airports to coordinate airport construction projects and changes to Airport Layout Plans (ALPs) with the rest of the FAA.

Table A-1 Definition of Terms Used in This Handbook

Definitions
Air Carrier Airport. Per 49 USC § 47102(1), an air carrier airport is a public airport regularly served by: An air carrier certificated by the Secretary of Transportation under 49 USC § 41102 of this title (except a charter air carrier); or At least one air carrier: Operating under an exemption from section 49 USC § 41101(a)(1) that the Secretary grants; and Having at least 2,500 passenger boardings at the airport during the prior calendar year.
Airport. Per 49 USC § 47102(2), an airport is: An area of land or water used or intended to be used for the landing and taking off of aircraft; An appurtenant area used or intended to be used for airport buildings or other airport facilities or rights of way; Airport buildings and facilities located in any of those areas; Per 49 USC § 47102(2)(B), this specifically includes heliports.
Airport Development. Airport development is a legal definition in 49 USC § 47102(3). This definition contains development projects that are eligible under AIP. This list is extensive and is therefore not duplicated in this table. However, this list is reflected throughout this Handbook (most specifically in Chapter 3 and the associated appendices).
Airport Hazard. Per 49 USC § 47102(4), a structure or object of natural growth located on or near a public-use airport, or a use of land near the airport, that obstructs or otherwise is hazardous to the landing or taking off of aircraft at or from the airport. For obstructions, the FAA Air Traffic Organization (ATO) must make this determination (per the current version of FAA Order JO 7400.2, Procedures for Handling Airspace Matters).
Airport Layout Plan. As of the publication date of this Handbook, the current version of Advisory Circular 150/5070-6, Airport Master Plans, defines an airport layout plan set as a set of drawings that provides a graphic representation of the sponsor's long-term development plan for an airport. This plan must show both existing and proposed airport facilities and all proposed and existing access points used to taxi aircraft across the airport's property boundary; the approval of which is evidenced by the signature of the FAA Administrator or his duly designated representative.
Airport Master Plan. As of the publication date of this Handbook-Advisory Circular 150/5070-6, Airport Master Plans, defines airport master plan as a comprehensive study of the airport and typically describes short-, medium-, and long-term plans for airport development. Master planning studies that address major revisions are commonly referred to as master plans, while those that change only parts of the existing document and require a relatively low level of effort tend to be known as master plan updates.

Table A-1 Definition of Terms Used in This Handbook

Definitions
Airport Planning. Per 49 USC § 47102(5), airport planning means planning as defined by regulations the Secretary prescribes and includes: Integrated airport system planning. Developing an environmental management system. Developing a plan for recycling and minimizing the generation of airport solid waste, consistent with applicable state and local recycling laws, including the cost of a waste audit.
Airport Property Map. An airport property map is a drawing depicting the airport property boundary, land or property interests (including method of acquisition and type of interest), and future proposed land acquisition. The Airport Property Map is required as part of the Airport Layout Plan drawing set if any of the airport land was acquired with Federal funds or through an FAA administered land transfer program. An airport property map is not a substitute for an Exhibit A (property inventory map), unless it is prepared in accordance with the Exhibit A requirements in the current version of Advisory Circular 150/5100-17, Land Acquisition and Relocation Assistance for Airport Improvement Program Assisted Projects.
Airport Purposes. All aviation activities normally found on an airport.
Airport Revenue. The current version of FAA Order 5190.6, Airport Compliance Manual, defines airport revenue. As of the publication date of this Handbook, that definition is as follows: Airport revenue generally includes those revenues paid to or due to the airport sponsor for use of airport property by the aeronautical and nonaeronautical users of the airport. It also includes revenue from the sale of airport property and resources and revenue from state and local taxes on aviation fuel. If this definition is modified in any succeeding version of FAA Order 5190.6, the new definition must be used.
Airside Needs/Development. All development within the areas accessible to aircraft including runways, taxiways, aprons, and aircraft gates and the land adjacent to these facilities required by current FAA standards. This may include airside facilities that are not justified for AIP grant funding.
Allocation. An allocation is the FAA notification to the sponsor of the intent to obligate funds (by issuing a grant). It does not involve a transfer of funds. It is an internal administrative re-delegation of the authority to incur obligations and make expenditures.
Allotments. After the FAA receives an Office of Management and Budget (OMB) apportionment, APP-520 requests the FAA Office of Budget and Performance – Operations and Capital Execution Branch (ABP-410) to make an allotment of funds to regional offices to support previously issued planning figures. Allotments and adjustments to allotments are made throughout the year.
Allowable Cost. The cost of an item or activity that can be funded with AIP per 49 USC § 47110.
Amendments. A formal change to the terms or scope of a grant agreement.

Table A-1 Definition of Terms Used in This Handbook

Definitions
Apportionments. There are two actions referred to as apportionments in AIP. The Act requires an apportionment of funds to be made each fiscal year to sponsors and states based on formulas in the Act. This notifies sponsors and states that these funds are available for eligible work but does not involve any transfer of funds. These funds are referred to interchangeably as state or sponsor *apportionments*, *entitlements*, or *formula* funds. The second type of apportionment is made by the Office of Management and Budget (OMB) to allow the FAA to use congressionally approved AIP funds. The OMB apportionment is formally requested by the FAA, which provides a financial plan for orderly use of the funds. The OMB apportionment may contain restrictions on the use of funds, such as the amount that may be used quarterly.
Appropriation. The appropriation is the annual budget established by Congress each year. Generally speaking, the appropriation allows Federal agencies to incur obligations and make payments for specific purposes. AIP gains the ability to incur its obligations through the Contract Authority set in the Authorization. This Contract Authority, however, is subject to the terms set forth in the annual appropriation each year. This means that Congress may use the appropriation to adjust the annual AIP funding level to exceed or reduce the amount of Contract Authority designated for any year.
Authorization. The authorization is commonly referred to as the FAA *Bill* or *Reauthorization* and may be passed by Congress for one or more years. The authorization sets yearly limits on the AIP funding levels and gives the FAA *contract authority* to issue grants.
Automated AIP System. This database integrates the project planning data necessary for the NPIAS Report, the project planning data necessary for the ADOs to create a three year ACIP, and the grant data for all grants issued into one system. This is an internal FAA system. As of the publication of this Handbook, this system is the System of Airport Reporting (SOAR).
B
Based Aircraft. Per the FAA report titled General Aviation Airports: A National Asset, dated May 2012, based aircraft are aircraft that are operational and airworthy, and are based at the airport for the majority of the year. Based aircraft are single-engine, multi-engine, jets, and helicopters derived from the FAA Form 5010-1, Airport Master Record (Existing Public Use Airports), Items 90 – 93.
Bathroom or Bathing Facility. A dedicated room for toilet facilities, washing basins, and bathing facilities such as a shower or tub. Restrooms do not provide bathing facilities.
Brooks Act. A Federal law (Public Law 92-582, codified at 40 USC § 1101) passed in 1972 that requires the Federal government to use qualifications based selection (a special form of competitive negotiations) for obtaining professional services.
C
Carryover Entitlements. Entitlements that were provided in a prior fiscal year were not used and remain available for obligation for the original recipient.

Table A-1 Definition of Terms Used in This Handbook

Definitions
Capacity Project. The current version of FAA Order 5100.39, Airports Capital Improvement Plan, defines capacity projects. As of the publication date of this Handbook, that definition is as follows: Development items that improve an airport or system of airports for the primary purpose of accommodating more passengers, cargo, aircraft operations or based aircraft. If this definition is modified in the next version of FAA Order 5100.39, the new definition must be used. In cases where it is unclear if a project is capacity or standards, the ADO must obtain a joint APP-400 and APP-510 concurrence on whether the project is considered capacity.
Certified Airfield Lighting Equipment. Airfield lighting equipment that has received a third party certification that it meets the requirements in the current version of Advisory Circular 150/5345-53, Airport Lighting Equipment Certification Program, and is in the latest published addendum to Appendix 3 of this advisory circular.
Channeling Act State. Based on individual state law, typically all funds from AIP would be deposited in a state account. State legislative action may be required to release funds to individual airports.
Cognizant Agency. Per 2 CFR §§ 200.18 and 200.19 (OMB Circular A-87, Attachment A, paragraph B.6.), the Federal agency responsible for reviewing, negotiating, and approving cost allocation plans or indirect cost proposals developed under 2 CFR part 200 Subpart E (OMB Circular A-87) on behalf of all Federal agencies.
Commercial Service Airport. Per 49 USC § 47102(7), a commercial service airport means a public airport in a state that the Secretary determines has at least 2,500 passenger boardings each year and is receiving scheduled passenger aircraft service.
Compatible Land Use. Per 14 CFR § 150.7, the use of land that is normally compatible with the outdoor noise environment (or an adequately attenuated noise level reduction for any indoor activities involved) at the location because the yearly day-night average sound level is at or below that identified for that or similar use under appendix A (Table 1) of 14 CFR part 150.
Condemnation. The governmental authority to take private property for public use is known as the power of eminent domain, commonly referred as condemnation. Most airport owners have this power which is an inherent power of the local government derived from its sovereignty, as well as a power implied from Article 1, Section 8, and the Tenth Amendment of the Constitution. The property owner's right to just compensation (fair market value payment) for property taken by condemnation is reserved in the Fifth Amendment to the Constitution.
Congressional Notification. Senate and House members are notified of proposed grants in their states or districts before others are notified. The Talking Points are used to inform Senate and House members about the proposed grant. An allocation is not made until this *congressional release* process is completed by DOT Office of the Secretary (OST) and FAA headquarters offices. In some cases, certain Senate and House committees are also given advance notification.
Continuing Resolution. This is legislation that allows an agency to continue funding programs, usually at levels equal to the previous year, while Congress continues work towards annual appropriations legislation and is generally of a shorter duration than a fiscal year. Due to the nature of the AIP formulas, the FAA needs to compute the different entitlements and discretionary funding (including set-asides) to match the funding available for each continuing resolution.

Table A-1 Definition of Terms Used in This Handbook

Definitions
Cost Allocation Plan. Sponsors that want to include a portion of their indirect costs in a project must have an approved Cost Allocation Plan. The Cost Allocation Plan must be prepared according to the requirements of 2 CFR part 200 Subpart E (OMB Circular A-87, Cost Principles for State, Local, and Indian Tribal Governments). It is the formal means by which a sponsor identifies indirect costs (i.e., overhead) and assigns them to the benefiting departments/funds on a reasonable and consistent basis. The Cost Allocation Plan must be approved by the cognizant agency of the Federal government. The approved indirect costs can only be applied to the sponsor's employee's salaries and wages, and cannot be applied to pass-through costs in the grant such as construction costs, consultant contracts, and equipment costs; or to other non-salary and wages costs.
Cost Analysis. A cost analysis is the evaluation of individual elements of a project, such as labor or materials that make up the total price, to determine if the elements are allowable, directly related to the project, and reasonable.
Critical Aircraft. The critical aircraft is the most demanding airplane which is currently, or is planned to use a runway, taxiway, apron or other aeronautical facility on a regular basis. The weight, wingspan, performance characteristics of the airplane impact the design of the facility. The ADO must use the current version of Advisory Circular 150/5000-17, Critical Aircraft and Regular Use Determination to determine the critical aircraft for specific projects and airport types.
D
DELPHI. The Department of Transportation's official accounting system of record. Each sponsor with a grant must have a designated user of the system in order to receive reimbursements on their grants. A grant cannot be issued until the sponsor has an account in the DELPHI system.
Design Standards. The engineering, design, and construction standards for various airport-related equipment, facilities, and structures defined by the FAA via the advisory circulars.
Design-Build Contracting. Per 49 USC § 47142, design-build contracting is defined as an agreement that provides for both design and construction of a project by a contractor.
Direct Cost. A direct cost is a cost that is only attributable to the work being performed. The payments for construction contract work for the project, contract design services of a design firm and contract planning services under a planning project are examples of direct costs. Project administrative costs are also considered direct costs (such as legal review, contract administration and oversight activities being performed specifically for the project) if the basis for the cost is easily identifiable through methods such as time cards used in cost accounting or other methods of capturing actual direct costs. Further information on direct cost can be found in 2 CFR § 200.413 (Attachment A, Section E of OMB Circular A-87, Cost Principles for State, Local, and Indian Tribal Governments).
Discretionary Funds. Discretionary funds are funds remaining within the obligation limitation after the entitlements are calculated. These funds, subject to certain restrictions in legislation, are available for distribution at the discretion of the FAA. The discretionary funds are not required to be distributed to specific states and sponsors. 49 USC § 47115 and 49 USC § 47117 provide statutory set-asides and minimum funding for noise, military, capacity, safety and security.

Table A-1 Definition of Terms Used in This Handbook

Definitions
Drawdown. A series of payments made during a project reflecting the progress that is being made on the project.
E
Earmark. A legislative provision that directs funds to be spent on specific projects. Note that these projects must still be eligible and justified before the ADO can approve funding.
Easement. Per Black's Law Dictionary (9th ed. 2009), an interest in land owned by another person, consisting in the right to use or control the land, or an area above or below it, for a specific limited purpose (such as to cross it for access to a public road). See Paragraph 2-15 in the current version of Advisory Circular 150/5100-17, Land Acquisition and Relocation Assistance for Airport Improvement (AIP) Assisted Projects, for description of typical *avigation* easement rights.
Enplanement. Revenue passenger boardings at airports (including heliport or seaplane base) that receive scheduled or nonscheduled passenger service. The definition also includes passengers who continue on an aircraft in international flight that stops at an airport in any of the 50 states for a non-traffic purpose, such as refueling or aircraft maintenance rather than passenger activity.
Exclusionary Practices. Exclusionary practices are designed to eliminate rivals, enabling the surviving firm to reap the benefit of less competition. Exclusionary practices are prohibited on AIP projects and the costs associated with exclusionary practices are not allowable.
Exclusive Use (of an area such as a taxiway, apron, or hangar). Per the current version of Advisory Circular 150/5190-6, Exclusive Rights at Federally Obligated Airports, [an area] that by express agreement, from the imposition of unreasonable standards or requirements, or by any other means excludes others from using the area. A taxiway that leads only to a single hangar is an exclusive use taxiway. If this definition is modified in a succeeding version of the advisory circular, the new definition must be used.
Exclusive Right. Per the current version of Advisory Circular 150/5190-6, Exclusive Rights at Federally Obligated Airports, a power, privilege, or other right excluding or debarring another from enjoying or exercising a like power, privilege, or right. An exclusive right can be conferred either by express agreement, by the imposition of unreasonable standards or requirements, or by any other means. Such a right conferred on one or more parties, but excluding others from enjoying or exercising a similar right or rights, would be an exclusive right. If this definition is modified in a succeeding version of the advisory circular, the new definition must be used.
Exhibit A. A detailed airport property inventory map that is prepared in accordance with the current version of Advisory Circular 150/5100-17, Land Acquisition and Relocation Assistance for Airport Improvement Program Assisted Projects. Note that this is a more detailed drawing than the airport property map that is sometimes required in the airport layout plan drawing set, and an Exhibit A can be substituted for an airport property inventory map.

Table A-1 Definition of Terms Used in This Handbook

Definitions
F
Fair Market Value. Per 44 CFR § 79.2, the amount in cash, or on terms reasonably equivalent to cash, for which in all probability the property would have sold on the effective date of the appraisal, after a reasonable exposure time on the open competitive market, from a willing and reasonably knowledgeable seller to a willing and reasonably knowledgeable buyer, with neither acting under any compulsion to buy or sell, giving due consideration to all available economic uses of the property at the time of the appraisal. Different variations may apply when purchasing personal property.
Fee Simple. Per Black's Law Dictionary (9th ed. 2009), an interest in land that, being the broadest property interest allowed by law, endures until the current holder dies without heirs.
Future Development. Development of a facility more than five years from the date of the approval of the ALP or the land acquisition. For the ALP, future development is shown in 5, 10, and 15 year time frames.
G
General Aviation Airport. Per 49 USC § 47102(8) a public airport that is located in a state that, as determined by the Secretary: Does not have scheduled service; or Has scheduled service with less than 2,500 passenger boardings each year.
Grant Agreement. Under 31 USC § 6304 and § 6305 (Federal Grant and Cooperative Agreement Act of 1977), a grant is a legal instrument used by a Federal agency to provide aid to carry out a public purpose as authorized by a United States law.
Grant Assurances. The obligations airport owners, planning agencies, or other organizations undertake when they accept funds from FAA-administered airport financial assistance programs. These obligations require the recipients to maintain and operate their facilities safely and efficiently and in accordance with specified conditions. The assurances appear either in the application for Federal assistance and become part of the final grant offer or in restrictive covenants to property deeds. The duration of these obligations depends on the type of recipient, the useful life of the facility being developed, and other conditions stipulated in the assurances.
Grantee. Many of the Federal documents referenced in the Handbook use the term *grantee*. For purposes of this Handbook, it is the same as sponsor.
H
Handbook. The current version of FAA Order 5100.38, Airport Improvement Program.
Hangar. A hangar is a facility for the storage of aircraft (self-maintenance is allowed as defined in the current version of FAA Order 5190-6, FAA Airport Compliance Manual). Throughout this document, the term *hangar* applies only to aircraft storage facilities. This differs from a fixed based operator building or aircraft maintenance facility, both of which have revenue generating maintenance activities.

Table A-1 Definition of Terms Used in This Handbook

Definitions
Hub Airport. 49 USC § 47102 defines hub airports as commercial service airports meeting the following criteria. *Large hub* airports enplane at least 1% of the national annual passenger boardings per 49 USC § 47102(11). *Medium hub* airports enplane at least 0.25% but less than 1% of the national annual passenger boardings per 49 USC § 47102(13). *Small hub* airports enplane at least 0.05% but less than 0.25% of the national annual passenger boardings per 49 USC § 47102(25). *Non hub* airports enplane less than 0.05% of the national annual passenger boardings per 49 USC § 47102(14).
I
Incurred Cost. An expense that has been incurred during the course of business, and is a liability until it is paid.
Indian Tribe. Per 25 USC § 5130, the term "Indian tribe" means any Indian or Alaska Native tribe, band, nation, pueblo, village, or community that the Secretary of the Interior acknowledges to exist as an Indian tribe. Pursuant to the Federally Recognized Indian Tribe List Act of 1994, the Secretary of the Interior publishes a list of federally acknowledged tribes.
Indirect Cost. Indirect costs are those that have been incurred for common or joint objectives and cannot be readily identified with a particular final cost objective. For a public agency, indirect costs may include the costs of utilities or rent that are allocated to different departments of the agency.
Indirect Cost Allocation Plan. See *Cost Allocation Plan*.
Insular Areas. The Insular Areas of the United States includes American Samoa, Guam, the Northern Mariana Islands, Puerto Rico, and the United States Virgin Islands.
J
Joint Use Airport. Per 49 USC § 47175(7), an airport owned by the Department of Defense, at which both military and civilian aircraft make shared use of the airfield.
L
Landside Needs/Development. All development on airport property that does not meet the definition of airside needs/development.
Large Hub Airport. Per 49 USC § 47102(11), a commercial service airport that enplanes at least 1% of the national annual passenger boardings.
Letter of Intent. A formal document issued by the FAA that states an intention to provide future funding.
M

Table A-1 Definition of Terms Used in This Handbook

Definitions
Maintenance. A comprehensive definition, including the differentiation between maintenance, rehabilitation, reconstruction, and replacement and examples are provided in Paragraph 3-6.
Medium Hub Airport. Per 49 USC § 47102(13), a commercial service airport that enplanes at least 0.25% but less than 1% of the national annual passenger boardings.
Metropolitan Area. Per OMB Bulletin 06-01 Corrected, Update of Statistical Area Definitions and Guidance on Their Uses, the Office of Management and Budget (OMB) defines metropolitan areas . The OMB published the Standards for Defining Metropolitan and Micropolitan Statistical Areas in a 65 Federal Register 82228 (December 27, 2000). Metropolitan areas comprise metropolitan statistical areas (MSAs), consolidated metropolitan statistical areas (CMSAs), and primary metropolitan statistical areas (PMSAs). These areas are defined in terms of entire counties, except in the six New England States where they are defined in terms of cities and towns. New England county metropolitan areas (NECMAs) are an alternative set of county-based areas defined for New England States.
Metropolitan Planning Agency. An organization whose is purpose is to ensure that government funding for transportation projects within a metropolitan area is based on continuing, cooperative, and comprehensive planning. Typical metropolitan planning agencies include metropolitan planning organizations (MPOs), councils of government, and regional planning commissions.
Modification to Standards. Any FAA approved change to FAA standards (other than dimensional standards for runway safety areas) applicable to an airport design, construction, or equipment procurement project.
N
NAVAID. An acronym for navigation aid. From the FAA Pilot/Controller Glossary, a navigational aid is any visual or electronic device airborne or on the surface which provides point-to-point guidance information or position data to aircraft in flight.
Near-Term Development. Per the current version of Advisory Circular 150/5070-6, Airport Master Plans, within the next five years.
Noncompatible Land Use. Per 14 CFR § 150.7, the use of land that normally not compatible with the outdoor noise environment (or an adequately attenuated noise level reduction for any indoor activities involved) at the location because the yearly day-night average sound level is at or below that identified for that or similar use under appendix A (Table 1) of 14 CFR part 150.
Nonhub Airport. Per 49 USC § 47102(14), a commercial service airport that enplanes less than 0.05% of the national annual passenger boardings.
Non-Federal Entity. Per 2 CFR § 200.69, a state, local government, Indian tribe, institution of higher education (IHE), or nonprofit organization that carries out a Federal award as a recipient or subrecipient. These were previously referred to as grantees and subgrantees.
Non-Primary Airport. An airport that is not a primary airport as defined under 49 USC § 47102(16). In other words, an airport that has 10,000 or less passenger enplanements each year.

Table A-1 Definition of Terms Used in This Handbook

Definitions
O
Obligations. The execution (signing) of a grant agreement with a sponsor constitutes an obligation of the Federal government to eventually pay the amount specified in the grant. Obligations of funds are processed through the FAA Office of Finance and Management, FAA Accounts Payable Section B (AMK-314) in two steps: a *reservation of funds* is made before the grant is signed, and an *obligation* is reported when the grant is signed. Total obligations for a year may never exceed the total of funds allotted to a regional office. There are *gross* and *net* obligations. Gross obligations are the total obligations of all types of funds (including recovered funds) without deducting funds recovered from old obligations. Net obligations are total obligations (including obligations of recovered funds) minus total funds recovered during the year.
Office of Management and Budget (OMB). The Federal agency responsible for providing fiscal accounting and budgeting services for the Federal government.
Order. Per the current version of FAA Order 1320.1, FAA Directives Management, directives are the primary means within the FAA to issue, establish, and describe agency policies, organization, responsibilities, methods, and procedures. Orders are permanent directives and stay in effect until canceled. *Note: Although the AIP Handbook is published as an FAA order, it provides program requirements to airports, consultants and all involved with AIP.*
OST Release Date. The DOT Office of the Secretary (OST) release date is the date that the congressional notification process is completed.
Overall Development Objective (ODO). The ODO is found in the current version of FAA Order 5100.39, Airport Capital Improvement Plan. The intent of the ODO is to recognize that many airport projects require several different projects in order to complete the overall objective. For example, a new runway project may require land acquisition, obstruction clearing and runway construction. Through the use of the ODO, the costs and effort involved with the land acquisition and obstruction clearing is captured as part of the new runway project.
P
Passenger Boardings. Per 49 USC § 47102(15), unless the context indicates otherwise, revenue passenger boardings in the United States in the prior calendar year on an aircraft in service in air commerce, as the Secretary determines under regulations the Secretary prescribes. This includes passengers who continue on an aircraft in international flight that stops at an airport in the 48 contiguous states, Alaska, or Hawaii for a nontraffic purpose. Note that *revenue passenger* is further defined in Section 3 of 14 CFR part 241, Uniform System of Accounts and Reports of Large Certificated Air Carriers.
Passenger Facility Charge. A charge approved by the FAA which is imposed by a public agency on eligible revenue passengers enplaned at a commercial service airport it controls. Public agencies may use PFC revenue to finance FAA-approved projects that meet the requirements of 49 USC § 40117. Note that *revenue passenger* is further defined in Section 3 of 14 CFR part 241, Uniform System of Accounts and Reports of Large Certificated Air Carriers.

Table A-1 Definition of Terms Used in This Handbook

Definitions
Permissive Statute. Per Black's Law Dictionary (9th edition 2009), a statute that allows certain acts but does not command them.
Precision Approach Procedure. From the FAA Pilot/Controller Glossary, a Precision Approach Procedures is a standard instrument approach procedure in which an electronic glide slope/glide path is provided, e.g., ILS (Instrument Landing System), MLS (Microwave Landing System), and PAR (Precision Approach Radar)
Price Analysis. A price analysis is a process analyzing a proposed total price without evaluating separate cost elements (including profit). The purpose is solely to ensure that a total price is fair and reasonable.
Primary Airport. Per 49 USC § 47102(16), primary airport means a commercial service airport the Secretary determines to have more than 10,000 passenger boardings each year.
Program Income or Program Revenue. Per 2 CFR § 200.80, gross income received by the recipient or subrecipient directly generated by a grant supported activity, or earned only as a result of the grant agreement during the grant period. "During the grant period" is the time between the effective date of the award and the ending date of the award reflected in the final financial report. To be considered program income, the sponsor must receive the income.
Programming. The FAA process of moving a proposed grant through all of the appropriate levels of review required prior to reserving funds for that grant.
Project. For the purposes of this Handbook, an item of work such as a runway extension or apron rehabilitation. Separate projects can be included in one grant application.
Project Cost. A cost involved in carrying out a project.
Public Agency. Per 49 USC § 47102(20), any one of the following: A state or political subdivision of a state (this includes state agencies, cities, and other municipalities). A tax-supported organization. An Indian tribe or pueblo. Except an Indian tribe or pueblo, a public agency requires specific state-enabling legislation that authorizes the agency and defines the responsibilities of the agency.
Public Airport. Per 49 USC § 47102(21), an airport used or intended to be used for public purposes that meet the following two criteria: The airport is under the control of a public agency. The area used or intended to be used for the landing, taking off, or surface maneuvering of aircraft is publicly owned.

Table A-1 Definition of Terms Used in This Handbook

Definitions
Public-Use Airport. Per 49 USC § 47102(22), a public-use airport is: A public airport; or A privately-owned airport used or intended to be used for public purposes that is: A reliever airport; or Determined by the Secretary to have at least 2,500 passenger boardings each year and to receive scheduled passenger aircraft service.
R
Reconstruction. A comprehensive definition, including the differentiation between maintenance, rehabilitation, reconstruction, and replacement and examples are provided in Paragraph 3-6.
Recoveries. As adjustments are made to grant amounts based on actual payments, funds may be recovered (deobligated) from existing obligations and reobligated for upward adjustments to existing projects and under certain circumstances may be reobligated for new projects. The amount of recoveries that may be reobligated is controlled by the Office of Management and Budget (OMB) and is communicated to regional offices in the allotment process as a *recovery ceiling*.
Rehabilitation. A comprehensive definition, including the differentiation between maintenance, rehabilitation, reconstruction, and replacement and examples are provided in Paragraph 3-6.
Regularly Scheduled Commercial Service. A 14 CFR part 121, 14 CFR part 129, or 14 CFR part 135 certificated air carrier operating on a published schedule and reporting scheduled commercial activity.
Reliever Airport. Per 49 USC § 47102(23), a reliever airport is an airport the Secretary designates to relieve congestion at a commercial service airport and to provide more general aviation access to the overall community.
Replacement. A comprehensive definition, including the differentiation between maintenance, rehabilitation, reconstruction, and replacement and examples are provided in Paragraph 3-6.
Restrooms. A dedicated room for toilet and wash basin facilities. Restrooms do not include bathing facilities such as a shower or tub (these are considered a bathroom or bathing facility).
Retainage. The money earned by a contractor but not paid to the contractor until the completion of construction or another predetermined date. The retainage is held back as assurance for the quality of the contractor's work. Per 2 CFR § 200.305(b), the ADO must not make payments to sponsors for amounts that the sponsor has retained or withheld from the contractor. 49 CFR § 26.29 requires that the retainage that is held for subcontracts must match or must not exceed the level of retainage held back from the contractor by the sponsor. (Although 49 CFR § 26.29 is the regulation for Disadvantaged Business Enterprises (DBE) in Department of Transportation Federal assistance programs, the requirements for prompt payment apply to payment to all contractors and subcontractors, and are not limited to DBE only.)

Table A-1 Definition of Terms Used in This Handbook

Definitions
Revenue Producing Aeronautical Support Facilities. Per 49 USC § 47102(24), fuel farms, hangar buildings, self-service credit card aeronautical fueling systems, air plane wash racks, major rehabilitation of a hangar owned by a sponsor, or other aeronautical support facilities that the Secretary determines will increase the revenue producing ability of the airport.
Runway Protection Zone (RPZ). Per the current version of Advisory Circular 150/5300-13, Airport Design, area at ground level prior to the threshold or beyond the runway end to enhance the safety and protection of people and property on the ground. This advisory circular defines RPZ requirements.
S
Safety/Security Equipment. Per 49 USC § 47102(3)(B)(ii), equipment, including explosive detection devices, universal access systems, and emergency call boxes, the Secretary requires by regulation for, or approves as contributing significantly to, the safety or security of individuals and property at the airport and integrated in-pavement lighting systems for runways and taxiways and other runway and taxiway incursion prevention devices.
Secretary. For the purposes of this Handbook, Secretary refers to the Secretary of the Department of Transportation. For some limited instances, Secretary may mean the Secretary of Homeland Security.
Sensitivity Analysis. For the purposes of Letter of Intent reviews, and as originally published in PGL 07-03, a sensitivity analysis is an analysis of the net impact of potential changes in key independent variables. For example, sensitivity analyses typically conducted on capital cost estimates may involve calculating the overall cost impact of an additional half-percentage point of annual cost escalation—e.g., the difference between 3.0% versus 3.5%—or the effect of a one-year delay in the overall construction schedule.
Set-Aside Funding. The AIP funding structure contains certain funding percentages or amounts that represent a minimum requirement for dedicated AIP funding. These *set-asides* include money for noise compatibility planning and projects, Military Airport Program participants, certain reliever airports and projects for capacity, safety, and security and noise projects at primary and reliever airports. Since these *set-asides* represent a minimum annual amount, the FAA calculates these categories after the apportionment of entitlement funding (which represent specific amounts). Funding remaining after entitlement funding and set-asides is referred to as remaining or *pure* discretionary.
Simplified Acquisition Threshold. Per 2 CFR 200.88, the dollar amount below which a non-Federal entity may purchase property or services using small purchase methods. The simplified acquisition threshold is set by the Federal Acquisition Regulation at 48 CFR Subpart 2.1 (Definitions) and in accordance with 41 USC § 1908. This threshold is periodically adjusted for inflation. The current threshold amount can be found in Table U-7.
Small Hub Airport. Per 49 USC § 47102(25), a commercial service airport that enplanes at least 0.05% but less than 0.25% of the national annual passenger boardings.

Table A-1 Definition of Terms Used in This Handbook

Definitions
Sponsor. A sponsor is defined in 49 USC § 47102(26) as: A *public agency* that submits to the Secretary under this subchapter an application for financial assistance; and A *private owner of a public-use airport* that submits to the Secretary under this subchapter an application for financial assistance for the airport.
Standards Projects. The current version of FAA Order 5100.39, Airports Capital Improvement Plan defines standards projects. As of the publication date of this Handbook, that definition is as follows: Projects to bring an airport up to standards recommended by the FAA based on the current design category of the airport. If this definition is modified in the next version of FAA Order 5100.39, the new definition must be used. In cases where it is unclear if a project is capacity or standards, the ADO must obtain a joint APP-400 and APP-510 concurrence on whether the project is considered capacity.
State. Per 49 USC § 47102(27), a state, for the purposes of this Handbook, is defined as a state of the United States, the District of Columbia, Puerto Rico, the Virgin Islands, American Samoa, Guam, and the Trust Territory of the Pacific Islands (Republic of the Marshall Islands, the Federated States of Micronesia, the Commonwealth of the Northern Mariana Islands, the Republic of Palau).
State Planning Agency. A state organization whose purpose is to ensure that government funding for transportation projects within a state is based on continuing, cooperative, and comprehensive planning. Typical state planning agencies include, but are not limited to, planning offices, aeronautics commissions, and departments of transportation.
Subgrant. Typically under AIP, the subgrant is the award of Federal funds to a subrecipient.
Subrecipient. Per 2 CFR § 200.93 (OMB Circular A-133, Subpart A), a non-Federal entity that expends Federal awards received from a pass-through entity to carry out a Federal program, but does not include an individual that is a beneficiary of such a program. A subrecipient may also be a recipient of other Federal awards directly from a Federal awarding agency. Typically under AIP grants, the subrecipient is the airport receiving a grant from a state in a block grant state.
Substantial Completion. Substantial completion is generally a defined term in a contract and is the stage of the project when work is sufficiently complete in accordance with the contract documents so that the sponsor can occupy or use the project for its intended purpose. The substantial completion date typically triggers: retainage release; the warranty period; determination of any actual or liquidated damages; the start of the statute of limitations; and related actions.
T

Table A-1 Definition of Terms Used in This Handbook

Definitions
Terminal Development. Per 49 USC § 47102(28), terminal development includes: An airport passenger terminal building, including terminal gates. Access roads servicing exclusively airport traffic that leads directly to or from an airport passenger terminal building. (Note that per FAA policy, the boundaries of this road are the first road or driveway in either direction from the terminal.) Note that an on-airport road (or the portion of a road) that does not go directly to or from a passenger terminal building is considered *access road* rather than *terminal development*. Walkways that lead directly to or from an airport passenger terminal building. Vehicles to move passengers between terminal facilities and between terminal facilities and aircraft per 49 USC § 47119(a)(1)(B).
Through-The-Fence Operation. A through-the-fence operation consists of an individual or company who owns property with aircraft storage facilities near an airport accessing the airfield of the airport with aircraft from off-airport property.
Turbojet Aircraft. For purposes of this Handbook, includes aircraft that have jet engines.
U
Unallowable Cost. The cost of an item or activity that is not allowed to be funded with AIP, either by FAA policy, published cost standards, or legal prohibition.
Uneconomic Remnant. A parcel of real property in which the owner is left with an interest after the partial acquisition of the owner's property, and which the sponsor has determined has little or no value or utility to the owner. This is a parcel in addition to the property needed. Uneconomic remnants may be incorporated into airport property as feasible, or disposed.
Usable Unit of Work. A completed project that will result in an increase in safety, usefulness, or usability at the airport. For the purposes of AIP grants, a usable unit of work can be obtained over one or more grants, provided the end result is a usable unit of work. This also requires a special condition in the grant requiring the sponsor to complete the work regardless of whether the associated future grants are issued. The automated AIP system contains the current available special conditions.
Used or Intended to be Used. Used means currently in use. Per FAA policy, *intended to be used* means that the use will be realized within the next three to five years.
Useful Life. Useful life is the period during which an asset or property is expected to be usable for the purpose it was acquired. It may or may not correspond with the item's actual physical life or economic life.

Table A-1 Definition of Terms Used in This Handbook

Definitions
W
Wide Area Augmentation System (WAAS). WAAS provides improved navigation accuracy, availability, integrity, and continuity for aircraft navigation during departure, en route, arrival, and approach operations including no precision approaches and approach procedures with vertical guidance. Without WAAS, aircraft using GPS navigation equipment under instrument flight rules (IFR) must be equipped with an approved and operational alternate means of navigation appropriate for the flight. WAAS corrects for GPS signal errors caused by ionospheric disturbances, timing, and satellite orbit errors, and it provides vital integrity information regarding the health of each GPS satellite.

Appendix B. References and Web Links

B-1. References and Web Links.

Table B-1 contains a list of the references included in this Handbook. Web links are provided in this list (they are not given again in the Handbook) and were current on the Handbook publication date. The versions for specific documents are not given – the current version must be used. Also, where possible, website links do not link directly to documents because these types of links tend to break often. Instead, they link to source web pages to ensure links stay current (and for some documents this is required by FAA Web policy).

Table B-1 References and Web Links

Web links to references in this Handbook include…
AIP Forms This website provides all available forms for AIP as well as other FAA Office of Airports functions. http://www.faa.gov/airports/resources/forms/
AIP Grant Assurances The grant assurances are the obligations associated with a grant that require the sponsors to maintain and operate their facilities safely and efficiently and in accordance with specified conditions. Many of the assurances are based on 49 USC §§ 47105, 47106 and 47107. http://www.faa.gov/airports/aip/grant_assurances/
AIP Grant Histories This website provides AIP grant histories for all airports included in the National Plan of Integrated Airport Systems (NPIAS). http://www.faa.gov/airports/aip/grant_histories/
AIP Grant Payments This website provides information on how to use the current DOT electronic payment system. http://www.faa.gov/airports/aip/grant_payments/
AIP Letter of Intent History This document contains the annual payments for all open and closed Letter of Intents (LOIs). http://www.faa.gov/airports/aip/loi/
AIP Program Guidance Letters (PGLs) Program guidance letters are interim guidance issued about AIP. A PGL is a change to the Handbook. http://www.faa.gov/airports/aip/guidance_letters

Appendix C. Prohibited Projects and Unallowable Costs

C-1. Examples of General Prohibited Projects/Costs (for All Types of Projects).

The list in Table C-1 is not comprehensive. Instead, it contains examples of projects or costs specifically prohibited in the Act or whose eligibility is frequently questioned. Unless a specific reference to the Act is cited, these prohibitions are FAA policy.

Table C-1 Examples of General Prohibited Projects/Costs for All Project Types

Examples include, but are not limited to…	
(1)	**ACIP Update as Project Formulation.** Updates to an airport's capital improvement plan as part of the project formulation costs. Updates to an airport's capital improvement plan are only eligible if warranted as part of a master plan study or update grant.
(2)	**Administrative Costs as a Percent of the Grant Amount.** Administrative costs must be based on work that is necessary for carrying out the project.
(3)	**Administrative Costs for AIP Program Management.** Because AIP funds can only be used for costs to carry out a specific AIP project, program administrative costs incurred by the sponsor for managing the grant program are not allowable.
(4)	**Airfield Operations and Maintenance Costs**.
(5)	**Approach Procedures – Design and Establishment Costs.** In general, AIP cannot be used to design new approach procedures or to fund the costs associated with establishing a new procedure except in very limited circumstances that are allowed under the Act.
(6)	**Budget Augmentation.** Combining funds between different Federal programs if not specifically allowed as discussed in Paragraph 4-13.
(7)	**Catering.** Including at public meetings or other events for an AIP project.
(8)	**Computer Software (Including Common Use Gate Software).** Software that does not meet the requirements in Paragraph 3-66.
(9)	**Conferences, Seminars, and Courses.** Tuition, travel, or subsistence for a sponsor's personnel to attend conferences, seminars, or courses.
(10)	**Construction on Land Leased from a Private Entity.** Projects must be on airport property with good title per Paragraph 3-16. As discussed in Table 2-9, leasing from a private entity does not meet the requirements for good title.
(11)	**Contingencies or Allowances**.

Table C-1 Examples of General Prohibited Projects/Costs for All Project Types

Examples include, but are not limited to…
(12) Correcting or Doing Something More than Once – Construction/Equipment/Land. Cost to correct or do something more than once. This is based on the general AIP premise that AIP is intended for something to be done correctly one time. Therefore, costs not required to complete the project are not allowable. This includes restocking charges if a contractor orders too much or an incorrect material and wants to return the materials to the supplier. While the supplier may charge the contractor to restock the materials, the costs of restocking are not required to complete the projects. It also includes costs for replacing defective materials, or items that are warranty issues, and all costs associated with the removal and replacement of pavement or materials that do not meet the FAA specifications.
(13) Correcting or Doing Something More than Once – Design/Planning. Cost for design more than once except as allowed in Paragraph 3-22 for advisory circular changes. Following the premise above, AIP grant funds cannot be used to redesign. The exception is for design omissions that were not negligent and the additional work was necessary and would have been done anyway under a correct set of plans. For example, if a sponsor is given a design-only grant and is delayed in starting the construction, the plans may need to be reviewed and some parts of it redesigned. The costs to redesign or to bring the plans up to date are not allowable costs since AIP paid the first time to correctly design the project.
(14) Costs to Recover Improper Payments. By FAA policy, the costs incurred by a sponsor to recover improper payments are not an allowable cost of an AIP grant project. Although 2 CFR § 200.428 considers costs to recover an improper payment an allowable cost, these costs are not allowable under AIP. This is because AIP grants are project specific and limited by 49 USC § 47110 to only those costs that are reasonable and necessary to carry out the project. The costs to recover improper payments do not meet that statutory requirement.
(15) Decorative Landscaping. This is per 49 USC § 47110(f). Planting can only be funded to the extent that it is a cost associated with an AIP project and required for erosion control, state and/or local construction practices or for noise mitigation. As with any ineligible work, where the sponsor desires to include landscaping for aesthetic effect with a project, the costs must be broken-out from the grant funded part of the project.
(16) DBE Plan Updates as a Stand-Alone Plan. DBE updates are required when the anticipated amount of Federal funding is $250,000 or greater in a fiscal year, and the cost of the plan update may be included as an allowable cost of the project that is triggering the need for the plan update.

Table C-1 Examples of General Prohibited Projects/Costs for All Project Types

Examples include, but are not limited to…
(17) Equipment – Turned Over at End of Project. Acquisition of non-expendable equipment as part of an AIP development project. Some examples include: **(a)** Hand held radios **(b)** Vehicle beacons **(c)** Pavement marking machines **(d)** Joint sealing machines **(e)** Ohm meters **(f)** Sweeper brooms **(g)** Commercial barricades **(h)** Construction vehicles/trucks **(i)** Inspection vehicles/trucks **(j)** Construction office trailer/building **(k)** Hand held cameras **(l)** Lighted X's While the cost associated with the temporary use of non-expendable equipment is eligible under AIP, the acquisition of such equipment under a development grant is not. The practice of requiring a project contractor to transfer ownership of temporary non-expendable equipment to the owner at the end of the project is an impermissible procurement action. For example, it is reasonable to require the contractor to furnish hand-held radios during the duration of the project. It is not allowable under AIP to require the contractor to transfer ownership of these radios to the airport owner at the conclusion of the project. AIP may not participate in costs associated with acquiring equipment for day-to-day airport operations. This includes direct and indirect acquisitions.
(18) Extended Warrantees. Not allowable because not required under 2 CFR § 200.325.
(19) Flight Checks – Certain Cost. Flight check costs for establishing procedures or anything other than the initial flight check for an AIP funded NAVAID or weather aid.
(20) Fundraising. Any costs incurred in connection with raising funds by the sponsor, including interest and premium charges and administrative expenses involved in conducting bond elections and in selling bonds. Such costs are ineligible unless specifically allowed by statute, regulation, or a similar provision.
(21) Indirect Cost Applied to Costs Other Than Direct Salary and Wages. The rate approved under the cost allocation plan (also referred to as the indirect cost allocation plan rate, or ICAP rate) for a sponsor is applied only to the costs associated with sponsor's employee's hourly rate. The rate is not a multiplier on anything but the employee's hourly rate. This means that the ICAP cannot be applied to contract costs, construction costs, consultant costs, or any other type of cost that is not a sponsor's employees' salaries and wages for hours worked on an AIP project.

Table C-1 Examples of General Prohibited Projects/Costs for All Project Types

Examples include, but are not limited to…
(22) Interest Charges. Interest charges, except payment of interest directed by a court in a condemnation proceeding, which then becomes part of the condemnation award and allowable. However, where the amount deposited in court as fair market value was adequate and could have been withdrawn by the property owner without prejudice to his/her rights in the condemnation proceeding, such interest payment is not allowable.
(23) Legal Fees Defending a Specification or Federal Contract Requirement. These costs are not required to complete the project.
(24) Liability Insurance – Excessive for Contractor/Consultant. Liability insurance well beyond that normally carried by the contractor or consultant for his own protection. This includes liability for damages beyond the scope of the consultant or contractor contract (such as making a consultant liable for acts of third party contractors not under the control of the consultant).
(25) Liability Insurance – For the Airport Sponsor. The requirement that the sponsor be indemnified by the contractor against potential damages is not an FAA or AIP requirement, nor is it an essential element in completing the project. Rather, this third party coverage would simply protect the airport and its insurer against the presumed added risk of airport operations during periods of construction and add the cost of that protection to the construction costs.
(26) Lobbying. Cost of activities associated with the lobbying for a project or influencing Federal employees. The regulations on lobbying or influencing Federal employees do not restrict technical negotiations involving AIP projects.
(27) Maintenance Bonds. Not allowable because not required under 2 CFR § 200.325.
(28) On the Job Training Programs. Agencies such as the Federal Highway Administration have specific statutory authorization to establish apprenticeship and training programs targeted to move women, minorities, and disadvantaged individuals into journey-level positions. The FAA does not have similar statutory authorization for AIP and therefore cannot participate in such programs.
(29) Procurements with Improper Bid Alternates. Using the procurement process as a cost estimating tool is not allowed. The sponsor is not allowed to bid alternates that it has no intention of putting under contract. An example would be where a sponsor is permitted by its 14 CFR part 139 index to acquire a 1,500 gallon ARFF vehicle, but wants a 3,000 gallon vehicle and intends to pay the additional cost using local funds. This is to avoid having contractors and suppliers incur significant costs to bid hypothetical projects.
(30) Projects That Have Not Been Determined to be Eligible. Any project that has not been determined to be eligible by the FAA. If this Handbook does not list a project as eligible, the ADO must receive an eligibility determination from APP-500.
(31) Repair, Replacement or Upgrading of AIP funded Computer Hardware and Software used in AIP Projects. Repair, replacement, or upgrading computer hardware or software before the useful life of the system has been met. Computer hardware and software are considered supplies and the ADO cannot fund interim replacement of components prior to the end of the useful life of the AIP project (such as electrical vaults and access control systems).

Table C-1 Examples of General Prohibited Projects/Costs for All Project Types

Examples include, but are not limited to…
(32) Replacement or Repair of Damaged Facilities or Equipment. **(a) Non-Emergency Repair or Replacement of Eligible Infrastructure.** Replacement or repair of facilities or equipment that has been damaged are not eligible unless the sponsor can prove that there is no other avenue of funding, such as insurance, legal recourse, an airport emergency reserved fund, or funding through another Federal agency responsible for such disasters. **(b) Emergency Repair or Replacement of Eligible Infrastructure.** From a disaster recovery aspect, AIP grant funding efforts are focused on the capital improvements that have been damaged**.** AIP funding is limited to eligible projects as long as there is no other avenue of funding, such as insurance, legal recourse, an airport emergency reserved fund, or funding through another Federal agency responsible for such disasters. In addition, the normal grant rules apply. **(c) Emergency Repair or Replacement of Ineligible Infrastructure.** AIP funding of emergency disaster repairs that are not normally eligible for AIP are not allowed without express congressional authorization.
(33) Replacement, Repair, or Renovation of Ineligible Facilities/Equipment. Unless allowed under Paragraph 3-74, if AIP cannot be used to construct or acquire something, then AIP cannot be used to repair, replace, or renovate it.
(34) Sculptures or Works of Art. Per 49 USC § 47110(f).
(35) Training. Only acquisition of certain training systems and equipment is eligible, not the actual training.
(36) Unclassified Airport Projects – Unjustified. Nonprimary airports that are not classified as National, Regional, Local, or Basic airports in the latest edition of the FAA Asset report have very low levels of activity. As a result, only projects that meet the requirements in Paragraph 3-10 may be funded by the ADO**.**

C-2. Examples of Construction Prohibited Projects/Costs.

The list in Table C-2 is not comprehensive. Instead, it contains projects or costs specifically prohibited in the Act or whose eligibility is frequently questioned. Unless a specific reference to the Act is cited, these prohibitions are FAA policy.

Table C-2 Examples of Prohibited Projects/Costs for Construction

Examples include, but are not limited to…
(1) All of the Examples in Table C-1.
(2) Access Road – Ineligible Segments. A portion of an access road that meets any of the following criteria: **(a)** Does not exclusively serve airport traffic to/from an aeronautical use on the airport (aeronautical use includes terminals, cargo facilities, hangars, air national guard, etc.). **(b)** Is exclusively for the purpose of connecting parking facilities (or other non-aeronautical facilities such as rental car facilities and on-airport hotels) to an eligible portion of the access road. **(c)** Solely serves industrial or non-aeronautical areas or facilities. **(d)** Is necessary only to maintain FAA facilities installed under the F&E program. **(e)** Is not on airport property or an airport-owned easement. **(f)** Is not needed for the circulation of airport passengers or air cargo.
(3) Air Compressors. Air compressors beyond the single fixed system in an ARFF building that is intended to support the maintenance bay and self-contained breathing apparatus (SCBA). Portable air compressors are also ineligible.
(4) Aircraft Deicing Equipment and Fluid Storage Facilities. Per 49 USC 47102(3)(G), the acquisition of *aircraft* deicing fluids or constructing or reconstructing storage facilities for *aircraft* deicing equipment or fluids. Note that this is not the same as drainage collection, treatment, and discharge systems for treating aircraft deicing fluids, which are considered AIP eligible.
(5) Airline Operations and Maintenance Facilities. This includes catering facilities and airline related waste disposal facilities such as triturators and food waste incinerators.

Table C-2 Examples of Prohibited Projects/Costs for Construction

Examples include, but are not limited to…
(6) Aircraft Rescue and Firefighting (ARFF) Buildings – Certain Areas/Equipment. **(a) Buildings Bays for Non-Airport ARFF Vehicles or Non-ARFF Vehicles.** ARFF building bays for fire trucks or vehicles that are stationed on the airport, but primarily provide services outside the airport boundaries, or for any vehicle that is not required by regulation except for a single structural fire truck that is used to provide backup support to ARFF vehicles and protection to airport buildings. **(b) Dedicated Office Space.** Office space beyond an open area to accommodate a desk for the shift commander and one administrative staff (when applicable). Dedicated space for other administrative purposes that are not allowable include office space for the Fire Chief, Deputy Chief, and other officers **(c) Conference Rooms**. **(d) Private Dormitories and Lavatories**. **(e) Exercise Facilities.** **(f) Extra Generators or Air Compressors.** Only one fixed emergency generator and one fixed air compressor of sufficient size to operate the ARFF bay system and to maintain the readiness of self-contained breathing apparatus (SCBA) are allowable. **(g) Non-fixed Furniture or Equipment.** Non-fixed items such as tables, chairs, couches, portable generators, and portable air compressors are not allowable. **(h) Station Store.** **(i) Public Restrooms and/or Bathrooms.** Restrooms and bathrooms beyond what is need for the ARFF staff. **(j) Separate TV Room.** Only a day room of proper size is eligible. **(k) Separate Telephone Room.** **(l) Washers/Dryers.** **(m) Separate Computer Training Room.** Only one training room for computer and non-computer training is allowable.
(7) Aircraft Self-Docking Systems. System to automatically guide pilots to the gate and allow the pilots to self–park aircraft without ramp personnel (advantageous during presence of lightning) through the use of laser range finders and light-emitting diode (LED) displays. This equipment is not required by rule or regulation and is typically airline owned.
(8) Bathrooms/Restrooms. Bathrooms differ from restrooms in that they include a shower or a tub, which is not required by the Americans with Disabilities Act (ADA). **(a) Bathrooms.** Not allowed except in ARFF buildings if required by 14 CFR part 139 staffing requirements. **(b) Restrooms.** Not allowed in any building other than ARFF buildings and public areas of a terminal building.

Table C-2 Examples of Prohibited Projects/Costs for Construction

Examples include, but are not limited to…
(9) Bid Alternates that are Not Possible. Sponsors must not use the procurement process, such as including bid alternates, as a means of determining project costs. Bidding a 1,500 gallon ARFF vehicle and a 3,000 gallon vehicle simply to determine the difference in costs of the two vehicles when the sponsor has no intent of actually acquiring the smaller vehicle.
(10) Buildings – Not in Act. Any building that is not an eligible facility at that airport for storing *airfield* deicing materials, terminal, ARFF building, snow removal equipment building, hangar, or contract tower (unless specifically allowed under a special AIP funding program in Chapter 6).
(11) Cell Phone Waiting Lots – Unnecessary Costs. Areas for unattended car parking and amenities such as flight information display boards are not considered necessary.
(12) Command and Control Centers Area/Cost Beyond Maximum. Any area or cost beyond what is allowed in Table O-3.
(13) Early Completion Bonuses.
(14) Explosive Detection System (EDS) or Associated Terminal Modification. Beginning in FY 2004, and in every year since then, the FAA appropriations bill has prohibited using AIP grant funds on EDS systems or any building modifications that are necessary to support or install an EDS system. Because PFC eligibility hinges on AIP eligibility, leaving the project eligible but prohibiting funding is a work-around that allows these projects to be funded with PFCs.
(15) Environmental Remediation. Environmental remediation and removal of fuel farms, underground fuel tanks, hazardous waste, or contaminated soil. This is because sponsors are required by the grant assurances to maintain facilities to environmental standards. In addition, the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), commonly known as Superfund, provides that the responsible party causing the contamination can be accountable for recovery of clean-up costs, regardless of the level of negligence.
(16) Fueling Facilities – Non-Aircraft. Fueling facilities are not eligible for non-aircraft vehicles, regardless of the location on the airport or the non-aircraft vehicles that will use the facility. This includes fueling facilities for AIP eligible vehicles such as aircraft rescue and firefighting trucks and snow removal equipment. Fuel *storage* for non-aircraft vehicles within a fuel farm is also ineligible.
(17) Fueling Facilities – Rehabilitating or Replacing. Unless otherwise eligible and approved under the Voluntary Airport Low Emission Program (VALE) or the Zero Emission Vehicle and Infrastructure Pilot Program (ZEV), the following is not eligible: **(a)** Constructing a new fuel farm if the airport already has a fuel farm, even if the existing fuel farm has reached the end of its useful life (AIP can only fund initial construction, then the facility is expected to be self-supporting). **(b)** Projects to address environmental deficiencies. **(c)** Replacing individual components like fuel tanks, even if the purpose is to provide more capacity. Only adding supplemental tanks are allowed if justified.

Table C-2 Examples of Prohibited Projects/Costs for Construction

Examples include, but are not limited to…
(18) Furniture. All furniture except fixed furniture for passenger seating (including fixed tables and counters) in holding areas of a terminal that is installed as an allowable cost of a terminal building project.
(19) Furniture – Replacement of Fixed. Replacement of fixed terminal furniture after the initial installation, unless the replacement is necessitated by an eligible terminal project.
(20) Hangar Acquisition (on Land Leased from the Airport). Acquisition of an existing hangar on land leased from the airport because there should have been a reverter clause for the hangar in the land lease agreement. APP-500, with support from and ACO-100, may approve exceptions with extraordinary justification on a case by case basis.
(21) Law Enforcement Facilities. Law enforcement facilities that are not airfield facilities to provide for a law enforcement presence required for air transportation security. The FAA has determined that the only facilities that are eligible are guard shacks at airfield access points. Co-located Command and Control Centers or Emergency Operations Centers also have limited eligibility.
(22) Light Emitting Diode (LED) Lighting. It is FAA policy that: **(a)** LED obstruction lights, LED approach lights (does not include touch down zone or centerline lights) and LED high intensity runway edge lights are not currently AIP eligible. This is because LED fixtures may not provide the infrared signature necessary for aircraft using Enhanced Flight Vision Systems or Night Vision Imagery technology. This FAA prohibition was reviewed and upheld in December 2014. **(b)** AIP funds cannot be used to replace AIP funded lighting fixtures with LED fixtures (either allowed or prohibited) if the existing AIP funded fixtures have not met the end of their useful life. **(c)** The installation of nonstandard electrical system components as part of an eligible LED lighting project is not allowed. **(d)** Costs for associated cable, conduit, etc., for prohibited LED lights is also restricted as discussed in Table 3-57.
(23) Maintenance/Service Facilities. Construction of maintenance/service facilities, except that allowed to store snow removal equipment, and to store the aircraft rescue and firefighting equipment that is required under 14 CFR part 139.
(24) Multimodal Terminals. Areas not directly related to air commerce. Only the areas directly related to air commerce are eligible.
(25) NAVAID Relocation. The relocation of NAVAIDs and other facilities except as allowed under Paragraph 3-74. Relocation strictly for the convenience of the owner (be it the sponsor, the FAA, or other type of owner) is not allowable.

Table C-2 Examples of Prohibited Projects/Costs for Construction

Examples include, but are not limited to…
(26) NAVAID Relocation – Refurbishing/Enhancing/Upgrading. AIP participation to move FAA-owned NAVAIDS that impede an AIP funded project must not include refurbishing, enhancing, or upgrading the impacted facility.
(27) Noise Barriers – Exclusive Use.
(28) Obstruction Removal – Beyond the Aircraft Category on the Approved ALP for that Runway.
(29) Obstruction Removal – Creation of Parks or Play Fields. Any redevelopment, such as the creation of parks or play fields, unless required as part of court ordered mitigation. This is because the redevelopment is not an essential element in completing the project.
(30) Obstruction Removal – More than Once. Topping trees, or any other obstruction removal, more than once using AIP funding. This includes re-topping a tree that cannot be removed because of environmental reasons (more than one topping is considered maintenance).
(31) Painting and Carpeting – Stand-Alone. Carpet replacement and painting as stand-alone projects. Carpet replacement or repainting impacted by an eligible project (and only within the boundaries of the eligible project) would be eligible as an incidental part of that project.
(32) Parking Lots/Garages for Passenger Vehicles – Except as Specifically Allowed. The following parking facilities are ineligible: **(a)** All parking lots at large, medium, and small hub airports. **(b)** All parking lots that are not for the movement of passengers per FAA policy (such as employee parking lots and restaurant parking lots) except as specifically allowed in this Handbook for limited passenger vehicle parking associated with an eligible building. **(c)** All parking garages. These are not considered parking lots (as specified in 49 USC 47119(a)(2)) and are not eligible at any size airport. **(d)** Revenue producing parking lots at nonhub airports (unless specifically allowed under a special AIP funding program in Chapter 6).
(33) Pavement – Adjacent to Terminal. The areas immediately adjacent to the terminal building that cannot be used by aircraft. This pavement may be eligible as terminal work provided it is associated with eligible terminal facilities.
(34) Pavement – Associated with a Snow Removal Equipment (SRE) or Aircraft Rescue and Firefighting (ARFF) Building. Pavement beyond what is necessary to move eligible SRE and ARFF vehicles in and out of AIP eligible SRE and ARFF buildings is ineligible. The exception is limited automobile parking for employee as allowed in this Handbook.

Table C-2 Examples of Prohibited Projects/Costs for Construction

Examples include, but are not limited to…
(35) Pavement – Exclusive Use. This includes exclusive use and near exclusive use aprons, taxiways, and taxilanes. Near exclusive use means that the airport has no procedures for the management and operation of the apron, hangar, or taxiway to ensure prompt access by each potential user. Appendix A contains a more complete definition and references on exclusive use.
(36) Pavement – In Front of an Ineligible Building. **(a)** For apron pavement in front of an ineligible building, the 50 feet of pavement immediately in front of the building is ineligible **(b)** A taxiway or taxilane that exclusively serves an ineligible building is ineligible.
(37) Pavement – Maintenance. Routine runway, taxiway, or apron maintenance except at nonhub primary airports and nonprimary airports under 49 USC § 47102(3)(H). Examples of eligible and ineligible maintenance are provided in Paragraph 3-6.
(38) Pavement – Unavailable for Aircraft Parking/Taxiing. Pavement for vehicle/aircraft maintenance, automobile parking, ground service equipment storage, areas to *square off* pavement if it is not needed or used for aircraft parking, or apron areas on the apron side of a hangar that cannot be used for public aircraft parking.
(39) Planning as Project Formulation. Including costs incurred preparing a metropolitan area or statewide airport planning as project formulation costs, even if the plan was not AIP funded. For example, photo slope or other obstruction analysis that was prepared in a non-AIP funded obstruction plan that is used as a basis for removing the obstructions at an airport.
(40) Price Escalation Increases.
(41) Restrooms. See Bathrooms/Restrooms in this table.
(42) Revenue Producing Aeronautical Support Facilities – Construction. Revenue producing aeronautical support facilities at other than nonprimary and Military Airport Program airports.
(43) Revenue Producing Aeronautical Support Facilities – Maintenance/Repair/Minor Rehabilitation. The maintenance, repair, and minor rehabilitation of revenue producing facilities is only allowed as part of the MAP program under 49 USC § 47118((f). The major rehabilitation of a hangar at a nonprimary airport or a Military Airport Program airport is allowed per 49 USC § 47102(24).
(44) Roads – To Federally Owned NAVAIDS.
(45) Roads – To Non-Aviation Areas/Facilities. This includes driveways and other access points that connect the access road to off airport property.
(46) Roads – To Parking. Roads, whatever length, exclusively for the purpose of connecting public parking facilities to an access road except where the public parking facility is constructed with AIP grant funds.

Table C-2 Examples of Prohibited Projects/Costs for Construction

Examples include, but are not limited to…
(47) Seismic Retrofit. For any building completed after July 14, 1993. This is because the DOT regulation requiring seismic measures was issued on this date.
(48) Service Road – For Airport Operations and Maintenance. Except as specifically allowed in Appendix P.
(49) Snow Removal Equipment (SRE) Buildings – Certain Areas. **(a)** Personnel Quarters. **(b)** Training Space. **(c)** Non-equipment Storage. **(d)** Restrooms and Bathrooms. **(e)** Maintenance Areas (beyond that eligible on an airport wide basis per Appendix N). **(f)** Offices. **(g)** Day Rooms or Lounges. **(h)** Kitchens or Break Rooms.
(50) Terminal – Certain Areas: **(a) Airline Frequent Flyer Lounge.** This is because these areas are not public use and are not necessary for the movement of passengers and baggage. **(b) Areas Behind Counters.** The areas behind airline, rental car, and concession counters are not eligible because they are not public use areas. **(c) Chamber of Commerce.** This is because these areas are not necessary for the movement of passengers and baggage. **(d) Conference Rooms.** Even if these areas are occasionally accessed by the public, they are not considered public-use. **(e) Customs and Border Patrol –Non-Public Areas.** Areas that are restricted from the public, including offices for screeners and supervisors, break rooms, training rooms, secure rooms where a passenger must be escorted (such as hold or search rooms), and similar uses are not eligible areas. **(f) Garbage Rooms.** Including equipment such as aircraft lavatory dump equipment, triturators, and incinerators. This is because these areas are not public use, are considered operations/maintenance, and are not necessary for the movement of passengers and baggage. **(g) Hallways (or Portions of Hallways) Not Serving Public Use Areas.** The portion of a hallway that is necessary to access a public use area (even if it also serves non-public use areas along the way), is eligible. The portion of the hallway that only serves non-public use area (including mechanical and electrical rooms) is not eligible. **(h) Janitor's Room.** This is because these areas are not public use, are considered operations/maintenance and are not necessary for the movement of passengers and baggage.

Table C-2 Examples of Prohibited Projects/Costs for Construction

Examples include, but are not limited to…
(i) Loading Docks. This is because these areas are not public use, are considered operations/maintenance, and are not necessary for the movement of passengers and baggage. **(j) Lost and Found Rooms.** Even if these areas are occasionally accessed by the public, they are not considered public-use. **(k) Offices.** All offices (airline, airport, tenant, security, etc.) are ineligible. Even if these areas are occasionally accessed by the public, they are not considered public-use and are not necessary for the movement of passengers and baggage. **(l) Passenger Screening Area Build Out and Equipment.** All build out costs and equipment (as with other terminal tenants) are ineligible. This includes exit doors or walls not needed for eligible purposes. Unlike access control and perimeter fencing, passenger screening is not 49 CFR part 1542 requirement. **(m) Police and Law Enforcement Facilities.** The only facilities that are eligible are guard shacks at airfield access points. In addition, co-located Command and Control Centers or Emergency Operations Centers also have limited eligibility. **(n) Staff Break Rooms.** **(o) Training Rooms.** Even if these areas are occasionally accessed by the public, they are not considered public-use. **(p) Transportation Security Administration (TSA) Security Checkpoint Consolidation – For TSA Staff Purposes Only.** In order for a checkpoint consolidation project to be eligible, there must be a current to five-year problem with the capacity of the existing lanes and the consolidation must be a reasonable cost solution to this problem. Security checkpoint consolidation for the sole purpose of reducing TSA staff costs is not eligible. **(q) TSA Checkpoint Rooms.** The room required by TSA staff to observe the checkpoint through a one way mirror is not eligible because it is not public use. **(r) TSA Storage Room for Confiscated Items.** Even if these areas are occasionally accessed by the public, they are not considered public-use. **(s) United Service Organizations (USO) Facilities.** This is because these areas are not public use and are not necessary for the movement of passengers and baggage.
(51) Terminal People Mover or Access Rail – Operations/Maintenance. Costs to operate or maintain the terminal people mover or access rail. This includes all associated maintenance facilities and equipment (including storage facilities, spare parts, spare equipment, tracks to a maintenance facility, maintenance equipment, and administrative offices).
(52) Terminal People Mover or Access Rail – To Certain Areas. Terminal people mover or access rail cost associated with access to commercial areas, maintenance areas, employee parking lots, or ticketing or fare collection areas.
(53) Through-the-Fence. Any development project to serve a through-the-fence operation per 49 USC § 47107(t)(2)(B)(ii). This is because through-the-fence operations are considered exclusive use and are not the responsibility of the sponsor.

Table C-2 Examples of Prohibited Projects/Costs for Construction

Examples include, but are not limited to…
(54) Utility Work – Stand-Alone Project. This is an allowable cost to an AIP eligible project, not a stand-alone project.

C-3. Examples of Equipment Prohibited Projects/Costs.

The list in Table C-3 is not comprehensive. Instead, it contains projects or costs specifically prohibited in the Act or whose eligibility is frequently questioned. Unless a specific reference to the Act is cited, these prohibitions are FAA policy.

Table C-3 Examples of Prohibited Projects/Costs for Equipment

Examples include, but are not limited to…
(1) All of the Examples in Table C-1.
(2) Air Compressors. Other than fixed air compressors built into an ARFF building to fill self-contained breathing apparatuses (SCBA).
(3) Aircraft Deicing Fluids. Per 49 USC § 47102(3)(B)(v).
(4) Aircraft Removal Equipment.
(5) Airport Surface Detection Systems. This must not be confused with equipment that TSA determines to be required to meet 49 CFR part 1542 for securing the airport perimeter, which may be eligible as security equipment.
(6) Airport Rescue and Firefighting (ARFF) Vehicles – Support Vehicles. ARFF support vehicles, such as fire marshal vehicles, unless AAS-1 has determined that this will significantly contribute to safety of individuals and property at the airport per 49 USC § 47102(3)(B)(ii).
(7) ARFF Vehicles – Back-Up or Reserve.
(8) ARFF Vehicles – Beyond Index. More than the minimum number, type, and size required by the ARFF index.
(9) ARFF Vehicles – No 14 CFR part 139 Certificate. ARFF vehicles for airports that do not hold 14 CFR part 139 certificates unless AAS-1 has determined that this will significantly contribute to safety of individuals and property at the airport per 49 USC § 47102(3)(B)(ii).
(10) ARFF Vehicles – Requiring a Delivery Period that is Less than 360 Days. Specifying a shorter period of time limits competition to those manufacturers that have ARFF vehicles that are already built.

Table C-3 Examples of Prohibited Projects/Costs for Equipment

Examples include, but are not limited to…
(11) AWOS– Bid as Upgradable. Sponsors must not bid an AIP funded AWOS-A, AWOS-A/V, AWOS-I and AWOS-II with a requirement for the system to be upgradable to an AWOS III or better. This is because not all AWOS manufacturers offer systems that can be upgraded, and therefore a bid requirement that establishes upgrade capabilities would limit competition. If the sponsor correctly bids the AWOS-A, AWOS-A/V, AWOS-I and AWOS-II (without an upgrade requirement), and the low bidder happens to be an AWOS that can be upgraded, the sponsor may use non-AIP funding to upgrade the system. However, it would then be the sponsor's responsibility to coordinate with their FAA Air Traffic Organization (ATO) Service Center Non-Federal Program Implementation Manager on all AWOS-III requirements.
(12) Certain Vehicles. The following vehicles are not eligible, even if the intent is to use the vehicle to pull an AIP eligible attachment. The exception is where AAS-1 has made a written determination that the vehicle or truck fills a unique safety or security need at that specific airport per Paragraph L-3. **(a)** Passenger cars (as defined by DOT). **(b)** Passenger trucks (as defined by DOT). **(c)** Snow removal vehicles below class 5. **(d)** Motor graders. **(e)** Skid steer loaders. **(f)** All-terrain vehicles (ATVs). **(g)** Lawn mowers. **(h)** Agricultural Tractors that do not have at least 100 horse power (HP) power take off (PTO) and 110 gross engine horse power (HP).
(13) Emergency Power Equipment. Equipment to provide emergency power to an airport for emergency housing, marshaling of equipment or supplies for catastrophe relief or other purposes. In addition to not being allowed, this could be an augmentation of another Federal agency's budgets since other agencies have the specific responsibility to provide those services.
(14) Expendable Items. Expendable items, such as extinguishing agents (except for one test charge and one refill at time of initial purchase of an ARFF vehicle), deicing materials (sand, chemicals, fluids, etc.), shotgun shells, chemicals, pyrotechnic devices (other than pyrotechnic pistols) and ammunition.
(15) Extended Warranty Costs or Requirements for Extended Servicing. The cost of extended warranties beyond that which is common in business because this is a maintenance and operational expense. This includes requirements in the bidding documents for ability to be onsite within a specified number of hours or for having service personnel within a certain geographic proximity of the project site which have been determined to be anti-competitive.
(16) Fencing – Beyond What is Reasonable. Fencing beyond what is minimally required for wildlife or people/vehicle deterrent purposes per the minimum requirements of the current version of Advisory Circular 150/5370-10, Standards for Specifying Construction of Airports.

Table C-3 Examples of Prohibited Projects/Costs for Equipment

Examples include, but are not limited to…
(17) Fencing – Non-Aeronautical. Fencing to benefit non-aeronautical use areas of the airport that is not primarily for protection of the airfield or terminal building.
(18) Flight Checks – More than One. The cost for the FAA Air Traffic Organization (ATO) to conduct more than one flight check (also called flight inspections) during the commissioning of a NAVAID or weather aid.
(19) Foreign Object Debris (FOD) Detection Systems – Optional Features. Optional features that exceed FAA design standards for system output requirements are not eligible for AIP and may not be used as a basis for selection of the system.
(20) Ground Communications Outlet (GCO). A GCO is a variant of a remote communications outlet (RCO), and like an RCO, is ineligible. Communications equipment of this type is normally funded through the FAA Air Traffic Organization (ATO).
(21) Ineligible Equipment – Any Associated Costs. AIP cannot be used to reimburse any costs associated with ineligible equipment. The single exception is for the installation of a sponsor's preferred airfield lighting equipment as discussed in Paragraph 3-36.
(22) Interactive Training Systems – Rental.
(23) Land and Hold Short Equipment. Trucks, follow-me signs, and other associated Land and Hold Short Operations (LAHSO) equipment.
(24) Maintenance Equipment/Tools. The acquisition of equipment or tools that are used to maintain, repair, reconstruct, or rehabilitate an item or facility, including equipment or tools used for pavement maintenance at nonhub primary or nonprimary airports. (If pavement maintenance is done by the sponsor's own forces using force account methods, a portion of the cost of the use of the equipment may be allowable.)
(25) Mobile Command Vehicles. The FAA has determined that mobile command vehicles cannot be considered as eligible firefighting and rescue equipment. This is because mobile command vehicles do not deliver firefighting personnel, equipment and fire suppression agents to the site of an accident, nor are they used in physically extinguishing fire or physically assisting in rescue efforts.
(26) Mobile Gate Power for Aircraft. Mobile air conditioning, heating or electric power facilities or equipment for the benefit of aircraft. This includes mobile preconditioned air units (PCA) and auxiliary power units (APU). This equipment is not considered terminal-based and are not eligible (unless otherwise eligible and approved under VALE). This is because the eligibility conferred in 49 USC 47102(O) limits this to only terminal-based systems. Therefore, systems that are mobile, non-terminal based, are not eligible.
(27) NAVAIDS at Airports without an FAA Air Traffic Organization (ATO) designated Instrument Runway. Only airport rotating beacons, runway end identification lights, and visual glide-slope indicator systems are eligible at airports without a designated instrument runway.
(28) Paint Machines. Paint machines for any purpose.

Table C-3 Examples of Prohibited Projects/Costs for Equipment

Examples include, but are not limited to…
(29) Pest Control Equipment for Rodent Extermination. This is considered a maintenance tool.
(30) Police Vehicles – More Than Allowed. Police vehicles are not eligible at airports without a 14 CFR part 139 certificate. Airports with a 14 CFR part 139 certificate are allowed a maximum of *one* police vehicle.
(31) Portable Emergency Generators. Portable emergency generators or light plants that function essentially as portable emergency generators.
(32) Radios and Communication Equipment – Stand-Alone and Portable (or Hand Held) Equipment. Radios and communication equipment are allowable costs only if they are part of the acquisition of an eligible ARFF vehicle, police vehicle, or a piece of snow removal equipment.
(33) Remote Communications Outlet (RCO). Communications equipment of this type is normally funded through the FAA Air Traffic Organization (ATO).
(34) Runway Surface Condition Sensors – Certain Features/Services. Service agreements, spare parts, and on-site service by the sensor system manufacturer required by the SAE document included in the current version of Advisory Circular 150/5200-30, Airport Field Condition Assessments and Winter Operations Safety. In addition, wind sensors, air sensor, relative humidity sensor, precipitation sensor, present weather/visibility sensor, sub-surfaces sensors; requirements for field processing units that exceed the minimum needed to support the eligible system, and central processing systems to receive, accept and display weather forecasts. These features and services are not allowable costs for runway surface condition sensors.
(35) Safety Equipment – Not Specifically Required by 14 CFR part 139. Except as allowed under Paragraph L-3.
(36) Security and Access Control Equipment – Landside. Security and access control equipment (such as closed circuit cameras) for protection of the unsecured landside areas of the airport (such as parking garages, rental car facilities, and terminal areas prior to security screening checkpoints).

Table C-3 Examples of Prohibited Projects/Costs for Equipment

Examples include, but are not limited to…
(37) Security Equipment. Projects exceeding the minimum requirements of 49 CFR part 1542 or are necessary to support local law enforcement. Examples include: **(a)** Video cameras that are not in the secured terminal area or airfield operations area. **(b)** Handheld cameras. **(c)** Badging supplies. **(d)** Tow trucks to tow vehicles. **(e)** Canines (dogs) and kennels (live animals). With the transfer of responsibility to DHS, airports are no longer responsible for canines for airport security. **(f)** Police radios (other than in an eligible police vehicle at time of acquisition). **(g)** Firearms for law enforcement or security purposes. **(h)** Law enforcement facilities except guard shacks at airfield access points.
(38) Sign Panel Replacement. See Paragraph J-3 for further discussion.
(39) Snow Removal Equipment (SRE) – Oversized or Increased Functionality. The size and/or functionality of snow equipment cannot be based on clearing snow from areas that are not priority 1 areas, such as parking lots, landside pavement, or between hangars.
(40) Snow Removal Equipment (SRE) - Specialized for Snow and Ice Removal on EMAS. There currently is no FAA requirement for the EMAS to be cleared of snow or ice.
(41) Squitters – Maintenance Contracts. This is an operational cost that is the responsibility of the sponsor.
(42) Tow Vehicles for Eligible Equipment.
(43) Towed FOD Sweepers. These are not considered eligible power sweepers.
(44) Visual Approach Slope Indicators (VASI). These have been replaced by the installation of Precision Approach Path Indicators (PAPI).
(45) Wildlife Reduction Equipment and Supplies. Shotgun shells, chemicals, pyrotechnic devices (other than pistols), and airport operations vehicles.

C-4. Examples of Land Prohibited Projects/Costs.

The list in Table C-4 is not comprehensive. Instead, it contains projects or costs specifically prohibited in the Act or whose eligibility is frequently questioned. Unless a specific reference to the Act is cited, these prohibitions are FAA policy.

Table C-4 Examples of Prohibited Projects/Costs for Land

Examples include, but are not limited to…
(1) All of the Examples in Table C-1.
(2) Compensation for Frustration of Development Plans.
(3) Compensation for Goodwill.
(4) Compensation for Loss of Business.
(5) Costs Exceeding Requirements. Any costs that exceed what is required by 49 CFR part 24 or do not conform to the Uniform Appraisal Standards for Federal Land Acquisitions.
(6) Costs to Lease Privately Owned Land. A lease of privately owned land is normally not considered adequate title and acquisition of the needed interest in the land is required.
(7) Land for Other than Airport Purposes. See Appendix A for definition of airport purposes.
(8) Real Estate Commissions.
(9) Stand-Alone Grants for Appraisals.

C-5. Examples of Noise Mitigation Prohibited Projects/Costs.

The list in Table C-5 is not comprehensive. Instead, it contains projects or costs specifically prohibited in the Act or whose eligibility is frequently questioned. Unless a specific reference to the Act is cited, these prohibitions are FAA policy.

Table C-5 Examples of Prohibited Projects/Costs for Noise Mitigation

Examples include, but are not limited to…
(1) All of the Examples in Table C-1.
(2) Block Rounding for Anything Other than a Residence. This includes buildings such as schools and places of worship.
(3) Block Rounding with Lower Local Standards. For example, if a local standard has been adopted to include residences that lie within the DNL 60 dB noise contour, residences that lie outside the DNL 60 dB are not eligible for block rounding. This is because by accepting a lower local standard, the FAA has already accepted exterior noise that is below the land use compatibility with yearly day-night average sound levels that FAA has accepted in 14 CFR part 150.

Table C-5 Examples of Prohibited Projects/Costs for Noise Mitigation

Examples include, but are not limited to…
(4) Building Code Corrections. If it is determined in the course of designing a sound insulation project that a building needs improvements in order to conform to local building codes, only the costs of the sound insulation are allowable. This includes making changes to meet current ventilation requirements where the existing central ventilation or air conditioning units do not meet current building code ventilation requirements.
(5) Cannot Be Implemented by an Eligible Sponsor. A 14 CFR part 150 approved NCP measure for a project that cannot be implemented by an eligible sponsor.
(6) Comfort or Attractiveness Improvements.
(7) Demonstration Programs. This may include installation of unproven methods of reducing sounds such as installing white noise generators in classrooms. This includes any 14 CFR part 150 approved NCP measure for a demonstration program intended to test the effectiveness of new noise mitigation technology.
(8) Follow-on Replacement. Follow-on replacement of windows, doors, equipment, or any items installed for noise reduction that appear to have met their useful life. Installation of noise reduction equipment is limited to the initial installation only.
(9) Inadequate Maintenance Corrections. Improvements to address inadequate maintenance.
(10) Inside DNL 75 dB or greater. Noise insulation projects for residences, schools, hospitals, places of worship, auditoriums, and concert halls within a DNL 75 dB or greater noise contour since these uses are never compatible in these noise contours, per Table 1 of Appendix A in 14 CFR part 150 —Land Use Compatibility With Yearly Day-Night Average Sound Levels. If a sponsor requests sound insulation in the DNL 75 dB contour, the ADO may consider consulting with APP-400 for guidance.
(11) Interior Noise Less than 45 dB. Noise mitigation inside the DNL 65 dB contour where the interior noise level is less than 45 dB unless the ADO has concurred that the limited costs are due to neighborhood equity.
(12) Mitigation of a Noise Sensitive Use in a Commercially Zoned Structure.
(13) Mitigation Outside DNL 65 dB. Noise mitigation outside the DNL 65 dB contour unless the interior noise level is greater than 45 dB and the ADO has concurred that the limited costs are due to block rounding, or the community has adopted a significant noise standard less than DNL 65 dB.
(14) Mobile Homes or Mobile Classrooms. Mobile homes and Mobile Classrooms are not viable noise compatibility projects since their design and construction do not lend themselves to effective noise reduction measures. (Note that this is not the same thing as permanent modular buildings.)
(15) Noise Buffer Land – Not Airport Owned. Noise buffer land must be owned by the airport.

Table C-5 Examples of Prohibited Projects/Costs for Noise Mitigation

Examples include, but are not limited to…
(16) Noise Monitoring Equipment - Fixed in Certain Situations. Fixed noise monitoring equipment where the 14 CFR part 150 noise exposure maps (existing and forecast) show no noncompatible land uses or the sponsor is unable to clearly show that portable monitors would be inadequate.
(17) Noise Monitoring Systems – Unnecessary Capability. Flight tracking capabilities beyond that needed for noise monitoring, such as the ability to track 100% of flights and/or real time display of flight tracks.
(18) Noise Monitoring Systems – Vendor Data Retention. Systems where the data ownership remains with the vendor, not the sponsor as required.
(19) Noise Compatibility Program (NCP) Measures Approved in Fiscal Years 2004-2007 Outside the DNL 65 dB Noise Contour. Per 49 USC § 47504(b)(4), a 14 CFR part 150 approved NCP measure for a project to mitigate aircraft noise less than DNL 65 dB if the FAA approved the NCP in fiscal years 2004-2007. This fiscal year requirement does not apply to soundproofing schools and hospitals since they are not required to be in an approved NCP.
(20) Non-Aircraft Noise Mitigation. The mitigation must be based on aircraft noise associated with the airport.
(21) Operational or Administrative Costs for an Ongoing Program. A 14 CFR part 150 approved NCP measure for operational or administrative costs of a sponsor's ongoing noise mitigation program.
(22) Parts of Schools. Sound insulation of school facilities such as gymnasiums, cafeterias, and hallways unless approved by APP-400. These areas are not considered to be adversely affected by a given level of noise as areas such as classrooms that are eligible for funding.
(23) Projects/Costs Based on Noise Exposure Maps that Are Not Current. The requirements and exceptions are provided in Paragraph R-7.
(24) Terminal Based Air Conditioning, Heating, or Electric Power. Acquiring or installing terminal-based air or power systems is allowable as a terminal project, but is not fundable as a noise mitigation measure.
(25) Undefined Noise Benefit. A 14 CFR part 150 approved NCP measure for a project that is not described in sufficient detail to determine its noise mitigation benefits.
(26) Ventilation or Central Air Conditioning System Replacement. Ventilation systems or central air conditioning systems are allowable only in buildings that do not currently have a ventilation or central air conditioning system.

C-6. Examples of Planning or Environmental Prohibited Projects/Costs.

The list in Table C-6 is not comprehensive. Instead, it contains projects or costs specifically prohibited in the Act or whose eligibility is frequently questioned. Unless a specific reference to the Act is cited, these prohibitions are FAA policy.

Table C-6 Examples of Prohibited Projects/Costs for Planning or Environmental

Examples include, but are not limited to…
(1) All of the Examples in Table C-1.
(2) Airport Capital Improvement Plan – Stand-Alone. A stand-alone grant to update an airport's capital improvement plan. Capital plan development costs are only eligible if warranted as part of a master plan study or update grant.
(3) Airport Certification Manual Updates. Only the initial airport certification manual developed for a new 14 CFR part 139 airport with scheduled air carrier service greater than 9 seats and/or unscheduled air carrier service greater than 30 passenger seats is eligible. Per APP-500 policy, this is considered planning because it is necessary for the airport to begin operations. Updates are considered operational, not planning.
(4) Airport Emergency Plan – Stand-Alone. Preparation or update of an airport emergency plan as a stand-alone project. An Airport Emergency Plan is operational by nature and therefore ineligible. The cost of preparing an Airport Emergency Plan may be an allowable cost if it is included in an AIP funded airport master plan, is required by 14 CFR part 139, and will result in AIP eligible development.
(5) Airport Geographic Information System (GIS) - Certain Costs. Any GIS costs not specifically allowable under Paragraph 3-77, including: **(a) Under Pilot Program or Transition Policy.** Both the pilot program and the transition policy are complete, so stand-alone GIS grants under either of these are no longer eligible. **(b) Under State or Metropolitan System Planning.** State or metropolitan system planning studies are used to study the performance and interaction of an entire aviation system in a specific geographic area. As such, AIP-funded system planning grants may not include whole-airport surveys unless approved by APP-400 and APP-500.
(6) Airport Zoning Ordinance. The cost of preparation and adoption of an airport zoning ordinance unless the work is done as part of an airport master plan, noise compatibility program, or land use compatibility planning program for states and units of local government for compatible land use planning and projects around large and medium hub airports that have either never submitted a noise compatibility program or have not updated such program within the preceding ten years.
(7) ALP Update to Only Document What Has Already Been Constructed. A drafting effort to update an ALP to only document what has already been constructed is not eligible as stand-alone project. An ALP update is considered an *allowable cost* within an eligible planning study grant (see Appendix E) that address a future airport need or with a construction or land grant.
(8) Airport Master Planning Study – Certain Planning Elements. The following are not allowable elements in an airport master plan or as stand-alone planning projects.

Table C-6 Examples of Prohibited Projects/Costs for Planning or Environmental

Examples include, but are not limited to…
(a) Asset management planning **(b)** Aviation business park analysis **(c)** Business plans **(d)** Economic benefit studies **(e)** Information technology (IT) master plan or analysis **(f)** Marketing studies **(g)** Minimum standards development **(h)** Rates and charges analysis **(i)** Rules and regulations development **(j)** Snow removal plans **(k)** Strategic business plans **(l)** Surface movement guidance and control system (SMGCS) plans **(m)** Tower siting studies beyond what general areas will work unless AIP is paying for the tower
(9) Benefit-Cost Analysis – Stand-Alone Grant. A benefit-cost analysis in a stand-alone grant. A benefit-cost analysis for a project can only be reimbursed as project formulation costs once the benefit-cost analyses has shown that the associated project is economically viable.
(10) Competition Plans – Stand-Alone Grant. Development or update of a competition plan as a stand-alone grant.
(11) Computer Hardware – Planning Projects. Computer hardware in planning projects. This includes Geographic Information System planning and Safety Management System manual and implementation plan development.
(12) Environmental Management System Updates. Only the initial development is eligible.
(13) GIS Platform. If a sponsor wishes to integrate the FAA-required data with other GIS datasets, then the sponsor must secure the necessary platform to do so at their own expense, as with any other airport operating expense.
(14) Ineligible Project Environmental Analysis. Preparing an EA or other environmental analysis for an ineligible project.
(15) Mitigation Site Management and Protection. Sponsors are responsible for funding long – term management and protection of mitigation sites past the period of establishment.
(16) Monitoring Mitigation Sites beyond the Period Specified in an Environmental Determination. By FAA policy, funding for monitoring is limited to the period specified in an environmental determination, up to five years maximum.
(17) Planning Project Equipment. Equipment for planning purposes, such as aircraft counters.

Table C-6 Examples of Prohibited Projects/Costs for Planning or Environmental

Examples include, but are not limited to…
(18) Stand-Alone Planning Studies. Portions of system, metropolitan, or master planning projects as stand-alone planning studies unless they are listed as eligible stand-alone studies in Paragraph E-4.
(19) Surface Transportation Origin-Destination Surveys. If not required as part of Metropolitan Planning Organization coordination or as part of an eligible multimodal project, surveys to determine the modes of surface transportation airport users are using to get to and from the airport as well as where they are coming from or going to (hotel, home, etc.).

Appendix D. Miscellaneous Projects

D-1. How to Use This Appendix.

This appendix is not a valid stand-alone document for making eligibility and justification determinations. The information in this appendix must be used in conjunction with the Handbook, especially the project cost requirements in Chapter 3.

D-2. Airfield Needs Requirement for Revenue Producing Aeronautical Support Facilities.

Per 49 USC § 47110(h), the sponsor must certify that all airfield needs have been accommodated before the ADO can fund a revenue producing aeronautical support facilities. Per FAA policy, the sponsor must adequately demonstrate to the ADO that airside needs within the next three years (current fiscal year and next two future fiscal years) will be accommodated through local funds or nonprimary entitlement funds. It is APP-500 policy that the sponsor requests for AIP would be limited to non-primary entitlement funds during that time unless there is a specific safety issue that must be addressed and was not foreseeable under normal planning efforts of the sponsor.

D-3. Project Requirements.

In addition to the information provided in the above paragraphs and the following table, Appendix C contains examples of prohibited projects and costs and is very useful to use alongside this appendix.

Table D-1 Miscellaneous Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
a. Stand-Alone Design Only Projects	**(1)** The ADO has every expectation that the associated development project will begin within two years after the design is completed. **(2)** The development work has not been started. If the work has been started, the ADO must include the design work in the development grant.	A set of plans and specifications that is ready to be bid.	Same as development project
b. Construct Wash Rack	**(1)** A wash rack is a pavement area with proper drainage and water runoff collection available for washing aircraft. **(2)** A wash rack is not technically considered apron construction, but a revenue-producing aeronautical support facility project, and	A fully functional wash rack that charges for services and is not exclusive use.	OT OT WR

Table D-1 Miscellaneous Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	maintenance and repair is not eligible. **(3)** The airport must be a nonprimary airport and only nonprimary entitlements may be used for the project. **(4)** All airfield needs have been accommodated per Paragraph D-2 **(5)** The ADO must ensure that the proper environmental permits have been obtained.		
c. Fuel Farms (Construct or Improve)	**(1)** For MAP funded projects, see Appendix T, as many of the following requirements do not apply. **(2)** The fuel farm must be owned by the sponsor. The current version of FAA Order 5190.6, FAA Airport Compliance Manual, contains detailed guidance on whether the sponsor may allow a fixed based operator to operate the fuel farm. **(3)** A fuel farm includes the bulk fuel storage tanks, the containment area, the pavement area needed for the fuel farm operations, and pumps and equipment needed to operate the fuel farm. In addition, since fuel trucks must be parked in a containment area when not in use, additional area in the containment area may also be included. It also may include self-service fuel pumps for the public (also referred to as credit card pumps). **(4)** Eligible fuel farm *construction* projects are limited to: **(a)** Initial construction of a fuel farm if the airport does not currently have a fuel farm. **(5)** Eligible fuel farm *improvement* projects are limited to:	A fully functional fuel farm that charges for services and is not exclusive use.	OT OT FF

Table D-1 Miscellaneous Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	(a) Initial installation of self-service fuel pumps. This can be done as a stand-alone project. **(b)** Installing facilities necessary to provide a fuel type not currently available at the airport (such as jet fuel). **(c)** Adding supplemental tanks if the sponsor is able to document to the ADO that the additional tanks are necessary based on increased demand and will therefore increase the revenue production at the airport. **(6)** A fuel farm is not technically considered apron construction, but a revenue-producing aeronautical support facility project, and maintenance and repair is not eligible. **(7)** The airport must be a nonprimary airport and only nonprimary entitlements may be used for the project. **(8)** All airfield needs have been accommodated per Paragraph D-2 **(9)** The facility must meet the requirements of 40 CFR § 112.8, Spill Prevention, Control, and Countermeasure Plan Requirements for On-Shore Facilities (excluding production facilities). **(10)** The ADO must ensure that the proper environmental permits have been obtained.		
d. Construct Deicing Pad *(Includes Associated Facilities)*	**(1)** An exclusive paved area for aircraft deicing or anti-icing activities is eligible if the improvements are to be owned by the airport and will become available on a non-exclusive use basis per 49 USC § 47102.	A fully functional aircraft deicing pad that meets FAA standards including aircraft and vehicle access.	ST AP DI

Table D-1 Miscellaneous Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	(2) A ground deicing pad includes the paved areas, drainage collection structures, treatment and discharge systems, lighting, paved access for deicing vehicles and aircraft. **(3)** The airport must be a commercial service airport. **(4)** This is not the same as a separate deicing containment facility required to serve the aircraft gate area at a terminal. See Appendix S for these projects.		
e. Parking Lot (Construct or Rehabilitate)	**(1)** For MAP funded projects, see Appendix T, as many of the following requirements do not apply. **(2)** The airport is a nonprimary commercial service, a nonhub primary airport, a reliever airport, or a general aviation airport. **(3)** The parking lot is non-revenue producing. **(4)** The parking lot is public-use. **(5)** Per 49 USC § 47119(c), this is considered an allowable cost of a terminal development project and must follow the terminal building funding rules in Table N-7. Stand-alone grants can be issued for eligible parking lots. **(6)** Per 49 USC § 47119(a)(1)(A), the airport has all safety equipment required for the airport per 49 USC § 44706 (Airport Operating Certificate), has all security equipment required by rule or regulation, and has provided for access by passenger to the area of the airport for boarding or exiting aircraft that are not air carrier aircraft.	A fully functional parking lot.	OT OT PA

Table D-1 Miscellaneous Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
f. Remove obstructions to support Area Navigation (RNAV) Approach	**(1)** The project must be supported by a RNAV obstruction removal survey based on the airport category on the approved ALP. **(2)** Per 49 USC § 47102(3)(A)(i) and § 47102(4), the removal, lowering, relocating, lighting, and marking obstructions is eligible. **(3)** Per FAA policy, this obstruction removal for RNAV approach purposes may include: **(a) Airport Design Advisory Circular.** Obstruction removal necessary to meet the object clearing criteria in the current version of Advisory Circular 150/5300-13, Airport Design. There are many surfaces and areas contained in the object clearing criteria. They include, but are not limited to, object free areas, runway and taxiway safety areas, obstacle free zones, threshold obstacle clearance surfaces, NAVAID critical areas, 14 CFR part 77 surfaces, approach and departure surfaces, runway protection zones, runway visibility zones, and inside the building restriction line. The ADO must consult the current version of the advisory circular to determine the current requirements. **(b) 14 CFR part 77 Surfaces.** Per FAA policy, obstructions to the 14 CFR part 77 primary approach and 7:1 transitional surfaces. **(c) TERPS.** Any of the United States Standard for Terminal Instrument Procedures (TERPS) requirements. **(4)** Obstruction removal is limited to obtain 100 feet vertical clearance above the elevation of the runway	An RNAV approach that is clear of obstructions.	SP OT VI

Table D-1 Miscellaneous Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	ends but no more than 5000 feet beyond the end of the runway. **(5)** Obstruction removal is limited to the airport category shown on the approved ALP. **(6)** Rebuilding a facility in a new location is only eligible if the facility meets the requirements in Paragraph 3-74**.** **(7)** Obstruction removal within runway safety areas must meet the requirements and use the work codes in Appendix G.		
g. Obstructions (Light, Mark, or Remove) *(For Hazards)*	**(1)** Per 49 USC § 47102(3)(A)(i) and § 47102(4), the removal, lowering, relocating, lighting, and marking of airport hazards is eligible. **(2)** Per FAA policy, the object must be determined by the FAA Air Traffic Organization (ATO) to be a hazard (per the current version of FAA Order JO 7400.2, Procedures for Handling Airspace Matters), or would be a significant adverse operational impact if no action were taken (such as cancelling an approach, raising an approach minimum, or relocating the runway threshold). **(3)** This code is limited to obstructions that have a written ATO hazard determination. **(4)** Obstruction removal is limited to obtain 100 feet vertical clearance above the elevation of the runway ends but no more than 5000 feet beyond the end of the runway.	The elimination or mitigation of an airport hazard.	SA OT OB
h. Obstructions (Light, Mark, or Remove) *(For Standards)*	**(1)** Per 49 USC § 47102(3)(A)(i) and § 47102(4), the removal, lowering, relocating, lighting, and marking obstructions is eligible.	The elimination or mitigation of an airport obstruction.	ST OT OB

Table D-1 Miscellaneous Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	(2) Per FAA policy, obstructions are eligible standards projects based on the aircraft category on the approved ALP for that runway and may include: **(a) Airport Design Advisory Circular.** Obstruction removal necessary to meet the object clearing criteria in the current version of Advisory Circular 150/5300-13, Airport Design. There are many surfaces and areas contained in the object clearing criteria. They include, but are not limited to, object free areas, runway and taxiway safety areas, obstacle free zones, threshold obstacle clearance surfaces, NAVAID critical areas, 14 CFR part 77 surfaces, approach and departure surfaces, runway protection zones, runway visibility zones, and inside the building restriction line. The ADO must consult the current version of the advisory circular to determine the current requirements. **(b) 14 CFR part 77 Surfaces.** Per FAA policy, obstructions to the 14 CFR part 77 primary approach and 7:1 transitional surfaces. **(c) TERPS.** Any of the United States Standard for Terminal Instrument Procedures (TERPS) requirements. **(3)** Obstruction removal, lowering, lighting or marking is limited to obtain 100 feet vertical clearance above the elevation of the runway ends but no more than 5000 feet beyond the end of the runway. **(4)** Rebuilding a facility in a new location is only eligible if the facility		

Table D-1 Miscellaneous Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	meets the requirements in Paragraph 3-74. **(5)** Obstruction removal within runway safety areas must meet the requirements and use the work codes in Appendix G. **(6)** Obstruction removal, lowering, lighting or marking is limited to the airport category shown on the approved ALP. **(7)** Obstruction removal, lowering, lighting or marking to support Area Navigation (RNAV) approaches is covered elsewhere in this table and has a different work code. **(8)** If the obstruction removal, lowering, lighting or marking is part of a larger AIP project, it can be included in the code for that project.		
i. Heliport/Helipad (Construct, Expand, Improve, Modify, Rehabilitate)	**(1)** The ADO must contact AAS-100 for guidance. **(2)** If the project meets the definition of a capacity project CA HE CO must be used. If the project meets the definition of a standards project, ST HE CO must be used. Appendix A contains these definitions.	A fully functional heliport or helipad that meets FAA design standards.	CA HE CO ST HE CO
j. Seaplane Base (Rehabilitate)	**(1)** The ADO must contact AAS-100 for guidance.	A fully functional seaplane base that meets FAA design standards.	RE SB IM
k. Seaplane Base (Construct or Improve)	**(1)** The ADO must contact AAS-100 for guidance.	A fully functional seaplane base that meets FAA design standards.	ST SB CO
l. Improve Airport Drainage	**(1)** Stand-alone projects for drainage improvements are eligible to the extent that they are needed to serve areas eligible for AIP assistance.	Improved airport drainage that meets FAA design standards.	ST OT IM

Table D-1 Miscellaneous Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	(2) The ADO will determine the method of proration. Paragraph 3-97 contains proration examples.		
m. Improve Airport Erosion Control	**(1)** Stand-alone projects for erosion control (blast pads, installation of sod, etc.) are eligible to the extent that they are needed to protect AIP eligible facilities. **(2)** The ADO will determine the method of proration. Paragraph 3-97 contains proration examples.	A reduction in erosion.	ST OT IM
n. Improve Airport Miscellaneous Improvements	**(1)** The ADO must not use this work code without first consulting with APP-520 or APP-400 and obtaining their approval.	N/A	ST OT IM

*The official list of work codes can be obtained from the automated AIP system.

This page has been intentionally left blank.

Appendix E. Planning Projects

E-1. How to Use This Appendix.

This appendix is not a valid stand-alone document for making eligibility and justification determinations. The information in this appendix must be used in conjunction with the Handbook, especially the project cost requirements in Chapter 3.

E-2. Conditions for Posting Planning Documents on the Internet.

If the sponsor, or a sponsor's consultant, posts an AIP funded planning document on the internet, it is FAA policy that the public must not be required to register to view or download the document (even if the document is posted elsewhere without registration requirements). This is because the collection of personal data may be construed by the public as a surveillance tool for the airport, which may intimidate members of the public, dissuading them from reviewing the document. In addition 5 USC § 552a, The Privacy Act of 1974, prohibits the unnecessary collection of private data by Federal agencies.

E-3. Disclaimer for AIP Funded Planning Studies.

The sponsor must include the following disclaimer and the AIP grant number on the inside front cover of each final narrative report of all AIP funded planning studies.

"The preparation of this document was supported in part with financial assistance through the Airport Improvement Program from the Federal Aviation Administration (AIP Grant Number _____) as provided under Title 49 USC § 47104. The contents do not necessarily reflect the official views or policy of the FAA. Acceptance of this report by the FAA does not in any way constitute a commitment on the part of the United States to participate in any development depicted therein, nor does it indicate that the proposed development is environmentally acceptable in accordance with appropriate public laws."

E-4. Stand-Alone Master Plan and System Plan (Metropolitan and State) Projects.

Table E-1 contains a list of studies that can be funded as stand-alone planning projects if the ADO determines that they are both necessary and reasonable in scope

Table E-1 Eligible Stand-Alone Planning Projects

Eligible stand-alone projects (coded PL PL MS unless otherwise noted) are limited to…
a. Airport Certification Manuals. Only the initial airport certification manual developed for a newly certificated 14 CFR part 139 airport with scheduled air carrier service greater than 9 seats and/or unscheduled air carrier service greater than 30 passenger seats is eligible. Per APP-500 policy, this is considered planning because it is necessary for the airport to begin operations. Updates are considered operational, not planning.
b. Airport Energy Efficiency Assessment. See Appendix S.

Table E-1 Eligible Stand-Alone Planning Projects

Eligible stand-alone projects (coded PL PL MS unless otherwise noted) are limited to…
c. Airport Sustainability Plans. If done as a separate stand-alone study outside of a master plan, see Appendix S.
d. Develop Environmental Management System (EMS). See Appendix S
e. Drainage Studies. See Appendix S.
f. Disparity Studies. The purpose of a disparity study is to determine whether there is evidence of discrimination or its effects showing a compelling need for an airport sponsor's DBE program. A disparity study will show whether there is evidence of discrimination supporting the need for race-based measures. The ADO must contact the FAA Office of Civil Rights (ACR) as soon as this type of study is proposed**.** This can only be done as a state or metropolitan system planning project.
g. Environmental Studies. See Appendix S**.**
h. Feasibility Studies. These are eligible for establishing a new airport or replacing an existing airport.
i. Noise Compatibility Plan. See Appendix R.
j. Obstruction Surveys. This normally involves a survey for all of the runways on an airport and is performed to identify existing obstructions to the existing runway approaches. Aeronautical surveys for Area Navigation (RNAV) approaches have a separate work code as listed in Table E-2. This can be done as a state or metropolitan system planning project.
k. Pavement Management Programs. This is a two part planning process. First, a pavement condition index (PCI) survey is conducted on eligible public use airfield pavements to establish the current condition of the airfield pavement. Second, a pavement maintenance program is developed to address how the airfield pavement will be maintained or upgraded to acceptable PCI levels. The current version of Advisory Circular 150/5380-7, Airport Pavement Management Program, provides detailed guidance on the preparation of pavement management programs. These two parts can be completed together, or under separate grants, however, the end result must be a pavement management program. Calculation of the pavement classification numbers (PCN) of the AIP eligible pavement at the airport per the current version of Advisory Circular 150/5335-5, Standardized Method of Reporting Airport Pavement Strength (PCN).is an allowable cost of a pavement management program. The cost to incorporate this information into the airport layout plan is also allowable. This can be done as a state or metropolitan system planning project.
l. Initial Pavement Classification Number Study. A study for the initial determination of pavement classification numbers (PCN) of the AIP eligible pavement at the airport per the current version of Advisory Circular 150/5335-5, Standardized Method of Reporting Airport Pavement Strength (PCN) is eligible. The cost to incorporate this information into the airport layout plan is also allowable. After this study is complete, the sponsor must complete PCN updates as part of their pavement management program or as part of the applicable pavement construction project, and must update the ALP accordingly. This can be done as a state or metropolitan system planning project.

Table E-1 Eligible Stand-Alone Planning Projects

Eligible stand-alone projects (coded PL PL MS unless otherwise noted) are limited to…
m. Recycling Plans. These types of plans are eligible under 49 USC § 47102(5)(C) and include developing a plan for recycling and minimizing the generation of airport solid waste, consistent with applicable state and local recycling laws. The cost of a waste audit is an allowable cost under these plans. The scope of these plans must be consistent with the current version of Guidance on Airport Recycling, Reuse, and Waste Reduction Plans (see Appendix B for link).
n. Site Selection Studies. A site selection study requires a completed ADO approved feasibility study.
o. State or Metropolitan System Plan Economic Impact Study. This can only be done as a state or metropolitan system planning project.
p. State or Metropolitan System Plan Multi-Airport Acoustical Counting Study. This can only be done as a state or metropolitan system planning project.
q. Terminal Area Narrative Reports. This may be appropriate if a terminal lacks capacity, has specific security needs, or if the aircraft fleet mix has changed at the airport impacting the terminal building space and use. This is limited to the passenger terminal building and associated facilities (a Triggering Event Narrative Report is appropriate for all other facilities). In addition, only planning, not preliminary design, is eligible under this project. The deliverable for a Terminal Area Narrative Report may result in an information revision to an ALP that identifies the airport's *future needs* (as opposed to simply reflecting previous changes and/or existing conditions) rather than a formal revision reissuing a new ALP.
r. Triggering Event Narrative Reports and Airport Layout Plan. Not all airports need to do all of the elements identified in the current version of Advisory Circular 150/5070-6, Airport Master Plans. In some cases, an ALP Narrative Report and an ALP update may suffice. In addition, if a specific area of an airport has changed functionality due to a triggering event, and a complete master plan is not necessary, a Triggering Event Narrative Report (and associated update to the airport layout plan) may be appropriate. Examples of triggering activities that may drive a Triggering Event Narrative Report are the introduction of new carriers, increased or decreased cargo activity, increased or decreased general aviation activity, a proposed residential through-the-fence operation, new availability of building areas or property, or changes to a nearby airport. The deliverable for a Triggering Event Narrative Report may result in an information revision to an ALP that identifies the airport's *future needs* (as opposed to simply reflecting previous changes and/or existing conditions) rather than a formal revision reissuing a new ALP.
s. Other Specifically Approved Stand-Alone Projects. Stand-alone projects that APP-500 and APP-400 have approved in writing prior to the ADO approving the scope of the project, such as a state system plan general aviation security study, or a state or metropolitan system plan surface access study.

E-5. Project Requirements Table.

In addition to the information provided in the above paragraphs and the following table, Appendix C contains examples of prohibited projects and costs and is very useful to use alongside this appendix.

Table E-2 Planning Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
a. State System Plan Study (Conduct or Update)	**(1)** The ADO must have determined that the plan is necessary and justified and approved the scope of work. The needs of airports differ in as many ways as there are airports. Although similar airports with similar roles may share common characteristics, system planning looks at specific needs and assets at the airports in question. Not all of the elements identified in the current version of Advisory Circular 150/5070-7, The Airport System Planning Process will be required for all airports in the system plan. **(2)** APP-400 is available to answer questions regarding which elements in these plans are justified and how often the plans must be updated. **(3)** Table E-1 contains a list of stand-alone planning projects. The specific stand-alone projects that can be conducted on a state system planning level are noted. **(4)** The sponsor is a planning agency sponsor as defined in Table 2-4.	A completed state system plan that meets FAA advisory circular requirements and the ADO has officially accepted.	PL PL ST (full state system plan study) *Note: The ADO must use Conduct/ Update Miscellaneous Study (PL PL MS) for eligible stand-alone projects in Paragraph E-3.*

Table E-2 Planning Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
b. Metropolitan System Plan Study (Conduct or Update)	**(1)** The ADO must have determined that the plan is necessary and justified and approved the scope of work. The needs of airports differ in as many ways as there are airports. Although similar airports with similar roles may share common characteristics, metropolitan planning looks at specific needs and assets at the airports in question. Not all of the elements identified in the current version of Advisory Circular 150/5070-7, The Airport System Planning Process will be required for all airports in the system plan. **(2)** APP-400 is available to answer questions regarding which elements in these plans are justified and how often the plans must be updated. **(3)** Table E-1 contains a list of stand-alone planning projects. The specific stand-alone projects that can be conducted on a metropolitan system planning level are noted. **(4)** The sponsor is a planning agency sponsor as defined in Table 2-4.	A completed metropolitan system plan that meets FAA advisory circular requirements and the ADO has officially accepted.	PL PL ME (full metropolitan system plan study) *Note: The ADO must use Conduct/ Update Miscellaneous Study (PL PL MS) for eligible stand-alone projects in Paragraph E-3.*
c. Airport Master Plan Study (Conduct or Update)	**(1)** The ADO must have determined that the plan is necessary and justified and approved the scope of work. The needs of airports differ in as many ways as there are airports. Although similar airports with similar roles may share common characteristics, master planning looks at the specific needs and assets at the airport in question. Not all airports need to do all of the elements identified in the current	An FAA accepted master plan and FAA approved airport layout plan that meet FAA advisory circular requirements and identifies the airport's future needs (as opposed to simply reflecting previous changes and/or	PL PL MA (full master plan study) *Note: The ADO must use Conduct/ Update Miscellaneous Study (PL PL MS) for eligible stand-alone*

Table E-2 Planning Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	version of Advisory Circular 150/5070-6, Airport Master Plans. In some cases, an ALP Narrative Report and an ALP update may suffice. **(2)** APP-400 is available to answer questions regarding which elements in these plans are justified and how often the plans must be updated. **(3)** Table E-1 contains a list stand-alone planning projects. **(4)** The ADO must contact APP-520 for sponsors that own multiple airports to issue a single grant to conduct master plans for the sponsor's airports. This is not considered a state or metropolitan system plan, but is similar to a state's Various Locations grants. APP-520 will advise the ADO whether or not the automated AIP system will allow tracking projects at different sponsor airports under one grant. **(5)** Per 49 USC § 47102(5)(C), the master plan must address issues related to solid waste recycling at the airport. The scope of these plans must be consistent with the current version of Guidance on Airport Recycling, Reuse, and Waste Reduction Plans maintained by APP-400. **(6)** Per 49 USC § 47102(5)(C), the FAA Modernization and Reform Act of 2012 (Public Law 112-95) also made the cost of a waste audit an allowable master planning element. **(7)** Airport sustainability planning is also an allowable master	existing conditions).	*projects in Paragraph E-3.*

Table E-2 Planning Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	planning element (or can be funded as a separate planning study as detailed in Appendix S.		
d. Conduct an Aeronautical Survey for Area Navigation (RNAV) Approach	**(1)** APP-400 must have concurred with the survey (to avoid duplication of effort with the RNAV office) before the ADO can program the grant. **(2)** The project may include the allowable cost to upload the data in the FAA Airports GIS program. **(3)** The project must meet the minimum requirements of the current versions of FAA advisory circulars addressing airport surveys.	A set of electronic airport data that meets FAA standards.	PL PL VI
e. Prepare SMS Manual	**(1)** The project must meet the minimum requirements of the current version of FAA Order 5200.11, FAA Airports (ARP) Safety Management System. **(2)** This is an eligible project for all airports, however, the ADO must determine that the project costs for airports that are not 14 CFR part 139 certificated are reasonable and reflect the scale and complexity of the airports infrastructure and operating environment. **(3)** The sponsor must receive ADO approval of the scope of work, deliverables, and cost estimates in order for the costs to be considered allowable. **(4)** Development of an SMS manual remains eligible even if an airport chooses to include the SMS manual in its Airport Certification Manual.	An SMS manual and implementation plan that meets the requirements of AAS-300.	SA PL MS

Table E-2 Planning Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	(5) Only the portions of the Implementation Plan and SMS Manual that outline the sponsor's initiatives to enforce airport policies and procedures, such as rules and regulations, minimum standards, or other existing controls are allowable. The plan can help establish safety protocols that affect users of the airport, but the costs associated with helping users of the airport manage their own operations are not allowable costs. **(6)** If a sponsor chooses to include aspects in the SMS manual and implementation plan that are outside the control of the sponsor, the sponsor must provide proration calculations for the ADO to exclude these costs from the grant. If the ADO does not agree with the prorated costs, the sponsor must revise the proration to address the concerns. The ADO also has the option to disallow the inclusion of these aspects from the SMS manual and implementation plan. In addition, the requirements for including ineligible or non-AIP funded work in the contract in Paragraph 3-39 must be met. **(7)** One time (initial) acquisition of airport-owned software applications that are specifically designed to support airport SMS implementation will be considered an allowable cost providing all of the following requirements are met: **(a)** The sponsor has demonstrated to the ADO that the software is necessary for		

Table E-2 Planning Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	successful SMS implementation consistent with the size and complexity of the airport; **(b)** The sponsor has completed the SMS manual for FAA review and acceptance before selecting or specifying computer software; **(c)** The sponsor agrees to share sanitized data with the FAA; **(d)** The software is a deliverable as part of the SMS planning study; and **(e)** The allowable cost of the software is limited to $50,000 per airport sponsor, based on demonstrated justification. **(8)** Other SMS activities and costs associated with a project must be included as project formulation costs or preliminary project costs for the grant for that project (see Paragraph 3-86 for additional details).		
f. Wildlife Hazard Assessments *(Or Wildlife Hazard Site Visits)*	**(1)** AAS-300 has made a determination that wildlife hazard assessments are justified at the following types of airports: **(a)** General aviation (and reliever) airports that have 100 or more based jets. **(b)** General aviation (and reliever) airports that have 75,000 or more annual operations. **(c)** 14 CFR part 139 airports. **(2)** AAS-300 has determined that general aviation (and reliever) airports with fewer than 100 based jets or less than 75,000 annual operations may only need a wildlife hazard site visit.	For a wildlife hazard site visit, an FAA accepted wildlife hazard site visit report with an associated written sponsor adoption of the report recommendations. For a wildlife hazard assessment, an FAA accepted wildlife hazard assessment mitigation plan with an associated	PL PL WH

Table E-2 Planning Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	The regional office (or if delegated to the ADO, the ADO) will determine if a wildlife hazard assessment is needed (and therefore eligible) based on the results of the site visit. **(3)** A wildlife hazard management plan must be based on a wildlife hazard assessment. This wildlife hazard management plan is eligible as part of the wildlife hazard assessment project. Normally the wildlife hazard management plan is done within the same grant. However, the wildlife hazard management plan is eligible as a stand-alone grant as long as it is based on an FAA-approved wildlife hazard assessment. **(4)** For a wildlife hazard site visit, the sponsor must submit the following information (referred to as an Adoption of Wildlife Hazard Site Visit Recommendations) to the ADO: **(a)** The airport name, LOCID, city and state. **(b)** The airport manager name and airport sponsor name. **(c)** The biologist name, company/agency, and date of wildlife hazard site visit. **(d)** A table that contains the list of accepted recommendation from the wildlife hazard site visit, who is responsible for carrying out the recommendation, and the frequency the recommendation will be performed. **(e)** A table that contains the list of remaining recommendations	wildlife hazard management plan.	

Table E-2 Planning Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	not accepted from the wildlife hazard site visit and the reason each recommendation is not being accepted. **(f)** A statement as follows: *"I hereby certify that this is a complete and accurate listing of responses to the foregoing items and have prepared documentation attached hereto for any item marked "no"."* **(g)** The signature of the sponsor's designated official representative, the typed name and title of this representative, and the date of the signature. **(5)** The sponsor must first solicit qualifications from private sector firms under either the competitive proposal process or the small procurement process (see 2 CFR § 200.319 and 2 CFR § 200.320 in Appendix U for these requirements). Since the U.S. Department of Agriculture (USDA) Wildlife Services (WS) is a governmental entity, the sponsor cannot include USDA WS as a qualified source under these procurement processes. However, the sponsor can separately obtain price and schedule information from USDA WS. If the sponsor determines that the qualified sources cannot reasonably or expeditiously provide the services, the sponsor may opt to use USDA WS as long as the sponsor provides a written statement to the ADO to this affect prior to the grant application. The ADO must		

Table E-2 Planning Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	include this written statement in the grant file. **(6)** AAS-300 is available for specific guidance on the scope of wildlife hazard assessments and wildlife hazard sight visits.		

*The official list of work codes can be obtained from the automated AIP system.

Appendix F. New Airport Projects

F-1. How to Use This Appendix.

This appendix is not a valid stand-alone document for making eligibility and justification determinations. The information in this appendix must be used in conjunction with the Handbook, especially the project cost requirements in Chapter 3.

F-2. Project Requirements Tables.

In addition to the information provided in the above paragraphs and the following tables, Appendix C contains examples of prohibited projects and costs and is very useful to use alongside this appendix.

Table F-1 New Airport Work Codes

If the project is justified as follows…	Use the following work codes…
a. The project meets the definition of a capacity project (see Appendix A).	CA NA CO
b. The project meets the definition of a standards project (see Appendix A).	ST NA CO

Table F-2 New Airport Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
a. Construct New Airport *(Replacement)*	**(1)** The airport is needed to replace an existing airport that is unable to meet long-term aviation demand in the community because the existing airport is constrained. **(2)** The ADO must notify APP-400 as soon the ADO becomes aware that a new airport is being considered and the ADO must keep APP-400 involved during the entire process. **(3)** APP-400 concurrence and APP-1 approval are required prior to issuing a grant for the feasibility study. A feasibility study to replace a NPIAS airport can be	A new airport constructed to FAA design standards.	ST NA CO CA NA CO See Table F-1 for the correct work code.

Table F-2 New Airport Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	undertaken without adding the new airport to the NPIAS. **(4)** The ADO must not issue a grant for any work beyond the feasibility study unless all of the following criteria have been met: **(a)** The sponsor has completed the feasibility study. **(b)** The ADO has concurred that the feasibility study supports the replacement airport. **(c)** ADO has obtained APP-400 concurrence and APP-1 approval prior to APP-400 adding the airport to the NPIAS. **(d)** The sponsor has submitted a signed request for release of the existing airport that includes a plan on how the airport revenue will be reinvested in the new airport per the current version of FAA Order 5190.6, FAA Airport Compliance Manual. **(e)** The FAA has approved the release of the old airport and the reinvestment plan. Generally, the existing airport will not be closed until the new airport is opened. **(f)** The sponsor has agreed to permanently close the existing airport when the new airport opens. **(g)** If the airport is a capacity project (historically, the majority have been standards projects), the benefit-cost analysis (BCA) requirements in Paragraph 3-14 have been met. **(5)** Value Engineering must be used for new primary airports as outlined in Paragraph 3-54.		

Table F-2 New Airport Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	(6) Per 49 USC § 47106(c)(1)(A)(i), the sponsor must provide an opportunity for a public hearing as part of meeting the environmental requirements. **(7)** The justifications for AIP funded airport facilities (runways, terminals, etc.) must follow the guidelines in the specific tables for those items.		
b. Construct New Airport *(Supplemental)*	**(1)** The airport is needed to supplement an existing NPIAS airport and the existing NPIAS airport stays open. It would be unusual to have a new general aviation airport supplement an existing general aviation airport. Typically, a supplemental airport would be considered to provide additional capacity for a large, medium, or small hub airport. **(2)** The ADO must notify APP-400 as soon the ADO becomes aware that a new airport is being considered and the ADO must keep APP-400 involved during the entire process. **(3)** The ADO has obtained APP-400 concurrence and APP-1 approval prior to issuing a grant for the feasibility study. A feasibility study to supplement a NPIAS airport can be undertaken without adding the new airport to the NPIAS. **(4)** The ADO must not issue a grant for any work beyond the feasibility study unless all of the following criteria have been met: **(a)** The sponsor has completed the feasibility study. **(b)** The ADO has concurred that the feasibility study supports the replacement airport.	A new airport constructed to FAA design standards.	CA NA CO

Table F-2 New Airport Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	(c) ADO has obtained APP-400 concurrence and APP-1 approval prior to APP-400 adding the airport to the NPIAS. **(d)** The benefit-cost analysis (BCA) requirements in Paragraph 3-14 have been met. **(5)** Value Engineering must be used for new primary airports as outlined in Paragraph 3-54. **(6)** Per 49 USC § 47106(c)(1)(A)(i), the sponsor must provide an opportunity for a public hearing as part of meeting the environmental requirements. **(7)** The justifications for AIP funded airport facilities (runways, terminals, etc.) must follow the guidelines in the specific tables for those items.		
c. Construct New Airport *(Additional)*	**(1)** The community must not have an existing NPIAS airport. **(2)** The ADO must notify APP-400 as soon the ADO becomes aware that a new airport is being considered and the ADO must keep APP-400 involved during the entire process. **(3)** The ADO has obtained APP-400 concurrence and APP-1 approval that an additional NPIAS location is feasible and would meet entry criteria. APP-400 must identify the additional airport in the NPIAS before the ADO can program any grants for the additional airport. A feasibility study can be undertaken once the new location is added to the NPIAS. **(4)** The ADO must not program a grant for any work other than a feasibility study until all of the following criteria have been met:	A new airport constructed to FAA design standards.	CA NA CO

Table F-2 New Airport Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	(a) The sponsor has completed the feasibility study. **(b)** The ADO has concurred that the feasibility study supports the replacement airport. **(c)** ADO has obtained APP-400 concurrence and APP-1 approval prior to APP-400 adding the airport to the NPIAS. **(d)** The benefit-cost analysis (BCA) requirements in Paragraph 3-14 are met. **(5)** Value Engineering must be used for new primary airports as outlined in Paragraph 3-54. **(6)** Per 49 USC § 47106(c)(1)(A)(i), the sponsor must provide an opportunity for a public hearing as part of meeting the environmental requirements. **(7)** The justifications for AIP funded airport facilities (runways, terminals, etc.) must follow the guidelines in the specific tables for those items.		
d. Acquire Existing Airport	**(1)** These requirements are typically for a public sponsor acquiring a privately-owned airport or possibly another public-owned airport. **(2)** These requirements do not apply to airports under the Military Airport Program (those requirements are contained in Section 3 of Chapter 6). **(3)** The ADO must notify APP-400 as soon the ADO becomes aware that acquisition is being considered and the ADO must keep APP-400 involved during the entire process. **(4)** If the airport is not in the NPIAS (including non-NPIAS former	Acquisition of an airport that meets, or can be upgraded to meet FAA standards.	ST NA AQ

Table F-2 New Airport Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	military or joint use airports not in the Military Airport Program), the ADO must obtain APP-400 concurrence and APP-1 approval prior to issuing a grant for the feasibility study. A feasibility study to replace a NPIAS airport can be undertaken without adding the new airport to the NPIAS. If the airport is in the NPIAS, a feasibility study is not required. **(5)** The ADO must not issue a grant for any work beyond the feasibility study unless all of the following criteria have been met: **(a)** The sponsor has completed the feasibility study. **(b)** The ADO has concurred that the feasibility study supports the replacement airport. **(c)** If the airport is not in the NPIAS, the ADO has obtained APP-400 concurrence and APP-1 approval prior to APP-400 adding the airport to the NPIAS. **(d)** If the existing airport is in the NPIAS, the ADO has obtained ACO-100 and APP-500 approval prior to programming the grant. **(6)** The justifications for AIP funded acquisition of the airport facilities (runways, terminals, etc.) must follow the guidelines in the specific tables for those items. **(7)** If the airport is a former military or joint use airport (not in the Military Airport Program), the AIP eligible work is limited to buying out the non-Federal tenants for eligible facilities. This is because the federally owned portions of the airport must be transferred, not purchased. The ADO must contact APP-400 and obtain		

Table F-2 New Airport Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	additional guidance on this process.		

*The current list of work codes can be obtained from the automated AIP system.

This page has been intentionally left blank.

Appendix G. Runway Projects

G-1. How to Use This Appendix.

This appendix is not a valid stand-alone document for making eligibility and justification determinations. The information in this appendix must be used in conjunction with the Handbook, especially the project cost requirements in Chapter 3.

G-2. Secondary, Crosswind and Additional Runways.

Per FAA policy, the ADO can only fund a single runway at an airport unless the ADO has made a specific determination that one or more crosswind or secondary runways are justified. The requirements, justification and eligibility for runways are listed in Table G-1.

Before planning a project on a runway, the ADO must determine the type of runway (primary, secondary, crosswind, or additional).

A runway that is not a primary runway, a secondary runway, or a crosswind runway is considered to be an *additional* runway. It is not unusual for a two-runway airport to have a primary runway and an additional runway, and no secondary or crosswind runway. This is because the ADO can only designate a runway as a secondary runway or crosswind runway if it meets the specific operating and justification parameters in Table G-1. Note that at busy airports, there may be more than one secondary and/or crosswind runways.

Additional runways are not eligible. Any development such as marking, lighting, or maintenance projects on an additional runway is also ineligible. There may be specific situations where additional runways may be considered a secondary or crosswind runway, however, APP-400 and APP-500 must concur with this reclassification.

Table G-1 Runway Types and Eligibility

For the following runway type…	Must meet all of the following criteria…	And is…
a. Primary Runway	**(1)** A single runway at an airport is eligible for development consistent with FAA design and engineering standards.	Eligible
b. Crosswind Runway	**(1)** One of the following two criteria are met: **(a)** For the first crosswind, the wind coverage on the primary runway less than 95% **(b)** For more than one crosswind runway, the wind coverage on the primary runway less than 95% and the existing crosswind runway(s) are operating at 60% or more of their annual capacity, which is based on guidance developed by APP-400 as the threshold for considering when to plan a new runway.	Eligible if justified

Table G-1 Runway Types and Eligibility

For the following runway type…	Must meet all of the following criteria…	And is…
c. Secondary Runway	**(1)** There is more than one runway at the airport. **(2)** This is not a crosswind runway. **(3)** Either of the following: **(a)** The primary runway (or primary runway AND all secondary runways) is operating at 60% or more of its annual capacity, which is based on guidance developed by APP-400 as the threshold for considering when to plan a new runway. **(a)** APP-400 has made a specific determination that the runway is required for operation of the airfield.	Eligible if justified.
d. Additional Runway	**(1)** There is more than one runway on the airport. **(2)** The ADO has determined that this runway does not meet the requirements to be designated a crosswind runway. **(3)** The ADO has determined that this runway does not meet the requirements to be designated a secondary runway.	Ineligible.

G-3. Pavement Condition Index Requirements for Airfield Pavement Projects.

For an airfield pavement project, the ADO may justify pavement work based on the thresholds listed in Table G-2. The ADO has the option to fund pavement work outside of these thresholds if the ADO determines that the work is justified based on engineering analysis and the ADO obtains concurrence from AAS-100. The definitions (and eligibility restrictions by airport type) for reconstruction, rehabilitation, and maintenance are defined in Paragraph 3-6.

Table G-2 Pavement Condition Index Requirements for Airfield Pavement Projects

For the following type of airfield pavement project…	The pavement condition index (PCI) must be less than…
a. Reconstruction	55 (Poor)
b. Rehabilitation	70 (Fair)
c. Maintenance	N/A

G-4. Project Requirements Tables.

In addition to the information provided in the above paragraph and the following tables, Appendix C contains examples of prohibited projects and costs and is very useful to use alongside this appendix.

Table G-3 Distinctions between Construct, Extend, Widen, Strengthen, Rehabilitate, Shift, and Remove

Use the following description…	If the project will…
a. Construct	Build a brand new runway.
b. Extend	Add additional length to a runway.
c. Widen	Increase the pavement width.
d. Strengthen	Will allow the pavement to accommodate a heavier class of aircraft.
e. Rehabilitate	Improves the pavement for the same class of aircraft.
f. Shift	Keep the same length, but move both ends of the runway.
g. Remove	Only remove pavement.

Table G-4 Runway Work Codes

If the project is justified as follows…	Use the following work codes…
a. The project meets the definition of a capacity project (see Appendix A).	CA RW CO (construct) CA RW EX (extend)
b. The project meets the definition of a standards project (see Appendix A).	ST RW CO (construct) ST RW CO (shift) ST RW CO (remove) ST RW IM (extend) ST RW IM (widen) ST RW IM (strengthen)
c. The project is justified in an environmental finding or 14 CFR part 150 program for environmental reasons. The project must be a condition of the environmental finding or 14 CFR part 150 program.	EN RW CO (construct)

Table G-5 Runway Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
a. Runway (Construct, Extend, Widen, Strengthen, Shift)	**(1)** Where a study is required to demonstrate need, the FAA must have accepted the study and concurred with the need. **(2)** For a runway capacity project intended to relieve scheduled commercial air service congestion or add capacity for scheduled commercial air service in metropolitan areas with a large or medium hub airport, the ADO must confirm consistency with a regional or state system plan document (if available) prior to programming the grant. **(3)** The length, width, and strength of the pavement work must be based on critical aircraft justification per Paragraph 3-10. The exception is if the project meets the requirements in Paragraph 3-24 to exceed FAA design standards. **(4)** Runways must be planned, designed and constructed in accordance with current FAA standards, including clearing the approach slopes that will be used upon completion of the project. For runway projects, object clearing and approach surfaces must be appropriate to the instrument approach procedures for that runway. If the approaches to a new runway or extended runway end will not be clear, the project does not meet FAA standards. **(5)** If the runway has a non-standard runway protection zone (RPZ), the RPZ requirements per the current version of Advisory Circular 150/5300-13, Airport Design must be followed.	An operational runway constructed to FAA design standards, including required proper access, clear approaches, shoulders, turf along edge of shoulders, signs, marking, and lighting.	CA RW CO CA RW EX ST RW CO ST RW IM EN RW CO See Table G-4 for the correct work code.

Table G-5 Runway Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	(6) Crosswind runways may be justified if the crosswind criteria of 95% wind coverage are not met on the primary runway. In addition, the justification must be based upon the number and type of aircraft that would use the crosswind in accordance with current APP-400 policy. **(7)** The approval criteria and coding for turf and aggregate runways is the same as for paved runways. If this project is required because the FAA Office of Aviation Safety (AVS) has issued a finding that ultralight aircraft must be relocated from the paved runway, the ADO must contact AAS-100 for further guidance. **(8)** Per 49 USC § 47106(c)(1)(A)(i), the sponsor must provide an opportunity for a public hearing for a new runway or major runway extension as part of meeting the environmental requirements. **(9)** The project may include runway safety area improvements (stand-alone projects are also covered in this table) or other runway approach obstruction removal (stand-alone projects are covered in Appendix D). **(10)** Runway lighting may be included for the new runway pavement as long as it meets the runway lighting requirements in Appendix J. Per APP-520 policy, runway lighting for existing pavement must be coded as a lighting project unless the lighting is in pavement lighting (then it can coded under the runway project). **(11)** The difference between construct, expand, modify, improve,		

Table G-5 Runway Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	rehabilitate, shift, and remove is listed in Table G-3. **(12)** The runway must be eligible and justified as a primary, crosswind, or secondary runway per the requirements in Paragraph G-2.		
b. Groove Runway	**(1)** Grooving is eligible as a stand-alone project at a commercial service airport as either part of a project on the runway (code under that runway project) or as a stand-alone project. **(2)** Grooving of a non-commercial service airport is justified for the following two situations: **(a)** Runways over 5,000 feet. **(i)** The runway must serve turbojet aircraft. **(ii)** The grooving may either be included as part of the runway project (code under that runway project) or as a stand-alone project. **(b)** Runways between 4,000 feet to 5,000 feet. **(i)** There is either one or more based turbo jet aircraft or there is documented history of turbojet aircraft operations on that runway. **(ii)** The grooving is only eligible as part of runway rehabilitation, reconstruction, or construction project (code under that runway project). Grooving is not eligible as a stand-alone project. **(3)** The runway must be eligible and justified as a primary, crosswind, or secondary runway per the requirements in Paragraph G-2.	An operational runway with surface treatment.	SP RW FR

Table G-5 Runway Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
c. Rehabilitate Runway *(Maintenance)*	**(1)** Maintenance is generally ineligible. However, per 49 USC § 47102(3)(H), the exception is routine runway, taxiway, or apron maintenance at nonhub primary airports and nonprimary airports. Paragraph 3-6 contains additional guidance and examples. **(2)** It is FAA policy that the sponsor must be unable to fund maintenance with its own resources. One way to satisfy this requirement is for the sponsor to submit a written certification to the ADO to this affect prior to the sponsor executing the grant. **(3)** The runway must be eligible and justified as a primary, crosswind, or secondary runway per the requirements in Paragraph G-2.	An operational runway.	RE RW IM
d. Rehabilitate Runway (*Seal Coat or Resealing of Joints in Concrete Pavement*)	**(1)** A major portion of the pavement is being addressed. **(2)** The ADO concurs with the need for the project. **(3)** The sponsor has satisfactorily complied with grant assurances on pavement maintenance. **(4)** The length and width of the pavement work must be based on critical aircraft justification per Paragraph 3-10. The exception is if the project meets the requirements in Paragraph 3-24 to exceed FAA design standards. **(5)** Paragraph 3-6 contains additional guidance (including useful life requirements) and examples that the ADO must use to differentiate between maintenance, rehabilitation, and reconstruction.	A fully functional runway with extended useful life.	RE RW IM

Table G-5 Runway Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	(6) The runway must be eligible and justified as a primary, crosswind, or secondary runway per the requirements in Paragraph G-2.		
e. Rehabilitate Runway *(Rehabilitate, Reconstruct)*	**(1)** The work must be supported a Pavement Condition Index (PCI) or planning study. The ADO has the option to consult AAS-100 for assistance with justifying pavement rehabilitation or reconstruction. **(2)** The length and width of the pavement work must be based on critical aircraft justification per Paragraph 3-10. The exception is if the project meets the requirements in Paragraph 3-24 to exceed FAA design standards. **(3)** Paragraph 3-6 contains additional guidance (including useful life requirements and that turf and aggregate runway rehabilitation is eligible) and examples that the ADO must use to differentiate between maintenance, rehabilitation, and reconstruction. **(4)** The pavement must not have been reconstructed within the last 20 years, rehabilitated within the last 10 years or resealed within the last 3 years except as allowed in Paragraph 3-12. **(5)** The project may include runway safety area improvements (stand-alone projects are also covered in this table) or other runway approach obstruction removal (stand-alone projects are covered in Appendix D). **(6)** Only in pavement runway lighting can be included in the rehabilitation project (as long as it meets the runway lighting requirements in Appendix J). Per APP-520 policy, all other runway	A fully functional runway with extended useful life.	RE RW IM

Table G-5 Runway Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	lighting must be separated into a stand-alone project. **(7)** The runway must be eligible and justified as a primary, crosswind, or secondary runway per the requirements in Paragraph G-2.		
f. Construct, Extend or Improve a Runway Safety Area *(For 14 CFR part 139 certificated runways only)*	**(1)** The project must be supported by a regional determination under the current version of FAA Order 5200.8, Runway Safety Area Program, to establish a safety area. **(2)** Engineered Material Arresting Systems (EMAS) must be supported by a runway safety area determination. **(3)** The only EMAS rehabilitation that is eligible is lid rehabilitation for EMAS installed with AIP funds prior to fiscal year 2007. This is because the EMAS installed before 2007 did not have the plastic lids. After fiscal year 2007, the manufacturer began fully encasing the blocks, which eliminated the need for lid replacement. **(4)** EMAS panels that were destroyed by an aircraft are eligible only if the sponsor can prove that there is no other avenue, such as insurance, for funding the replacement. **(5)** Where an airport is improving its RSA and existing FAA-owned equipment will be impacted by the airport's RSA project, it is FAA policy that the ADO may be able to include the relocation of the FAA-owned equipment as part of the AIP project. However, where the airport's RSA meets the RSA standards except for FAA-owned equipment, it is FAA policy that the Air Traffic Organization is responsible for relocating	A runway safety area that incorporates all of the improvements outlined in the regional determination.	SA RW SF

Table G-5 Runway Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	and/modifying the FAA-owned equipment in the RSAs. This policy is contained in the Relocation of FAA-owned Equipment from Runway Safety Areas jointly signed on July 31, 2012 by ARP-1 and AJO-0. **(6)** The runway must be eligible and justified as a primary, crosswind, or secondary runway per the requirements in Paragraph G-2.		
g. Construct, Extend or Improve a Runway Safety Area *(For runways that are not 14 CFR part 139 certificated)*	**(1)** The project must be supported by a regional determination under the current version of FAA Order 5200.8, Runway Safety Area Program, to establish a safety area. **(2)** Engineered Material Arresting Systems (EMAS) must be supported by a runway safety area determination. **(3)** The only EMAS rehabilitation that is eligible is lid rehabilitation (encasing the top of the blocks) for EMAS installed with AIP funds prior to fiscal year 2007. This is because the EMAS installed before 2007 did not have the plastic lids. After fiscal year 2007, the manufacturer began fully encasing the blocks, which eliminated the need for lid replacement. **(4)** EMAS panel replacement for panels that were destroyed by an aircraft is eligible if the sponsor has determined that there is no other avenue, such as insurance, for funding the replacement. **(5)** Where an airport is improving its RSA and existing FAA-owned equipment will be impacted by the airport's RSA project, it is FAA policy that the ADO may be able to include the relocation of the	A runway safety area that incorporates all of the improvements outlined in the regional determination.	ST RW SF

Table G-5 Runway Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	FAA-owned equipment as part of the AIP project. However, where the airport's RSA meets the RSA standards except for FAA-owned equipment, it is FAA policy that the Air Traffic Organization is responsible for relocating and/modifying the FAA-owned equipment in the RSAs. This policy is contained in the Relocation of FAA-owned Equipment from Runway Safety Areas jointly signed on July 31, 2012 by ARP-1 and AJO-0. **(6)** The runway must be eligible and justified as a primary, crosswind, or secondary runway per the requirements in Paragraph G-2.		
h. Runway Surface Condition Sensors	**(1)** The runway sensors must transit airfield conditions so that the timing of chemical applications may be determined. **(2)** The ADO must have concurred that the local weather conditions justify the need for the equipment. **(3)** The purpose is to ensure that aircraft can land and take off safely. Therefore, only runways are eligible for sensors. **(4)** Based on the current version of Advisory Circular 150/5200-30, Airport Field Condition Assessments and Winter Operations Safety, three or four sensors are normally sufficient for a runway. The ADO has the option to fund additional sensors if the ADO determines additional sensors are justified. **(5)** The runway surface condition sensor system is limited to a system that reports:	An operational system that successfully transmits runway conditions, indicates when chemical treatment must be applied, and meets FAA standards.	ST RW SR

Table G-5 Runway Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	(a) Runway surface temperature (actual temperature of pavement at the sampling site); **(b)** Presence or absence of moisture (dry pavement – no perceptible moisture, or wet pavement – perceptible moisture on surface); **(c)** Pre-ice conditions – advance alert of incipient ice formation prior to actual formation on the pavement; **(d)** Actual ice – visible or otherwise detectable ice on pavement; and **(e)** Ambient air temperature – at ground level in the vicinity of the runway. **(6)** The runway must be eligible and justified as a primary, crosswind, or secondary runway per the requirements in Paragraph G-2.		

*The current list of work codes can be obtained from the automated AIP system.

Appendix H. Taxiway Projects

H-1. How to Use This Appendix.

This appendix is not a valid stand-alone document for making eligibility and justification determinations. The information in this appendix must be used in conjunction with the Handbook, especially the project cost requirements in Chapter 3.

H-2. Taxiway Types (and Associated AIP Funding Rules).

AIP participation in a taxiway is limited to the requirements of the current version of Advisory Circular 150/5320-6, Airport Pavement Design and Evaluation, and the current version of Advisory Circular 150/5300-13, Airport Design. The common forms of taxiway pavements projects are listed below. For the purposes of this Handbook, the term *taxiway* refers to any of these types of projects so long as they are public-use.

a. Parallel and Partial Parallel Taxiway. A full length parallel taxiway connected to each end of a runway. If the runway is eligible and justified, then a parallel taxiway is eligible. A partial parallel taxiway is also eligible if the runway is eligible and justified and is normally considered at low activity airports where cost to construct the full length is excessive and the benefits do not warrant a full parallel taxiway.

b. Turnarounds. Turnarounds (also referred to as teacups) are small taxiways constructed at the end of a runway so that aircraft can change direction on the runway. A turnaround is eligible if the runway is eligible and justified. They are normally constructed at low activity airports when it is not economically feasible to construct a parallel or partial taxiway.

c. Holding Bays. Holding bays (also referred to as run-up pad and holding pads) are a paved area off the taxiway near the end of the runway where aircraft can conduct their final preflight activities or can wait for departure clearance or tower instruction. A holding bay is eligible if the runway is eligible and justified and the holding bay meets the justification requirements in the current version of Advisory Circular 150/5300-13, Airport Design.

d. Other Taxiways. A taxiway is a defined path for taxing of aircraft from one point to another. Taxiways on, or connecting to, aprons available for use by the general public are eligible.

e. Taxilanes. Taxilanes are used for access between taxiways and aircraft parking positions or buildings/hangars. They are outside the aircraft movement area controlled by the tower (if a towered airport). Public use taxilanes which serve multiple buildings are eligible using the same funding rules that apply to taxiways. A taxiway or taxilane that exclusively serves a hangar or building is considered part of the hangar or building (and the associated hangar or building eligibility and funding rules apply).

f. Converting Runways to Taxiways. A project to convert an ineligible runway to a taxiway will be eligible only if the ADO has determined that the taxiway is justified based on an operational need and the costs are reasonable to convert the pavement. Such projects must be identified on the airport layout plan and the pavement markings must be modified to meet FAA design standards.

H-3. Pavement Condition Index Requirements for Airfield Pavement Projects.

For an airfield pavement project, the ADO may justify pavement work based on the thresholds listed in Table H-1. The ADO has the option to fund pavement work outside of these thresholds if the ADO determines that the work is justified based on engineering analysis and the ADO obtains concurrence from AAS-100. The definitions (and eligibility restrictions by airport type) for reconstruction, rehabilitation, and maintenance are defined in Paragraph 3-6.

Table H-1. Pavement Condition Index Requirements for Airfield Pavement Projects

For the following type of airfield pavement project…	The pavement condition index (PCI) must be less than…
a. Reconstruction	55 (Poor)
b. Rehabilitation	70 (Fair)
c. Maintenance	N/A

H-4. Project Requirements Tables.

In addition to the information provided in the above paragraphs and the following tables, Appendix C contains examples of prohibited projects and costs and is very useful to use alongside this appendix.

Table H-2 Distinctions between Construct, Extend, Widen, Strengthen, Rehabilitate, Shift, and Remove

Use the following description…	If the project will…
a. Construct	Build a brand new taxiway.
b. Extend	Add additional length to a taxiway.
c. Widen	Increase the pavement width.
d. Strengthen	Will allow the pavement to accommodate a heavier class of aircraft.
e. Rehabilitate	Improves the pavement for the same class of aircraft.
f. Shift	Keep the same length, but move both ends of the taxiway.
g. Remove	Only remove pavement.

Table H-3 Taxiway Work Codes

If the project is justified as follows…	Use the following work codes…
a. The project meets the definition of a capacity project (see Appendix A).	CA TW CO (construct) CA TW EX (extend)
b. The project meets the definition of a standards project (see Appendix A).	ST TW CO (construct) ST TW CO (shift) ST TW CO (remove) ST TW IM (extend) ST TW IM (widen) ST TW IM (strengthen) RE TW IM (rehabilitate)
c. The project is justified in an environmental finding or 14 CFR part 150 program for environmental reasons. The project must be a condition of the environmental finding or 14 CFR part 150 program.	EN TW CO (construct)

Table H-4 Taxiway Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
a. Taxiway (Construct, Extend, Widen, Strengthen, Shift)	**(1)** The taxiway must connect runways, taxiways, public-use aprons, or buildings eligible at that airport. **(2)** The length, width, and strength of the pavement work must be based on critical aircraft justification per Paragraph 3-11. The exception is if the project meets the requirements in Paragraph 3-24 to exceed FAA design standards. **(3)** Taxiway lighting may be included for the new taxiway pavement as long as it meets the taxiway lighting requirements in Appendix J. Per APP-520 policy, taxiway lighting for existing pavement must be separated into a stand-alone project. **(4)** The difference between construct, expand, modify, improve, rehabilitate, shift, and remove is listed in Table H-2. **(5)** Construction of parallel taxiways to support an approved Area Navigation (RNAV) approach is covered elsewhere in this table and has a different work code. **(6)** A taxiway or taxilane that exclusively serves a building is considered part of the building (and the associated building funding rules apply).	An operational taxiway constructed to FAA design standards, including required proper access, shoulders, turf along edge of shoulders, signs, taxiway safety areas, marking, and lighting.	CA TW CO CA TW EX EN TW CO ST TW CO ST TW IM See Table H-3 for the correct work code.
b. Install Infrastructure to support Area Navigation (RNAV) Approach *(Parallel Taxiway)*	**(1)** This is for a parallel taxiway required for an approved RNAV approach. **(2)** An approved RNAV approach is not sufficient justification for a parallel taxiway. The length, width, and strength of the pavement work must still be based on critical aircraft justification per Paragraph 3-11.	An operational taxiway constructed to FAA design standards, including required proper access, shoulders, turf along the edge of the shoulders, signs, marking, and taxiway lighting.	SP OT VI

Table H-4 Taxiway Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
c. Rehabilitate Taxiway *(Maintenance)*	**(1)** Maintenance is generally ineligible. However, per 49 USC § 47102(3)(H), the exception is routine runway, taxiway, or apron maintenance at nonhub primary airports and nonprimary airports. Paragraph 3-6 contains additional guidance and examples. **(2)** It is FAA policy that the sponsor must be unable to fund maintenance with its own resources. **(3)** The taxiway must connect runways, taxiways, public-use aprons, or buildings eligible at that airport. **(4)** A taxiway or taxilane that exclusively serves a building is considered part of the building (and the associated building funding rules apply).	An operational taxiway.	RE TW IM

Table H-4 Taxiway Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
d. Rehabilitate Taxiway (Seal Coat or Resealing of Joints in Concrete Pavement)	**(1)** A major portion of the pavement is being addressed. **(2)** The ADO concurs with the need for the project. **(3)** The sponsor has satisfactorily complied with grant assurances on pavement maintenance. **(4)** The length and width of the pavement work must be based on critical aircraft justification per Paragraph 3-103-11. The exception is if the project meets the requirements in Paragraph 3-24 to exceed FAA design standards. **(5)** Paragraph 3-6 contains additional guidance (including useful life requirements) and examples that the ADO must use to differentiate between maintenance, rehabilitation, and reconstruction. **(6)** The taxiway must connect runways, taxiways, public-use aprons, or buildings eligible at that airport. **(7)** A taxiway or taxilane that exclusively serves a building is considered part of the building (and the associated building funding rules apply).	A fully functional taxiway with extended useful life.	RE TW IM

Table H-4 Taxiway Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
e. Rehabilitate Taxiway (Rehabilitate or Reconstruct)	**(1)** The work must be supported a Pavement Condition Index (PCI) or planning study. The ADO has the option to consult AAS-100 for assistance with justifying pavement rehabilitation or reconstruction. **(2)** The length and width of the pavement work must be based on critical aircraft justification per Paragraph 3-11. The exception is if the project meets the requirements in Paragraph 3-24 to exceed FAA design standards. **(3)** Paragraph 3-6 contains additional guidance (including useful life requirements) and examples that the ADO must use to differentiate between maintenance, rehabilitation, and reconstruction. **(4)** The pavement must not have been reconstructed within the last 20 years, rehabilitated within the last 10 years or resealed within the last 3 years except as allowed in Paragraph 3-12. **(5)** The taxiway must connect runways, taxiways, public-use aprons, or buildings eligible at that airport. **(6)** Only in-pavement taxiway lighting can be included in the rehabilitation project (as long as it meets the taxiway lighting requirements in Appendix J). Per APP-520 policy, all other taxiway lighting must be separated into a stand-alone project. **(7)** A taxiway or taxilane that exclusively serves a building is considered part of the building (and the associated building funding rules apply).	A fully functional taxiway with extended useful life.	RE TW IM

*The official list of work codes can be obtained from the automated AIP system.

This page has been intentionally left blank.

Appendix I. Apron Projects

I-1. How to Use This Appendix.

This appendix is not a valid stand-alone document for making eligibility and justification determinations. The information in this appendix must be used in conjunction with the Handbook, especially the project cost requirements in Chapter 3.

I-2. Non-Exclusive Use Available for Public Aircraft Parking/Access.

Apron pavement is only eligible if it will be used for aircraft parking or as a compass calibration pad and is not exclusive use (see Appendix A for a definition and references on exclusive use). A good rule of thumb is that the flying public must be able to park on the pavement in order for it to be considered eligible apron area.

The portion of the apron project that will be used for support areas, such as service vehicle parking and fixed based operator equipment storage, is not eligible.

I-3. Apron in Front of a Building.

For apron pavement immediately in front of a building, per FAA policy, the 50 feet of pavement in front of the building is considered part of that building (and the associated building eligibility and funding building apply). The rest of the apron pavement in front of a building is only eligible as apron work if is available for public aircraft parking and is not exclusive use.

I-4. Pavement Condition Index Requirements for Airfield Pavement Projects.

For an airfield pavement project, the ADO may justify pavement work based on the thresholds listed in Table I-1. The ADO has the option to fund pavement work outside of these thresholds if the ADO determines that the work is justified based on engineering analysis and the ADO obtains concurrence from AAS-100. The definitions (and eligibility restrictions by airport type) for reconstruction, rehabilitation, and maintenance are defined in Paragraph 3-6.

Table I-1 Pavement Condition Index Requirements for Airfield Pavement Projects

For the following type of airfield pavement project…	The pavement condition index (PCI) must be less than…
a. Reconstruction	55 (Poor)
b. Rehabilitation	70 (Fair)
c. Seal Coat or Resealing of Joints in Concrete Pavement	N/A

Table I-1 Pavement Condition Index Requirements for Airfield Pavement Projects

For the following type of airfield pavement project…	The pavement condition index (PCI) must be less than…
d. Maintenance	N/A

I-5. Project Requirements Tables.

In addition to the information provided in the above paragraphs and the following tables, Appendix C contains examples of prohibited projects and costs and is very useful to use alongside this appendix.

Table I-2 Distinctions between Construct, Expand, Strengthen, and Rehabilitate

Use the following description…	If the project will…
a. Construct	Build a brand new apron.
b. Extend	Add additional area to an apron.
c. Widen	Add additional area to an apron by widening the apron.
d. Strengthen	Will allow the pavement to accommodate a heavier class of aircraft.
e. Rehabilitate	Improves the pavement for the same class of aircraft.

Table I-3 Apron Work Codes

If the project is justified as follows…	Use the following work codes…
a. The project meets the definition of a capacity project (see Appendix A).	CA AP CO (construct) CA AP EX (expand)
b. The project meets the definition of a standards project (see Appendix A).	ST AP CO (construct) ST AP IM (expand) ST AP IM (strengthen) RE AP IM (rehabilitate)

Table I-3 Apron Work Codes

If the project is justified as follows…	Use the following work codes…
c. The project is justified in an environmental finding or 14 CFR part 150 program for environmental reasons. The project must be a condition of the environmental finding or 14 CFR part 150 program.	EN AP CO (construct)

Table I-4 Apron Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
a. Apron (Construct, Expand, Strengthen)	**(1)** The project cannot include pavement for auto parking or other non-aeronautical uses. **(2)** The project cannot include pavement for exclusive use areas (must be open to the public to park their aircraft). **(3)** Cargo aprons are limited use and the public is not allowed to freely use the apron. However, apron for freight or cargo activity is eligible if the opportunity to compete for use of the apron is available.	An operational apron constructed to FAA design standards, including required proper access, shoulders, turf along edge of shoulders, signs, marking, and lighting.	CA AP CO CA AP EX ST AP CO ST AP IM EN AP CO See Table I-3 for the correct work code.

d. Rehabilitate Apron (Rehabilitate or Reconstruct)	**(1)** The project must not include pavement for auto parking or other non-aeronautical uses. **(2)** The project must not include pavement for exclusive use areas (must be open to the public to park their aircraft). **(3)** The work must be supported a Pavement Condition Index (PCI) or planning study. The ADO has the option to consult AAS-100 for assistance with justifying pavement rehabilitation or reconstruction. **(4)** The length and width of the pavement work must be based on critical aircraft justification per Paragraph 3-11. The exception is if the project meets the requirements in Paragraph 3-24 to exceed FAA design standards. **(5)** Paragraph 3-6 contains additional guidance (including useful life requirements) and examples that the ADO must use to differentiate between maintenance, rehabilitation, and reconstruction. **(6)** The pavement must not have been reconstructed within the last 20 years, rehabilitated within the last 10 years or resealed within the last 3 years except as allowed in Paragraph 3-12.	A fully functional apron with extended useful life.	RE AP IM

*The official list of work codes can be obtained from the automated AIP system.

Appendix J. Airfield Marking, Signage, and Lighting Projects

J-1. How to Use This Appendix.

This appendix is not a valid stand-alone document for making eligibility and justification determinations. The information in this appendix must be used in conjunction with the Handbook, especially the project cost requirements in Chapter 3.

J-2. Eligibility of Pavement Marking as a Stand-Alone Project.

The eligibility of pavement markings as a stand-alone project depends on the airport type as shown in Table J-1.

Table J-1 Eligibility of Stand Alone-Projects for New and Faded Marking

For the following airport types…	Stand-alone projects for new or faded marking are…
a. Large, medium, and small hub	**Not Allowed.** This includes new marking due to a change in magnetic variation. In addition, the replacement of faded markings is not eligible (considered maintenance) because 14 CFR part 139.311 includes replacing faded or inaccurate markings as a maintenance activity at an airport.
b. Nonhub primary and nonprimary	**Allowed.** The project must be coded as runway, taxiway, or apron rehabilitation (maintenance).

J-3. Eligibility of Sign Panel Replacement as a Stand-Alone Project.

The eligibility of sign panel replacement as a stand-alone project is included in Table J-2.

Table J-2 Eligibility of Stand-Alone Projects for Sign Panel Replacement

For the following situation…	Stand-alone projects for sign panel replacement are…
a. Replacement of sign panels due to a runway designation change based on magnetic variation as required by the current version of FAA Order 8260.19, Flight Procedures and Airspace.	**Eligible.** Note that the requirements in the current version of Advisory Circular 150-5340-1 are not sufficient justification for this type of project. The designation change must be required by the current version of FAA Order 8260.19, Flight Procedures and Airspace. The correct code for this project is that of a signage project under Table J-4. Also, since this may be a small grant, the ADO must ensure that the minimum grant amount requirement in Paragraph 5-20 are be met.
b. Replacement of sign panels required by a change in airfield geometry or new sign panel specifications.	**Eligible.** Since this may be a small stand-alone grant, the ADO must ensure that the minimum grant amount requirement in Paragraph 5-20 are be met. The correct code for this project is that of a signage project under Table J-4. If the project is being done concurrently with an associated AIP funded runway, taxiway, or apron project, the costs can be include and coded under the runway, taxiway, or apron project.
c. Replacement of faded sign panels associated with an AIP funded runway, taxiway, or apron project.	**Not Eligible (but can be funded as an allowable cost).** The cost to replace faded sign panels is considered to be incidental allowable costs if it is included in the grant for the runway, taxiway, or apron project. In this case, the ADO must include the costs under the project code for the runway, taxiway, or apron project.
d. Replacement of faded sign panels.	**Not Eligible.** Stand-alone projects to replace faded sign panels are considered a maintenance activity.

J-4. Airport Lighting Control Panel Modification.

Airfield lighting projects may include modification of the airport lighting control panel in the air traffic control tower to accommodate the changes to the airfield lighting. The panel modification is considered a noncompetitive proposal must follow the additional requirements that are located in Paragraphs 3-36 and U-18.

J-5. Certified Lighting Equipment for which there is Only a Single Manufacturer.

Airfield lighting projects may include acquisition of certified airfield lighting equipment for which there is only a single manufacturer. The procurement of this equipment is considered a noncompetitive proposal and must follow the additional requirements that are found in Paragraphs 3-36 and U-18.

J-6. Lighting for Pavement that Exceeds FAA Design Standards.

For pavements that exceed FAA design standards width, the ADO must not fund installation of edge lighting to the extra width unless the sponsor agrees that it will not seek pavement rehabilitation funds for 10 years (which is the useful life of a lighting project). The sponsor must also agree that if pavement rehabilitation is needed within the 10 year period, the pavement will be rehabilitated to the FAA design standards width and the cost of removing and replacing the airfield lighting to the corrected width will be funded with non-AIP funds. The ADO must include a special condition in the associated grant outlining this requirement. The automated AIP system contains the current available special conditions.

J-7. Project Requirements Table.

In addition to the information provided in the above paragraphs and the following table, Appendix C contains examples of prohibited projects and costs and is very useful to use alongside this appendix.

Table J-3 Airfield Marking, Signage, and Lighting Work Codes

If the project is justified as follows…	Use the following work codes…
a. The project is one of the special emphasis items listed in 49 CFR § 47101(f) for a primary or secondary runway or taxiway at a commercial service airport.	**SP** XX XX
b. The project meets all of the associated eligibility requirements for that type of project *and* is needed to satisfy a safety issue identified by a 14 CFR part 139 violation, be identified by a 14 CFR part 139 certification inspector as needed runway incursion prevention measure, or a Runway Safety Action Team (RSAT) recommendation. The ADO must review the project to verify that it is eligible. For instance, runway marking is not eligible at a small hub airport and a 14 CFR part 139 violation does not make it eligible.	**SA** XX XX
c. The project is required to meet current FAA design standards in accordance with applicable advisory circulars and does not meet the above two sets of criteria.	**ST** XX XX

Table J-4 Airfield Signage and Lighting Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
a. Install Guidance Signs	**(1)** If the airport is a 14 CFR part 139 certificated airport, the sponsor must have included the proposed signs in the sign plan, and the FAA must have reviewed and accepted the airport sign plan. For non-certificated airports, the 14 CFR part 139 certification inspector and/or the ADO have the option to impose this same requirement. **(2)** Lighted guidance signs must be supported by night or instrument approach operations. **(3)** The associated pavement must be AIP eligible and justified.	Fully functional guidance signs that meets FAA standards.	SP OT SG SA OT SG ST OT SG See Table J-3 for the correct work code.

Table J-4 Airfield Signage and Lighting Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
b. Install Runway Lighting	**(1)** Installation of runway lighting may include modifications of the airfield electrical vault as part of the overall project. **(2)** The lighting must be supported by night or instrument approach operations. **(3)** Per APP-520 policy, taxiway and/or apron lighting must not be included in the runway lighting project. These projects must be separated into stand-alone projects. **(4)** For centerline lights, the runway must meet at least one of the following criteria: **(a)** Landing operations below 2,400 feet runway visual range ; **(b)** Used by aircraft with approach speeds exceeding 140 knots or if the runway has a width greater than 170 feet; or **(c)** Takeoff operations below 1,600 feet RVR. **(5)** Touchdown zone lights are considered an integral part of a centerline lighting system. **(6)** The associated pavement must be AIP eligible and justified.	A fully functional runway lighting system that meets FAA standards.	SP RW LI SA RW LI ST RW LI See Table J-3 for the correct work code.

Table J-4 Airfield Signage and Lighting Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
c. Rehabilitate Runway Lighting	**(1)** Rehabilitation of runway lights may include replacing a significant number of fixture lenses, transformers, and cabling. The main light base and conduit will normally remain in place. **(2)** If new light bases and fixtures are installed for a major part of the runway, the project is no longer considered rehabilitation, and the appropriate install work code must be used instead. **(3)** The lighting must be supported by night or instrument approach operations. **(4)** Per APP-520 policy, taxiway and/or apron lighting must not be included in the runway lighting project. These projects must be separated into stand-alone projects. **(5)** The rehabilitation must be supported by analysis demonstrating a need for rehabilitation and that rehabilitation will result in the useful life being extended by at least five years. **(6)** The associated pavement must be AIP eligible and justified.	A fully functional runway lighting system that meets FAA standards.	RE RW LI

Table J-4 Airfield Signage and Lighting Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
d. Install Land and Hold Short Lights	**(1)** Justification for land and hold short (LAHSO) lights requires an approved LAHSO plan per the current version of FAA Order 7110.118, Land and Hold Short Operations. **(2)** The associated pavement must be AIP eligible and justified.	A runway lighting system that allows LAHSO at the airport.	SP RW LI SA RW LI ST RW LI See Table J-3 for the correct work code.
e. Install Runway Distance-To-Go Signs	**(1)** Per FAA policy, the runway must have turbojet aircraft operations. **(2)** These signs are also called distance remaining signs. **(3)** This would only rarely be a stand-alone grant. The ADO can only allow this as a stand-alone grant if an airport begins having turbojet operations. **(4)** Lighted signs must be supported by night or instrument approach operations. **(5)** The associated pavement must be AIP eligible and justified.	A fully functional set of distance-to-go signs that meet FAA standards.	SP RW SG

Table J-4 Airfield Signage and Lighting Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
f. Improve Airport Miscellaneous Improvements (Install/Rehabilitate Airfield Lighting Vault)	**(1)** The vault must serve eligible airfield lighting. **(2)** Rehabilitation of a vault must include replacement of major equipment such as the regulators. **(3)** Rehabilitation must be supported by analysis demonstrating a need for rehabilitation and that rehabilitation will result in the useful life being extended by at least five years. **(4)** The vault work may be coded under another project if it is required by the other project and is done as part of that project (such as runway lighting rehabilitation that requires an upgrade to the vault). **(5)** The associated pavement must be AIP eligible and justified.	A fully functional vault that meets FAA standards.	ST OT IM
g. Install Taxiway Edge Lighting	**(1)** Taxiway lighting is only justified for taxiways that are associated with lighted runways. **(2)** Reflectors are eligible in lieu of taxiway edge lights. **(3)** The associated pavement must be AIP eligible and justified.	A fully functional taxiway lighting system that meets FAA standards.	SP TW LI SA TW LI ST TW LI See Table J-3 for the correct work code.

Table J-4 Airfield Signage and Lighting Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
h. Install Taxiway Centerline Lighting	**(1)** Taxiway centerline lighting is only justified for taxiways that are associated with runways that have centerline lighting. **(2)** One of the following conditions must be met: **(a)** The taxiway connects to a Category II or III runway. **(b)** The lighting is a Runway Safety Action Team recommendation. The ADO must review RSAT recommendations on a case by case basis to determine if they are eligible and justified. **(3)** The associated pavement must be AIP eligible and justified.	A fully functional taxiway lighting system that meets FAA standards.	SP TW LI SA TW LI ST TW LI See Table J-3 for the correct work code.

Table J-4 Airfield Signage and Lighting Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
i. Rehabilitate Taxiway Lighting	**(1)** Taxiway lighting is only justified for taxiways that are associated with lighted runways. Taxiway centerline lighting is only justified for taxiways that are associated with runways that have centerline lighting. **(2)** Rehabilitation of taxiway lights may include replacing a significant number of fixture lenses, transformers, and cabling. The main light base and conduit will normally remain in place. **(3)** If new light bases and fixtures are installed for a major part of the taxiway, the project is no longer considered rehabilitation, and the appropriate install work code must be used instead. **(4)** The rehabilitation must be supported by analysis demonstrating a need for rehabilitation and that rehabilitation will result in the useful life being extended by at least five years. **(5)** The associated pavement must be AIP eligible and justified.	A fully functional taxiway lighting system that meets FAA standards.	RE TW LI

Table J-4 Airfield Signage and Lighting Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
j. Install Runway Incursion Lighting *(Including Lighted X's)*	**(1)** Runway incursion lighting may include lighted X's, runway status lights, runway guard lights, clearance bars, and/or stop bars. Lighted X's may also be purchased. **(2)** The sponsor cannot transfer the ownership and maintenance of these systems to the FAA Air Traffic Organization (ATO). **(3)** Except for lighted X's, the project must be identified as a safety issue by a 14 CFR part 139 certification inspector or in a Runway Safety Action Team recommendation. The ADO must review RSAT recommendations on a case by case basis to determine if they are eligible and justified. **(4)** The associated pavement must be AIP eligible and justified.	A fully functional runway incursion lighting system or a lighted X that meets FAA standards.	SA OT SG
k. Install Runway Incursion Marking	**(1)** This is also referred to as enhanced taxiway centerline marking. **(2)** Runway incursion markings cannot be applied to select airfield locations. They must be applied to every runway holding position on the airport. **(3)** The associated pavement must be AIP eligible and justified.	A set of runway incursion markings that meets FAA standards and are applied to all runway holding positions on the airport.	SA OT SG (14 CFR part 139) SP OT SG (non 14 CFR part 139 Commercial Service)

Table J-4 Airfield Signage and Lighting Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
l. Install Surface Movement Guidance and Control System (SMGCS) Lighting	**(1)** SMGCS lighting may include runway guard lights, clearance bars, and/or stop bars. **(2)** The airport must have an FAA approved SMGCS plan. **(3)** The associated pavement must be AIP eligible and justified.	A complete SMGCS lighting pattern that allows aircraft to taxi from a Category II/ III runway to the apron.	SP OT SG
m. Install Apron Edge Lights	**(1)** The apron must be eligible.	An apron with edge lights that meet FAA standards.	ST AP LI
n. Install Apron Flood Lighting	**(1)** The added lighting must not cause an adverse effect on airport operations. **(2)** Apron flood lighting must be free standing. Lighting that is attached to a building is coded as the building, not the apron. **(3)** Although apron lighting may be a recommendation from TSA, a TSA letter is not mandatory. **(4)** The associated pavement must be AIP eligible and justified.	An illuminated apron area.	ST OT LI

Table J-4 Airfield Signage and Lighting Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
o. Install Terminal Gate Position Lead-In Lights	**(1)** The ADO must coordinate the project with AAS-100 to ensure the added lighting will not cause confusion for aircraft operations. **(2)** Gate position lead-in lighting must be free standing. Lighting that is attached to a building is coded as the building, not the apron. **(3)** The associated terminal gate must not be exclusive use.	An operational lead in system to an eligible gate.	ST OT LI

*The official list of work codes can be obtained from the automated AIP system.

Appendix K. Navigational Aid (NAVAID) and Weather Reporting Equipment Projects

K-1. How to Use This Appendix.

This appendix is not a valid stand-alone document for making eligibility and justification determinations. The information in this appendix must be used in conjunction with the Handbook, especially the project cost requirements in Chapter 3.

K-2. Installation of Instrument Landing Systems (ILS).

The FAA Air Traffic Organization (ATO) is transitioning to Performance Based Navigation (PBN) approaches, as enabled by satellite navigation, rather than adding new ILS ground based equipment to the National Airspace System. These GPS approaches using Area Navigation (RNAV) provide equivalent instrument approach capability as ground based equipment can for Category I approaches.

On December 15, 2011, the FAA announced in 76 Federal Register 77939 that "In order to maximize operational benefits and take advantage of the cost savings associated with WAAS, the FAA no longer intends to establish new Category I ILSs using Facilities and Equipment (F&E) funding."

In the same notice, the FAA announced consideration of "…programmatic changes under AIP that would favor WAAS for new precision approaches at airports, rather than ILS." Consistent with the notice, the FAA policy is that AIP funds must not be used to install a new Instrument Landing System (ILS) where the FAA has determined that an RNAV approach can provide similar capabilities. Therefore, where the ATO has determined that an RNAV approach cannot be implemented on a new or extended runway, and APP-500 has determined that the ILS installation is justified, the installation of a ground-based ILS installation is allowable with AIP. In accordance with the FAA Office of Airports and the Air Traffic Organization written agreement, the ADO must not program a new ILS on an existing runway.

Appendix Z summarizes the contents of ILS policy of the Offices of Airports and Air Traffic Control.

K-3. Transfer of Equipment to the FAA Air Traffic Organization (ATO).

Under 49 USC § 44502(e), an airport may transfer an instrument landing system (and associated approach lighting equipment and runway visual range equipment) to ATO if funded with AIP and the applicable FAA standards have been met. However, because the FAA is transitioning away from installing new ground based ILS, by FAA policy, installation of an ILS that is planned for ATO takeover must be approved in advance by APP-1.

Except for the specific statutory exception that allows a full ILS to be transferred to the ATO for ownership and maintenance, all NAVAIDs and signs installed under AIP will be owned and operated by the airport.

K-4. Required FAA Air Traffic Organization (ATO) Coordination.

If the project impacts or involves the relocation of an FAA-owned NAVAID, the ADO must complete all required coordination with FAA Technical Operations (AJW).

K-5. Designated Instrument Runway Requirement.

Airport approach and landing systems are not eligible unless the FAA Air Traffic Organization (ATO) has designated the associated runway as an instrument runway. The ATO designation considers safety requirements, relevant meteorological history, NAS-wide capacity, delays at individual airports, aviation activity forecasts, changes in the airfield and operational environment (including relocation of existing systems), as well as overall airport capital improvement costs regardless of the funding source.

Only airport rotating beacons, runway end identification light systems, and visual glide-slope indicator systems are eligible at airports without a designated instrument runway.

K-6. NAVAID and Weather Reporting Equipment Communication Requirements.

All NAVAID and weather reporting equipment must directly communicate with pilots, rather than directly communicate with the air traffic control tower, in order to be considered eligible. This is because equipment that communicates with the air traffic control tower is funded through the FAA Air Traffic Organization (ATO)'s budget.

K-7. Compass Calibration Pad.

A compass calibration pad is normally planned and constructed with adjacent taxiway or apron pavements. A compass calibration pad is not normally a stand-alone project. If the ADO determines that a stand-alone project is appropriate, the project is coded as an apron project rather than a NAVAID.

K-8. Airside Service Roads to Access AIP Eligible NAVAIDs.

The ADO has the option to fund an airside service road for access to an AIP eligible NAVAID. However, note that service roads are not eligible for pavement maintenance under AIP (only *runway, taxiway, and apron* pavement maintenance at certain airports is eligible).

K-9. Project Requirements Table.

In addition to the information provided in the above paragraphs and the following table, Appendix C contains examples of prohibited projects and costs and is very useful to use alongside this appendix.

Table K-1 NAVAID and Weather Reporting Equipment Work Codes

If the project is justified as follows…	Use the following work codes…
a. The project is for a primary or secondary runway or taxiway at a commercial service airport.	**SP** XX XX
b. The project is needed to satisfy a safety issue identified by a 14 CFR part 139 violation or a Runway Safety Action Team (RSAT) recommendation. The ADO must review RSAT recommendations on a case by case basis to determine if they are eligible and justified.	**SA** XX XX
c. The project is required to meet current FAA design standards in accordance with applicable advisory circulars and does not meeting the above to sets of criteria.	**ST** XX XX

Table K-2 NAVAID and Weather Reporting Equipment Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
a. Install Instrument Approach Aid *(Instrument Landing System)*	**(1)** The ADO must not program a ground-based ILS without specific written APP-1 approval. The guidance for funding an ILS can be found in Paragraph K-2. **(2)** The ADO must not program a ground-based ILS unless the ADO has received written notification from the FAA Air Traffic Organization (ATO) that the ATO has determined that an Area Navigation (RNAV) approach is not suitable for a given location (e.g., ILS is needed to maintain efficiency with merging and spacing, approach transition guidance, or substantially better minima). **(3)** An ILS will not necessarily include installing an Approach Lighting System, which must be separately justified. Per APP-500 policy, an ALS is not justified for AIP funding unless the airport will have a reduction in minimums of at least ¼ mile and records 300 or more annual	A fully functional ILS that meets FAA standards.	ST RW IN

Table K-2 NAVAID and Weather Reporting Equipment Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	instrument approaches to the runway. **(4)** The project must be designed to meet the requirements in the current version of Advisory Circular 150/5300-13, Airport Design, and the requirements in the ATO reimbursable agreement. **(5)** Unless the ADO has received APP-1 approval per (1), and ATO notification that an RNAV approach is not suitable per (2), then of the following must be met: **(a)** The airport must be a large, medium, or small hub primary airport. **(b)** The ILS is for a new or extended runway. **(c)** The ILS will provide Category II or III minimums. **(6)** APP-500 has conducted a benefit-cost analysis that resulted in a benefit-cost ratio of 1.0 or more.		
b. Install Instrument Approach Aid *(Runway Visual Range (RVR))*	**(1)** The FAA Air Traffic Organization (ATO) must have designated the runway as an instrument runway. **(2)** The visibility information is made available directly to pilots. **(3)** Per FAA policy, the ADO can program an RVR at a nonprimary airport using nonprimary entitlement funds only. **(4)** Per FAA policy, the ADO can only program an RVR at an airport that has a published instrument flight procedure that has published RVR minimums. **(5)** The airport cannot transfer ownership of AIP-funded RVR	A fully functional RVR that meets FAA design standards.	ST RW IN

Table K-2 NAVAID and Weather Reporting Equipment Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	equipment to the ATO unless it will be associated with an ILS that is being installed in the same project. **(6)** ADOs must contact APP-500 for assistance with proposed RVR projects.		
c. Install Miscellaneous NAVAIDs *(Airport Beacon)*	**(1)** The airport rotating beacon equipment must be necessary for visual approaches to the airfield at night. **(2)** The airport must be open at night and must have runway lights in order to have a justified beacon.	A fully functional airport beacon that meets FAA design standards.	SP OT IN ST OT IN See Table K-1 for the correct work code.
d. Install Miscellaneous NAVAIDs (*Wind Cone)*	**(1)** The airport must be open at night and must have runway lights in order to justify a lighted wind cone.	A fully functional wind cone that meets FAA standards.	SP OT IN ST OT IN See Table K-1 for the correct work code.
e. Install Miscellaneous NAVAIDs (*Segmented Circle)*	**(1)** Where warranted, segmented circles used for landing direction, traffic pattern indicators or right turn indicators are allowed.	A fully functional segmented circle that meets FAA standards.	SP OT IN ST OT IN See Table K-1 for the correct work code.
f. Install Runway Vertical/Visual Guidance System *(Approach Light System (ALS))*	**(1)** The FAA Air Traffic Organization (ATO) must have designated the runway as an instrument runway. **(2)** Per APP-500 policy, an ALS is not justified for AIP funding unless the airport will have a reduction in minimums of at least ¼ mile. **(3)** APP-500 has conducted a benefit-cost analysis that resulted in a benefit-cost ratio of 1.0 or more.	A complete ALS installation with clear approaches that reduces the minimums and meets FAA standards.	SP RW VI ST RW VI See Table K-1 for the correct work code.

Table K-2 NAVAID and Weather Reporting Equipment Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	(4) The sponsor cannot transfer the ownership and maintenance of these systems to ATO unless installed as part of a complete ILS that includes an ALS. **(5)** An ALS is only eligible on a runway that either has a precision approach procedure published instrument flight procedure and 300 or more recorded annual instrument approaches or is forecast to have a published instrument flight procedure and 300 or more recorded annual instrument approaches within five years. **(6)** Eligible ALSs include: **(a)** Approach Lighting System (ALS). **(b)** Approach Lighting System with Sequenced Flashing Lights (ALSF). **(c)** Medium-Intensity Approach Light System and Runway Alignment Indicator Lights (MALSR). **(d)** Medium-Intensity Approach Light System without Runway Alignment Indicator Lights (MALS). This is rare and requires additional justification because Runway Alignment Indicator Lights are an integral part of most ALS installations. **(e)** Medium-Intensity Approach Lights System with Sequenced Flashing Lights (MALSF).		
g. Install Runway Vertical/Visual Guidance System (Omni-Directional	**(1)** The FAA Air Traffic Organization (ATO) must have designated the runway as an instrument runway. **(2)** The ODALS must result in a reduction of minimums of at least ¼ mile.	A complete ODALS installation with clear approaches that reduces the minimums and	SP RW VI ST RW VI See Table K-1 for the

Table K-2 NAVAID and Weather Reporting Equipment Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
Approach Lighting System (ODALS))	**(3)** An ODALS is only eligible on a runway that either has a published instrument flight procedure and 300 or more recorded annual instrument approaches or is forecast to have a published instrument flight procedure and 300 or more recorded annual instrument approaches within five years. **(4)** APP-500 has conducted a benefit-cost analysis that resulted in a benefit-cost ratio of 1.0 or more. **(5)** The airport cannot transfer the ownership of these systems to the ATO.	meets FAA standards.	correct work code.
h. Install Runway Vertical/Visual Guidance System *(Runway End Identification Light System (REILS))*	**(1)** This project will provide visual guidance on runways that are not equipped with an approach light system. **(2)** Per FAA policy, the ADO can fund REILs at a nonprimary airport only if the REILS are funded using nonprimary entitlement funds only. **(3)** The airport cannot transfer the ownership of these systems to the FAA Air Traffic Organization (ATO).	A fully functional REILS that meet FAA standards.	SP RW VI ST RW VI See Table K-1 for the correct work code.
i. Install Runway Vertical/Visual Guidance System *(Visual Glide-Slope Indicator System (PAPI))*	**(1)** The precision approach path indicator (PAPI) is the only eligible visual glide-slope system eligible for an airport holding a 14 CFR part 139 certificate. **(2)** Although there are some other older types of visual glideslope systems still in use by some airports, the PAPI is the only eligible visual glide-slope system eligible for funding at facilities used by fixed-wing aircraft without the sponsor providing significant justification to the	A PAPI system that meets FAA standards.	SP RW VI ST RW VI See Table K-1 for the correct work code.

Table K-2 NAVAID and Weather Reporting Equipment Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	ADO as to why a PAPI cannot be installed. **(3)** For non-PAPI installations, the sponsor must obtain a Modification of Standards for siting and installation requirements. **(4)** Per FAA policy, the ADO can only fund a PAPI at a nonprimary airport using nonprimary entitlement funds. **(5)** Per the current versions of Advisory Circular 150/5340-30, Design and Installation of Airport Visual Aids, a four box PAPI is only justified for runways with any jet operations. **(6)** The airport cannot transfer the ownership of these systems to the FAA Air Traffic Organization (ATO). **(7)** The design threshold crossing height angle must not limit the airport or aircraft from the Airplane Design Group shown or forecast on the approved ALP. **(8)** Unless the airport is a nonprimary airport, the project must have a benefit-cost analysis (BCA) ratio of 1.0 or more based on the criteria in the current version of FAA Order 7031.2, Airway Planning Standard Number One Terminal Air Navigation Facilities and ATC Services (APS-1), Appendix 2.		
j. Acquire Snow Removal Equipment *(Weather Support to Deicing Decision-Making)*	**(1)** The WSDDM equipment must be included in an FAA approved snow and ice control plan. If not, the ADO must make this a requirement in the grant offer.	A fully functional WSDDM system.	ST EQ SN

Table K-2 NAVAID and Weather Reporting Equipment Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
k. Install Weather Reporting Equipment *(AWOS III or better)*	**(1)** The AJW-144 Weather Processors and Sensors – Non-Federal AWOS website identifies the reference documents containing the design, installation, commissioning, and maintenance requirements for non-Federal AWOS equipment. **(2)** The sponsor must have notified the Service Center Non-Federal Program Implementation Manager (PIM) of its intent to procure and install an AWOS and have received concurrence by the PIM to proceed with the proposed project. **(3)** If a discrete frequency is required, the sponsor must have filed for and received a radio frequency spectrum assignment. Some AWOS may transmit over the existing UNICOM frequency. **(4)** The sponsor must provide the ADO the evidence of PIM concurrence and radio frequency spectrum assignment information. **(5)** A benefit-cost analysis (BCA) is not required if the airport is a primary airport, or if the airport is a National or Regional Airport in the latest published edition of FAA's ASSET report. Otherwise, a new AWOS requires a BCA ratio greater than one; and a proposed replacement, relocation, and/ or rehabilitation of an existing AWOS requires a BCA ratio of 0.5 or greater. **(6)** If a BCA is required, the sponsor must provide the ADO with the documentation required in FAA Form 5100-138, Data Requirements for an Office of	A fully functional, operational, commissioned and FAA-inspected AWOS that meets FAA design standards.	ST EQ WX

Table K-2 NAVAID and Weather Reporting Equipment Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	Airports Automated Weather Observation System (AWOS) Benefit Cost Analysis (BCA) (see the AIP Forms link in Appendix B). The ADO must forward this information to APP-500 so that APP-500 can prepare the benefit-cost analysis. The ADO must advise the sponsor that incomplete documentation will not be accepted, and that the sponsor must allow at least three months after APP-500 has received the data to complete the analysis. **(7)** Because the BCA is based principally on published factual data, unless the sponsor can demonstrate that significant circumstances have changed that may alter the result, APP-500 will not rerun the BCA once the analysis is completed. **(8)** When preparing the BCA, APP-500 will include the full costs of the AWOS, including all fixed costs and variable costs, not simply the incremental cost increase over the basic cost of an AWOS installation. Inclusion of the AWOS data into the Weather Message Switching Center Replacement (WMSCR) is not considered a benefit and must not be included in the BCA to increase the BCA score. **(9)** The ADO must not program the project unless the ADO has received verification that the sponsor has completed PIM coordination, radio spectrum frequency assignment, and received a greater than one benefit-cost analysis. **(10)** No other FAA-owned and/or maintained weather reporting		

Table K-2 NAVAID and Weather Reporting Equipment Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	systems must exist or be planned at the airport. The ADO must confirm this with the PIM. If another FAA-owned system exists or is planned, AIP cannot be used to install an AWOS. **(11)** The sponsor is willing and able to obtain a third party contract, for the life of the equipment, to report the minimum METAR data to the Weather Message Switching Center for the dissemination of weather data. The first 60 days of a subscription cost are allowable costs of the AIP grant, however all costs after the first 60 days are the responsibility of the sponsor. **(12)** The ADO must advise the sponsor that AWOS are not eligible for FAA Air Traffic Organization (ATO) takeover under the current version of FAA Order 6700.20, Non-Federal Navigational Aids and Air Traffic Control Facilities. **(13)** The ADO must advise the sponsor that the sponsor will be responsible for operation and periodic maintenance of the AWOS (including paying the costs of third party reporting contracts and participating in the yearly FAA inspections). **(14)** The sponsor must not limit a bid for an AWOS based on the method of radio transmission. **(15)** Automatic telephone answering systems or radio transmitters are an allowable cost to an AWOS.		
I. Install Weather Reporting Equipment	**(1)** The AJW-144 Weather Processors and Sensors – Non-Federal AWOS website identifies the reference documents for the	A fully functional, operational, commissioned and FAA-inspected	ST EQ WX

Table K-2 NAVAID and Weather Reporting Equipment Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
(AWOS A, A/V, I or II)	design, installation, commissioning, and maintenance requirements for non-Federal AWOS equipment. **(2)** The AWOS-A, AWOS-A/V, AWOS-I and AWOS-II are eligible without additional justification. **(3)** No other FAA-owned and/or maintained weather reporting systems must exist or be planned at that airport. The ADO must confirm this with Service Center Non-Federal Program Implementation Manager (PIM), and if another FAA-owned system exists or is planned, AIP cannot be used to install an AWOS. **(4)** The ADO must advise the sponsor that AWOS are not eligible for FAA Air Traffic Organization (ATO) takeover under the current version of FAA Order 6700.20, Non-Federal Navigational Aids and Air Traffic Control Facilities **(5)** The ADO must advise the sponsor that the sponsor will be responsible for operation and periodic maintenance of the AWOS (including paying the costs of third party reporting contracts and participating in the yearly FAA inspections). **(6)** The sponsor must not limit a bid for an AWOS based on the method of radio transmission. Different manufacturers of FAA-certified AWOS may use Unicom or radio discrete frequency transmission. **(7)** Automatic telephone answering systems or radio transmitters are	AWOS that meets FAA design standards.	

Table K-2 NAVAID and Weather Reporting Equipment Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	eligible as an allowable cost to an AWOS. **(8)** A replacement AWOS is eligible if the existing AWOS has reached the end of its useful life.		
m. Install Infrastructure to support Area Navigation (RNAV) Approach *(Parallel Taxiway)*	**(1)** The requirements for parallel taxiway projects that are required for an approved RNAV approach are provided in Appendix H.	N/A	N/A
n. Remove obstructions to support Area Navigation (RNAV) Approach	**(1)** The requirements for obstruction removal projects that are required for an approved RNAV approach are provided in Appendix D.	N/A	N/A
o. Install Approach Aid *(NextGen Equipment such as Ground Based Augmentation System (GBAS)*	**(1)** **APP-400 Coordination**. The ADO (and/or the regional office) must coordinate with APP-400 and have received APP-400 and APP-500 written concurrence with the project. **(2)** **Equipment Location**. AIP funding can install equipment that is physically located on the airfield. This will typically be transmitters and related equipment that augment satellite navigation feeds. No effort has been made to list the eligible types of equipment. Rather, any equipment that meets the prescribed guidelines will be eligible for AIP. **(3)** **Cable Ducts and Cabling**. For AIP funded NextGen equipment, AIP can be used for incidental cable ducts for cabling from the equipment to the processors. FAA Air Traffic Organization (ATO) will install the cabling, work in the tower, or computer hardware or software work. This	A fully functional NextGen system that meets FAA standards.	ST RW IN May be replaced with a new work code.

Table K-2 NAVAID and Weather Reporting Equipment Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	is consistent with current guidance that allows for installation of duct banks for ATO. If the airport installs the empty ducts when it is installing the equipment, the ducts are in-place and ready for ATO to pull cables, install wiring and activate the system at a future date without impacting airport operations. The equipment will be installed and the associated earthwork, grading, and construction of gravel access roads will be included in the AIP grant. **(4) ATO's Responsibility**. Cabling, computer programming and verification testing will remain ATO's responsibility. The integrity of the NAS relies on a computer system that drives the communication, tracking, and surveillance systems together. This entire system is mission-critical. ATO cannot ensure the system integrity if individual airports are asked to modify or install the data systems. **(5) Operation/Maintenance**. As a non-Federal system, the airport is responsible for the maintenance and operation of the approach aid. ATO will not take over the maintenance and operation of the equipment under current NAS strategic plans.		

*The official list of work codes can be obtained from the automated AIP system.

Appendix L. Safety and Security Equipment Projects

L-1. How to Use This Appendix.

This appendix is not a valid stand-alone document for making eligibility and justification determinations. The information in this appendix must be used in conjunction with the Handbook, especially the project cost requirements in Chapter 3.

L-2. Justification for Safety and Security Equipment.

Safety and security projects are not automatically justified. In all cases, the ADO must review these projects to determine if the project meets the eligibility and justification requirements outlined in this Handbook. Safety and security projects that require additional review by the ADO include, but are not limited to, those listed in Paragraph 3-9.

L-3. Safety Equipment beyond 14 CFR part 139 Requirements.

The basic criteria for eligibility of equipment beyond 14 CFR part 139 requirements will be that it is needed to meet a significant safety requirement at a particular airport. The sponsor's justification or reasoning to acquire the equipment with documentation of the features and costs, as well as the 14 CFR part 139 inspector recommendation, must be sent to APP-500. Decisions on funding of safety equipment contributing significantly to the safety of persons and property at an airport will be referred on a case-by-case basis to AAS-1.

L-4. Use of Safety and Security Equipment.

AIP funded equipment cannot be used for non-airport purposes. The exception is when a mutual aid agreement is approved by the 14 CFR part 139 certification inspector. In that case, an AIP funded ARFF vehicle can be used to meet the requirements of that agreement.

L-5. Off-Airport Storage of ARFF Equipment.

The option to allow a sponsor to store ARFF equipment off airport was originally introduced in Program Guidance Letter 07-02.1. This exception was in response to changes in 14 CFR part 139 that required many smaller airports to obtain certification. In order to approve off airport storage of ARFF Equipment the conditions in Table L-1 must be met.

Table L-1 Requirements for Off-Airport Storage of ARFF Vehicles

The requirements include…	
a.	The vehicle must be available for airport use at times necessary to meet 14 CFR part 139 requirements.
b.	The vehicle must not be used for local community needs (AIP funding cannot be used for non-airport purposes and use of the vehicle for non-airport purposes must not reduce the useful life of the vehicles).

Table L-1 Requirements for Off-Airport Storage of ARFF Vehicles

The requirements include…
c. The sponsor must demonstrate to the satisfaction of the ADO that there is no viable on-airport storage solution and the off-airport storage provides a tangible benefit to the airport.
d. The sponsor and the local government entity must execute an agreement that: **(1)** Restricts the use of the vehicle for airport purposes only (except for FAA-approved mutual aid agreement uses). **(2)** Contain language that use of the vehicle of other than airport purposes could require repayment of the grant funding since it would be in violation of the grant conditions. **(3)** Contains provisions for documenting the use of the vehicle.
e. The ADO must forward a copy of the agreement between the sponsor and the local government entity to the 14 CFR part 139 certification inspector so that the certification inspector can ensure that the requirements are included in the certification manual and are being met.
f. The ADO must obtain approval for this request from AAS-300 and ACO-100 prior to issuing approval to the sponsor.

L-6. Radios and Communication Equipment.

Radios and communication equipment for an eligible AIP vehicle or piece of equipment are allowable costs of the eligible AIP vehicle or piece of equipment. This may include installation of ADS-B out vehicle squitters per Advisory Circular 150/5220-26, Airport Ground Vehicle Automatic Dependent Surveillance – Broadcast (ADS-B) Out Squitter Equipment, for vehicles that are used at an airport with FAA ADS-B Surface Surveillance.

L-7. Security Equipment beyond 49 CFR part 1542 Requirements.

Projects exceeding the minimum requirements of 49 CFR part 1542 or that are necessary to support local law enforcement are ineligible. The security equipment that is currently eligible for AIP is included in Table L-2 and the commonly requested security equipment that has been determined ineligible is included in Table C-3.

L-8. Sensitive Security Information.

The ADO must coordinate with a TSA official to identify planning and material that must be protected under 49 CFR part 1520, which governs the release of such information.

L-9. Project Requirements Table.

In addition to the information provided in the above paragraphs and the following table, Appendix C contains examples of prohibited projects and costs and is very useful to use alongside this appendix.

Table L-2 Safety and Security Equipment Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
a. Acquire Aircraft Rescue & Firefighting Vehicle	**(1)** The airport must currently hold a 14 CFR part 139 certificate. **(2)** If an airport that does not hold 14 CFR part 139 certificate, AAS-1 must have made an airport specific determination that the vehicle will contribute significantly to the safety or security at the airport (as allowed under 49 USC § 47102(3)(B)(ii)). **(3)** 14 CFR part 139 sets forth minimum extinguishing agents and water required for ARFF vehicles. AIP funding is limited to the minimum number and minimum size of ARFF vehicles required to satisfy 14 CFR part 139 requirements. **(4)** A rapid response vehicle (also called a rapid intervention vehicle) is only eligible if specifically required to satisfy 14 CFR part 139 requirements. **(5)** For an airport that currently holds a 14 CFR part 139 certificate, the ADO may calculate the number of eligible vehicles based on the airport index in accordance with the criteria specified in 14 CFR part 139 for conditions forecast within five years of the proposed ARFF equipment acquisition date provided that the ADO has received written confirmation from its regional certification inspector that the airport meets the other requirements associated with owning an ARFF vehicle, including training, staffing, and maintaining the vehicle. **(6)** In the event of a conflict between the requirements in any applicable advisory circular and 14 CFR part 139, the	A fully operational ARFF vehicle that meets FAA design standards.	SA EQ RF The ST EQ RF is no longer available because it applied to a situation that was in place prior to the 2004 revision to 14 CFR part 139.

Table L-2 Safety and Security Equipment Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	requirements in 14 CFR part 139 take precedence. **(7)** For vehicles that are 10 or more years old, a major rehabilitation is eligible if it extends the useful life by 10 or more years. Forcible aircraft entry tools may also be replaced at this time. **(8)** One set of forcible aircraft entry tools per vehicle is eligible if it is included in the grant for acquisition of an eligible ARFF vehicle and is not acquired as a stand-alone grant. For assistance and/or a list of standard equipment, contact AAS-300. **(9)** Emergency lighting that is mounted to the ARFF vehicles is eligible if it is included in the acquisition of an ARFF vehicle and is not acquired as a stand-alone grant. **(10)** One test charge and one refill of expendable items at the time of initial purchase of an ARFF vehicle are eligible. **(11)** The sponsor must separate the acquisition purchase of the ARFF vehicle and the acquisition of the gear and tools into two procurements. This is because including the gear and tools in the ARFF vehicle procurement documents unnecessarily increases the costs of those items. **(12)** The airport must either include a line item in the ARFF vehicle procurement to mount the necessary ARFF gear to the vehicle or must mount the equipment using its own forces. **(13)** The upgrade of an ARFF vehicle to add enhanced struts is eligible for ARFF vehicles built before		

Table L-2 Safety and Security Equipment Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	2002. Those built after 2002 are required to come equipped with the enhanced struts so an upgrade is neither necessary nor eligible.		
b. Acquire Aircraft Rescue & Firefighting Vehicle *(Structural Firefighting Vehicle)*	**(1)** The airport must hold a 14 CFR part 139 certificate. **(2)** If an airport that does not hold 14 CFR part 139 certificate, AAS-1 must have made an airport specific determination that the vehicle will contribute significantly to the safety or security at the airport (as allowed under 49 USC § 47102(3)(B)(ii)). **(3)** Only one vehicle per airport is eligible. **(4)** The vehicle must be stored on-airport. **(5)** The 14 CFR part 139 certification inspector has determined that the response time for an off airport structural unit exceeds 10 minutes. **(6)** For vehicles that are 10 or more years old, a major rehabilitation is eligible if it extends the useful life by 10 or more years. Forcible aircraft entry tools may also be replaced at this time. **(7)** One set of forcible aircraft entry tools per vehicle is eligible if it is included in the acquisition of an eligible ARFF vehicle and is not acquired as a stand-alone grant. For assistance, contact AAS-300. **(8)** Emergency lighting that is mounted to the ARFF vehicles is eligible if it is included in the acquisition of an ARFF vehicle and is not acquired as a stand-alone grant.	A fully operational structural firefighting vehicle that meets FAA design standards.	SA EQ RF

Table L-2 Safety and Security Equipment Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	(9) One test charge and one refill of expendable items at the time of initial purchase of an ARFF vehicle are eligible. **(10)** The sponsor must separate the acquisition of the ARFF vehicle and the acquisition of the gear and tools into two procurements. This is because including the gear and tools in the ARFF vehicle procurement documents unnecessarily increases the costs of those items. **(11)** The airport must either include a line item in the ARFF vehicle procurement to mount the necessary ARFF gear to the vehicle or must mount the equipment using its own forces. **(12)** The upgrade of an ARFF vehicle to add enhanced struts is eligible for ARFF vehicles built before 2002. Those built after 2002 are required to come equipped with the enhanced struts so an upgrade is neither necessary nor eligible.		
c. Acquire Driver's Enhanced Vision System (DEVS)	**(1)** The airport must have a 14 CFR part 139 certificate and published operations below 1200 feet runway visual range. **(2)** The primary fire station that services the airfield can have DEVS on a maximum of two vehicles per the current version of Advisory Circular 150/5210-19, Driver's Enhanced Vision System. This will provide driver's enhanced vision system (DEVS) equipment to an ARFF vehicle and one additional vehicle. **(3)** In addition, one more DEVS is eligible for each fire station that services the airfield beyond the first station. For instance, an	A fully functional DEVS added to an existing ARFF vehicle in accordance with FAA standards.	ST EQ MS

Table L-2 Safety and Security Equipment Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	airport with two fire stations that service the airfield is eligible for three DEVS. **(4)** Forward-looking infrared system (FLIRS) is a component of DEVS. A stand-alone FLIRS mounted is eligible for AIP eligible ARFF vehicles.		
d. Forward Looking Infrared System	**(1)** Forward looking infrared system (FLIRS) is a component of DEVS. A stand-alone FLIRS mounted is eligible for AIP eligible ARFF vehicles in accordance with the current version of Advisory Circular 150/5210-19, Driver's Enhanced Vision System.	A fully functional FLIRS added to an existing ARFF vehicle in accordance with FAA design standards.	ST EQ MS
e. Acquire Aircraft Rescue & Firefighting Vehicle *(Protective Clothing)*	**(1)** The airport must hold a 14 CFR part 139 certificate. **(2)** If an airport that does not hold 14 CFR part 139 certificate, AAS-1 must have made an airport specific determination that the clothing will contribute significantly to the safety or security at the airport (as allowed under 49 USC § 47102(3)(B)(ii)). **(3)** One suit is eligible for each fire fighter employed full-time to fight aircraft fires. **(4)** For part time positions, the number of suits is limited to a maximum of two per lightweight vehicle and five per large type vehicle. These limitations may be exceeded if approved by the 14 CFR part 139 certification inspector. **(5)** The replacement of personal protective equipment is eligible after the useful life has been reached (see Paragraph 3-12). Self-contained breathing	Protective clothing that meets FAA standards.	SA EQ RF

Table L-2 Safety and Security Equipment Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	apparatus is only replaced when the gear is replaced. **(6)** In addition, the replacement of protective clothing is eligible if the 14 CFR part 139 inspector has verified that the clothing has been destroyed accidentally, or may be otherwise deemed inoperable through no fault of the sponsor.		
f. Regional ARFF Training Facility	**(1)** Project costs may include land, the burn area, maneuvering areas, a control center, an ARFF vehicle with capacity not to exceed 1,500 gallons, the vehicle bay(s), utilities, maintenance facilities, environmental protection, fencing, the access road, and a building for classrooms, showers, and lockers as discussed in the current version of Advisory Circular 150/5210-17, Programs for Training of Aircraft Rescue and Firefighting Personnel. **(2)** One additional ARFF vehicle may be eligible if justified in the view of the 14 CFR part 139 certification inspector based on the mix of area airport indices. **(3)** The 14 CFR part 139 certification inspector must review the list of available training facilities in the area of the proposed facility to avoid duplication. This information is currently available in the addendum to the current version of Advisory Circular 150/5210-17, Programs for Training of Aircraft Rescue and Firefighting Personnel (see Appendix B for link). **(4)** Not all states need such a facility, but if the 14 CFR part 139 certification inspector determines several area-wide training	A fully operational regional ARFF training facility that meets FAA standards.	ST OT RF

Table L-2 Safety and Security Equipment Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	facilities in a state are required due to the area served they must contact APP-500 for additional assistance. **(5)** The initial acquisition of the computer server, software, and dedicated hardware are eligible.		
g. Mobile ARFF Training Facility	**(1)** The airport has a 14 CFR part 139 certificate and is required to comply with Index A or B ARFF standards. **(2)** The airport must be more than 100 miles from the nearest regional training facility. The FAA CertAlerts contain the latest list of facilities. At the time this Handbook was published, the current list was in FAA CertAlert 09-07 (see Appendix B for link). **(3)** The ADO has the option to contact AAS-100 regarding the design requirements of this equipment. **(4)** Mobile training equipment is also eligible for acquisition by states if it will benefit more than one airport. **(5)** The initial acquisition of the computer server, software, and dedicated hardware are eligible.	A fully operational mobile ARFF training facility that meets FAA design standards.	ST OT RF
h. Acquire Aircraft Rescue & Firefighting Vehicle *(Water Rescue Equipment)*	**(1)** The airport must hold a 14 CFR part 139 certificate. **(2)** If an airport that does not hold 14 CFR part 139 certificate, AAS-1 must have made an airport specific determination that the equipment will contribute significantly to the safety or security at the airport (as allowed under 49 USC § 47102(3)(B)(ii)).	A fully operational piece of water rescue equipment that meets FAA design standards.	SA EQ RF

Table L-2 Safety and Security Equipment Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	(3) The 14 CFR part 139 certification inspector determines that the equipment is need at the airport. **(4)** Acquisition of a helicopter for water rescue must be supported by additional justification and AAS-1 and APP-1 must have concurred with the action.		
i. Acquire Equipment *(Power Vacuum Sweeper for Foreign Object Debris (FOD))*	**(1)** The power sweeper is for the control of debris on the airport. **(2)** Per FAA policy, eligibility is limited as follows. **(a)** Where the primary areas are less than 500,000 square yards and the where the airports annual operations level is 40,000 or less, one power sweeper is eligible. **(b)** Where the primary areas are 500,000 square yards or more, or where the airports annual operations level is more than 40,000, two power sweepers are eligible.	A fully operational sweeper that meets FAA design standards.	ST EQ MS
j. Acquire Equipment *(Acquire Fixed Foreign Object Debris (FOD) Detection Equipment)*	**(1)** AAS-100 has determined that FOD detection equipment contributes "significantly to the safety or security of individuals and property" at an airport as described in 49 USC § 47102(3)(B)(ii). **(2)** The airport must be a large hub airport. **(3)** The sponsor must provide the following information to the ADO: **(a)** Number of aircraft operations per average 24-hour period for the selected runway. **(b)** Distribution of operations and percentage of airport departures over a 24-hour period on the selected runway.	A fully operational fixed FOD Detection System that meets FAA standards.	ST EQ MS

Table L-2 Safety and Security Equipment Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	(c) Percentage of wide body aircraft using selected runway per day and overall diversity of fleet-mix using the runway. **(d)** Surface material and condition of selected runway. **(e)** Climatic conditions at the airport. **(f)** Significant construction activity on or near the airfield. **(g)** If available, historical data of FOD at the airport and/or on the specific runway being considered. **(4)** The airport is eligible for either one fixed system for a single primary runway at the airport, or one mobile system, not both. **(5)** Selection of airports receiving FOD detection systems will be made by APP-1; therefore, after the sponsor has submitted the required information to the ADO, the regional office must submit the proposal to APP-1. **(6)** AIP participation is limited to 50% of the eligible items associated with the project at the normal Federal share. **(7)** Reimbursement of administrative costs is limited to $2,000. **(8)** The system must be configured to provide real time alerts, FOD identification, and FOD location to airport operations personnel. **(9)** The airport must continue to comply with all 14 CFR part 139 requirements for detection and removal of FOD. **(10)** Installation of a FOD detection system is a categorically excluded action unless		

Table L-2 Safety and Security Equipment Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	extraordinary circumstances exist. **(11)** Optional features that exceed FAA design standards for system output requirements are not eligible for AIP and may not be used as a basis for selection of the system.		
k. Acquire Equipment *(Acquire Mobile Foreign Object Debris (FOD) Detection Equipment)*	**(1)** AAS-100 has determined that FOD detection equipment contributes "significantly to the safety or security of individuals and property" at an airport as described in 49 USC § 47102(3)(B)(ii). **(2)** The airport must be a large hub airport. **(3)** The sponsor must provide the following information to the ADO: **(a)** Number of aircraft operations per average 24-hour period for the selected runway. **(b)** Distribution of operations and percentage of airport departures over a 24-hour period on the selected runway. **(c)** Percentage of wide body aircraft using selected runway per day and overall diversity of fleet-mix using the runway. **(d)** Surface material and condition of selected runway. **(e)** Climatic conditions at the airport. **(f)** Significant construction activity on or near the airfield. **(g)** If available, historical data of FOD at the airport and/or on the specific runway being considered. **(4)** The airport is eligible for either one fixed system for a single	A fully operational mobile FOD Detection System that meets FAA standards.	ST EQ MS

Table L-2 Safety and Security Equipment Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	primary runway at the airport, or one mobile system. **(5)** Selection of airports receiving FOD detection systems will be made by APP-1; therefore, after the sponsor has submitted the required information to the ADO, the regional office must submit the proposal to APP-1. **(6)** AIP participation is limited to 50% of the eligible items associated with the project at the normal Federal share. **(7)** Reimbursement of administrative costs is limited to $2,000. **(8)** Acquisition of a mobile FOD detection system may also include the vehicle on which the equipment is mounted if the airport does not already own a suitable vehicle that can be converted to FOD detection system use. The use of the FOD detection vehicle is strictly limited to FOD detection. The maximum reimbursement for the vehicle is $15,000, regardless of the type, size, or options selected for the vehicle. **(9)** A separate Buy American determination must be made for the vehicle. **(10)** The system must be configured to provide real time alerts, FOD identification, and FOD location to airport operations personnel. **(11)** The airport must continue to comply with all 14 CFR part 139 requirements for detection and removal of FOD. **(12)** Installation of a FOD detection system is a categorically excluded action unless		

Table L-2 Safety and Security Equipment Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	extraordinary circumstances exist. **(13)** Optional features that exceed FAA design standards for system output requirements are not eligible for AIP and may not be used as a basis for selection of the system.		
I. Acquire Equipment *(Avian Radar System)*	**(1)** On October 4, 2010, AAS-1 determined that avian radar systems contribute significantly to the safety or security at an airport, which makes them eligible under 49 USC § 47102(3)(B)(ii). **(2)** The airport has a wildlife hazard management plan that has been accepted by the FAA. **(3)** The airport has an ongoing bird harassment plan in place incorporating the recommendations for continued harassment by airport employees to reduce wildlife hazards. **(4)** If the airport is a 14 CFR part 139 airport and has an Airport Certification Manual, the manual must include the requirements for operation and maintenance of the avian radar system, as well as requirements for analyzing the incoming data feeds, tracking the data, and acting on the data trends. **(5)** The airport must have a training plan in place that includes initial and yearly follow-up training on the proper use of radar readings, analysis and interpretation. **(6)** The costs of acquiring the radar equipment, installing the antenna(s) and radar equipment, and acquiring the Digital Radar Signal Processor are allowable	A fully operational avian radar system that meets FAA standards.	ST EQ MS *Note: Do not use SA EQ MS. APP-500 decided that ST EQ MS is the work code that must be used.*

Table L-2 Safety and Security Equipment Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	costs. However, because accommodating the equipment is essentially providing space for airport employees to monitor the radar, the costs of modifying existing office space to accommodate the radar equipment, acquiring a mobile trailer, and constructing a permanent structure to support the avian radar equipment is not allowable. **(7)** Because the proper placement of the antenna includes an initial trial placement, the costs of a trial installation and a final operational installation are allowable. **(8)** The airport must maintain data to evaluate the radar performance until advised otherwise by the FAA. This must include the daily archives or radar recordings of birds tracked, related logs of birds harassed, hours in service, hours out of service, service and repair records, and updates to software or hardware. The data must be available for review by the FAA upon request. **(9)** Replacement of the system is only eligible after the useful life of the whole system has been met.		
m. Acquire Equipment *(Initial Squitter Acquisition)*	**(1)** The acquisition of squitters is limited to the 35 ASDE-X equipped airports or the 8 civil airports that are scheduled to receive ASSC. **(2)** APP-1 must select the specific airport for participation in the squitter acquisition program. **(3)** Acquisition is limited to 75 squitters. **(4)** By FAA policy, the APP-1 sets the maximum grant amount for a	Up to 75 squitter units installed and operational in existing sponsor-owned and operated vehicles.	ST EQ MS

Table L-2 Safety and Security Equipment Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	squitter project on an annual basis. **(5)** Squitters may use either the 1090 ES or 978 MHz/UAT link. **(6)** Only products that have been approved following certification testing may be acquired. **(7)** FAA Air Traffic Organization (ATO) Surveillance and Broadcast Services will generate the squitter transmit map. **(8)** Only ADS-B out is allowable (ADS-B in is not eligible). **(9)** Squitters are limited to installation in airport-owned, airport employee-operated vehicles that operate on pavements that are controlled by FAA Air Traffic Control, such as snow plows, airport rescue and firefighting vehicles, and airside operations vehicles. **(10)** The sponsor must provide a listing of the vehicle, assigned use (such as airside operational vehicle), and its airside designation (such as Operations Vehicle OPS-1, ARF-2) to the ADO. **(11)** The costs of acquiring computer hardware, software or software subscription services used in support of airport surface displays are not allowable. **(12)** Costs for installation and commissioning services, including Site Acceptance Testing (SAT) are allowable.		
n. Wildlife Hazard Reduction Equipment	**(1)** Equipment for broadcasting distress calls, exploding gas cannons, shotguns, and pyrotechnic pistols are eligible if recommended in a wildlife hazard	A fully operational piece of equipment.	ST EQ MS

Table L-2 Safety and Security Equipment Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	management plan or a written sponsor's adoption of a wildlife hazard site visit report. **(2)** The airport has an ongoing bird harassment plan in place incorporating the recommendations for continued harassment by airport employees to reduce wildlife hazards.		
o. Wildlife Hazard Habitat Modification	**(1)** The project must be recommended by a wildlife hazard management plan or a written sponsor's adoption of a wildlife hazard site visit report. However, these recommendations are not automatically eligible or justified. **(2)** Some wildlife hazard reduction equipment (see this appendix), some avian radar system (see this appendix), some wildlife fencing (see this appendix) and some airport drainage (see Appendix D) is normally eligible and justified. **(3)** For other potentially eligible projects (like tree removal or pond meshing), the ADO must consult both APP-520 (for eligibility) and AAS-300 (for feasibility) prior to grant programming.	A completed project that reduces wildlife attractants.	ST OT MS
p. Install Perimeter Fencing required by 49 CFR 1542	**(1)** TSA must have approved the airfield access control project in writing as being needed to meet the minimum requirements of 49 CFR part 1542. **(2)** The fencing project may include closed circuit monitoring of the airfield boundary or guard shacks. Guard shacks must be minimal in nature (no additional office space, restrooms, etc.).	A complete fencing installation that meets the 49 CFR part 1542 requirements.	SA EQ SE

Table L-2 Safety and Security Equipment Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	(3) The closed circuit cameras must be for the secured airfield area. **(4)** Unless the TSA has approved the use of an electric locking device or automatic gate, only standard gate and mechanical locking devices are eligible.		
q. Install Perimeter Fencing *not* Required by 49 CFR part 1542	**(1)** The proposed fencing must be identified on the approved airport layout plan to be eligible. **(2)** If the purpose of the fence is to discourage wildlife, the fence is not eligible unless it is justified by a wildlife hazard management plan (mandatory for Class I-III 14 CFR part 139 certificated airports) or a written sponsor's adoption of a wildlife hazard site visit report (required for non-certificated airports). Either type of documentation is acceptable for Class IV 14 CFR part 139 certificated airports. In addition, the fence must met FAA design standards for wildlife fencing. **(3)** If the purpose of the fencing is to discourage unauthorized access to the airfield by people or vehicles, the fence must be reasonable for the type of situation. **(a)** Five foot high chain link fence is reasonable within 500 feet of a terminal area because it is considered a sensitive security area. **(b)** Fencing around the remainder of the airfield perimeter is only needed to serve as a notice of legal boundary. Five foot high woven wire fence, which is significantly more economical than chain link fence, is reasonable. For urban areas, no more than a five foot chain	A complete fencing installation that increases safety of the airfield.	ST EQ SE

Table L-2 Safety and Security Equipment Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	link fence is also considered reasonable. **(4)** Epoxy-coated fencing is not considered reasonable for perimeter fencing. **(5)** Unless the ADO has approved the use of an electric locking device or automatic gate, only standard gate and mechanical locking devices are eligible.		
r. Command and Control Centers, also known as Emergency Operations Centers	**(1)** Command and Control Centers, or Emergency Operations Centers are not specifically required under 49 CFR part 1542 and are not consider security or safety equipment. **(2)** The requirements for Command and Control Centers or Emergency Operations Centers are found in Chapter 1.Appendix A.	A fully operational command and control center console for airfield security.	ST BD MS
s. Security Enhancements *(Fingerprinting Equipment for Background Checks)*	**(1)** The TSA must have approved, in writing, that the airport is required by 49 CFR part 1542 to have a badging system that requires background checks. **(2)** The type of equipment and quantity to permit processing of three employees per hour is eligible provided the airport has that turnover rate. **(3)** Equipment certified by the Federal Bureau of Investigation is listed on their website.	Fully functional fingerprinting equipment.	SA EQ SE
t. Security Enhancements *(Terminal Access Control)*	**(1)** TSA must have approved the terminal access control system, in writing, as being needed to meet the minimum requirements of 49 CFR part 1542. **(2)** Replacement of the systems and software is only eligible after the	A fully operational access control system that meets 49 CFR part 1542.	SA EQ SE

Table L-2 Safety and Security Equipment Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	useful life of the system has been met. **(3)** The closed circuit cameras must be for the secured terminal area. **(4)** If the terminal access control system is being installed as part of larger terminal project, the ADO has the option of coding the project as a separate security project or as part of the terminal project.		
u. Security Enhancements *(Police Vehicle)*	**(1)** TSA must have approved the police vehicle, in writing, as being needed to meet the minimum requirements of 49 CFR part 1542. **(2)** The primary purpose of the police vehicle must be for perimeter patrol of the airfield operational area or other secured airfield area. **(3)** Only one police vehicle is allowed. The vehicle must be a standard police vehicle. **(4)** The airport must have a 14 CFR part 139 certificate.	A fully operational standard police vehicle that meets 49 CFR part 1542.	SA EQ SE
v. Security Enhancements *(Badging Equipment)*	**(1)** TSA have approved the badging equipment, in writing, as being needed to meet the minimum requirements of 49 CFR part 1542.	Fully operational badging equipment that meets 49 CFR part 1542.	SA EQ SE
w. Security Enhancements *(Apron Lights)*	**(1)** Although apron lighting may be a recommendation from TSA, a TSA letter is not mandatory. Apron lighting requirements are listed in Table J-4.	N/A	N/A

*The official list of work codes can be obtained from the automated AIP system.

Appendix M. Other Equipment Projects

M-1. How to Use This Appendix.

This appendix is not a valid stand-alone document for making eligibility and justification determinations. The information in this appendix must be used in conjunction with the Handbook, especially the project cost requirements in Chapter 3.

M-2. Project Requirements Table.

In addition to the information provided in the above paragraph and the following table, Appendix C contains examples of prohibited projects and costs and is very useful to use alongside this appendix.

Table M-1 Other Equipment Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
a. Acquire Aircraft Deicing Equipment	**(1)** The equipment must be owned by the airport and be available on a non-exclusive use basis for any aircraft owner. **(2)** Vehicles and equipment for aircraft deicing and anti-icing on the ground are eligible at any NPIAS airport.	A fully functional piece of aircraft deicing equipment that meets FAA design standards.	ST EQ DI
b. Acquire Interactive Training System	**(1)** The systems and software must be for federally required safety and security requirements, or training related to the Americans with Disabilities Act and the Clean Air Act (42 USC § 7401). **(2)** The initial acquisition of the server, software, and dedicated hardware are eligible. **(3)** Replacement of the systems and software is only eligible after the useful life of the training system has been met. **(4)** New training modules to add new eligible material are eligible.	A fully functional interactive training system that meets FAA design standards.	OT EQ MS
c. Emergency Generator (Acquire, Install or Rehabilitate)	**(1)** Fixed standby generators necessary to support the following lighting on Cat II/III	A fully functional emergency generator that	ST EQ LI

Table M-1 Other Equipment Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	runways are eligible (not limited to entitlement funding): **(a)** Runway touch down zone, centerline, and edge lights. **(b)** Land and hold short lights. **(c)** Taxiway edge lights for taxiways serving the runway. **(d)** Surface movement guidance and control system (SMGCS) lights. **(2)** Specific airports have been designated as continuous power airports and are eligible for fixed generators (not limited to entitlement funding). They provide continuous operations in the event of an area wide power failure. The current versions of FAA Order 6030.20, Electrical Power Policy, and FAA Order 6950.2, Electrical Power Policy Implementation at National Airspace System Facilities, list these airports and the designated runways. These orders outline the fixed generator requirements. **(3)** Per FAA policy, for airports that do not meet one of the two criteria listed above, one fixed generator is eligible to support AIP eligible airside infrastructure. Only entitlement funds can be used in this case. **(4)** Per FAA policy, fixed emergency generators are only eligible for terminal use for the specific purpose of meeting life safety code requirements for building evacuation of the public use areas (not to allow the terminal to continue operations). **(5)** The generator must be a fixed generator, not a mobile generator.	meets FAA design standards.	

Table M-1 Other Equipment Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
d. Acquire Snow Removal Equipment	**(1)** For 14 CFR part 139 certificated airports: **(a)** Equipment required for clearing snow and ice from the runways, principal taxiways, aprons, and emergency access roads is eligible. **(b)** The equipment must be justified based on the current versions of Advisory Circular 150/5200-30, Airport Field Condition Assessments and Winter Operations Safety and Advisory Circular 150/5220-20, Airport Snow and Ice Control Equipment. **(c)** As of September 24, 2014, Advisory Circular 150/5200-30, Airport Field Condition Assessments and Winter Operations Safety and Advisory Circular 150/5220-20, Airport Snow and Ice Control Equipment, permits a sponsor to specify multi-task equipment (MTE). An MTE counts as two pieces of equipment for eligibility purposes (a plow and a broom). **(d)** The number of eligible pieces must be determined using the above two advisory circulars and the airport's approved Snow and Ice Control Plan, and there must be existing FAA specifications for the equipment. **(e)** Eligibility is limited to the minimum requirements recommended by the advisory circulars unless the ADO approves the airport's assertion that the volume of traffic requires additional equipment. Sponsors must have submitted	A fully functional piece of snow removal equipment that meets FAA standards.	ST EQ SN

Table M-1 Other Equipment Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	detailed information supporting additional equipment and the ADO must have agreed with the justification. **(2)** For airports that are not 14 CFR part 139 certificated airports: **(a)** Per FAA policy, only one snow removal carrier vehicle is eligible unless the ADO concurs that the airport is large enough, busy enough, and/or has significant snowfall to warrant an additional vehicle. **(b)** The equipment must be designed and justified based on the current versions of Advisory Circular 150/5200-30, Airport Field Condition Assessments and Winter Operations and Advisory Circular 150/5220-20, Airport Snow and Ice Control Equipment. **(c)** Per FAA policy, incidental use on non-AIP eligible surfaces is permitted at nonprimary airports without an active 14 CFR part 139 certificate only if: **(i)** The activity does not significantly degrade the SRE useful life. **(ii)** The SRE is used only for airport purposes and will not be used off airport. **(iii)** The SRE is only used by airport employees. **(iv)** The SRE is generally used for activities on AIP eligible surfaces. **(v)** The incidental use is not used as part of the SRE justification or as part of		

Table M-1 Other Equipment Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	the design requirements when procuring the SRE. **(3)** The sponsor must provide the ADO with a current FAA Form 5100-141, Inventory of Snow Removal Equipment (see the AIP Forms link in Appendix B). **(4)** Fixed and portable snow melters are eligible in very limited circumstances and must have been coordinated and approved by APP-500. The airport must be able to document that there is no other safe and efficient way to remove snow without adversely impacting aircraft operations.		
e. Acquire Friction Measuring Equipment	**(1)** Only a self-contained device or a towed device is eligible. Airports must provide their own towing vehicles for towed devices. **(2)** The airport must be a commercial service airport, hold a 14 CFR part 139 certificate, and have scheduled turbojet operations. **(3)** This equipment can be acquired for use at multiple neighboring airports. State aviation agencies may sponsor such projects.	A fully functional piece of friction measuring equipment (if towed, truck to be paid for with local funds) that meets FAA design standards.	ST EQ SR

*The official list of work codes can be obtained from the automated AIP system.

This page has been intentionally left blank.

Appendix N. Terminal Building Projects

N-1. How to Use This Appendix.

This appendix is not a valid stand-alone document for making eligibility and justification determinations. The information in this appendix must be used in conjunction with the Handbook, especially the project cost requirements in Chapter 3.

N-2. Eligibility of Terminals Non-Commercial Service Airports.

It is not clear in the Act that non-commercial service airports can receive a grant for terminal development. However, this congressional intent is clearly contained in § 512(d) of House Report 108-143 to Vision 100 (Public Law 108-176). This section indicates that 49 USC § 47119(c)(5) (formerly (b)(5)) "permits a general aviation airport to use its AIP entitlement for terminal development." H.R Report 108-143 § 512(d), 2003 WL 21301449, 72. Both revenue producing and non-revenue producing terminal development can be funded using nonprimary entitlements.

N-3. Public-Use and Movement of Passengers/Baggage Requirements.

Terminal development is defined under 49 USC § 47102(28). 49 USC § 47119 further defines the eligible space within terminal development projects as public-use areas that are directly related to the movement of passengers and baggage in terminal facilities within the boundaries of the airport.

In order to determine if a particular area within a terminal is eligible, it must be a public-use area per Table N-1 and it must be for the movement of passengers and baggage per Table N-2.

Table N-1 Public-Use Requirements for Terminal Buildings

The space must be public use as follows…
a. Public use spaces are those areas that passengers may need to occupy as part of their air travel. Areas such as airport administration offices or conference rooms (even if occasionally accessed by the public) are not considered public-use.
b. Public use spaces include the utility support space needed to make the public space operational, including the mechanical and electrical rooms.
c. Public use spaces do not include areas such as airport operations areas, police areas, administrative space, janitor's closets, and meetings and conference rooms, even though the public may occasionally go to some of these areas.

Table N-1 Public-Use Requirements for Terminal Buildings

The space must be public use as follows…
d. General aviation terminals can be stand-alone buildings, collocated within a commercial service terminal, or collocated within a fixed base operator (FBO) facility. What makes general aviation terminal areas eligible is that they are public use. In the case of general aviation terminal area that is collocated within an FBO, the areas behind the counter, office space, and conference room space (even if occasionally used by the public for meetings) are not considered public-use and are not eligible as terminal development. Although this space is ineligible as terminal development, it may be eligible under the revenue producing aeronautical support facility eligibility rules and requirements in Table O-3.
e. Areas that are past passenger screening (meaning that only ticketed passengers may access the public-use area) may still be considered public-use.

Table N-2 Movement of Passengers and Baggage Requirements

The space must be directly related to the movement of passengers or baggage as follows…
a. The prime function of a terminal building is to allow passengers and baggage to move from the curb of the terminal building to an airplane. Other uses that may be constructed in a terminal building may be public-use, but may not be directly related to moving passengers and baggage.
b. If the area does not need to be at an airport, but could be located somewhere else, it is not directly related to the movement of passengers and baggage and is not eligible. For example, a satellite office for a county's Department of Motor Vehicles may be public-use, but it is not directly related to the movement of passengers and baggage and is therefore not eligible.
c. Stores and restaurants for the convenience of the general traveling public are considered related to the movement of passengers. However, these facilities are subject to the revenue producing limitations outlined in Paragraph N-4, and the eligible area is limited to the space that the general public can access.

N-4. Revenue Producing Eligibility and Conditions for Terminal Buildings.

Revenue producing areas are eligible as outlined in Table N-3.

Table N-3 Revenue Producing Eligibility and Conditions for Terminal Buildings

For the following size airports…	Revenue producing areas are…	And the following conditions apply…
a. Large, medium, or small hub primary	Ineligible	N/A
b. All other airports	Eligible	**(1)** The area must be public-use per 49 USC § 47119(a)(1). The ability to fund revenue producing terminal areas at these airports under 49 USC § 47119(a)(2) does not remove this requirement. **(2)** The sponsor must certify any needed airport development project affecting safety, security or capacity will not be deferred due to the revenue producing project. These certifications are required per 49 USC § 47119(a)(2)(B) and the sponsor must provide this certification in writing to the ADO. Per FAA policy, deferring a needed capacity project includes allowing airfield pavement to deteriorate to a poor to failed condition.

N-5. Safety, Security, and Access Needs Met.

Per 49 USC § 47119(a)(1)(A), the sponsor must certify that it has, on the date of submittal of the project application, all the applicable 14 CFR part 139 safety and 49 CFR part 1542 security equipment required by rule or regulation. In addition, the sponsor must certify that they have provided access and equipment for passengers boarding or exiting non-air carrier aircraft. The sponsor must provide this certification in letter format to the ADO.

N-6. Terminal Areas Related to Security (Landside, Sterile, and Secured).

A terminal building is divided into roughly three different areas (landside, sterile area, and secured area). The TSA is responsible under 49 CFR part 1544 for controlling access between the landside and the sterile area. The airport is responsible under 49 CFR part 1542 for controlling access to the secured area.

a. Landside. This is the area that is accessible to the general public.

b. Sterile Area. This area (as more fully defined in 49 CFR part 1540) is restricted to passengers, airline employees and others who have passed airport security.

c. Secured Area. This area (as more fully defined in 49 CFR part 1540) is the portion of terminal or terminal ramp that has direct access to the aircraft.

N-7. Prorated Areas and High Cost Eligible/Ineligible Items.

AIP cannot be used to pay for items or costs that are not eligible or allowable. The way this is addressed in terminals, which contain a mix of both eligible and ineligible areas, is by prorating the total cost.

The easiest method of proration is to use the ratio of the square footage of the eligible areas to the total area. High cost eligible and ineligible items of equipment must not be included in the proration calculations, but added (or deducted) separately to avoid skewing the result. An example of a high cost eligible item is a passenger loading bridge or an escalator/elevator. An example of a high cost ineligible item is a large commissioned sculpture. The formula for determining the eligible cost of a terminal building is in Table N-4.

In addition, the requirements for including ineligible or non-AIP funded work in the contract in Paragraph 3-39 must be met.

Table N-4 Terminal Eligibility Proration Calculation

Step	Action
1	Determine the square footage for each of the following categories: A: Eligible Areas B: Ineligible Areas C: Prorated Areas (areas that needed for utilities such as mechanical, electrical, or water) D: High Cost 100% Eligible Items (Examples: Passenger loading bridges, escalators, elevators) E: High Cost 100% Ineligible Items (Example: Large commissioned sculpture, ineligible build out costs)
2	Determine the eligible proration % as follows: Eligible Proration % = A / (A+B)
3	Determine the eligible cost as follows: Eligible Cost = [(Cost of A+B+C) * (Eligible Proration %)] + (Cost of D)

N-8. Terminal Area Impacted by an AIP Eligible Terminal Project.

If the area being impacted would normally be AIP eligible, then this area can be replaced with AIP funding under the project. If the area being impacted is not AIP eligible (such as a revenue producing restaurant in a small, medium, or large hub airport), only the demolition of the impacted area is eligible. This impacted area is considered an ineligible sponsor facility and cannot be replaced with AIP funding (see Paragraph 3-74).

N-9. Typical Eligible Areas/Equipment within a Terminal Building.

Table N-5 contains typical eligible areas within a terminal building. As further discussed in Paragraph 3-6, replacement of carpeting (or other flooring, such as tiles or terrazzo), painting,

wall coverings, ceiling tiles, and fixed public use seating (including tables and counters) in a terminal are considered ineligible maintenance items if they are not directly required as a result of an eligible terminal project.

Table N-5 Typical Eligible Areas/Equipment within a Terminal Building

The following terminal areas/equipment…
a. Ticketing lobby from entrance to ticket counters (but not including the ticket counters or the areas behind the counters).
b. Other lobbies used by passengers and guests (commonly called *meeters and greeters*).
c. The public use-portion of the baggage claim delivery areas (including lost baggage retrieval areas). This includes the baggage carousel equipment (even though by function, a portion of the carousel is located in the non-public area).
d. A prorated amount of the space for equipment needed to make the public space operational, including the mechanical and electrical rooms.
e. Public-use corridors to boarding areas.
f. Central waiting rooms.
g. Passenger boarding bridges at commercial service terminals.
h. Public restrooms.
i. Gate holding areas, including fixed public-use seating (including fixed tables and counters) within the holding area.
j. Directional signs and non-exclusive use flight information display systems (FIDS) and baggage information display systems (BIDS).
k. Passenger screening areas that are used directly for the inspection of passengers have limited eligibility. Eligibility is limited to the construction of bare space (drywall, standard paint, and standard floor covering) with appropriate utilities.
l. Customs and Border Control (formerly Federal Inspection Service) areas that are used directly for the inspection of individuals and goods have limited eligibility . Eligibility is limited to the construction of bare space (drywall, standard paint, and standard floor covering) with appropriate utilities and baggage carousels. Note that these can be separate buildings, but still are considered terminal development. Customs and Border Control must verify that the building is sized to the staffing levels that will be provided (note that the funding source of the staffing does not affect eligibility).
m. The FAA has determined that public use areas for general aviation operations are eligible areas (even within commercial service terminals). Note that these can be separate buildings, but still are considered terminal development.

Table N-5 Typical Eligible Areas/Equipment within a Terminal Building

The following terminal areas/equipment…
n. Terminal modifications to accommodate in-line baggage screening as required by 49 CFR part 1542. In-line explosive detection system (EDS) equipment is eligible for AIP funding. However, from FY 2004 to the publication date of this Handbook, the FAA appropriations bill has prohibited using AIP grant funds on EDS systems or any building modifications that are necessary to support or install an EDS system. Because PFC eligibility is based on AIP eligibility, leaving the project eligible but prohibiting use of AIP still allows these projects to be funded with PFCs. TSA determines the size of the facility and the amount of equipment. Normally, this consists of EDS machines, various baggage conveyer systems, monitoring cameras and rooms, and baggage containment rooms. Associated space for staff rooms, offices, and break rooms are not considered necessary components of an EDS installation.
o. Acquiring and installing facilities and equipment to provide air conditioning, heating, or electric power from terminal-based (not mobile), non-exclusive use facilities to aircraft per 49 USC § 47102(3)(O). This type of work used to only be eligible if approved under the Voluntary Airport Low Emissions (VALE) program, but is now also eligible as terminal development outside of the VALE program and does not require the airport to be in a nonattainment or maintenance area. 49 USC § 47102(3)(O) limits eligibility to those facilities that will reduce energy use or harmful emissions as compared to aircraft based systems. There is ample scientific evidence that using power from the terminal rather than from the aircraft will reduce emissions, therefore, per FAA policy, the airport does not have to provide any documentation supporting this assertion. Terminal-based aircraft air conditioning, heating or electric power will be eligible following all of the funding, usage, and hub size requirements for other terminal projects.
p. Although a sponsor has the option to include a command and control center in the terminal, it is not required to be in a terminal. The ADO has the option of separating the command and control center out into a separate project (prorating the cost of the square footage) or including it as eligible terminal development (in which case the terminal funding rules would apply). Regardless of which method the ADO choses (as a separate project or as part of the terminal), the command and control center must meet all of the requirements in Appendix N.
q. If the terminal is a multimodal, only the area that is public use for the movement of passengers and baggage is eligible.
r. Incidental use of public space for display, advertising, or vending machines for public convenience will not make the space ineligible, although modifications to install these items are not eligible.
s. Service animal relief areas to comply with Title II of the Americans with Disabilities Act of 1990 (42 USC § 12101 et seq.).
t. Elevators to normally ineligible areas of the terminal (such as the airport offices to accommodate public meetings) if the elevators are necessary for the *sponsor* to comply with Title II of the Americans with Disabilities Act of 1990 (42 USC § 12101 et seq.). The elevators are 100% eligible (do not have to be prorated to reflect the ineligible areas being served).
u. Other accommodations to normally ineligible areas of the terminal (such as the airport offices to accommodate public meetings) if the accommodations are necessary for the sponsor to comply with Title II of the Americans with Disabilities Act of 1990 (ADA) (42 USC § 12101 et seq.). The ADO must contact the FAA Office of Civil Rights (ACR) to determine if the accommodations are required under ADA.

Table N-5 Typical Eligible Areas/Equipment within a Terminal Building

The following terminal areas/equipment…
v. If the terminal access control system (see Table L-2 for requirements) is being installed as part of larger terminal project, the ADO has the option of coding the project as a separate security project or as part of the terminal project. In addition, the space required to house the associated computer equipment is eligible. If the area to house the equipment is also an office or other ineligible use, that portion of the area remains ineligible.
w. A public address system in the public use portions of the terminal is an allowable cost of terminal development (similar to lights in the public area and the sprinkler system in the public area). This is because the public address system is necessary for the movement of passengers and baggage in the public portion of the terminal.

N-10. Additional Eligible Terminal Areas/Equipment at Nonhub Primary and Nonprimary Airports.

In addition to the eligible areas listed in Paragraph N-9, nonhub primary and nonprimary airports may be eligible for the areas listed in Table N-6.

Table N-6 Additional Eligible Terminal Areas/Equipment at Nonhub Primary and Nonprimary Airports

Additional eligible terminal areas/equipment at nonhub primary and nonprimary airports includes the public-use space associated with…
a. Ticket counters at commercial service airports (but not the areas behind the counters).
b. Rental car counters (but not the area behind the counter).
c. The public portion of concession areas (the part that the general public can actually access) that is commonly found in airports such as restaurants, lounges, business centers, snack bars, snack vending areas, seating areas for snack areas/restaurants, newsstands, rental car areas, ground transportation and bookstores. Although not considered directly related to the movement of passengers or baggage per 49 USC § 47119(a)(1)(B), these areas are eligible under 49 USC § 47119(a)(2) as terminal development. However, the eligibility is limited to the construction of bare space (drywall, standard paint, and standard floor covering) with appropriate utilities and fixed public-use seating (including fixed tables and counters).
d. Nonrevenue parking lots for the parking of vehicles of passengers and persons meeting or delivering passengers.
e. A pilot briefing area or pilot lounge at general aviation terminals if the area is open to the public.

N-11. Terminal Building Funding Rules by Airport Type.

The funding rules for terminal buildings are listed in Table N-7.

Table N-7 Terminal Building Funding Rules by Airport Type

For the following airport type…	The following funding rules apply…
a. Large, Medium and Small Hub Airports	**(1) Passenger Entitlements (Allowed).** The ADO is only allowed to apply passenger entitlement funds at large, medium and small hub airports. 49 USC § 47119(c)(1) authorizes funds from amounts apportioned under 49 USC § 47114(c)(1), which is the statutory reference for passenger entitlement. **(2) Discretionary (Potentially allowed at a small hub primary that has changed from a nonhub primary).** Per 49 USC § 47108(e)(3), if a nonhub primary airport changes to a small hub primary when a phased terminal development project that has received discretionary is underway, the project remains eligible for discretionary under the nonhub airport discretionary funding rules for three fiscal years after the start of the construction project (or longer if the ADO approves an extension). **(3) Discretionary (Allowed at a small hub airport with exactly .05% of the annual passenger boardings up to $20 million total).** 49 USC § 47119(c)(3) authorizes funds from the discretionary fund and the Small Airport Fund at a small hub airport with exactly .05% of the annual passenger boardings. On February 14, 2012, the FAA Modernization and Reform Act of 2012 (Public Law 112-95) added 49 USC § 47119(f), which limits the amount of discretionary to $20 million for the cumulative total of *all* terminal development project costs as of February 14, 2012 at that airport. See the definition for terminal development in Appendix A for an explanation of what needs to be included in the $20 million dollar calculation (including what portion of the access road must be included). **(4) All Other Funding (Not allowed).** The Act does not authorize other funding at large, medium or small hub airports except as listed above.
b. Nonhub Primary Airports	**(1) Passenger Entitlements (Allowed).** The ADO can apply passenger entitlement funds at nonhub primary airports. 49 USC § 47119(c)(1) authorizes funds from amounts apportioned under 49 USC § 47114(c)(1), which is the formula for passenger entitlements. **(2) Discretionary (Allowed up to $20 million total).** 49 USC § 47119(c)(3) authorizes funds from the discretionary fund and the Small Airport Fund at nonhub primary airports. On February 14, 2012, the FAA Modernization and Reform Act of 2012 (Public Law 112-95) added 49 USC § 47119(f), which limits the amount of discretionary to $20 million for the cumulative total of *all* terminal development project costs as of February 14, 2012 at that airport. See the definition for terminal development in Appendix A for an explanation of what needs to be included in the $20 million dollar calculation (including what portion of the access road must be included). **(3) All Other Funding (Not allowed).** The Act does not authorize other funding at these airports except as listed above.

Table N-7 Terminal Building Funding Rules by Airport Type

For the following airport type…	The following funding rules apply…
c. Nonprimary Commercial Service	**(1) Nonprimary Entitlement (Allowed).** The ADO can apply nonprimary entitlement funds at nonprimary commercial service airports. 49 USC § 47119(c)(5) authorizes funds from amounts apportioned under 49 USC § 47114(d)(3)(A), which is the reference for nonprimary entitlements. **(2) Discretionary (Allowed up to $200,000 per fiscal year).** 49 USC § 47119(c)(2) authorizes funds from the discretionary fund under 49 USC § 47115 at nonprimary commercial service airports. The Small Airport Fund cannot be used because 49 USC § 47119(c)(3) only authorize the use of these funds at small hub airports with exactly .05% of the annual passenger boardings and nonhub primary airports. **(3) All Other Funding (Not allowed).** The Act does not authorize other funding at these airports except those listed above.
d. Reliever Airports	**(1) Discretionary (Allowed up to $200,000 per fiscal year).** 49 USC § 47119(c)(2) authorizes funds from the discretionary fund under 49 USC § 47115 at these airports. After review of the legislative history, the FAA has determined that 49 USC § 47119(c)(2) allows reliever airports to use discretionary on a terminal building, regardless if the airport has commercial service. The Small Airport Fund cannot be used because 49 USC § 47119(c)(3) only authorize the use of these funds at small hub airports with exactly .05% of the annual passenger boardings and nonhub primary airports. **(2) Discretionary (Potentially allowed for a reliever airport that has dropped from commercial service).** Per 49 USC § 47108(e)(2), if a commercial service airport (either a nonprimary commercial service or a hub airport) changes to a noncommercial service airport (either a reliever or general aviation airport) when a phased terminal development project is underway, the project remains eligible for discretionary under the funding rules for the previous airport type. **(3) Nonprimary Entitlement (Allowed).** The ADO can apply nonprimary entitlements at reliever airports. 49 USC § 47119(c)(5) authorizes funds from amounts apportioned under 49 USC § 47114(d)(3)(A), which is the reference for nonprimary entitlements. After review of the legislative history, the FAA has determined that 49 USC § 47119(c)(5) allows reliever airports to use nonprimary entitlements on a terminal building, regardless of whether the airport has commercial service. **(4) All Other Funding (Not allowed).** The Act does not authorize other funding at reliever airports except those listed above.

Table N-7 Terminal Building Funding Rules by Airport Type

For the following airport type…	The following funding rules apply…
e. General Aviation Airports (Excluding Reliever Airports)	**(1) Discretionary (Potentially allowed for a general aviation airport that has dropped from commercial service).** Per 49 USC § 47108(e)(2), if a commercial service airport (either a nonprimary commercial service or a primary airport) changes to a noncommercial service airport (either a reliever or general aviation airport) when a phased terminal development project is underway, the project remains eligible for discretionary under the original funding rules for the previous airport type. **(2) Nonprimary Entitlement (Allowed**). The ADO can apply nonprimary entitlements at general aviation airports. 49 USC § 47119(c)(5) authorizes funds from amounts apportioned under 49 USC § 47114(d)(3)(A), which is the reference for nonprimary entitlements. After review of the legislative history, the FAA has determined that 49 USC § 47119(c)(5) allows general aviation airports to use nonprimary entitlements on a terminal building, regardless if the airport has commercial service. **(3) All Other Funding (Not Allowed).** The Act does not authorize other funding at these airports except those listed above.

N-12. Project Requirements Tables.

In addition to the information provided in the above paragraphs and the following tables, Appendix C contains examples of prohibited projects and costs and is very useful to use alongside this appendix.

Table N-8 Terminal Work Codes

If the project is justified as follows……	Use the following work codes…
a. The project meets the definition of a capacity project (see Appendix A).	CA TE XX
b. The project meets the definition of a standards project (see Appendix A).	ST TE XX

Table N-9 Terminal Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
a. Construct Terminal Building	**(1)** The ADO must have concurred with the sponsor's terminal sizing methodology. The ADO and regional office may contact APP-400 for assistance on terminal design and justification. **(2)** To the extent possible, the development must meet the anticipated terminal needs for the 10 years after project completion. **(3)** Modification/rehabilitation of existing facilities must be considered before the ADO can consider new terminal development. The ADO can consider funding new terminal development if costs are comparable to modification/rehabilitation of existing facilities and the new construction will provide better flexibility, ability to expand, or a longer useful life. **(4)** Because of the requirement for public use, by FAA policy, gates cannot be leased for more than 10 years and must not be subject to a majority in interest clause. **(5)** The project must be supported by an FAA-accepted planning study. **(6)** A project for walkways that lead directly to or from a terminal is eligible terminal development per 49 USC § 47102(28)(iii). Per FAA policy, walkways include surface sidewalks, moving sidewalks, tunnel walkways, stairs, and overhead walkways. Covers or canopies over surface sidewalks may be included in a walkway project when necessary to protect	A complete terminal building to allow the movement of passengers and baggage.	CA TE CO ST TE CO See Table N-8 for the correct work code.

Table N-9 Terminal Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	concentrations of persons from the weather such as at passenger loading or unloading areas. In addition, only the portion of the walkway that is on airport is eligible. **(7)** Per 49 USC § 47119(a)(1)(A), the airport has all safety equipment required for the airport per 49 USC § 44706 (Airport Operating Certificates), has all security equipment required by rule or regulation, and has provided for access by passenger to the area of the airport for boarding or exiting aircraft that are not air carrier aircraft. **(8)** Per 49 USC § 47119(a)(1), only public-use areas of the terminal are allowable (regardless of the revenue producing status of the area). **(9)** ADOs may use the current versions of Advisory Circular 150/5360-13, Planning and Design Guidelines for Airport Terminal Facilities and Advisory Circular 150/5360-9, Planning and Design of Airport Terminal Facilities at Non-Hub Locations for additional guidance. However, the eligibility and justification rules within this Handbook must be followed for AIP funded terminals. **(10)** The ADO must coordinate all multimodal terminal projects with APP-520 prior to programming the associated grant.		
b. Expand Terminal Building	**(1)** The requirements for Construct Terminal Building apply. **(2)** This work code is used for physical expansion to increase	A completed terminal expansion with an increase in the number of gates,	CA TE EX ST TE EX` See Table N-8

Table N-9 Terminal Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	the number of gates, ticket counters, or baggage carousels. **(3)** The ADO must coordinate all multimodal terminal projects with APP-520 prior to programming the associated grant.	ticket counters, or baggage carousels.	for the correct work code.
c. Modify Terminal Building	**(1)** The requirements for Construct Terminal Building apply. **(2)** This may include modification needed for security screening, modifications to meet Federal mandates, or modifications needed to accommodate a new class of aircraft at the terminal. **(3)** The ADO must coordinate all multimodal terminal projects with APP-520 prior to programming the associated grant.	A completed modification of the building that allows for a specific additional function.	CA TE IM ST TE IM See Table N-8 for the correct work code.
d. Rehabilitate Terminal Building	**(1)** The requirements for Construct Terminal Building apply. **(2)** This may include the replacement of eligible major capital equipment systems that will extend the useful life of the terminal building or replacement of a fixed building component. **(3)** Rehabilitate Terminal Building projects are: **(a)** Major renovation of public restrooms. **(b)** Replacement or major overhaul of public elevators, escalators, and moving sidewalks. **(c)** Major replacement of a significant percentage of a terminal roof. **(d)** Replacement of a significant portion of the terminal	A complete renovation that extends the useful life by the minimums in Paragraph 3-12 (note that equipment may have a shorter minimum useful life than the building).	CA TE IM ST TE IM See Table N-8 for the correct work code.

Table N-9 Terminal Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	windows in the public-use areas. **(4)** The ADO must coordinate all multimodal terminal projects with APP-520 prior to programming the associated grant.		
e. Improve Terminal Building	**(1)** The requirements for Construct Terminal Building apply. **(2)** Justification for improvement of a terminal building will rely on a terminal study that justifies improvements based on improved passenger or baggage handling. It will involve adding new capabilities that do not currently exist at the terminal, generally through the installation of new capital equipment. **(3)** Improve terminal building projects may include installations of: **(a)** New baggage carousels. **(b)** Loading bridges. **(c)** Pedestrian walkways. **(d)** Elevators or escalators. **(e)** Preconditioned air/power for aircraft parked at a gate per 49 USC § 47102(3)(O). **(4)** The ADO must coordinate all multimodal terminal projects with APP-520 prior to programming the associated grant.	A completed improvement of the building that adds new capabilities.	CA TE IM ST TE IM See Table N-8 for the correct work code.
f. Acquire Passenger Lift Device	**(1)** This is eligible under 49 USC § 47102(3)(F). **(2)** The equipment must be required for compliance with the Americans with Disabilities Act of 1990 (42 USC 12101 et seq)	A new lift device that meets FAA design standards.	ST TE MS

Table N-9 Terminal Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	(3) The equipment must be used to board passengers on an aircraft, not to transport passengers between gates in airport terminals (these are considered people mover projects and are covered under Appendix P). **(4)** The sponsor must include specific information describing the vehicle or equipment that is being acquired in the project description of the application.		

*The official list of work codes can be obtained from the automated AIP system.

This page has been intentionally left blank.

Appendix O. Other Building Projects

O-1. How to Use This Appendix.

This appendix is not a valid stand-alone document for making eligibility and justification determinations. The information in this appendix must be used in conjunction with the Handbook, especially the project cost requirements in Chapter 3.

O-2. Aircraft Rescue & Firefighting Building Costs at 14 CFR part 139 Airports.

The main purpose of an ARFF building is to protect the grant-funded ARFF vehicle. For airports without a 14 CFR part 139 certificate a minimal structure to house and protect the grant funded ARFF vehicle is usually all that is justified.

More areas and items are eligible at an airport with a 14 CFR part 139 certificate. However, the current version of Advisory Circular 150/5210-15, Aircraft Rescue and Firefighting Station Building Design, contains facilities that are not required and will not be considered justified for project funding. Table O-1 narrows these FAA design standards to the allowable costs for AIP funding. Although the advisory circular allows for a 20% increase in the size of the areas without receiving FAA approval, this does not apply to AIP eligibility. Only the minimum space required for the eligible function is allowable under AIP unless the ADO provides written approval. In order to provide such approval, the ADO must have determined that there is justification for the increase and must document this justification and determination in the grant file.

Table O-1 Allowable Costs for Areas in an ARFF Building at 14 CFR part 139 Certificated Airports

For the following area/items…	The following cost criteria apply…
a. Vehicle bays	The number of eligible bays is limited to that necessary for housing eligible ARFF equipment. Space for a structural fire truck is eligible if the structural fire truck is allowable.
b. Maintenance bay	A maintenance bay may be allowable within an ARFF building if all of the requirements for maintenance facilities in Table O-3 are met.
c. Administrative space	Administrative space is limited to a common area for maintaining department files and documents. This may include an open area to accommodate a desk for the shift commander and one administrative staff member (when applicable).
d. Watch/alarm room	The space is limited to that necessary for a consolidated area to receive emergency calls, dispatch ARFF vehicles and direct support resources.
e. Support rooms	Space for necessary gear, medical equipment storage, and decontamination is allowable.

Table O-1 Allowable Costs for Areas in an ARFF Building at 14 CFR part 139 Certificated Airports

For the following area/items…	The following cost criteria apply…
f. Personnel facilities	The number of personnel (as required by 14 CFR part 139 response times or local government staffing requirements) for the eligible ARFF vehicles determines the allowable personnel space requirements. Allowable areas include a day room, dormitories, locker rooms, restrooms, bathrooms, shower facilities, a kitchen, and a laundry room.
g. Training	The number of personnel (as required by 14 CFR part 139 response times or local government staffing requirements) for the eligible ARFF vehicles determines allowable training space requirements.
h. Furnishings, appliances, and support utilities	Minimum fixed furnishings and utilities to serve the building are allowable. This includes cabinets, a stove, a refrigerator, and a sink. One fixed emergency generator and one fixed air compressor of sufficient size to operate the ARFF bay system and one fixed compressor to maintain the readiness of self-contained breathing apparatus (SCBA) are allowable.

O-3. Project Requirements Tables.

In addition to the information provided in the above paragraphs and the following tables, Appendix C contains examples of prohibited projects and costs and is very useful to use alongside this appendix.

Table O-2 Distinctions between Construct, Expand, Modify, Improve, and Rehabilitate

Use the following description…	If the project will…
a. Construct	Build a brand new building.
b. Expand	Add on to an existing building.
c. Modify	Change a building.
d. Improve	Provide a distinct new feature to a building.
e. Rehabilitate	Extend the useful life of a building by completing major renovation or major replacement of parts of the building.

Table O-3 Other Building Project Requirements (Other than Terminals)

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
a. Aircraft Rescue & Firefighting Building (Construct, Expand, Modify, Improve, or Rehabilitate)	**(1)** The building must be sized according to the airport's ARFF index. **(2)** Allowable building costs are discussed in Paragraph O-2. **(3)** The difference between construct, expand, modify, improve, and rehabilitate is listed in Table O-2. **(4)** The ADO must determine that only the allowable areas listed in Table O-3 are included in the project. **(5)** The ADO has the option to fund limited employee vehicle parking necessary to support essential ARFF personnel on duty. **(6)** The ADO has the option to fund an airside service road for access to the facility. However, note that service roads are not eligible for maintenance under AIP (only runway, taxiway, and apron maintenance at certain airports is eligible).	A fully functional ARFF building.	SA BD EX
b. Aircraft Rescue & Firefighting Building (Rehabilitate) *(Replace Communication System)*	**(1)** Total replacement of the ARFF communication system is eligible for a stand-alone project every 10 years and is coded as rehabilitation.	A new, fully functional ARFF communication system.	SA BD EX
c. Snow Removal Equipment Building (Construct, Expand, Modify, Improve, or Rehabilitate)	**(1)** Snow removal equipment buildings are intended to protect the AIP funded snow removal equipment and materials. **(2)** Funding snow and ice control buildings is limited to space in the building necessary for eligible Snow Removal Equipment as well as storing abrasive or chemicals used in treatment of paved areas.	A fully functional snow removal equipment building.	ST BD SN

Table O-3 Other Building Project Requirements (Other than Terminals)

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	All other areas and equipment recommended in the current version of Advisory Circular 150/5220-18, Buildings for Storage and Maintenance of Airport Snow and Ice Control Equipment and Materials, must be paid for by the sponsor. **(3)** The eligibility of a maintenance bay for safety and security equipment is provided elsewhere in this table and may be included in the SRE building if the requirements for the safety and security equipment maintenance bay are met. **(4)** At the time the building is programmed, the eligible equipment must be owned, on order, or budgeted by the airport within the next five years. **(5)** The SRE building is not intended to function as personnel quarters, snow desk, training space, or other functions. It is only intended for storage of eligible equipment. If non-eligible equipment storage is included in the building, the requirements for including ineligible or non-AIP funded work in the contract in Paragraph 3-39 must be met. **(6)** The difference between construct, expand, modify, improve, and rehabilitate is listed in Table O-2. **(7)** The ADO has the option to fund limited employee vehicle parking necessary to accommodate essential snow removal personnel on duty. **(8)** The ADO has the option to fund an airside service road for access to the facility. However, note that service roads are not eligible for		

Table O-3 Other Building Project Requirements (Other than Terminals)

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	pavement maintenance under AIP (only runway, taxiway, and apron pavement maintenance at certain airports is eligible). **(9)** For airports that are not 14 CFR part 139 certificated airports and are only eligible for one snow removal carrier vehicle, it is FAA policy that a 1600 square foot SRE building is eligible. In the instance where two vehicles are eligible, a 2000 square foot SRE building is eligible.		
d. Construct Sand and Chemical Storage Building (Construct, Expand, Modify, Improve, or Rehabilitate)	**(1)** Small stand-alone buildings for storage of airport surface deicing chemicals and sand may be constructed if the size and design is appropriate for the facility. **(2)** This function may also be incorporated as eligible area in a snow removal equipment building. **(3)** Snow and ice control abrasive or chemicals are to be used for airport pavement (not aircraft) because 49 USC § 47102(3)(G) does not permit the purchase or storage of deicing materials for aircraft. **(4)** The difference between construct, expand, modify, improve, and rehabilitate is listed in Table O-2.	A fully functional sand and chemical storage building.	ST BD SN
e. Miscellaneous Building (Construct, Expand, Modify, Improve, or Rehabilitate) *(Maintenance Bay or Service Facility)*	**(1)** One service facility (also called a maintenance bay) for maintaining required safety and security equipment at airports with a 14 CFR part 139 certificate may be funded. For AIP purposes, snow removal equipment is not considered safety or security equipment. Only ARFF equipment is allowed to be used to justify and size the building.	A fully functional maintenance or service area or building.	ST BD MS

Table O-3 Other Building Project Requirements (Other than Terminals)

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	(2) The facility must not exceed 1500 square feet in size and may be co-located within an existing or new building or in its own free standing building. **(3)** The eligible area is determined by adding 10 feet to the length and 10 feet to the width of the largest ARFF vehicle serving the airport, then multiplying these two dimensions for the bay size and adding a like amount for support space. **(4)** The ADO must confirm whether the airport already has an existing maintenance or service bay in the ARFF or SRE buildings. If so, an additional facility is not justified. **(5)** Eligibility is limited to the construction of bare space with appropriate utilities. **(6)** The building/area must not be used for storage of any equipment or materials. Limited use of the facility to maintain other airport eligible equipment is permitted provided such use does not adversely affect maintenance of the eligible ARFF vehicles. **(7)** The difference between construct, expand, modify, improve, and rehabilitate is listed in Table O-2.		
f. Miscellaneous Building (Construct, Expand, Rehabilitate) *(Aircraft Hangar, Fixed Based Operator (FBO) Building, or Aircraft*	**(1)** For MAP funded hangars, see Appendix T, as many of the following requirements do not apply for MAP projects. **(2)** 49 USC § 47102(3)(24) specifically allows expansion and construction of sponsor owned hangars that the ADO has determined will increase the revenue producing ability of the airport. In addition,	A fully functional aircraft hangar, FBO building, or aircraft maintenance building.	ST BD MS

Table O-3 Other Building Project Requirements (Other than Terminals)

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
Maintenance Building)	49 USC § 47102(3)(24) allows expansion and construction of sponsor owned aeronautical support facilities that the ADO has determined will increase the revenue producing ability of the airport. The FAA has determined that this includes sponsor owned FBOs and aircraft maintenance buildings. **(3)** The only rehabilitation allowed under 49 USC § 47102(3)(24), is major rehabilitation of a sponsor owned hangar. **(4)** Per 49 USC § 47110(h), the airport must be a nonprimary airport. **(5)** Only nonprimary entitlements funding may be used for the building. **(6)** Per 49 USC § 47110(h), the sponsor must certify that all airfield needs have been accommodated before the ADO can fund a revenue producing aeronautical support facilities. Per FAA policy, the sponsor must adequately demonstrate to the ADO that airside needs within the next three years (current fiscal year and next two future fiscal years) will be accommodated through local funds or nonprimary entitlement funds. It is APP-500 policy that the sponsor requests for AIP would be limited to non-primary entitlement funds during that time unless there is a specific safety issue that must be addressed and was not foreseeable under normal planning efforts of the sponsor. **(7)** Per 49 USC § 47102(24), the use of the building must only be for aeronautical purposes (storage of		

Table O-3 Other Building Project Requirements (Other than Terminals)

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	property other than aircraft or aircraft supplies is not allowed). Non-aeronautical uses are not allowed. **(8)** The use and lease of the building must meet the compliance requirements outlined in the current version of FAA Order 5190.6, FAA Airport Compliance Manual. **(9)** The difference between construct, expand, modify, improve, and rehabilitate is listed in Table O-2. **(10)** The apron in front of a building that cannot be used for public parking or taxiing of aircraft is considered part of the building (and the associated building funding rules apply). This includes the wingtip clearance from the building as defined in the current version of Advisory Circular 150/5300-13, Airport Design. **(11)** The taxilane/taxiway that exclusively serves a building is also considered part of the building (and the associated building funding rules apply). **(12)** The ADO has the option to fund limited landside vehicle parking necessary to support the functions of the building. **(13)** The acquisition of existing buildings involves further review of existing environmental issues, useful life issues, and reverter clause issues. Therefore, the ADO must coordinate these requests with APP-520 and ACO-100. **(14)** If the FBO is collocated with the general aviation terminal, the public use area can be funded as		

Table O-3 Other Building Project Requirements (Other than Terminals)

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	terminal development as discussed in Appendix N. The areas behind the counter, office space, and conference room space (even if occasionally used by the public for meetings) are not considered public-use and are not eligible as terminal development.		
g. Miscellaneous Building (Construct, Expand, Modify, Improve, or Rehabilitate) *(Command and Control Center or Emergency Operations Center)*	**(1)** Only the portion of the building dedicated to airfield security is eligible. By FAA policy, this only includes the prorated building cost for a single position at the console and must not include the cost for equipment or furniture that is not fixed or mounted. In addition, the requirements for including ineligible or non-AIP funded work in the contract in Paragraph 3-39 must be met. **(2)** This is not specifically required under 49 CFR part 1542, therefore a letter from TSA is not mandatory for AIP funding. **(3)** Although a sponsor has the option to include a command and control center in the terminal, it is not required to be in a terminal and is therefore not considered terminal development. **(4)** For ease of prorating the eligible costs of a Command and Control Center, the square footage allowed for the single position is limited to a maximum of 500 square feet (which includes consideration of common spaces in the center.) For example, in a 5,000 center, the maximum AIP participation is limited to 500 square feet/5,000 square feet, or 10% of the total project cost.	A fully operational command and control center console for airfield security.	ST BD MS
h. Miscellaneous Building	**(1)** If an airport proposes state apportionments for these projects,	Construction or equipment to	ST BD MS

Table O-3 Other Building Project Requirements (Other than Terminals)

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
(Construct, Expand, Modify, Improve, or Rehabilitate) *(Contract Air Traffic Control Tower (ATCT))*	those funds may be used provided the ADO consults with the state aviation official and obtains the state's support for the project as part of its airport capital improvement plan. State apportionment funds may only be used on projects that are to be undertaken in the future rather than for retroactive funding. The project file must include the state's written support. **(2)** Only the equipment contained in the Federal Contract Tower Minimum Equipment List is eligible for AIP funding. **(3)** The FAA Air Traffic Organization (ATO) must provide a letter or comparable documentation stating that the airport was selected to be a participant in the FAA Contract Tower program under 49 USC § 47124 or that the construction of the ATCT would qualify the sponsor to be added to the program and it will seek appropriations for the airport to be in the contract tower program. The ADO must keep a copy of this documentation in the grant file. **(4)** The Federal share of the cost of planning and construction is limited to a cumulative maximum of $2.0 million per airport per 49 USC § 47124(b)(4)(C). In addition, the type of AIP funding is limited per Paragraph 4-7. **(5)** Eligible costs include the ATCT structure and equipment inside it. **(6)** ATO standards must be met for ATCT equipment in an AIP project. Modification of any	support a contract control tower that meets FAA standards.	

Table O-3 Other Building Project Requirements (Other than Terminals)

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	equipment standard must have been approved by ATO. **(7)** For projects that were completed after October 1, 1996, retroactive funding of the ATCT and equipment is eligible, provided the airport demonstrates statutory requirements were met. For instance, the project must have been accomplished using DBE, minimum wage, veteran's preference, environmental approval, and other requirements under 2 CFR part 200). **(8)** The sponsor must certify in the FAA operating agreement and the cost share agreement, if applicable, that it will pay its share of the cost to equip, maintain and operate the ATCT. **(9)** The ATCT must be located so that it does not conflict with the airport design requirements in the current version of Advisory Circular 150/5300-13, Airport Design. **(10)** The ATCT must be based on the current version of FAA Order 6480.4, Air Traffic Control Tower Siting Process. **(11)** The difference between construct, expand, modify, improve, and rehabilitate is listed in Table O-2.		
i. Law Enforcement Facilities	**(1)** The only eligible law enforcement facilities are airfield facilities to provide for a law enforcement presence required for air transportation security. The FAA has determined that the only facilities that meet these requirements are guard shacks at airfield access points. Guard	N/A	N/A

Table O-3 Other Building Project Requirements (Other than Terminals)

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	shacks are coded under security fencing (see Table L-2).		

*The official list of work codes can be obtained from the automated AIP system.

Appendix P. Roads and Surface Transportation Projects

P-1. How to Use This Appendix.

This appendix is not a valid stand-alone document for making eligibility and justification determinations. The information in this appendix must be used in conjunction with the Handbook, especially the project cost requirements in Chapter 3.

P-2. Project Requirements Tables.

In addition to the information provided in the above paragraph and the following tables, Appendix C contains examples of prohibited projects and costs and is very useful to use alongside this appendix.

Table P-1 Distinctions between Construct, Expand, Modify, Improve, and Rehabilitate

Use the following description…	If the project will…
a. Construct	Build a brand new road or surface transportation facility.
b. Expand	Add on to an existing road or surface transportation facility.
c. Modify	Change a road or surface transportation facility.
d. Improve	Provide a distinct new feature to a road or surface transportation facility.
e. Rehabilitate	Extend the useful life of a road or surface transportation facility.

Table P-2 Road and Surface Transportation Work Codes

If the project is justified as follows……	Use the following work codes…
a. The project meets the definition of a capacity project (see Appendix A).	CA GT XX
b. The project meets the definition of a standards project (see Appendix A).	ST GT XX

Table P-3 Roads and Surface Transportation

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
a. Access Road (Construct, Expand, Modify, Improve, or Rehabilitate)	**(1)** The terminal development definition in Appendix A defines which portion of the access road is treated as terminal development and therefore is subject to the funding restrictions for terminal development in Table N-7. **(2)** Generally, only one connection from the airport to the public road is allowable. However, more than one connection is eligible if the airport surface traffic is of sufficient volume to require more than one connection (must be supported by traffic counts and a recent traffic study) or there is no landside access to reach aeronautical facilities from any portion of the access road. **(3)** The connection from the airport to the public road may only extend to the nearest public highway of sufficient capacity to accommodate airport traffic. **(4)** Access roads directly to or from a terminal and an eligible or an ineligible area (such as a revenue producing parking lot or rental car facility) are eligible. This is because 49 USC § 47119(a)(1)(B) provides that access roads to and from a terminal is eligible because it is directly related to moving passengers and baggage in air commerce within the airport. **(5)** Access roads must be located on the airport or within a right-of-way acquired by the sponsor. **(6)** The access road must serve exclusively airport traffic. This means that an access road cannot be prorated. In mixed use situations of airport/nonairport use, only the portion of the road	A complete roadway access system that ties the public highway to the airport.	CA GT AC OT GT AC See Table P-2 for the correct work code.

Table P-3 Roads and Surface Transportation

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	that is beyond the non-airport access point is allowable. **(7)** Related facilities such as acceleration and deceleration lanes, exit and entrance ramps, street lighting, guidance and traffic signs, and bus stops may be included in the access road project when they are a necessary part of an eligible access road. **(8)** Guidance signs are not eligible unless they are required as part of an eligible road project, a major roadway reconfiguration, or a complete replacement of the signage system because the signs have met the end of their useful life. Airport entrance signs are not eligible. **(9)** Per FAA policy, bike lanes are allowable as part of access road development and must meet all of the other access road requirements. **(10)** The pavement must not have been reconstructed within the last 20 years; rehabilitated within the last 10 years, or resealed within the last 3 years except as allowed in Paragraph 3-12. **(11)** The application of asphalt seal coats or resealing of joints in concrete pavement is also eligible as a stand-alone project provided: **(a)** A major portion of the access road is being addressed; **(b)** The ADO concurs with the need for the project. **(12)** Recirculation roads and cell phone waiting lots are allowable if the ADO has determined that the additional costs are minimal, and can be included in the access road project, but not as a stand-		

Table P-3 Roads and Surface Transportation

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	alone project. Allowable cell phone waiting area costs are limited to those necessary to allow cars to remove themselves from the roadway circulation traffic and safely wait for arriving passengers. Areas for unattended car parking and amenities such as telephones, seating, flight information display boards are not considered necessary and are therefore are not eligible. **(13)** Like access roads, a project for walkways that lead directly to or from a terminal is eligible terminal development per 49 USC § 47102(28)(A)(iii); and the walkway can be included as part of the access road project. Per FAA policy, walkways include surface sidewalks, moving sidewalks, tunnel walkways, stairs, and overhead walkways. Covers or canopies over surface sidewalks may be included in a walkway project when they are necessary to protect concentrations of persons from the weather such as at passenger loading or unloading areas. In addition, only the portion of the walkway that is on airport is eligible. **(14)** The difference between construct, expand, modify, improve, and rehabilitate is listed in Table P-1.		
b. Service Road (Construct, Expand, Modify, Improve, or Rehabilitate)	**(1)** Airfield service roads are eligible as follows: **(a)** A service road for ARFF access to a runway or runway safety area. **(b)** A service road for separation of vehicles and aircraft justified on the basis of safety as determined by a	A fully functional service road that provides access to the intended area.	OT GT SV

Table P-3 Roads and Surface Transportation

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	14 CFR part 139 inspector or a Runway Safety Action Team recommendation. **(c)** A gravel service road located along the perimeter fence if necessary for security (and supported by a letter from TSA) or for safety (as determined by a 14 CFR part 139 inspector or a Runway Safety Action Team recommendation). The road must be on airport property and per FAA policy is limited to a 15 foot wide gravel road. **(d)** A temporary gravel service road on either side of a fence during construction of the fence. **(e)** A service road for access to an AIP eligible airside facility or NAVAID is eligible as part of that project or as a stand-alone project. **(2)** A service road that is otherwise eligible but provides incidental access to FAA or other non-aviation related areas or facilities is still considered eligible. **(3)** The difference between construct, expand, modify, improve, and rehabilitate is listed in Table P-1.		
c. Terminal People Mover (Construct, Expand, Modify, Improve, or Rehabilitate)	**(1)** Per FAA policy, terminal people movers are treated the same as access roads. As such, per 49 USC § 47102(28), terminal people movers are included in the definition of terminal development and must follow the terminal building funding rules in Table N-7. Stand-alone grants can be issued for these projects. **(2)** Light rail, monorail, and automated people mover systems used to transport passengers and	A fully functional airport people mover.	CA GT PM OT GT PM See Table P-2 for the correct work code.

Table P-3 Roads and Surface Transportation

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	baggage between terminals are considered eligible terminal people movers. **(3)** In addition, vehicles for moving passengers between terminal facilities and between terminal facilities and aircraft is specifically eligible as terminal development under 49 USC § 47102(28)(B). **(4)** Stations or stops must be on airport property and only for passenger access to the airport. **(5)** If any ineligible areas (examples of ineligible costs are listed in Appendix C) are included in the system's or station's design, the cost for the system and station must be prorated. The requirements for including ineligible or non-AIP funded work in the contract in Paragraph 3-39 must be met. **(6)** Extensive justification for an on-airport passenger transportation system is required. This justification must include a discussion of other alternatives. Any such project must be coordinated with APP-500. **(7)** The sponsor must include specific information describing the vehicle or equipment that is being acquired in the project description. **(8)** Per 49 USC § 47119(a)(1)(A), the airport has all safety equipment required for the airport per 49 USC § 44706 (Airport Operating Certificate), has all security equipment required by rule or regulation, and has provided for access by passenger to the area of the airport for boarding or exiting aircraft that are not air carrier aircraft.		

Table P-3 Roads and Surface Transportation

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	(9) The difference between construct, expand, modify, improve, and rehabilitate is listed in Table P-1.		
d. Access Rail (Construct, Expand, Modify, Improve, or Rehabilitate)	**(1)** Per FAA policy, access rails are treated the same as access roads. As such, per 49 USC § 47102(28), access rails are considered to be terminal development. Therefore, all funding restrictions for terminal development apply. **(2)** Public train service to an airport must meet the same eligibility criteria as airport access roads. The rail line must be limited to only serve passengers and employees traveling to and from the airport. **(3)** If any ineligible areas (examples of ineligible costs are listed in Appendix C) are included in the system's or station's design, the cost for the system and station must be prorated. The requirements for including ineligible or non-AIP funded work in the contract in Paragraph 3-39 must be met. **(4)** The difference between construct, expand, modify, improve, and rehabilitate is listed in Table P-1.	A fully functional access rail system.	CA GT RL OT GT RL See Table P-2 for the correct work code.

*The official list of work codes can be obtained from the automated AIP system.

This page has been intentionally left blank.

Appendix Q. Land Projects

Q-1. How to Use This Appendix.

This appendix is not a valid stand-alone document for making eligibility and justification determinations. The information in this appendix must be used in conjunction with the Handbook, especially the project cost requirements in Chapter 3.

Q-2. General Eligibility Requirements.

The acquisition of any interest in land is eligible when it is needed for *airport purposes*. Even though many infrastructure and construction elements are not eligible for AIP, the land they occupy is eligible for AIP funding if they meet this definition (see Appendix A).

The sponsor is responsible for maintaining adequate documentation to support costs as eligible for Federal reimbursement. A documentation checklist and quality control guidelines are provided in the current version of Advisory Circular 150/5100-17, Land Acquisition and Relocation Assistance for Airport Improvement Program Assisted Projects, and the current version of FAA Order 5100.37, Land Acquisition and Relocation Assistance for Airport Projects.

Q-3. Applicable Land Orders, Regulations, and Advisory Circulars.

When acquiring land for an AIP assisted project (AIP in any portion of the project) the airport owner must comply with 49 CFR part 24, Uniform Relocation Assistance and Real Property Acquisition for Federal and Federally-Assisted Programs. 49 CFR part 24 requirements are described in the current version of FAA Order 5100.37, Land Acquisition and Relocation Assistance for Airport Projects, and guidance for sponsor documentation and compliance is provided in the current version of Advisory Circular 150/5100-17, Land Acquisition and Relocation Assistance for Airport Improvement Program Assisted Projects. The airport owner must certify to the FAA its compliance to 49 CFR part 24 for any land acquired for an AIP funded airport project.

Q-4. Appraisal Requirement.

The cost of all AIP funded real property must be supported by a real estate appraisal, accepted settlement justification and evidence of good title to the acquired property. The FAA appraisal requirements are based on 49 CFR § 24.103. These requirements are described in the current version of FAA Order 5100.37, Land Acquisition and Relocation Assistance for Airport Projects, and in the current version of Advisory Circular 150/5100-17, Land Acquisition and Relocation Assistance for Airport Improvement Program Assisted Projects.

The fair market value of the land at the time of purchase must be used, not the current fair market value. The exception is for privately-owned airports, where 49 USC § 47109(d) requires that the current fair market value of the land at the time of the project be used.

Q-5. Good Title Requirements for Land and Easement Acquisition.

All AIP funded land and easement acquisition must meet the requirements for good title found in Table Q-1.

Table Q-1 Good Title Requirements for Land and Easement Acquisition

The following criteria apply…	
a.	The sponsor must acquire sufficient right, title and interest in the property to meet project requirements (e.g., construct, operate and maintain). Property interests required in off-airport areas must be sufficient to assure that the sponsor will not be deprived of its right to occupy and use such lands for the purposes intended.
b.	The sponsor must ensure marketable title to property is conveyed to the airport free and clear of any interest or encumbrance that may conflict with the project need and use of the property.
c.	Airport property title and airport interests in property must be recorded in the local public land records.
d.	The property title conveyed must be as appraised and agreed for the purchase.
e.	The sponsor's attorney must certify to ADO that good to title has been acquired.
f.	The attorney may rely on title insurance (title company commitment of insurance of marketable title), or title abstract or an attorney's certificate of title.

Q-6. Acceptable Land Interests.

The acceptable types of land interests that may be funded with AIP are listed in Table Q-2.

Table Q-2 Types of Land Interests

For the following type of land interest…	The following applies…
a. Fee Simple.	This is the preferred land interest for AIP funded projects.
b. Easements and Lesser Interests.	In some instances, a lesser property interest may be appropriate if the interest is legally sufficient for the purpose of the project or the acquisition is to a lesser property interest by a court order. For instance, it may be preferable to acquire an adequate easement for the transitional surface instead of the fee interest in the land. However, if the cost of a lesser interest, such as an easement, is nearly equivalent to the cost of fee simple interest, the sponsor must give priority to acquiring fee simple title. The ADO has an option to approve a lesser interest in such instances if the sponsor provides a valid and just reason acceptable to the ADO that substantiates the lesser interest. Additional guidance on easement terms and requirements is provided in the current version of Advisory Circular 150/5100-17, Land Acquisition and Relocation Assistance for Airport Improvement Program Assisted Projects.

Q-7. Logical Boundaries.

Where feasible, land may be acquired to a logical boundary, such as existing property lines and/or boundaries created by nature such as rivers and manmade development (highways, railroads, etc.).

Q-8. Uneconomic Remnants.

When a partial acquisition would leave the owner with an uneconomic remnant, as defined in 49 CFR part 24, the airport owner must offer to purchase the remnant.

Q-9. Disposal of Excess Land.

Occasionally, the sponsor may negotiate the purchase of more of a property than is required for the airport project (such as agreeing to a whole taking versus the needed partial take from the owner's property). In this case, AIP can be used to acquire the excess land. However, the airport sponsor must agree that it will promptly dispose of the excess land (per the requirements of Paragraph 5-68).

Q-10. Purchasing Land from a State/Local Public Agency.

The FAA must determine that land acquired from another public agency is, in fact, a bona fide sale to the sponsor, and that such land was not transferred merely for the purpose of making the land eligible for Federal funding.

Q-11. Project Requirements Tables.

In addition to the information provided in the above paragraphs and the following tables, Appendix C contains examples of prohibited projects and costs and is very useful to use alongside this appendix.

Table Q-3 Land Work Codes

If the project is for…	Use the following work codes…
a. Land or easement acquisition for a specific AIP eligible project.	The work code for the associated project
b. Land or easement acquisition for multiple AIP eligible projects.	ST LA DV (Acquire Land for Development) ST LA DV (Acquire Easement for Development)
c. Land acquisition for *airport purposes* (as defined in Appendix A) that are not AIP eligible.	ST LA MS (Acquire Miscellaneous Land)

Table Q-4 Land Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
a. Acquire Land or Easements	**(1)** The acquisition must meet the requirements of 49 CFR part 24, the current version of FAA Order 5100.37, Land Acquisition and Relocation Assistance for Airport Projects, and in the current version of Advisory Circular 150/5100-17, Land Acquisition and Relocation Assistance for Airport Improvement Program Assisted Projects. **(2)** The land or easement must be needed for airport purposes (as defined in Appendix A) within the next 20 years. **(3)** For reimbursement of previously acquired land or easements, the land or easement can be currently used for existing airport purposes or be needed for airport purposes (as defined in Appendix A) within the next 20 years.	Sponsor owned land or easement with good title.	See Table Q-3 for the correct work code.

Table Q-4 Land Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	(4) The associated development must be shown on the FAA approved airport layout plan. **(5)** The sponsor must certify that the requirements of 49 CFR part 24 are being met. **(6)** The Exhibit A must be updated when the purchase is complete.		
b. Lease Publically Owned Land	**(1)** These are rare, so the ADO must contact APP-400 for guidance to ensure that all of the necessary requirements are being met. **(2)** The Federal government is not considered a public agency in this instance. **(3)** The lease must meet the requirements of 49 CFR part 24, the current version of FAA Order 5100.37, Land Acquisition and Relocation Assistance for Airport Projects, and in the current version of Advisory Circular 150/5100-17, Land Acquisition and Relocation Assistance for Airport Improvement Program Assisted Projects. **(4)** The lease must be between the sponsor and public agency (a state; a political subdivision of a state (such as a city, municipality, or state agency); a tax-supported organization; or an Indian tribe or pueblo). **(5)** The acquisition, easement, or other interest in the land is not available. **(6)** The lease negotiations must meet applicable requirements of 49 CFR part 24. If the sponsor cannot condemn the land, then the lease negotiations may be exempt from the provisions of 49 CFR part 24 as a voluntary	A long term lease that helps ensure adequate rights needed to operate the airport.	See Table Q-3 for the correct work code.

Table Q-4 Land Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	transaction (as described at 49 CFR § 24.101(b)(2)). **(7)** Prepaid rent, which is payment in full in advance for the full term of the lease, is eligible. The pre-paid rent must reflect the present value of the rent payments, not to exceed the current fair market value of the real property leased. **(8)** The lease term must exceed 20 years. This is because the lease term must be longer than the grant assurances for AIP construction projects. **(9)** Justification must include reason why the land is not to be acquired instead of leased. **(10)** Periodic rental or lease payments are not allowable. **(11)** The land must be needed for airport purposes (as defined in Appendix A) within the next 20 years. **(12)** The associated development must be shown on the FAA approved airport layout plan. **(13)** The sponsor must certify that the requirements of 49 CFR part 24 are being met. **(14)** The Exhibit A must be updated when the purchase is complete.		
c. Exchange Land or Easement	**(1)** These are rare, so the ADO must contact APP-400 for guidance to ensure that all of the necessary requirements are being met. **(2)** Appraisals must be completed for the sponsor owned land and the property to be acquired. **(3)** Both properties must be appraised. If one piece of property has a higher value, the	Sponsor owned land or easement with good title.	See Table Q-3 for the correct work code.

Table Q-4 Land Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	owner of that property must be offered the difference. **(4)** The ADO must issue a land release before the sponsor owned land can be exchanged. **(5)** The acquired land or easement must be needed for airport purposes (as defined in Appendix A) within the next 20 years. **(6)** The associated development must be shown on the FAA approved airport layout plan. **(7)** The sponsor must certify that the requirements of 49 CFR part 24 are being met. **(8)** The Exhibit A must be updated when the purchase is complete.		
d. Acquire Land or Easement for Approaches	**(1)** Land acquisition and easements for approaches are eligible for the following: **(a) Airport Design Advisory Circular Surfaces.** Approach surfaces in the current version of Advisory Circular 150/5300-13, Airport Design. There are many approach surfaces including, but are not limited to, obstacle free zones, threshold obstacle clearance surfaces, 14 CFR part 77 surfaces, and approach and departure surfaces. **(b) 14 CFR part 77 Surfaces.** Per FAA policy, obstructions to the 14 CFR part 77 primary approach and 7:1 transitional surfaces. **(c) TERPS.** Any of the United States Standard for Terminal Instrument Procedures (TERPS) requirements.	Sponsor owned land or easement with good title.	ST LA SZ

Table Q-4 Land Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	(2) Land acquisition and easements (to control land use on the property) for Runway Protection Zones are eligible per the current version of Advisory Circular 150/5300-13, Airport Design. **(3)** For approach protection, land acquisition and easement are limited to that necessary for the approach surfaces to obtain vertical clearance 100 feet above the elevation of the runway ends, but no more than 5,000 feet beyond the end of the runway. Beyond 5,000 feet from the runway end, it is expected that the airport sponsor will rely on local zoning and land use controls to protect approaches. **(4)** The Exhibit A must be updated when the purchase is complete. **(5)** For new acquisition, the land or easement must be needed within the next 20 years. **(6)** For reimbursement of previously acquired land or easements, the land or easement must currently be needed or must be needed within the next 20 years. **(7)** If the sponsor is purchasing an easement for approaches, it is preferable that the easement allows the sponsor to clear rather than top trees. This is because AIP can only be used to top the trees once and any future clearing on the property cannot be grant funded. The actual clearing or topping is funded under an obstruction removal projects. If the easement and obstruction removal is done at the same time, the entire project is coded as obstruction removal.		

Table Q-4 Land Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	(8) Rebuilding a facility in a new location is only eligible if the facility meets the requirements in Paragraph 3-74. **(9)** Obstruction removal within runway safety areas must meet the requirements and use the work codes in Appendix G. **(10)** Obstruction removal to support Area Navigation (RNAV) approaches is covered elsewhere in Appendix D and has a different work code.		
e. Acquire Land for Noise Compatibility	**(1)** The requirements for this type of land are contained in Appendix R.	N/A	N/A

*The official list of work codes can be obtained from the automated AIP system.

This page has been intentionally left blank.

Appendix R. Noise Compatibility Planning/Projects

R-1. How to Use This Appendix.

This appendix is not a valid stand-alone document for making eligibility and justification determinations. The information in this appendix must be used in conjunction with the Handbook, especially the project cost requirements in Chapter 3.

R-2. General Eligibility Requirements (The Four Types of Justification).

To be eligible, a noise compatibility project (also referred to as a noise mitigation project) must meet one of the following justification requirements in Table R-1.

Table R-1 General Eligibility Requirements for Noise Compatibility Projects

The noise compatibility project must be…
a. Included in an FAA approved 14 CFR part 150 Program. A noise compatibility project in an FAA approved 14 CFR part 150 Noise Compatibility Program (NCP). The Aviation Safety and Noise Abatement Act of 1979 (ASNA) directed the FAA to identify land uses that are normally compatible with various noise exposure levels. In response, the FAA adopted the 14 CFR part 150, Airport Noise Compatibility Planning. The adoption of the regulation was published in the 46 Federal Register 8316 (January 26, 1981). 14 CFR part 150 serves as the guidance for many of the AIP funded noise compatibility projects. 14 CFR part 150, Appendix A includes Table 1 - Land Use Compatibility with Yearly Day-Night Average Sound Levels that defines compatible and noncompatible land uses and related structures.
b. A Facility Used Primarily for Medical or Educational Purposes. A noise compatibility project for an adversely affected facility used primarily medical or educational purposes (per 49 USC § 47504(c)(2)(D), regardless if the airport has a 14 CFR part 150 program or not). Schools and hospitals are the most typical facilities that fall under this justification.
c. In a Land Use Compatibility Plan. A noise compatibility project that is included in a land use compatibility plan prepared by a local jurisdiction surrounding a medium or large hub airport that either has not prepared a 14 CFR part 150 program or has not updated 14 CFR part 150 program in the preceding 10 years. Per 49 USC § 47141(f), grants for projects approved under an FAA accepted compatible land use plan are only allowable until September 30, 2018. After this date, the ADO must check the current legislation to see if the sunset date was extended.
d. In a Record of Decision. A noise mitigation project approved in an environmental record of decision for an airport development project.

R-3. Noncompatible Land Uses.

Table 1 of Appendix A in 14 CFR part 150 contains the requirements for determining when various land uses are noncompatible with aircraft noise, and therefore potentially eligible for AIP funding.

R-4. Not all 14 CFR part 150 Measures are Eligible.

Not all of the projects included in an approved 14 CFR part 150 program are eligible for AIP funding. Examples of ineligible 14 CFR part 150 NCP measures are listed in Appendix C.

R-5. Reduction Due to Aircraft Noise Associated with the Airport.

Noise insulation projects are designed to reduce interior noise in habitable rooms or classroom areas due to *aircraft* noise associated with the airport (as further discussed in the current version of Advisory Circular 150/500-9, Announcement of Availability Report No. DOT/FAA/PP/92-5, Guidelines for the Sound Insulation of Residences Exposed to Aircraft Operations).

R-6. Eligible Noise Contour Threshold (or the Use of a Lower Local Standards).

The primary measurement of noise impact is the exterior noise measurement of cumulative yearly day-night average sound level (DNL), normally depicted as noise contours on a map. The noise contour is a graphical representation of the level of 24 hour average sound level in decibels for the period from midnight to midnight, obtained after the addition of ten decibels to sound levels for the periods between midnight and 7 a.m. and between 10 p.m. and midnight local time that is experienced by land uses surrounding the airport due to aircraft operations.

a. DNL 65 dB Noise Contour. The DNL 65 dB noise contour is the noise level at or above which certain land uses are not considered to be compatible (49 USC § 47502, as implemented by Table 1 of Appendix A in 14 CFR part 150). The converse is also true – because DNL 65 dB is the Federal threshold for considering certain land uses as compatible, noise-sensitive land uses located outside of the DNL 65 dB noise contour are not considered to be impacted by airport related noise. They are not eligible for mitigation funding unless a lower local standard is formally adopted.

b. Community Noise Exposure Level (CNEL). The FAA recognizes CNEL (community noise exposure level) as an alternative noise metric for California. For purposes of this Handbook the metric DNL and CNEL can be used interchangeably for projects in California.

c. Lower Local Standard. The FAA can consider a lower level of noise than the DNL 65 dB noise contour only if both the jurisdictions with land use authority surrounding the airport and the sponsor have each formally adopted a lower local standard (per a footnote to Table 1 of Appendix A in 14 CFR part 150, which reads in part, "The responsibility for determining the acceptable and permissible land uses and the relationship between specific properties and specific noise contours rests with the local authorities."). The ADO can contact APP-400 for further information on determining whether locally adopted noise contours may be considered a local standard in the 14 CFR part 150 study.

R-7. Required Validation of the Noise Exposure Maps.

Per 49 USC § 47503, the noise exposure maps that the sponsor submits to the FAA must reflect current or reasonably projected conditions. 49 USC § 47503(b) requires that sponsors update their noise exposure maps if there is a substantial increase or significant decrease in the noise contour over noncompatible land uses. 14 CFR part 150 defines a DNL 1.5 dB change or more

as substantial. The exception is for noise mitigation projects in an environmental record of decision for an airport development project.

In addition, the FAA requires by policy that if the FAA-accepted Noise Exposure Maps used to document project eligibility are more than five years old, sponsors must confirm in writing to the ADO that the noise exposure maps upon which noise compatibility projects are based continue to be a reasonable representation of current and/or forecast conditions at the airport. The ADO must verify whether or not the noise exposure map reflects the current or projected operational conditions at the airport and associated noncompatible land uses. The ADO must also place a copy of the sponsor confirmation and ADO verification in the grant file. The ADO must not program noise compatibility projects using noise exposure maps that are more than five years old unless this process has been completed.

R-8. Interior Noise Level Requirements.

The 45 dB standard has been adopted by the FAA for interior noise. This is based on 46 Federal Register 8316 (January 26, 1981), which established the interim rule for 14 CFR part 150 and included specific requirements regarding interior noise level. This was further clarified in 1992 by the Federal Interagency Committee on Noise (FICON) findings of 45 dB to be the interior noise level that will accommodate indoor conversations or sleep.

A noise-impacted noncompatible structure must be experiencing existing interior noise levels that are 45 dB or greater with the windows closed to be considered eligible. (For schools, the 45 dB measurement is based on the number of hours of the school day.)

The calculation of interior noise level must be based on the average noise level of only the habitable rooms or parts of school that are used for educational instruction. Habitable areas of residences are living, sleeping, eating or cooking areas (single family and multifamily) per the current version of Advisory Circular 150/5000-9, Announcement of Availability Report No. DOT/FAA/PP/92-5, Guidelines for the Sound Insulation of Residences Exposed to Aircraft Operations. Bathrooms, closets, halls, vestibules, foyers, stairways, unfinished basements storage or utility spaces are not considered to be habitable. For schools, noise insulation is limited to classrooms, libraries, fixed seat auditoriums, and educators' offices.

Areas that are not allowed under local building codes are not considered habitable. For example, a resident has converted part of a basement to a bedroom and the bedroom conversion does not meet the building code requirements to be categorized as a bedroom. The converted bedroom is not considered habitable space. For schools, areas that are used for incidental instruction, such as hallways, gymnasiums and cafeterias, are not eligible.

By policy, the FAA does not recognize a lower local standard below 45 dB for interior noise levels.

R-9. Block Rounding.

Per FAA policy, if sponsor proposes to expand noise mitigation just beyond the DNL 65 dB contour to include parcels contiguous to the project area (referred to as block rounding), the ADO has the option to approve this request if the requirements in Table R-2 are met.

Table R-2 Block Rounding Requirements

Requirements include…
a. DNL 65 dB Contour does not have a Reasonable End Point. The block rounding must be necessary to reach a reasonable end point for noise insulation projects.
b. Sponsor Provides a Detailed List of Residences. The sponsor must provide the ADO the proposed end point information, including a complete list of the specific residences (by address) that are proposed for block rounding.
c. Called Out on All Lists. On all other lists of residences, these residences must be noted as *included due to block rounding*.
d. ADO Determination. The ADO must review and either approve or disapprove including the proposed block rounding residences at part of the associated noise mitigation program or environmental study. The ADO must document the determination and place a copy of the determination in the grant file.
e. Logical Breakpoint. In determining the reasonable end point for noise insulation projects, the ADO must ensure that the end point is a logical breakpoint (such as a neighborhood boundary, significant arterial surface street, highway, river, other physical or natural barrier or feature) or whether the end point extends unreasonably beyond a natural break. Neighborhood or street boundary lines may help determine the reasonable number of additional properties.
f. Interior Noise Levels Qualify. Once a residence is approved for block rounding, its interior noise levels must meet the requirements in Paragraph R-8 in order for that particular residence to be eligible.
g. Not Applicable for Lower Local Standards. Residences that lie outside of an eligible lower local standard below DNL 65 dB (per Paragraph R-6) are not eligible for block rounding.

R-10. Neighborhood Equity.

A sponsor may consider the use of neighborhood equity when residences in the eligible noise contour threshold (per Paragraph R-6) that do not meet the interior noise level requirements are scattered among residences that do meet the interior noise level criteria. If sponsor proposes to use neighborhood equity provisions, the ADO has the option to approve this request if the requirements in Table R-3 are met.

Table R-3 Requirements for Neighborhood Equity

Requirements include…
a. In the Eligible Noise Contour Threshold. The residence must be in the eligible noise contour threshold (per Paragraph R-6).
b. Separate Package. The sponsor must develop a separate neighborhood equity package limited to improvements such as caulking, weather stripping, installation of storm doors or ventilation packages. The ADO must not approve the use of the standard noise insulation package for neighborhood equity residences.
c. Percent Participation Limit. Per FAA policy, the ADO must not approve neighborhood equity for more than 10% of the residences in the neighborhood, (as logically bounded by either streets or other geographic delineation) or 20 residences in a phase of the noise insulation program, whichever is less. Note that the FAA has determined that PFC and airport revenue cannot be used to fund any residences beyond this limit, because homes beyond this limit are not adversely affected by airport noise.
d. APP-1 Approval for Exceeding Percent Participation Limit. In extremely rare cases, ADO may determine that the program will benefit by providing noise equity packages to more than the 10%/no more than 20 residence limit. In this instance, the ADO must have received written APP-1 approval to exceed this limit.
e. Sponsor Provides a Detailed List of Residences. The sponsor must provide the ADO with a complete list of the specific residences (by address) that are proposed for neighborhood equity.
f. Sponsor Provides a Cost Comparison. The sponsor must provide the ADO with detailed information comparing the cost of the proposed neighborhood equity package with the cost of a standard noise insulation package.
g. ADO Determination. The ADO must review and approve or disapprove the sponsor's proposed neighborhood equity package. In their determination, the ADO must ensure that the use of the minimal neighborhood equity packages on non-eligible residences is required to allow successful completion of the overall noise insulation program in the neighborhood, thus allowing these residences to be noise insulated within the guidelines of AIP eligibility. The ADO must document the determination and place a copy of the determination in the grant file.

R-11. Pre- and Post-Testing Criteria for Noise Insulation Projects.

In order for a structure to be funded with AIP grant funding, the sponsor must follow the sampling and testing criteria listed in Table R-4.

Table R-4 Pre- and Post-Testing Criteria for Noise Insulation Projects

For the following…	The requirement is…
a. Published Guidance	**(1)** In 1992, the FAA adopted guidance on test sampling frequency and other statistical measures that can be applied to a neighborhood to estimate the interior noise levels in the residences that are in the 65 dB DNL contour. This information is compiled into the Acoustical Testing Plan. Long standing agency policy is that an airport sponsor must use the 1992 guidance to establish the existing interior noise levels to determine whether or not the building qualifies for sound insulation using AIP. The 1992 guidance is found in current version of Advisory Circular 150/5000-9, Announcement of Availability Report No. DOT/FAA/PP/92-5, Guidelines for the Sound Insulation of Residences Exposed to Aircraft Operations. **(2)** The 1992 guidance was written to cover a broad range of sound insulation topics. There are recommendations in the guidance that exceed what is justified under AIP. However, just because an item is discussed in the guidance, this does not make it eligible or justified. This Handbook, not the guidance, provides the guidance for determining eligibility and justification for any project that is AIP funded.
b. Sponsor Requirements for submitting Testing Protocol to the ADO	**(1)** The sponsor must submit the proposed testing protocol to the ADO. **(2)** The ADO has the option to review the testing protocol. **(3)** After ADO review or after the ADO has indicated that the testing protocol will not be reviewed, the sponsor will then noise insulate the residences in the testing phase.

Table R-4 Pre- and Post-Testing Criteria for Noise Insulation Projects

For the following…	The requirement is…
c. First Step – Initial Testing	**(1)** The first step of a noise insulation program is generally the initial testing phase. In this phase, the sponsor characterizes the neighborhood by characterizing the housing types, level of noise exposure (i.e., Location within the noise contour) and address. The sponsor must also describe the acoustical issues, number of residences to be tested and describe the acoustical criteria and testing methodology. **(2)** A sponsor starting a sound insulation program in a community near the airport will typically first conduct a windshield survey of the types of residences that are in the current phase. The windshield survey catalogs the types of residences in the neighborhood, notes similarities and differences in the age, construction type, size, number of levels, and types of housing (single family or multi-family). **(3)** Once the sponsor has characterized the diversity of the residences in the noise contour, it will select a representative sample of each type of similarly-constructed residences for testing, which based on industry review is typically 10% to 30%. Testing in this case means that the sponsor develops and installs a sound insulation package that the sponsor believes will reduce the interior noise level in the residence for each type of construction. **(4)** In a neighborhood where the residences are made of either brick or wood siding, the sponsor will develop two different packages – one for the brick residences and one for the siding residences. **(5)** The sponsor will then measure the interior noise levels and prepare a summary report detailing the effectiveness of the design package, make recommendations for any changes to the package, lists the before and after interior noise level data, and submits the package to the ADO. **(6)** Reimbursement for initial and subsequent phase testing is limited to 10% of the residences of a particular type unless the sponsor has provided the justification for the request to the ADO and the ADO has approved the request. **(7)** The ADO must approve or disapprove a sponsor request for reimbursement for testing more than 10%, but not more than 30%, of the residences of a particular construction type. The ADO may request APP-400 assistance in evaluating sponsor requests. A copy of the sponsor's written request and the ADO approval or disapproval must be kept in the grant file. **(8)** For requests for reimbursement for more than 30% of the residences of a particular type, the ADO must have received APP-400 approval. The request to APP-400 from the ADO must contain the sponsor's justification for the request and the ADO's recommendation for approval or disapproval.

Table R-4 Pre- and Post-Testing Criteria for Noise Insulation Projects

For the following…	The requirement is…
d. Second Step - ADO and Sponsor Review of Initial Testing Results	**(1)** The sponsor must review the results to determine if there is a need to test additional residences. **(2)** The ADO has the option to review and approve or disapprove all sponsor revisions to the sampling program.
e. Special Circumstance – Resident Requests Specific Testing	**(1)** A resident may request that their residence be tested specifically. This may be because of the condition of the home, or because the resident believes that their residence will test differently than others. These additional tests are generally allowable. However, if an additional residence is tested, it must be tested both before and after any noise insulation work to ensure the 5 dB NLR is achieved.
f. Final Step – Completing the Testing Phase	**(1)** After the completion of the testing phase, the sound insulation program will begin for the neighborhood. In these later phases, the sponsor is still expected to test from 10% to 30% of each different category of residences in the phase to revalidate the design assumptions. The results of the revalidation testing must be submitted by the sponsor to the ADO. The ADO has the option to review these test reports.

R-12. Conditions for Posting Planning Documents on the Internet.

If the sponsor, or a sponsor's consultant, posts an AIP funded planning document on the internet, it is FAA policy that the public must not be required to register to view or download the document (even if the document is posted elsewhere without registration requirements). This is because the collection of personal data may be construed by the public as a surveillance tool for the airport, which may intimidate members of the public, dissuading them from reviewing the document. In addition 5 USC § 552a(e), The Privacy Act of 1974, prohibits the unnecessary collection of private data by Federal agencies by restricting the agency to maintain only such information about an individual as is relevant and necessary to accomplish the purpose.

R-13. Disposal of Excess/Unneeded AIP Funded Noise Land (and ADO/Sponsor Tracking).

The requirements for the disposal of excess or unneeded AIP funded noise land are contained in Paragraph 5-68.

R-14. Project Requirements Tables.

In addition to the information provided in the above paragraphs and tables, and the following tables, Appendix C contains examples of prohibited projects and costs and is very useful to use alongside this appendix.

Table R-5 Noise Compatibility Planning/Project Work Codes

If the noise mitigation planning and implementation project is defined by where it is in the DNL, and is…	Use the following work codes…
Outside the 65 DNL.	XX XX 60
Within the 65 – 69 DNL.	XX XX 65
Within the 70 – 74 DNL.	XX XX 70
Within the 75 DNL.	XX XX 75

Table R-6 Noise Compatibility Planning/Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
a. Conduct Noise Compatibility Program Study *(14 CFR part 150 Study)*	**(1)** The study and noise exposure maps must comply with the requirements of 14 CFR part 150.	An FAA approved noise compatibility program study and FAA accepted noise exposure maps.	EN PL NO
b. Conduct Noise Compatibility Plan Study *(Stand-Alone Noise Exposure Map Update)*	**(1)** The noise exposure map (NEM) update must comply with the requirements of 14 CFR § 150.21(d). **(2)** Per 14 CFR § 150.21(a)(1), the noise exposure levels must be based on forecast aircraft operations at the airport for a forecast period that is at least five years in the future beginning at the date of sponsor submission. **(3)** The sponsor must submit the updated noise exposure map to the ADO for FAA review. **(4)** The FAA must complete the required notice and comment in the Federal Register (this is a requirement in 14 CFR § 150.21(c)) **(5)** The sponsor must evaluate the impact of the updated NEMs against the existing noise compatibility program (NCP).	New FAA accepted noise exposure maps.	EN PL NO

Table R-6 Noise Compatibility Planning/Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	Note: This is not a complete update of the Record of Approval and NCP – rather this is an evaluation of whether the work items in the NCP are still valid. **(6)** The sponsor must submit the results of the evaluation to the ADO. The ADO must include the sponsor's evaluation in the grant file. **(7)** If, in the opinion of the FAA, the changes in the NCP impact are extensive, the FAA has the option to require an update to the NCP.		
c. Conduct Noise Compatibility Plan Study (Compatible Land Use Plan by State and Local Governments per 49 USC § 47141)	**(1)** The compatible land use planning is for an area around a large or medium hub airport. **(2)** The airport has not submitted an airport noise compatibility program to the FAA under 14 CFR part 150, or has not updated its approved noise compatibility program within the preceding 10 years. **(3)** The state or local government sponsor and airport have entered into a written agreement to prepare the compatible land use plan cooperatively (prior to the grant being issued). **(4)** The state or local government sponsor must maintain compatible land use measures listed in the completed plan. **(5)** The land use plan will be reasonably consistent with the goal of reducing existing non-compatible land uses and preventing the introduction of additional non-compatible land uses per 14 CFR part 150. **(6)** The land use plan will only include measures that are within the authority of the state or local	An FAA accepted (and airport approved) compatible land use plan with a capital improvement plan containing the plan measures.	EN PL NO

Table R-6 Noise Compatibility Planning/Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	government sponsor to implement. Measures such as studying or implementing aircraft operational procedures, airport layout changes, and airport noise and access restrictions must not be included because the state or local government sponsor has no authority to carry out these measures. **(7)** The airport must provide the state or local government sponsor with valid airport noise exposure maps and all noise abatement measures adopted by the airport. The airport must certify to the state or local government sponsor and the FAA that the noise exposure maps are representative of the current conditions at the airport. The state or local government sponsor must use this information when developing the land use plan. **(8)** The land use plan must not duplicate and must be consistent with all of the airport's noise compatibility measures for the same area. **(9)** The state or local government sponsor must include evidence of public involvement in the land use plan. **(10)** The state or local government sponsor must make provisions to implement those elements of the plan that are ineligible for Federal financial assistance. **(11)** Per 49 USC § 47141(f), these types of grants are only allowable until September 30, 2018. After this date, the ADO must check the current legislation to see if the sunset date was extended.		

Table R-6 Noise Compatibility Planning/Project Requirements

d. Noise Mitigation *(Required by an Environmental Record of Decision)*	**(1)** Noise mitigation projects approved in an environmental record of decision for an AIP eligible project is an allowable cost (or phase) of the AIP eligible project per Paragraph R-2.	A noise mitigation measure that meets the requirements of the record of decision.	The work code of the associated AIP eligible project must be used
e. Acquire Land for Noise Compatibility *(To Change Land Use)*	**(1)** The project must be included in an FAA approved 14 CFR part 150 program or an FAA accepted compatible land use plan. **(2)** The land must be included on the Noise Land Inventory Map and the Noise Land Reuse Plan. Noise Land Management and Requirements for Disposal of Noise Land or Development Land Funded with AIP (see Appendix B for link) contains guidance for these plans. **(3)** Per 49 USC § 47141(f), grants for projects approved under an FAA accepted compatible land use plan are only allowable until September 30, 2018. After this date, the ADO must check the current legislation to see if the sunset date was extended. **(4)** The project must be within the DNL 65 dB noise contour unless a lower local standard has been formally adopted. **(5)** The requirements for interior noise do not apply to acquisition projects. **(6)** The project may include residential relocation. **(7)** The sponsor must provide the ADO with the number of people that have benefited. **(8)** The acquisition must meet the requirements of 49 CFR part 24,	Sponsor owned land with good title that will allow the sponsor to clear the noncompatible land use.	EN LA 60 EN LA 65 EN LA 70 EN LA 75 See Table R-5 for correct work code

	exchange for sound insulation. The FAA encourages sponsors to work out such voluntary property agreements locally. **(5)** The acquisition must meet the requirements of 49 CFR part 24, the current version of FAA Order 5100.37, Land Acquisition and Relocation Assistance for Airport Projects, and the current version of Advisory Circular 150/5100-17, Land Acquisition and Relocation Assistance for Airport Improvement Program Assisted Projects. **(6)** The sponsor must certify that the requirements of 49 CFR part 24 are being met. **(7)** The acquisition must meet all other applicable requirements in Appendix Q. **(8)** The project must meet the general eligibility requirements in Paragraph R-2.		
g. Noise Mitigation Measures for Residences *(Full Sound Insulation Package)*	**(1)** The project must be included in an FAA approved 14 CFR part 150 program or an FAA accepted compatible land use plan. **(2)** Per 49 USC § 47141(f), grants for projects approved under an FAA accepted compatible land use plan are only allowable until September 30, 2018. After this date, the ADO must check the current legislation to see if the sunset date was extended. **(3)** The project must meet the two-stage eligibility test. First the property must be in an eligible noise contour threshold (per Paragraph R-6) and second, the property must meet the interior	A residence that has been mitigated to 14 CFR part 150 requirements.	EN HO 60 EN HO 65 EN HO 70 EN HO 75 See Table R-5 for correct work code.

Table R-6 Noise Compatibility Planning/Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	noise level requirement (per Paragraph R-8). **(4)** The sound insulation package must provide a reduction in indoor noise level of at least 5 dB and bring the average interior noise level below 45 dB. If for any reason the sponsor believes that the 5 dB reduction cannot be achieved, the sponsor must provide a written request to the ADO. The ADO must receive APP-1 concurrence to proceed with the work. APP-1 concurrence will generally be limited to ventilation packages, cases of neighborhood equity or for older or poorly maintained residences where the 5 dB reduction may be difficult to achieve. **(5)** The sponsor must follow the sampling and testing criteria listed in Paragraph R-11. **(6)** The following measures are allowable: window and door replacement, caulking, weather-stripping, and installing central air ventilation so that the windows can be kept closed only if the structure does not already have a central air ventilation system. The use of other measures is not allowable unless the ADO has approved the use of the measures in advance. In this case, the ADO must keep a copy of the sponsor's request for use of other measures and a copy of the ADO approval of the request in the grant file. Eligibility is limited to the measures listed above unless the ADO has received approval from APP-400 and APP-500 to use other measures.		

Table R-6 Noise Compatibility Planning/Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	(7) The structure must have been built prior to October 1, 1998 unless the sponsor has demonstrated to the ADO that no published noise contours existed at that time. New noncompatible land uses created by subsequent airport development may also be eligible for funding consideration. The October 1, 1998 date is based on the FAA Final Policy on Part 150 Approval of Noise Mitigation Measures: Effect on the Use of Federal Grants for Noise Mitigation Projects, 63 Federal Register 16409 (April 3, 1998). **(8)** An easement may be conveyed by the property owner in exchange for the sound insulation improvements provided. However, an AIP grant may not include a requirement that a property owner convey an easement (or other interest in the property) to the sponsor in exchange for sound insulation. The FAA encourages sponsors to work out such voluntary property agreements locally, exclusive of FAA grant stipulations. **(9)** Both single and multi-family residences, including apartment buildings, are eligible. **(10)** The sponsor must provide the ADO with the number and address of homes mitigated and the number of people that have benefited. **(11)** Additional guidance is provided in the current version of Advisory Circular 150/5000-9, Announcement of Availability Report No. DOT/FAA/PP/92-5, Guidelines for the Sound		

Table R-6 Noise Compatibility Planning/Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	Insulation of Residences Exposed to Aircraft Operations. **(12)** Permanent Modular Buildings. Some modular structures may be classified as permanent if they meet construction guidelines applied to permanent structures. **(13)** The project must meet the general eligibility requirements in Paragraph R-2.		
h. Noise Mitigation Measures for Residences *(Positive Ventilation Package Only)*	**(1)** The residence must not have continuous positive ventilation and when tested, must demonstrate interior noise levels less than 45 dB. **(2)** Because the interior noise measurements are conducted with "windows closed", there may be situations where a residence does not have an existing ventilation system, but relies on keeping the windows open for air circulation. **(3)** A Continuous Positive Ventilation System is the allowable package for these residences. The sponsor must also provide detailed information about the ventilation package including costs of the package compared to the cost of a standard noise insulation package. The sponsor may recommend an air conditioning system in lieu of ventilation- only. **(4)** Because a ventilation system is likely to increase utility and maintenance costs for the residence, the sponsor must provide information about utility and maintenance costs for the installed equipment to the residence owners.	A residence that has been mitigated to 14 CFR part 150 requirements.	EN HO 60 EN HO 65 EN HO 70 EN HO 75 See Table R-5 for correct work code.

Table R-6 Noise Compatibility Planning/Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	(5) This package is limited to those structures that do not have an existing continuous positive ventilation system. It is not available to structures that have an existing continuous positive ventilation system in place even if the system is inoperable, older, or does not meet the current building code standards for air exchanges. **(6)** The project must meet the general eligibility requirements in Paragraph R-2.		
i. Noise Mitigation Measures for Public Buildings *(Full Sound Insulation Package)*	**(1)** The project must meet the two-stage eligibility test. First the property must be in an eligible noise contour threshold (per Paragraph R-6) and second, the property must meet the interior noise level requirement (per Paragraph R-8). **(2)** The sound insulation package must provide a reduction of at least 5 dB and bring the average interior noise level below 45 dB. Depending on the pre-insulation noise measurements, the 5 dB reduction may result in an interior noise level that is less than 45 dB. If for any reason the sponsor believes that the 5 dB reduction cannot be achieved, the sponsor must provide a written request to the ADO. The ADO must receive APP-1 concurrence to proceed with the work. APP-1 concurrence will generally be limited to ventilation packages and cases of neighborhood equity or for older or poorly maintained residences where the 5 dB reduction may be difficult to achieve.	A public building that has been mitigated to 14 CFR part 150 requirements.	EN PB 60 EN PB 65 EN PB 70 EN PB 75 See Table R-5 for correct work code

Table R-6 Noise Compatibility Planning/Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	(3) The sponsor must follow the sampling and testing criteria listed in Paragraph R-11. **(4)** The following measures are allowable: window and door replacement, caulking, weather-stripping, and installing central air ventilation so that the windows can be kept closed only if the structure does not already have a central air ventilation system. The use of other measures is not allowable unless the ADO has approved the use of the measures in advance. In this case, the ADO must keep a copy of the sponsor's request for use of other measures and a copy of the ADO approval of the request in the grant file. Eligibility is limited to the measures listed above unless the ADO has received approval from APP-400 and APP-500 to use other measures. **(5)** For schools, only the actual educational areas are eligible. This normally only includes classrooms, libraries, fixed seat auditoriums, and school educator's offices. The ADO must contact APP-400 for guidance on eligibility for facilities or areas beyond those specifically listed here. Appendix C includes some areas that have previously been determined to be ineligible. **(6)** The structure must have been built prior to October 1, 1998 unless the sponsor has demonstrated to the ADO that no published noise contours existed at that time. New noncompatible land uses created by subsequent airport development may also be eligible for funding consideration. The October 1, 1998 date is		

Table R-6 Noise Compatibility Planning/Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	based on the FAA Final Policy on Part 150 Approval of Noise Mitigation Measures: Effect on the Use of Federal Grants for Noise Mitigation Projects, 63 Federal Register 16409 (April 3, 1998). **(7)** Permanent Modular Buildings. Some modular structures may be classified as permanent if they meet construction guidelines applied to permanent structures. **(8)** The sponsor must certify to the ADO that the engineering plans and specifications for the noise insulation project conform to the local building code. **(9)** Only the costs related to the noise insulation improvements are included in the project. If it is determined in the course of designing a noise insulation project that a building needs improvements in order to conform to local building codes, only the costs of the noise insulation are allowable. **(10)** An easement may be conveyed by the property owner in exchange for the sound insulation improvements provided. However, an AIP grant may not include a requirement that a property owner convey an easement (or other interest in the property) to the sponsor in exchange for sound insulation. The FAA encourages sponsors to work out such voluntary property agreements locally, exclusive of FAA grant stipulations. **(11)** The sponsor must provide the ADO with the number of students benefitting.		

Table R-6 Noise Compatibility Planning/Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	(12) The project must meet the general eligibility requirements in Paragraph R-2.		
j. Noise Mitigation Measures for Public Buildings *(Positive Ventilation Package Only)*	**(1)** The building must not have continuous positive ventilation and when tested, must demonstrate interior noise levels less than 45 dB. **(2)** Because the interior noise measurements are conducted with "windows closed," there may be situations where a public building does not have an existing ventilation system, but relies on keeping the windows open for air circulation. **(3)** A Continuous Positive Ventilation System is the allowable package for these building. The sponsor must also provide detailed information about the ventilation package including costs of the package compared to the cost of a standard noise insulation package. The sponsor may recommend an air conditioning system in lieu of ventilation- only. **(4)** This package is limited to those structures that do not have an existing continuous positive ventilation system. It is not available to structures that have an existing continuous positive ventilation system in place even if the system is inoperable, older, or does not meet the current building code standards for air exchanges. **(5)** This package is limited to only those areas that are being noise insulated in the public building. **(6)** The project must meet the general eligibility requirements in Paragraph R-2.	A public building that has been mitigated to 14 CFR part 150 requirements.	EN PB 60 EN PB 65 EN PB 70 EN PB 75 See Table R-5 for correct work code

Table R-6 Noise Compatibility Planning/Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
k. Install Outdoor Noise Monitoring System/Equipment *(Portable Noise Monitoring System and Equipment*	**(1)** The project must be included in an FAA approved 14 CFR part 150 Noise Compatibility Program or an FAA accepted compatible land use plan. **(2)** Per 49 USC § 47141(f), grants for projects approved under an FAA accepted compatible land use plan are only allowable until September 30, 2018. After this date, the ADO must check the current legislation to see if the sunset date was extended. **(3)** Non-airport sponsors are only eligible for portable noise monitoring equipment when used in connection with noise insulation projects managed by the non-airport sponsors. **(4)** In cases where more than one sponsor is expected to engage in noise insulation programs, the airport sponsor is encouraged to acquire the equipment and make it available to other local agencies as needed. **(5)** The system can be replaced every 10 years (the useful life). **(6)** Portable outdoor noise monitors must be used for carrying out/certifying approved noise mitigation measures. This typically includes periodic short-term noise monitoring of aircraft operations at the airport for the purposes of reporting the results as described in an approved 14 CFR part 150 program management measure. This also means that purpose for the outdoor noise monitors cannot be for enforcement of noise rules.	A completely operational portable outdoor noise monitoring system that meets the requirements of 14 CFR part 150.	EN OT NO

Table R-6 Noise Compatibility Planning/Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	(7) The sponsor must provide the ADO copies of noise monitoring data on request. **(8)** Monitoring systems are limited to outdoor monitoring systems. **(9)** Only the Federal share of the least costly system that will satisfy the purposes used to justify the project is eligible. The ability to track 100% of flights and/or real time display of flight tracks is beyond the functionality necessary to meet the purposes of noise monitoring. **(10)** The data ownership must remain with the sponsor, not the vendor. **(11)** The sponsor is responsible for ongoing vendor service costs that may be needed to access FAA surveillance tracking data. **(12)** The project must meet the general eligibility requirements in Paragraph R-2.		
l. Install Noise Monitoring System/Equipment *(Fixed Noise Monitoring System and Equipment)*	**(1)** The project must be included in an FAA approved 14 CFR part 150 program or an FAA accepted compatible land use plan. **(2)** Per 49 USC § 47141(f), grants for projects approved under an FAA accepted compatible land use plan are only allowable until September 30, 2018. After this date, the ADO must check the current legislation to see if the sunset date was extended. **(3)** Systems are limited to circumstances where sponsors can clearly show that portable monitors are not feasible. **(4)** Placement of fixed noise monitoring equipment is eligible	A completely operational fixed noise monitoring system that provides regular reporting of noise events.	EN OT NO

Table R-6 Noise Compatibility Planning/Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	only within the DNL 65 dB noise contour at the time of installation. **(5)** Only the Federal share of the least costly system that will satisfy the purposes used to justify the project is eligible. The ability to track 100% of flights and/or real time display of flight tracks is beyond the functionality necessary to meet the purposes of noise monitoring. **(6)** The data ownership must remain with the sponsor, not the vendor. **(7)** The sponsor is responsible for ongoing vendor service costs that may be needed to access real-time FAA surveillance tracking data. **(8)** The system can be replaced every 10 years (the useful life). **(9)** Monitoring results must be in accordance with the approved 14 CFR part 150 program or compatible land use program measure. **(10)** The sponsor must provide the ADO copies of noise monitoring data on request. **(11)** The project must meet the general eligibility requirements in Paragraph R-2.		
m. Noise Mitigation Measures *(On-Airport Noise Barriers)*	**(1)** The project must be approved in a 14 CFR part 150 program. **(2)** Noise barriers, earth berms, wall structures, hush houses, ground run-up enclosures and other devices designed to shield land uses that are noncompatible with aircraft noise are eligible. **(3)** The on-airport noise barrier must be public-use (not exclusive use by any specific aircraft operator).	A fully functional noise reduction structure that meets the requirements of 14 CFR part 150.	EN OT MS

Table R-6 Noise Compatibility Planning/Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
	(4) The project must reduce noise to a land use noncompatible with aircraft noise by at least 5 dB. **(5)** The project must not impact wingtip clearances or air traffic control tower line of sight. **(6)** The project must meet the general eligibility requirements in Paragraph R-2.		
n. Noise Mitigation Measures *(Runway and Taxiway Construction)*	**(1)** These are rare, so the ADO must contact APP-400 for guidance to ensure that all of the necessary requirements are being met. **(2)** The project must be approved in a 14 CFR part 150 program. **(3)** A runway or taxiway project (including land acquisition, lighting, marking, and/or NAVAIDs) is eligible as a noise mitigation measure if it can be shown that the principal purpose and benefit of the project is for noise relief. If the noise relief is a secondary benefit, the FAA will not approve the project as a noise mitigation measure, and the project must meet the normal eligibility requirements for a runway or taxiway project. **(4)** Lighting and NAVAIDs for noise must be used for the purpose of directing pilots to follow noise abatement flight paths and must be associated with a noise abatement runway. **(5)** The project must meet the general eligibility requirements in Paragraph R-2.	An airfield or NAVAID installation that meets FAA design standards.	EN OT MS
o. Conduct Environmental Study for Flight Procedures Approved in a	**(1)** The requirements for environmental studies for flight procedure approvals are provided in Appendix S.	N/A	N/A

14 CFR part 150 Study			

*The official list of work codes can be obtained from the automated AIP system.

Appendix S. Environmental Planning/Mitigation Projects

S-1. How to Use This Appendix.

This appendix is not a valid stand-alone document for making eligibility and justification determinations. The information in this appendix must be used in conjunction with the Handbook, especially the project cost requirements in Chapter 3.

S-2. Conditions for Posting Planning Documents on the Internet.

If the sponsor, or a sponsor's consultant, posts an AIP funded planning document on the internet, it is FAA policy that the public must not be required to register to view or download the document (even if the document is posted elsewhere without registration requirements). This is because the collection of personal data may be construed by the public as a surveillance tool for the airport, which may intimidate members of the public, dissuading them from reviewing the document. In addition 5 USC § 552a, The Privacy Act of 1974, prohibits the unnecessary collection of private data by Federal agencies by restricting the agency to maintain only such information about an individual as is relevant and necessary to accomplish the purpose.

S-3. Project Requirements Tables.

In addition to the information provided in the above paragraphs and the following tables, Appendix C contains examples of prohibited projects and costs and is very useful to use alongside this appendix.

Table S-1 Environmental Planning/Mitigation Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
a. Conduct Environmental Study	**(1)** The project must follow the requirements of the current version of FAA Order 5050.4, National Environmental Policy Act (NEPA) Implementing Instructions for Airport Projects. **(2)** Environmental Assessments (EA) and Environmental Impact Statements (EIS) must be coded separately from the proposed project (EN PL MA). The one exception is if such a study or assessment is less than $25,000, in which case it can then be coded under the proposed project. **(3)** This work code is used for a study that analyzes a specific environmental condition at an airport. An example is an emissions analysis necessary to comply with the Clean Air Act (42 USC § 7401). **(4)** This work code is also used for an environmental assessment for the development that is in the airport's capital improvement plan in the next five-years. **(5)** Per FAA policy, environmental assessments and environmental impact statements are considered to be planning. This allows the ADO to issue a stand-alone grant for an environmental study.	A completed environmental study that has been approved by the FAA.	EN PL MA

Table S-1 Environmental Planning/Mitigation Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
b. Conduct Environmental Study for Flight Procedures Approved in a 14 CFR part 150 Study	**(1)** Per 49 USC § 47504(e)(1), the project must be for the FAA to complete an environmental review for flight procedures that have been approved by the FAA in a noise compatibility plan study (14 CFR part 150 study). **(2)** Until specific guidance is published by APP-400, ADOs must contact APP-400 to determine the correct procedures for conducting these studies.	A completed environmental study that has been approved by the FAA.	EN PL NO
c. Conduct/Update Miscellaneous Study *(Environmental Management System)*	**(1)** 49 USC § 47102(5)(B), makes development of an environmental management system (EMS) eligible as airport planning. **(2)** The airport must be a medium or large hub airport. **(3)** Only the initial development of the environmental management program is eligible. **(4)** Per FAA policy, the sponsor must provide a written certification to the ADO at the end of the project that the EMS is compliant with the current version of Advisory Circular 150/5050-8, Environmental Management Systems for Airport Sponsors.	A completed environmental management system document that meets FAA advisory circular requirements.	PL PL MS
d. Conduct/Update Miscellaneous Study *(Conduct Drainage Study)*	**(1)** 49 USC § 47102, makes construction, reconstruction, repair or purchasing capital equipment for meeting the requirements of 33 USC § 1251, Federal Water Pollution Control Act eligible. A drainage study may be required to determine the means of complying with this Act.	A completed drainage study that is acceptable to the ADO.	PL PL MS

Table S-1 Environmental Planning/Mitigation Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
e. Conduct Airport Energy Efficiency Assessment	**(1)** Per 49 USC § 47140a(a), the project must assess the airport's energy requirements, including heating and cooling, base load, back-up power, and power for on-road airport vehicles and ground support equipment, for the purpose of identifying opportunities to increase energy efficiency at the airport. **(2)** As of the publication date of this Handbook, APP-400 was developing guidance for airport energy efficiency assessments. Until this new guidance is published, ADOs must contact APP-400 for guidance. **(3)** The ADO must coordinate all proposed projects with APP-400 and receive their approval for the project prior to programming the grant. **(4)** It is FAA policy that airport energy efficiency studies are airport planning and are eligible for stand-alone grants. **(5)** There is a limit of one assessment per five year period, unless the APP-400 concurs with an ADO determination that extraordinary circumstances exist that warrant an additional assessment.	A completed airport energy efficiency study that is acceptable to the ADO.	EN PL ES

Table S-1 Environmental Planning/Mitigation Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
f. Energy Efficiency Equipment/ Infrastructure	**(1)** A completed airport energy efficiency assessment that is acceptable to the ADO is a prerequisite for these projects. **(2)** As of the publication date of this Handbook, APP-400 was developing guidance for projects to increase the energy efficiency of airport *power sources*. Until this new guidance is published, the ADO and regional office must contact APP-400 for project information prior to programming the grant. **(3)** Additional guidance and requirements for this program are contained in Section 7 of Chapter 6. **(4)** These grants are only for airport power sources discussed in Section 7 of Chapter 6. This differs from project costs to improve the energy efficiency of an AIP eligible project discussed in Paragraph 3-70.	A fully functional project that increases the energy efficiency of airport power sources.	EN EQ MS

Table S-1 Environmental Planning/Mitigation Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
g. Airport Sustainability Plan *(Note that the project name, Identify the Airports Environmental Footprint was only for the pilot program and is no longer in use)*	**(1)** The FAA has determined that this is airport planning under 49 USC § 47102(5) and is no longer a pilot program as of fiscal year 2012. **(2)** Until told otherwise by APP, the ADO must obtain approval of the scope from APP-400 prior to programming these types of projects. **(3)** The term *sustainability master plan* refers to a traditional master plan that incorporates sustainability, whereas an *airport sustainability plan* is a stand-alone document. The ADO must not fund a stand-alone airport sustainability plan if the sponsor is updating the master plan in the near future. **(4)** The project must follow all requirements provided by APP-400.	A completed study that the ADO has officially accepted.	EN PL ES
h. Construct Deicing Containment Facility	**(1)** 49 USC § 47102 makes construction, reconstruction, repair or purchasing capital equipment for meeting the requirements of 33 USC 1251, Federal Water Pollution Control Act eligible. **(2)** The facility must be for public-use, must be for aeronautical purposes, and must not serve revenue producing areas. **(3)** ACRP Report 14, Deicing Planning Guidelines and Practices for Stormwater Management Systems, is a useful reference.	A fully functional deicing containment facility that meets FAA standards.	EN OT DI

Table S-1 Environmental Planning/Mitigation Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
i. Environmental Mitigation (Purchase Glycol Recovery Truck)	**(1)** This is also referred to as a glycol vacuum. **(2)** 49 USC § 47102(3)(F) and (G) makes construction, reconstruction, repair or purchasing capital equipment for meeting the requirements of 33 USC § 1251, Federal Water Pollution Control Act eligible. **(3)** The airport must own and operate the truck.	A fully functional glycol recovery truck that meets FAA standards.	EN OT MT
j. Environmental Mitigation *(Required by an Environmental Determination)*	**(1)** Environmental mitigation projects (such as wetland mitigation) approved in an environmental determination for an AIP eligible project is and allowable cost (or phase) of the AIP eligible project. **(2)** The costs of wetland monitoring for the required period of monitoring that is included in the record of decision, up to a maximum of five years is an allowable cost.	An environmental mitigation measure that meets the requirements of the environmental determination.	The work code of the associated AIP eligible project must be used

Table S-1 Environmental Planning/Mitigation Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
k. Voluntary Airport Low Emissions (VALE) Infrastructure	**(1)** The ADO must coordinate all proposed projects with APP-400 and receive their approval for the project prior to programming the grant. **(2)** A large volume of guidance on this subject is available at the Airports Organization website. **(3)** Terminal gate air conditioning, heating and electric power is eligible as terminal development outside of the VALE program and does not require the airport to be in a nonattainment or maintenance area per 49 USC § 47102(3)(O). If the work is not approved under VALE, the ADO must code this work as terminal development and follow the terminal development requirements in Appendix N.	A fully functional VALE infrastructure.	EN EQ MS
l. VALE Vehicle	**(1)** The ADO must coordinate all proposed projects with APP-400 and receive their approval for the project prior to programming the grant. **(2)** A large volume of guidance on this subject is available at the Airports Organization website.	A fully functional VALE vehicle.	EN EQ MS
m. Zero Emissions Infrastructure	**(1)** The ADO must coordinate all proposed projects with APP-400 and receive their approval for the project prior to programming the grant. **(2)** The requirements, including that the Federal share is restricted to 50% per 49 USC § 47136a(d), are discussed in Section 6 of Chapter 6.	Fully functional zero emissions infrastructure.	EN EQ ZE

Table S-1 Environmental Planning/Mitigation Project Requirements

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
n. Zero Emissions Vehicle	**(1)** The ADO must coordinate all proposed projects with APP-400 and receive their approval for the project prior to programming the grant. **(2)** The requirements, including that the Federal share is restricted to 50% per 49 USC § 47136a(d), are discussed in Section 6 of Chapter 6.	A fully functional zero emissions vehicle.	EN EQ ZE

*The official list of work codes can be obtained from the automated AIP system.

Appendix T. Military Airport Program Projects

T-1. How to Use This Appendix.

This appendix is not a valid stand-alone document for making eligibility and justification determinations. The information in this appendix must be used in conjunction with the Handbook, especially the project cost requirements in Chapter 3.

T-2. Project Requirements Tables.

In addition to the information provided in the above paragraph and the following tables, Appendix C contains examples of prohibited projects and costs and is very useful to use alongside this appendix.

Table T-1 Distinctions between Construct, Expand, Modify, Improve, and Rehabilitate

Use the following description…	If the project will…
a. Construct	Build a brand new building.
b. Expand	Add on to an existing building.
c. Modify	Change a building.
d. Improve	Provide a distinct new feature to a building.
e. Rehabilitate	Extend the useful life of a building by completing major renovation or major replacement of parts of the building.

Table T-2 Military Airport Program Project Requirements (for typical projects)

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
a. All regularly eligible AIP projects	**(1)** Unless otherwise specified in this table, all of the justification and eligibility factors that would normally be associated with the project, airport, and sponsor apply. **(2)** The FAA must have officially approved the airport and project for MAP funding before the grant is programmed. **(3)** The project must aid in the conversion of a military or former military facility to civilian use. **(4)** Per 49 USC § 47118(e), total MAP funding may not exceed $7 million per year per airport for terminal projects. Per 49 USC § 47118(f), total MAP funding may not exceed $7 million per year per airport for construction, improvement, or repair of airport surface parking lots, fuel farms, utilities, hangars and air cargo terminal building facilities that are 50,000 square feet or less. Hangars and air cargo terminal building facilities that are larger than 50,000 square feet are not eligible for funding. **(5)** Per 49 USC § 47118(e), terminal gate projects must not be leased for more than 10 years and must not be subject to a majority in interest clause. **(6)** Per APP-500 policy, the project justification must only be based on civilian operations. **(7)** The sponsor must have good title to the land on which the project sits as discussed in Table 6-14.	Same as for the regularly eligible AIP project.	Same as for the regularly eligible AIP project.

Table T-2 Military Airport Program Project Requirements (for typical projects)

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
b. Miscellaneous Building (Construct, Expand, Modify, Improve, or Rehabilitate) *(Hangar)*	**(1)** The normal AIP restrictions for hangars do not apply (such as the requirement to meet airside needs, the restriction on discretionary, the restriction by funding type, and the restriction by airport type). **(2)** Except as noted above, all of the justification and eligibility factors that would normally be associated with the project, airport, and sponsor apply. **(3)** The FAA must have officially approved the airport and project for MAP funding before the grant is programmed. **(4)** The project must aid in the conversion of a military or former military facility to civilian use. **(5)** Per 49 USC § 47118(f), total MAP funding may not exceed $7 million per year per airport for construction, improvement, or repair of airport surface parking lots, fuel farms, utilities, hangars and air cargo terminal building facilities that are 50,000 square feet or less. **(6)** Per APP-500 policy, the project justification must only be based on civilian operations. **(7)** The sponsor must have good title to the land on which the project sits as discussed in Table 6-14.	A fully functional aircraft hangar.	ST BD MS

Table T-2 Military Airport Program Project Requirements (for typical projects)

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
c. Miscellaneous Building (Construct, Expand, Modify, Improve, or Rehabilitate) *(Cargo Building)*	**(1)** The cargo building must not be exclusive use (see Appendix A for a definition and references on exclusive use). **(2)** The facility must be 50,000 square feet or less. **(3)** Except as noted above, all of the justification and eligibility factors that would normally be associated with the project, airport, and sponsor apply. **(4)** The FAA must have officially approved the airport and project for MAP funding before the grant is programmed. **(5)** The project must aid in the conversion of a military or former military facility to civilian use. **(7)** Per 49 USC § 47118(f), total MAP funding may not exceed $7 million per year per airport for construction, improvement, or repair of airport surface parking lots, fuel farms, utilities, hangars and air cargo terminal building facilities that are 50,000 square feet or less. **(8)** Per APP-500 policy, the project justification must only be based on civilian operations. **(9)** The sponsor must have good title to the land on which the project sits as discussed in Table 6-14.	A fully functional cargo building.	ST BD MS

Table T-2 Military Airport Program Project Requirements (for typical projects)

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
d. Construct Utilities	**(1)** Eligible costs include utility upgrades necessary to meet code requirements, to support the civilian function of a MAP airport, or to allow utilities serving the civilian portion of the base to be separated from the military portion. **(2)** Except as noted above, all of the justification and eligibility factors that would normally be associated with the project, airport, and sponsor apply. **(3)** The FAA must have officially approved the airport and project for MAP funding before the grant is programmed. **(4)** The project must aid in the conversion of a military or former military facility to civilian use. **(5)** Per 49 USC § 47118(e), total MAP funding may not exceed $7 million per year per airport for terminal projects. Per 49 USC § 47118(f), total MAP funding may not exceed $7 million per year per airport for construction, improvement, or repair of airport surface parking lots, fuel farms, utilities, hangars and air cargo terminal building facilities that are 50,000 square feet or less. These limits include the costs of utility projects. **(6)** Per APP-500 policy, the project justification must only be based on civilian operations. **(7)** The sponsor must have good title to the land on which the project sits as discussed in Table 6-14.	A fully functional utility system.	OT OT FF

Table T-2 Military Airport Program Project Requirements (for typical projects)

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
e. Parking Lot (Construct or Rehabilitate)	**(1)** The parking lot must be a surface parking lot. **(2)** The other normal AIP restrictions for parking lots do not apply (such as the restriction by airport type and the restriction against revenue production). **(3)** Except as noted above, all of the justification and eligibility factors that would normally be associated with the project, airport, and sponsor apply. **(4)** The FAA must have officially approved the airport and project for MAP funding before the grant is programmed. **(5)** The project must aid in the conversion of a military or former military facility to civilian use. **(6)** Per 49 USC § 47118(f), total MAP funding may not exceed $7 million per year per airport for construction, improvement, or repair of airport surface parking lots, fuel farms, utilities, hangars and air cargo terminal building facilities that are 50,000 square feet or less. **(7)** Per APP-500 policy, the project justification must only be based on civilian operations. **(8)** The sponsor must have good title to the land on which the project sits as discussed in Table 6-14.	A fully functional parking lot.	OT OT PA

Table T-2 Military Airport Program Project Requirements (for typical projects)

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
f. Fuel Farms (Construct, Repair, or Improve)	**(1)** The normal AIP restrictions for fuel farms do not apply (such as the restriction by airport type and the restriction against revenue production). **(2)** Except as noted above, all of the justification and eligibility factors that would normally be associated with the project, airport, and sponsor apply. **(3)** The FAA must have officially approved the airport and project for MAP funding before the grant is programmed. **(4)** The project must aid in the conversion of a military or former military facility to civilian use. **(5)** Per 49 USC § 47118(f), total MAP funding may not exceed $7 million per year per airport for construction, improvement, or repair of airport surface parking lots, fuel farms, utilities, hangars and air cargo terminal building facilities that are 50,000 square feet or less. **(6)** Per APP-500 policy, the project justification must only be based on civilian operations. **(7)** The sponsor must have good title to the land on which the project sits as discussed in Table 6-14. **(8)** The facility must meet the requirements of 40 CFR § 112.8, Spill Prevention, Control, and Countermeasure Plan Requirements for On-Shore Facilities (excluding production facilities).	A fully functional fuel farm.	OT OT FF

Table T-2 Military Airport Program Project Requirements (for typical projects)

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
g. Operational and Maintenance Expenses (per 49 USC § 47117(e)(1)(B))	**(1)** The airport cannot be a commercial service airport. **(2)** The ADO must restrict the grant amount for this type of work to $30,000 in any fiscal year. **(3)** The FAA must have determined that the airport is adversely affected by the base closure or realignment. **(4)** The sponsor of the airport must certify to the ADO that the airport would otherwise close if the airport does not receive the grant. **(5)** The FAA must have officially approved the airport and project for MAP funding before the grant is programmed.	An airport that remains open.	The ADO must contact APP-520 for the correct work code.

Table T-2 Military Airport Program Project Requirements (for typical projects)

What Can Be Done If Justified	Factors to Consider For Justification and Eligibility	Required Usable Unit of Work and Required Outcome	Work Code*
h. A project to preserve or enhance minimum airfield infrastructure under 49 USC § 47118(h) *(Safety Critical Airports)*	**(1)** APP-1 must have designated the airport as a safety critical airport. **(2)** The APP-500 must have officially approved the project for MAP funding before the grant is programmed. **(3)** The normal AIP restrictions for these projects do not apply. **(4)** The airport is federally owned. **(5)** The project is necessary to meet the minimum safety and emergency operational requirements established under 14 CFR part 139. **(6)** The project is necessary to support emergency diversionary operations for transoceanic flights in locations that meet the following criteria: **(a)** Locations within United States jurisdiction or control. **(b)** Locations where there is a demonstrable lack of diversionary airports within the distance or flight-time required by regulations governing transoceanic flights.	A completed project that meets 49 USC § 47118(h).	Same as for the regularly eligible AIP project.

*The official list of work codes can be obtained from the automated AIP system.

Appendix U. Sponsor Procurement Requirements (Including 2 CFR §§ 200.317-200.326 (formerly 49 CFR § 18.36))

U-1. Appendix Layout.

This appendix contains 2 CFR §§ 200.317-200.326 in its entirety, with clarifications. As discussed in detail in Paragraph 1-7, this regulation replaced 49 CFR § 18.36 on December 19, 2014.

The remaining paragraphs in this Appendix contain additional sponsor contracting and miscellaneous procurement issues not directly addressed in CFR §§ 200.317-200.326.

Section 10 of Chapter 3 contains ADO procurement responsibilities.

U-2. Sponsor Force Account Costs.

Procurement is obtaining services from commercial sources, therefore, sponsor force account work does not fall under the procurement rules of 2 CFR §§ 200.317-200.326. The rules for sponsor force account work are contained in Paragraph 3-53.

U-3. Sponsor Furnished Material or Supplies.

If a sponsor wishes to provide materials or supplies within an AIP funded project, the sponsor must obtain prior written approval from the ADO. The sponsor must provide a written statement to the ADO indicating whether the material or supplies have been procured per 2 CFR §§ 200.317-200.326 and meet all applicable Federal contract provisions, which can be found on the FAA Office of Airports website (see Appendix B for link). The ADO also has the option to request that the sponsor submit additional documentation to support this statement.

The requirements for the ADO to concur with the use of sponsor furnished materials or supplies are contained in Paragraph 3-36.

U-4. Buy American Requirements.

The Buy American Preferences under 49 USC § 50101 require that all steel and manufactured goods used in AIP funded projects are produced in the United States. Detailed sponsor and ADO requirements are included in Appendix X.

U-5. Suspension or Debarment of Persons or Companies.

Table U-1 contains the requirements sponsors must follow regarding persons or companies that have been excluded from working on AIP funded projects.

Additional information on suspension and debarment is available on the FHWA Construction Program Guide/Suspension and Debarment and the current version of DOT Order 4200.5, Suspension and Debarment, and Ineligibility Procedures.

Table U-1 Sponsor Requirements Regarding Suspension or Debarment

For the following…	The sponsor requirements include…
a. The sponsor is awarding a contract.	2 CFR part 180, OMB Guidelines to Agencies on Governmentwide Debarment and Suspension (Nonprocurement) prohibits a sponsor from entering into a new contract with a person or company that is suspended or debarred. A sponsor must check the System for Award Management (SAM) website (see Appendix B for link) for every procurement to ensure that no suspended or debarred firms or individuals bid on, or are part of an AIP contract.
b. A person or company currently working on an AIP project is suspended or debarred.	If the Federal government suspends or debars a person or company while the person or company is working on an AIP funded project, the sponsor must follow the procedures in 2 CFR part 180 (Subpart C) OMB Guidelines to Agencies on Governmentwide Debarment and Suspension (Nonprocurement), and 2 CFR part 1200, Nonprocurement Suspension and Debarment.
c. It appears that a person or company might need to be suspended or debarred.	If the sponsor becomes aware of this situation, the sponsor must pursue their own contractual remedies and has the option to contact the ADO with this information.
d. The sponsor has suspended or debarred a person or company.	Per the current version of DOT Order 4200.5, Suspension and Debarment Procedures and Ineligibility, the sponsor must notify the ADO.

U-6. Terminology Used in Industry

Industry terminology is evolving and may differ from the terminology contained in 2 CFR §§ 200.317-200.326. This is especially true in 2 CFR § 200.320(d) for competitive proposals. Sponsors are cautioned that the many project delivery methods, regardless of the terminology, must still conform to the basic requirements within this regulation.

U-7. Prohibited Light Emitting Diode (LED) Lighting.

The list of LED lighting that is prohibited from AIP funding is included in Paragraph C-2.

The sponsor must separately procure the prohibited LED lighting equipment from any associated AIP funded project. However, the sponsor may include the installation in the contract of the associated AIP funded project. The eligibility for the purchase and installation of this equipment is contained in Paragraph 3-93.

Sponsors must notify the ADO when the sponsor is proposing to procure prohibited LED lighting concurrently with an associated AIP funded project and confirm that the procurement of the lighting equipment will be separate from the associated AIP funded project. The ADO has the option to review the sponsor's procurement documents to ensure that the sponsor has separated AIP funded procurement and prohibited LED lighting equipment procurement.

U-8. Why 2 CFR §§ 200.317-200.326 is Reproduced in This Appendix.

2 CFR §§ 200.317-200.326 is a critical companion document to the Handbook, and sponsors and ADOs should refer to its contents frequently. Therefore, this regulation has been included below in its entirety. In addition, clarifications have been added under the sections as appropriate.

U-9. 2 CFR § 200.317 - Procurements by States.

The following italicized text is directly quoted from 2 CFR part 200.

§ 200.317 Procurements by states.

When procuring property and services under a Federal award, a state must follow the same policies and procedures it uses for procurements from its non-Federal funds. The state will comply with § 200.322 Procurement of recovered materials and ensure that every purchase order or other contract includes any clauses required by section § 200.326 Contract provisions. All other non-Federal entities, including subrecipients of a state, will follow §§ 200.318 General procurement standards through 200.326 Contract provisions.

Table U-2 AIP Handbook Clarification of 2 CFR § 200.317 - Procurements by States

Clarifications include…
(1) **Difference Between State Procurement Standards and State Design, Planning, or Construction Standards.** State procurement standards are not the same thing as the state planning, design, or construction standards discussed in Paragraph 3-26.
(2) **Buying off a State Schedule.** A sponsor is *not* allowed to purchase off a state schedule unless the state procurement includes *all* of the required causes in 2 CFR § 200.317.
(3) **Subrecipient of States.** Per 2 CFR § 1201.317, the DOT has provided the following exception: **(a)** Notwithstanding 2 CFR § 200.317, subrecipient of states must follow such policies and procedures allowed by the State when procuring property and services under a Federal award.

U-10. 2 CFR § 200.318 - General Procurement Standards.

The following italicized text is directly quoted from 2 CFR part 200.

§ 200.318 General procurement standards.

(a) The non-Federal entity must use its own documented procurement procedures which reflect applicable State and local laws and regulations, provided that the procurements conform to applicable Federal law and the standards identified in this section.

(b) Non-Federal entities must maintain oversight to ensure that contractors perform in accordance with the terms, conditions, and specifications of their contracts or purchase orders.

(c)

(1) The non-Federal entity must maintain written standards of conduct covering conflicts of interest and governing the performance of its employees engaged in the selection, award and administration of contracts. No employee, officer, or agent must participate in the selection, award, or administration of a contract supported by a Federal award if he or she has a real or apparent conflict of interest. Such a conflict of interest would arise when the employee, officer, or agent, any member of his or her immediate family, his or her partner, or an organization which employs or is about to employ any of the parties indicated herein, has a financial or other interest in or a tangible personal benefit from a firm considered for a contract. The officers, employees, and agents of the non-Federal entity must neither solicit nor accept gratuities, favors, or anything of monetary value from contractors or parties to subcontracts. However, non-Federal entities may set standards for situations in which the financial interest is not substantial or the gift is an unsolicited item of nominal value. The standards of conduct must provide for disciplinary actions to be applied for violations of such standards by officers, employees, or agents of the non-Federal entity.

(2) If the non-Federal entity has a parent, affiliate, or subsidiary organization that is not a state, local government, or Indian tribe, the non-Federal entity must also maintain written standards of conduct covering organizational conflicts of interest. Organizational conflicts of interest means that because of relationships with a parent company, affiliate, or subsidiary organization, the non-Federal entity is unable or appears to be unable to be impartial in conducting a procurement action involving a related organization.

(d) The non-Federal entity's procedures must avoid acquisition of unnecessary or duplicative items. Consideration should be given to consolidating or breaking out procurements to obtain a more economical purchase. Where appropriate, an analysis will be made of lease versus purchase alternatives, and any other appropriate analysis to determine the most economical approach.

(e) To foster greater economy and efficiency, and in accordance with efforts to promote cost-effective use of shared services across the Federal government, the non-Federal entity is encouraged to enter into state and local intergovernmental agreements or inter-entity agreements where appropriate for procurement or use of common or shared goods and services.

(f) The non-Federal entity is encouraged to use Federal excess and surplus property in lieu of purchasing new equipment and property whenever such use is feasible and reduces project costs.

(g) The non-Federal entity is encouraged to use value engineering clauses in contracts for construction projects of sufficient size to offer reasonable opportunities for cost reductions.

Value engineering is a systematic and creative analysis of each contract item or task to ensure that its essential function is provided at the overall lower cost.

(h) The non-Federal entity must award contracts only to responsible contractors possessing the ability to perform successfully under the terms and conditions of a proposed procurement. Consideration will be given to such matters as contractor integrity, compliance with public policy, record of past performance, and financial and technical resources.

(i) The non-Federal entity must maintain records sufficient to detail the history of procurement. These records will include, but are not necessarily limited to the following: rationale for the method of procurement, selection of contract type, contractor selection or rejection, and the basis for the contract price.

(j)

(1) The non-Federal entity may use time and material type contracts only after a determination that no other contract is suitable and if the contract includes a ceiling price that the contractor exceeds at its own risk. Time and material type contract means a contract whose cost to a non-Federal entity is the sum of:

(i) The actual cost of materials; and

(ii) Direct labor hours charged at fixed hourly rates that reflect wages, general and administrative expenses, and profit.

(2) Since this formula generates an open-ended contract price, a time-and-materials contract provides no positive profit incentive to the contractor for cost control or labor efficiency. Therefore, each contract must set a ceiling price that the contractor exceeds at its own risk. Further, the non-Federal entity awarding such a contract must assert a high degree of oversight in order to obtain reasonable assurance that the contractor is using efficient methods and effective cost controls.

(k) The non-Federal entity alone must be responsible, in accordance with good administrative practice and sound business judgment, for the settlement of all contractual and administrative issues arising out of procurements. These issues include, but are not limited to, source evaluation, protests, disputes, and claims. These standards do not relieve the non-Federal entity of any contractual responsibilities under its contracts. The Federal awarding agency will not substitute its judgment for that of the non-Federal entity unless the matter is primarily a Federal concern. Violations of law will be referred to the local, state, or Federal authority having proper jurisdiction.

Table U-3 AIP Handbook Clarification of 2 CFR § 200.318 - General Procurement Standards

Clarifications include…	
(1)	**Required Notification to ADO.** Sponsors are responsible for complying with 2 CFR §§ 200.317-200.326. If the sponsor's procurement procedures or operations fail to comply with 2 CFR §§ 200.317-200.326, the sponsor must notify the ADO in writing.
(2)	**Intergovernmental Agreement.** An example where an intergovernmental agreement may be appropriate is where several small airports would like to purchase an AWOS-A for each of the airports. Another example is where a state aviation department enters into a task order contract for eligible pavement maintenance at multiple airports within the state.
(3)	**Time and Materials Contract.** The time and materials contract discussed under 2 CFR § 200.318(j) is only used in the rare instance that no other contract method is suitable.
(4)	**Suitable Contract.** The sponsor is the entity that determines contract suitability under 2 CFR § 200.318(j)(1).
(5)	**Fixed Hourly Rate.** Under 2 CFR § 200.318(j), the hourly rate is fixed for the duration of the contract and cannot be changed when salaries increase.
(6)	**Value Engineering.** Per FAA policy, sponsors are required to use value engineering for new primary airports. In addition, ADOs have the option to require sponsors to use value engineering for unusually complex projects of greater than average costs (or require cost-benefit studies, present worth analysis, the study of alternatives, tactical planning, or other forms of technical evaluation). Value engineering must follow the requirements of the current version of Advisory Circular 150/5300-15, Use of Value Engineering for Engineering and Design of Airport Grant Projects. In addition, the ADO must have concurred in writing on the scope of the value engineering contract prior to the work commencing. Sponsors are cautioned that significant advance preparation may be needed for value engineering.
(7)	**Sponsor Written Protest Procedures.** Per FAA policy (formerly captured in 49 CFR § 18.36(b)(12)), the sponsor must have *written* protest procedures in place before initiating any procurement actions that will be funded with AIP. The protest procedures must define how the sponsor will handle and resolve disputes relating to their procurements and must disclose information regarding the protest to the ADO. A protestor must exhaust all administrative remedies with the sponsor before pursuing a protest with the ADO.
(8)	**Submittal of All Protests and Appeals to ADO.** Per FAA policy, the sponsor must send a copy of the protest and the sponsor's written protest procedures to the ADO without delay. The sponsor must also send a copy of the resolution to the ADO. The ADO will not formally act on bid protests until the protester has exhausted all administrative remedies with the sponsor and the protester submits a formal appeal to the ADO. The ADO's role is limited to a review of 1) violations of Federal law and rules, and 2) violations of the sponsor's protest procedures.

Table U-3 AIP Handbook Clarification of 2 CFR § 200.318 - General Procurement Standards

Clarifications include…
(9) Defects in Bid Solicitation. Per FAA policy, if a protester formally disputes the procurement because the bid solicitation is allegedly defective, it is the responsibility of the protester to notify the sponsor in writing before the bid opening (or before a reasonable deadline set by the sponsor). This will allow the sponsor to correct the deficiency by amending the solicitation. Per FAA policy, if a protester disputes a defective solicitation after bid opening, the sponsor has the choice of rejecting the protest without action if state and/or local procurement rules allow. This is because a protester normally has enough time to protest before bid opening. If the sponsor uses a shortened bidding time (such as 10 days), the FAA recommends that the sponsor accept protests up to contract award. If the protester is not satisfied with the way that the sponsor has resolved the protest, the protester has the option to appeal to the ADO. The ADO acceptance of a Sponsor Certification or the ADO approval of the plans and specifications does not relieve the sponsor of their responsibility for the accuracy, completeness, or technical content of the plans and specifications.
(10) Improper Evaluation of Bids. While protests pertaining to defective solicitations are made prior to bid opening, protests regarding improper bid evaluations occur after bid opening. If the protester believes the sponsor has improperly awarded the project, it is the responsibility of the protester to notify the sponsor in writing of their protest. If the protester is not satisfied with the way that the sponsor has resolved the dispute, the protester has the option to appeal to the ADO.
(11) Switching Suppliers or Subcontractors. A *contractor* may switch suppliers or subcontractors as long as there is no change in the bid and the requirements of 49 CFR part 26 are met. There is no Federal requirement preventing a *contractor* from switching suppliers or subcontractors as long as there is no change in the bid. However, the *sponsor* must not influence the contractor's selection of subcontractors or suppliers. If the sponsor directs or influences a change in supplier or subcontractor, this would be a 2 CFR §§ 200.317-200.326 violation since the sponsor is interfering with the open and competitive market.
(12) Potential Funding Impacts. Failure of the sponsor to properly resolve a bid protest or an ADO identified violation may result in a loss of AIP funding.
(13) Submittal of Resolutions to the ADO. The sponsor must notify the ADO in writing how all bid protest and appeals were resolved.
(14) Restrictions on Payment Requests for Disputed Costs. If the project is already under grant, the sponsor must not request payments for the disputed costs.

U-11. 2 CFR § 200.319 - Competition.

The following italicized text is directly quoted from 2 CFR part 200.

§ 200.319 Competition.

(a) All procurement transactions must be conducted in a manner providing full and open competition consistent with the standards of this section. In order to ensure objective contractor

performance and eliminate unfair competitive advantage, contractors that develop or draft specifications, requirements, statements of work, and invitations for bids or requests for proposals must be excluded from competing for such procurements. Some of the situations considered to be restrictive of competition include but are not limited to:

(1) Placing unreasonable requirements on firms in order for them to qualify to do business;

(2) Requiring unnecessary experience and excessive bonding;

(3) Noncompetitive pricing practices between firms or between affiliated companies;

(4) Noncompetitive contracts to consultants that are on retainer contracts;

(5) Organizational conflicts of interest;

(6) Specifying only a "brand name" product instead of allowing "an equal" product to be offered and describing the performance or other relevant requirements of the procurement; and

(7) Any arbitrary action in the procurement process.

(b) The non-Federal entity must conduct procurements in a manner that prohibits the use of statutorily or administratively imposed state or local geographical preferences in the evaluation of bids or proposals, except in those cases where applicable Federal statutes expressly mandate or encourage geographic preference. Nothing in this section preempts state licensing laws. When contracting for architectural and engineering (A/E) services, geographic location may be a selection criterion provided its application leaves an appropriate number of qualified firms, given the nature and size of the project, to compete for the contract.

(c) The non-Federal entity must have written procedures for procurement transactions. These procedures must ensure that all solicitations:

(1) Incorporate a clear and accurate description of the technical requirements for the material, product, or service to be procured. Such description must not, in competitive procurements, contain features which unduly restrict competition. The description may include a statement of the qualitative nature of the material, product or service to be procured and, when necessary, must set forth those minimum essential characteristics and standards to which it must conform if it is to satisfy its intended use. Detailed product specifications should be avoided if at all possible. When it is impractical or uneconomical to make a clear and accurate description of the technical requirements, a "brand name or equivalent" description may be used as a means to define the performance or other salient requirements of procurement. The specific features of the named brand which must be met by offers must be clearly stated; and

(2) Identify all requirements which the offerors must fulfill and all other factors to be used in evaluating bids or proposals.

(d) The non-Federal entity must ensure that all prequalified lists of persons, firms, or products which are used in acquiring goods and services are current and include enough qualified sources to ensure maximum open and free competition. Also, the non-Federal entity must not preclude potential bidders from qualifying during the solicitation period.

Table U-4 AIP Handbook Clarification of 2 CFR § 200.319 - Competition

Clarifications include…
(1) Unfair Competitive Advantage. Per 2 CFR § 200.319, contractors and consultants who develop or draft specifications, requirements, statements of work, invitations for bids, or requests for proposals on a project are not allowed to bid or submit a proposal on that project.
(2) Brand Name or Equal. If an existing FAA technical specification establishes all necessary performance requirements, the FAA considers the use of a brand name or equal to be a restriction on competition. A sponsor must not disqualify a material, product, or service for not having a characteristic that the brand name material, product, or service possesses if the characteristic was not explicitly identified in the technical requirements.
(3) Matching Existing Equipment. Sponsors often want to specify a particular company or brand of equipment so that the acquired equipment matches what is currently at the airport. The requirements for these situations are contained in Paragraph 3-36.
(4) Required Notification to ADO. If the specification requires a *brand name or equal* product, the sponsor must notify the ADO in writing prior to the award. A sponsor requiring that contractors obtain sponsor approval for a product *prior* to the award if the product is not a specified brand name or equal. This could unduly limit competition by placing additional burdens on the non-brand name product.
(5) Examples of situations that do *not* unduly limit competition. Some examples include: **(a)** A sponsor limiting the height of an ARFF vehicle based on the existing height of the ARFF building door. **(b)** A sponsor specifying sign face dimensions to fit in the existing sign units because the taxiways have been renamed as a result of an AIP funded project.
(6) Examples of situations that could unduly limit competition. Some examples include: **(a)** A sponsor specifying Company X or equal for an L-858R, Mandatory Instruction Sign. Since an existing FAA technical specification establishes all necessary performance requirements, it is unnecessary for the sponsor to specify an actual company and implies a sponsor preference. **(b)** A sponsor specifying that an ARFF truck windshield wiper must be mounted on the top center of the windshield. However, this is not a required feature for performance of the ARFF vehicle and is not a standard feature for ARFF trucks for all manufacturers. This places an unreasonable requirement that could unduly limit competition. **(c)** A sponsor including a requirement for personal attendance at a pre-bid meeting for a project. Contractors and suppliers may not need to attend a pre-bid meeting if they are already very familiar with the project site, or have another member of the bidding team attending the meeting. This places an unreasonable requirement that could unduly limit competition.

Table U-4 AIP Handbook Clarification of 2 CFR § 200.319 - Competition

Clarifications include…
(7) Geographical Preference. Some examples of geographical preference that unduly limit competition are: **(a)** A sponsor requiring a vendor to have local maintenance support within 50 miles or 40 minutes away from the airport. **(b)** A sponsor requiring that a percentage of employees reside in the city, county, or state boundaries. **(c)** A sponsor requiring that a percentage of the required materials be purchased from companies located in the city, county, or state boundaries.

U-12. 2 CFR § 200.320 - Methods of Procurement to be Followed.

The following italicized text is directly quoted from 2 CFR part 200.

§ 200.320 Methods of procurement to be followed.

The non-Federal entity must use one of the following methods of procurement.

Table U-5 AIP Handbook Clarification of 2 CFR § 200.320 - Methods of Procurement to be Followed

Clarifications include...
(1) Difference from Procurement of Professional Services. Sponsors must not confuse the small purchase procurement procedures with the requirements for procurement of professional services discussed in the current version of Advisory Circular 150/5100-14, Architectural, Engineering, and Planning Consultant Services for Airport Grant Projects. The procurement of professional services is not tied to the small purchase procedure threshold ($150,000) noted above.
(2) Sponsor Documentation. Sponsors must adequately document all quotations in writing and make this available to the ADO upon request. It is FAA policy that adequate documentation for projects over $10,000 includes a letter request from the sponsor and a written estimate from each qualified source. For projects $10,000 or below, it is FAA policy that the sponsor has the option of obtaining the quotes verbally as long as the sponsor documents the results in writing.
(3) Submittal of Technical Specifications to ADO. Per 2 CFR § 200.324(a), sponsors must submit all technical specifications to the ADO upon the ADO's request. This may include the plans, the specifications, the engineer's report, and any other items that make up the procurement package.
(4) Calculation of $150,000 and $10,000. It is FAA policy that the *accepted* quote must come below $150,000 for the sponsor to use the small procurement process. It is FAA policy that the *accepted* quote must come below $10,000 for the sponsor to obtain quotes verbally.

Table U-5 AIP Handbook Clarification of 2 CFR § 200.320 - Methods of Procurement to be Followed

Clarifications include...
(5) Indefinite Quantity/Delivery (Task Orders for Construction and Equipment). This contracting method defines a minimum and maximum quantity that may be obtained at any time during the contract period through individual task orders. This contracting method is rarely used for AIP projects. In order to be used for an AIP project, the contract must include any clauses required by Federal statutes and Executive orders and their implementing regulations and must not exceed 12 months unless the contract contains provisions for updating Davis-Bacon requirements. In addition, it is FAA policy that the contract must not exceed five years.
(6) Proposals Containing Ineligible and/or non-AIP Funded Work. Per FAA policy, sponsors must obtain written ADO concurrence before including ineligible and/or non-AIP funded work within the same contract (see Paragraph 3-39). Per FAA policy, the sponsor must award to the lowest responsive and responsible bidder *on the AIP-funded portion of the contract* when the bid is separated by line items or bid schedules. The sponsor must award to the lowest responsive and responsible bidder *on the entire contract* when the bid will be prorated for Federal participation.
(7) Projects Exceeding Design Standards. Per FAA policy, sponsors must obtain written ADO concurrence before designing or bidding a project that will exceed FAA design standards (see Paragraph 3-24).
(8) Proposals Containing Improper Bid Alternates. Sponsors must not use the procurement process, such as including bid alternates, as a means of determining project costs. For example, a sponsor has justified the acquisition of a 1,500 gallon ARFF vehicle but plans to acquire a 3,000 gallon ARFF vehicle, paying the additional costs with local sources of funding. The sponsor is not allowed to bid both vehicles because the procurement process is based on an expectation that the sponsor intends to complete the procurement. In this case, the sponsor has no plan to acquire a 1,500 gallon ARFF vehicle and is simply using the procurement process as a cost estimating tool, which is not allowed.

U-13. 2 CFR § 200.320(a) - Procurement by Micro-Purchases.

The following italicized text is directly quoted from 2 CFR part 200.

(a) Procurement by micro-purchase is the acquisition of supplies or services, the aggregate dollar amount of which does not exceed $3,000 (or $2,000 in the case of acquisitions for construction subject to the Davis-Bacon Act). To the extent practicable, the non-Federal entity must distribute micro-purchases equitably among qualified suppliers. Micro-purchases may be awarded without soliciting competitive quotations if the non-Federal entity considers the price to be reasonable.

Table U-6 AIP Handbook Clarification of 2 CFR § 200.320(a) - Procurement by Micro-Purchases

Clarifications include...
(1) New Requirement. This requirement was not found in 49 CFR 18.36.
(2) Construction Supplies and Services. This is limited to $2,000 under the micro-purchase procurement method.
(3) Non- Construction Supplies and Services. This is limited to $3,000 under the micro-purchase procurement method.
(4) Abuse of Micro-Purchase Procurement Method. Sponsors must not split a single procurement action into multiple procurement actions in order to apply the micro –purchase procurement method..

U-14. 2 CFR § 200.320(b) - Procurement by Small Purchase Procedures.

The following italicized text is directly quoted from 2 CFR part 200.

(b) Procurement by small purchase procedures. Small purchase procedures are those relatively simple and informal procurement methods for securing services, supplies, or other property that do not cost more than the Simplified Acquisition Threshold. If small purchase procedures are used, price or rate quotations must be obtained from an adequate number of qualified sources.

Table U-7 AIP Handbook Clarification of 2 CFR § 200.320(b) - Procurement by Small Purchase Procedures

Clarifications include…
(1) Clarifications for all Procurement Methods. Additional clarifications that apply to all procurement methods, including small purchase procurement, are contained in Paragraph U-12.
(2) Adequate Number of Qualified Sources. The FAA considers an adequate number of qualified sources to be two or more for small purchase procedures (the same as for competitive bids under 2 CFR § 200.320(c)(1)(ii)). If the sponsor is only able to obtain a quotation from one qualified source, then the sponsor must then follow sole source requirements.
(3) Simplified Acquisition Threshold. The simplified acquisition threshold is set in 2 CFR § 200.88 at $150,000. This was previously directly referenced in 49 CFR § 18.36(d)(1) as $100,000.

U-15. 2 CFR § 200.320(c) - Procurement by Sealed Bids (Formal Advertising).

The following italicized text is directly quoted from 2 CFR part 200.

(c) Procurement by sealed bids (formal advertising). Bids are publicly solicited and a firm fixed price contract (lump sum or unit price) is awarded to the responsible bidder whose bid, conforming with all the material terms and conditions of the invitation for bids, is the lowest in price. The sealed bid method is the preferred method for procuring construction, if the conditions in paragraph (c)(1) of this section apply.

(1) In order for sealed bidding to be feasible, the following conditions should be present:

(i) A complete, adequate, and realistic specification or purchase description is available;

(ii) Two or more responsible bidders are willing and able to compete effectively for the business; and

(iii) The procurement lends itself to a firm fixed price contract and the selection of the successful bidder can be made principally on the basis of price.

(2) If sealed bids are used, the following requirements apply:

(i) The invitation for bids will be publicly advertised and bids must be solicited from an adequate number of known suppliers, providing them sufficient response time prior to the date set for opening the bids;

(ii) The invitation for bids, which will include any specifications and pertinent attachments, must define the items or services in order for the bidder to properly respond;

(iii) All bids will be publicly opened at the time and place prescribed in the invitation for bids;

(iv) A firm fixed price contract award will be made in writing to the lowest responsive and responsible bidder. Where specified in bidding documents, factors such as discounts, transportation cost, and life cycle costs must be considered in determining which bid is lowest. Payment discounts will only be used to determine the low bid when prior experience indicates that such discounts are usually taken advantage of; and

(v) Any or all bids may be rejected if there is a sound documented reason.

Table U-8 AIP Handbook Clarification of 2 CFR § 200.320(c) - Procurement by Sealed Bids (Formal Advertising)

Clarifications include…
(1) Clarifications for all Procurement Methods. Additional clarifications that apply to all procurement methods are contained in Paragraph U-12. These clarifications must be used in addition to the ones listed below.
(2) Required Notification to ADO. The sponsor must notify the ADO in writing prior to the award if the procurement is expected to exceed the simplified acquisition threshold (provided in Table U-7) and any of the following situations apply: **(a)** The award will be made without competition. **(b)** Only one bid is received. **(c)** The award will be made to other than the apparent low bidder.
(3) Submittal of Technical Specifications to ADO. Per 2 CFR § 200.324(a), sponsors must submit all technical specifications to the ADO upon the ADO's request. This may include the plans, the specifications, the engineer's report, and any other items that make up the procurement package.
(4) Items Needed for Bidder to Properly Respond. Bid documents must specify the method by which the successful bid will be determined, which may include factors such as life cycle costs, bid alternates, and availability of Federal funding.
(5) Responsive vs. Responsible. The terms responsive and responsible are often misunderstood. *Responsive* applies to the bid documents filed by a bidder and *responsible* applies to qualifications of the bidder. **(a)** *Responsive*. A responsive bid conforms to all significant terms and conditions contained in the sponsor's invitation for bid. It is the sponsor's responsibility to decide if the exceptions taken by a bidder to the solicitation are material or not and the extent of deviation it is willing to accept. **(i)** Material Deviations. It is FAA policy that sponsors may not waive material deviations. Material deviations include those that affect significant terms and conditions of the invitation for bids such as delivery time, quantity, technical specifications, price, or failure to send required bond and insurance information. **(ii)** Minor Deviations. It is FAA policy that sponsors may waive minor deviations. These might include a simple failure to enter an extended price on an item, when such extended price can be ascertained simply by multiplying the unit price by the number of units. **(b)** *Responsible.* A responsible bidder has the ability to perform successfully under the terms and conditions of a proposed procurement, as defined in 2 CFR § 200.318(h). This includes such matters as contractor integrity, compliance with public policy, record of past performance, and financial and technical resources.
(6) Apparent Low Bidder. The apparent low bidder is the bidder with the lowest dollar proposal, and does not reflect whether the sponsor has determined the bidder to be responsive or responsible.

Table U-8 AIP Handbook Clarification of 2 CFR § 200.320(c) - Procurement by Sealed Bids (Formal Advertising)

Clarifications include…
(7) Bid Alternates. A sponsor must not bid a project with alternates (additive or deductive) without establishing how an award will be made within the bid package (commonly referred to as the basis for award). Otherwise, Federal participation may be adversely affected because the bid documents could be considered unclear and the award arbitrary. **(a)** The solicitation must clearly establish the base bid and must define the order of bid alternate combinations based on the availability of funding. **(b)** Sponsors must not arbitrarily choose a bid alternate combination for an unallowable purpose such as choosing or eliminating a specific bidder. **(c)** Sponsors have the option of consulting with the ADO to validate that their use of bid alternates will meet grant requirements. **(d)** The FAA cautions sponsors against using an excessive amount of bid alternates because it may create ambiguities in the bid award. **(e)** Life cycle cost analyses is often used for as part of establishing the basis for award for bid alternatives. **(f)** If a sponsor is bidding both asphalt and concrete alternatives in a project, there are funding implications as discussed in Paragraph 3-46
(8) Life Cycle Cost Analysis (LCCA). The life cycle cost concept recognizes that although an item may have the lowest initial cost, it may be more expensive than another item when costs such as operation and maintenance are considered. Under the life cycle cost concept, any costs expected to be incurred for the item over its useful life (including acquisition, installation, operation, and maintenance) are considered. Cost data must be verifiable independently of a claim by the manufacturer or contractor. OMB Circular A-94, Guidelines and Discount Rates for Benefit-Cost Analysis of Federal Programs, requires elements of a life cycle cost analysis include the following: **(a)** The LCCA must explicitly state assumptions, benefit factors, and costs. **(b)** Sponsors must identify key data for independent analysis and review. **(c)** Sponsor must use real or constant dollars in their LCCA (omit the effects of inflation). **(d)** For AIP funded projects, the sponsor must use the 7% discount rate found in Paragraph 8b(1).of OMB Circular A-94, Guidelines and Discount Rates for Benefit-Cost Analysis of Federal Programs, instead of the real discount rate published annually in Appendix C of the same circular. The 7% rate is the rate that is prescribed by the Federal government for public investment, which is the standard by which AIP is judged. The 7% is based on historical long term trends and is not tied to current available rates. **(e)** The sponsor must not use a project life that exceeds 20 years. For options that have a service life that exceeds 20 years, the sponsor may include a salvage value for the life beyond 20 years. **(f)** If at the 30% design stage, a sponsor conducting a LCCA that results in a particular solution for which there is only one contractor has the option to bidding multiple solutions to establish competition.

Table U-8 AIP Handbook Clarification of 2 CFR § 200.320(c) - Procurement by Sealed Bids (Formal Advertising)

Clarifications include…
(9) Guidance for Conducting Life Cycle Cost Analyses. The following three documents provide useful guidance to sponsors. The first document is especially useful for sponsors who have never completed a life cycle cost analysis and would like a simplified primer. **(a)** Life-Cycle Cost Analysis Primer. **(b)** The current version of Advisory Circular 150/5320-6, Airport Pavement Design and Evaluation. **(c)** AAPTP 06-06, Life Cycle Cost Analysis for Airport Pavements.
(10) Limits on Using Life Cycle Cost Prior to Bidding. The practice of limiting what alternatives the sponsor will consider in their procurement action prior to bidding may unduly exclude an otherwise eligible alternative and is thus contrary to the fair and open requirements of 2 CFR § 200.319. Per FAA policy, the one exception to this limitation is the comparative analysis of pavement design alternatives. Due to additional design costs associated with multiple pavement design alternatives, sponsors have the option to select a pavement design alternative prior to the bid solicitation provided that sufficient competition exists for the selected alternative. Funding limitations for designing two pavement alternatives is discussed in Paragraph 3-46.

U-16. 2 CFR § 200.320(d) - Procurement by Competitive Proposals.

The following italicized text is directly quoted from 2 CFR part 200.

(d) Procurement by competitive proposals. The technique of competitive proposals is normally conducted with more than one source submitting an offer, and either a fixed price or cost-reimbursement type contract is awarded. It is generally used when conditions are not appropriate for the use of sealed bids. If this method is used, the following requirements apply:

(1) Requests for proposals must be publicized and identify all evaluation factors and their relative importance. Any response to publicized requests for proposals must be considered to the maximum extent practical;

(2) Proposals must be solicited from an adequate number of qualified sources;

(3) The non-Federal entity must have a written method for conducting technical evaluations of the proposals received and for selecting recipients;

(4) Contracts must be awarded to the responsible firm whose proposal is most advantageous to the program, with price and other factors considered; and

(5) The non-Federal entity may use competitive proposal procedures for qualifications-based procurement of architectural/engineering (A/E) professional services whereby competitors' qualifications are evaluated and the most qualified competitor is selected, subject to negotiation of fair and reasonable compensation. The method, where price is not used as a selection factor, can only be used in procurement of A/E professional services. It cannot be

used to purchase other types of services though A/E firms are a potential source to perform the proposed effort.

Table U-9 AIP Handbook Clarification of 2 CFR § 200.320(d) - Procurement by Competitive Proposals

Clarifications include…
(1) Clarifications for all Procurement Methods. Additional clarifications that apply to all procurement methods are contained in Paragraph U-12. These clarifications must be used in addition to the ones listed below.
(2) Difference between Sealed Bids and Competitive Proposals. The main difference between sealed bids and competitive proposals is that a sponsor awards sealed bids based principally on price, and awards competitive proposals based price *and/or* other factors (such as qualifications, contract time, proposed phasing, or method of construction).
(3) Common Types of Competitive Proposals in AIP. Design-build, construction manager-at-risk, qualification based, and any other alternative delivery methods are all considered to be competitive proposals. A competitive proposal may be a one step or a two-step process. A brief summary of the most common methods are discussed below. Clarification on EMAS procurement, which is a unique type of competitive proposal, is provided at the end of this table. **(a) Qualification Based with Negotiated Price (Professional Services).** This method is a qualifications based method that is required for professional services. Per 49 USC § 47107(a)(17), AIP must use a qualification based selection method under the Brooks Act for "program management, construction management, planning studies, feasibility studies, architectural services, preliminary engineering, design engineering, surveying, mapping, and related services." Per the Brooks Act, the competitor cannot provide (and the sponsor cannot use) price information when the sponsor ranks the competitors. The FAA interprets this to mean competitors cannot provide any price information before the sponsor determines the most qualified competitor, even if the price information is in a sealed envelope. However, the sponsor must then negotiate a fair and reasonable price or go to the next qualified competitor. The current version of Advisory Circular 150/5100-14, Architectural, Engineering, and Planning Consultant Services for Airport Grant Projects, provides further guidance. **(b) Design-Build.** 49 USC § 47142 establishes design-build contracting as an approvable form of contracting under AIP and defines it as "an agreement that provides for both design and construction of a project by a contractor". This section of the Act also requires that "three or more bids must be submitted". Section 139 of the Wendell H. Ford Aviation Investment and Reform Act for the 21st Century (AIR-21) established a pilot program design-build contracting under AIP, however, this pilot program expired September 30, 2003 and was replaced by the statute in 49 USC § 47142 per Vision 100 – Century of Aviation Reauthorization Act which made this type of contracting eligible outside of the pilot program. **(c) Construction Manager At Risk (CMAR).** Under CMAR, the sponsor engages a design firm for the project design. The sponsor selects a construction manager-at-risk (CMAR) based on qualifications and price (e.g. fee) early in the design phase. The CMAR conducts document reviews, constructability reviews, cost estimating and scheduling. The CMAR then competitively procures the construction component of the project and is responsible for ensuring the project is completed within budget and schedule.

Table U-9 AIP Handbook Clarification of 2 CFR § 200.320(d) - Procurement by Competitive Proposals

Clarifications include…
(4) Required Notification to ADO. If the procurement is expected to exceed the simplified acquisition threshold (provided in Table U-7) and is to be awarded without competition, or only one proposal is received in response to a solicitation, the sponsor must notify the ADO in writing prior to the award.
(5) Competitive Proposals Containing Ineligible Work. For competitive proposals the sponsor must select the proposal that is most advantageous to Federal interest and the sponsor must be able to clearly show how the ineligible and eligible costs are divided.
(6) Adequate Number of Qualified Sources. The FAA considers an adequate number of qualified sources to be two or more for competitive proposals, except for when the sponsor uses the design-build method, in which case three or more are required. If the sponsor is only able to obtain a quotation from one qualified source, then the sponsor must then follow sole source requirements.
(7) Written Method for Selection. The sponsor must have a written basis for selection prior to receiving proposals**.**
(8) Qualification Based With Negotiated Price (Consultant Contracts) Only: **(a) When Price must not be used as a Factor.** The only competitive proposal procedure where price cannot be used (only other factors) is for the qualifications based procurement of architectural/engineering professional services. **(b) Consultant Contract Requirements.** The current version of Advisory Circular 150/5100-14, Architectural, Engineering, and Planning Consultant Services for Airport Grant Projects, provides sponsor requirements for consulting contracts, including the unique contract methods (retainers, cost-plus-a-fixed-fee, cost-plus-a-percentage-of-cost, indefinite delivery). Sponsor must not deviate from the requirements in this advisory circular unless the ADO has reviewed the contract and concurs with the deviations. Note that cost-plus-a-percentage-of-cost is specifically prohibited per 2 CFR § 200.323(d). In addition, if the sponsor uses cost-plus-a-fixed-fee, it is FAA policy that profit must be based on a value, not on a multiplier or percentage. For lump sum contracts, it is FAA policy that the negotiation process must clearly show the amount of profit and how it was derived.
(9) Design Build And Construction Manager-At-Risk (And Any Other Competitive Proposal Not Qualification Based With Negotiated Price): **(a) Clarifications for Sealed Bids.** Since these proposals use price as a factor, the clarifications under sealed bids contained in Paragraph U-15 also apply. **(b) When the Use of Sealed Bids Alone is Not Appropriate.** The sponsor must only use sealed bids instead of competitive proposals unless: **(i)** A complete, adequate, and realistic specification or purchase description is not available (for instance, a complex project contains too many unknowns). **(ii)** The procurement does not lend itself to a firm fixed price contract and the selection of the successful bidder cannot be made principally on the basis of price.

Table U-9 AIP Handbook Clarification of 2 CFR § 200.320(d) - Procurement by Competitive Proposals

Clarifications include…
(c) Example of Situations where Competitive Proposals may be Appropriate. Examples include complex terminal projects (where there are multiple methods of construction and phasing), large demolition projects (where there are multiple methods of demolition), and rehabilitation of runway crossings (where contract time, phasing, or method may have added benefits). In order for the sponsor to consider using competitive proposals, the sponsor must first determine that sealed bids *cannot* be used. **(d) Advantages of Competitive Proposals that are not Allowed under AIP.** Because of the Federal contract and procurement requirements, some of the advantages of competitive proposals are not eligible for AIP funding. Sponsors must still meet all applicable 2 CFR §§ 200.317-200.326 and AIP requirements in order for the ADO to fund the costs with AIP. Examples of some costs that are not allowed include early completion bonuses, cost overruns greater than the allowable grant amendment percent, shared costs savings, contingency costs, price escalation, consultant and airport insurance costs, and state and local preferences. **(e) Obtaining ADO Concurrence Prior to Award.** Per 49 USC § 47142, the sponsor must not award AIP funded design build proposals prior to obtaining ADO concurrence. Per FAA policy, this also applies to construction manager-at-risk proposals (and any other competitive proposals not qualifications based with negotiated price). **(f) Submittal of Technical Specifications to ADO**. Per 2 CFR § 200.324(a), sponsors must submit all technical specifications to the ADO upon the ADO's request. This may include the plans, the specifications, the engineer's report, and any other items that make up the procurement package. **(g) Submittal of Additional Documentation.** The sponsor must provide all additional documentation required by the ADO, which for these types of proposals includes, but is not limited to: **(i)** A description of the method to be used. **(ii)** A full description of the project with general sketches of proposed work. **(iii)** Documentation that provides the reason and justification for using the competitive proposal method over sealed bids. **(iv)** A responsibility matrix showing the contractual relationships between all parties involved in the project. A flowchart is often useful for this purpose. **(v)** Documentation that the selection process is allowed under state or local law. **(vi)** A statement describing what safeguards are in place to prevent conflicts of interest. **(vii)** Proof that the system will be as open, fair and objective as the traditional sealed bid method under 2 CFR § 200.320(c). **(viii)** Documentation of the amount of experience the parties involved in the project have in the proposed method.
(10) Engineered Materials Arresting Systems (EMAS) Procurement. **(a) Procurement Requirement Background.** Prior to April 2012, there was only one manufacturer whose product meets the requirements of the current version of Advisory Circular 150/5220-22, Engineered Materials Arresting Systems (EMAS) for Aircraft Overruns. As of the

Table U-9 AIP Handbook Clarification of 2 CFR § 200.320(d) - Procurement by Competitive Proposals

Clarifications include…
date of this publication, two manufacturers meet these requirements. Therefore, the sponsor must procure the EMAS project under the competitive proposal procurement method that bases the award on price plus other factors, such as phasing, design factors, or total contract time. **(b) Exception for Competitive Proposal Procurement.** The exception on using the competitive procurement method for EMAS is when an EMAS design project is currently under design on the date of Change 1 of this Handbook and the design is beyond 30 percent. In this case, the ADO has the option of allowing the sponsor to use the noncompetitive proposal method to procure the EMAS acquisition and installation. **(c) Request for Information (RFI).** The sponsor is allowed to issue a Request for Information (RFI) to obtain conceptual designs from EMAS vendors. The RFI is issued solely for informational purposes and is not a solicitation. Similarly, responses to RFI's are not offers from the EMAS vendors. **(d) Request for Proposal (RFP) Requirements**. At a minimum, the RFP must contain the following information: **(i)** A description of the project. **(ii)** An existing site drawing showing topography, utilities and structures. **(iii)** Preliminary site design information that will affect the design of the EMAS bed. Examples include: RSA available dimensions, proposed grades, new drainage structures, runway/taxiway extensions, new approach light stations. **(iv)** The current and future (if different from current) fleet mix. Future fleet mixes must be based on terminal area forecasts approved by the ADO. **(v)** All evaluation criteria. **(e) Evaluation Criteria.** **(i)** Proposals demonstrating, through design, that they can meet the requirements for a standard EMAS (70 knot stopping capability for the design aircraft), will take precedence over proposals not demonstrating that they can meet the requirements for a standard EMAS **(ii)** If all of the proposals are unable to demonstrate that they can meet the requirements for a standard EMAS, but still demonstrate that they can meet the requirements for a non-standard EMAS (minimum of 40 knot stopping capability for the design aircraft), the Sponsor must apply the following rating method for relative importance for these primary categories: a. Stopping capability of aircraft within the fleet mix (50% weighting) b. Cost of the bed (40% weighting) c. Maintenance requirements and costs of the bed annually over the design life (5% weighting d. Other unique local conditions, such as severe occurrences of jet blast and environmental and operational impact of the EMAS footprint (5% weighting) **(iii)** The Sponsor may provide additional detailed evaluation criteria, such as ability to meet project schedule and any applicable and unique goal requirements, but must use the

Table U-9 AIP Handbook Clarification of 2 CFR § 200.320(d) - Procurement by Competitive Proposals

Clarifications include…
primary categories listed above. The rating method does not need to be included in the RFP. **(f) Vendor Proposal Requirements.** The proposals from the vendors must contain the following information: **(i)** The specifications of the proposed EMAS. **(ii)** An updated preliminary site plan drawing that shows the actual dimensions of the proposed EMAS footprint and any changes to the sponsor's provided site design. **(iii)** A description of the product performance assessment and modeling process. **(iv)** Details on the profile and cross sections of the EMAS including grade. **(v)** Preliminary calculations for the stopping capability of aircraft within the fleet mix of operation (the highest runway exit speed for each aircraft that can be arrested within the bed). **(vi)** The cost of the EMAS bed. The cost must be submitted based upon the firm fixed price contract method for all EMAS, installation materials, and self-inspection, testing and administration. Payment for materials will be made upon delivery to the site. At the Sponsor's option, the Sponsor may allow the costs for construction inspection, by the vendor or its representative, to be broken out separately using the cost plus fixed fee method of contract pricing. All shipping, storage and travel costs must be included in the firm fixed price. **(vii)** The schedule for material delivery. **(viii)** Annual maintenance cost and requirements of the EMAS over the life of the product. **(g) Sponsor Evaluation.** The sponsor must review, evaluate, and rate each proposal based on the criteria in the RFP. The sponsor's review must result in the selection of a responsible vendor whose proposal is the most advantageous to the project. The sponsor must give precedence to proposals that provide a standard EMAS over those that do not. For proposals with a standard EMAS, the sponsor must award to the lowest responsible, responsive bidder, with respect to the cost of the EMAS bed. **(h) EMAS Bed Replacements and Retrofits.** If the ADO concurs that an existing bed must be replaced, then the procurement requirements for new EMAS installation apply. The sponsor must follow the competitive procurement process to select the vendor. In order for a sponsor to retrofit an EMAS with the original vendor, the sponsor must submit documentation to the ADO showing that the bed can only be modified or retrofitted by the original vendor and that the cost benefit of replacing the bed outweighs the cost benefit of retrofit. The retrofitting project cannot be funded without ADO concurrence.

U-17. 2 CFR § 200.320(e) - Reserved.

The following italicized text is directly quoted from 2 CFR part 200.

(e) [Reserved]

U-18. 2 CFR § 200.320(f) - Procurement by Noncompetitive Proposals.

The following italicized text is directly quoted from 2 CFR part 200.

(f) Procurement by noncompetitive proposals. Procurement by noncompetitive proposals is procurement through solicitation of a proposal from only one source and may be used only when one or more of the following circumstances apply:

(1) The item is available only from a single source;

(2) The public exigency or emergency for the requirement will not permit a delay resulting from competitive solicitation;

(3) The Federal awarding agency or pass-through entity expressly authorizes noncompetitive proposals in response to a written request from the non-Federal entity; or

(4) After solicitation of a number of sources, competition is determined inadequate.

Table U-10 AIP Handbook Clarification of 2 CFR § 200.320(f) - Procurement by Noncompetitive Proposals 2 CFR § 200.320(f) - Procurement by Noncompetitive Proposals

Clarifications include…
(1) Clarifications for all Procurement Methods. Additional clarifications that apply to all procurement methods are contained in Paragraph U-12. These clarifications must be used in addition to the ones listed below.
(2) Single Source, Sole Source, and Proposals with an Inadequate Number of Qualified Sources. Single source, sole source, and proposals with an inadequate number of qualified sources are noncompetitive. The number of adequate qualified sources is found in Table U-7 for small purchase proposals and Table U-9 for competitive proposals.
(3) Contract Changes. Change orders, supplemental agreements, and contract modifications are noncompetitive. The sponsor and ADO requirements are included in Paragraph 5-35.
(4) Cost Analysis. Per FAA policy, the sponsor must prepare a written cost analysis for noncompetitive procurement proposals.
(5) Required Notification to ADO. If the sponsor procures using noncompetitive proposals, makes a contract modification that changes the scope of a contract, or increases the contract amount by more than the simplified acquisition threshold (provided in Table U-7), the sponsor must notify the ADO in writing prior to executing the procurement action.
(6) Submittal of Technical Specifications to ADO. Per 2 CFR § 200.324(a), sponsors must submit all technical specifications to the ADO upon the ADO's request. This may include the plans, the specifications, the engineer's report, cost analysis, and any other items that make up the procurement package.

Table U-10 AIP Handbook Clarification of 2 CFR § 200.320(f) - Procurement by Noncompetitive Proposals 2 CFR § 200.320(f) - Procurement by Noncompetitive Proposals

Clarifications include…
(7) Example where Noncompetitive Proposals may be Appropriate. **(a) Some Services for Less than $10,000.** Services for $10,000 or less for appraisals, grant audit services performed as a part of a project, and Independent project cost estimates. The $10,000 was set by FAA policy in Advisory Circular 150/5100-14, Architectural, Engineering, and Planning Consultant Services for Airport Grant Projects. **(b) Public utility company services.** Public utility companies generally do not allow work on their property or equipment by anyone other than their own employees. A sponsor often has no other choice than to use a noncompetitive proposal for this type of work. In addition, the FAA has determined that the Federal contract provisions do not apply to this situation. **(c) Eligible replacement of a component of a piece of equipment.** This may be allowable if using a competitor's replacement part would make the equipment inoperable, such as during a rehabilitation of an ARFF vehicle. The sponsor must document their justification and make it available to the ADO upon request.
(8) Example where Noncompetitive Proposals may not be Appropriate. **(a) Sponsor convenience**. Sponsors must not use a noncompetitive proposal to ensure consistency of equipment, to improve spare parts management, or to work with companies they have experience with. **(b) Compatibility with nonstandard features.** If a sponsor purchased equipment with nonstandard features that were not required by the FAA, then the sponsor cannot use compatibility as justification for using noncompetitive procurement. An example is when a sponsor purchases an airfield lighting control panel that includes remote maintenance monitoring, which is not required by the FAA. The sponsor cannot limit the procurement of future regulators to only those regulators that support the nonstandard remote maintenance monitoring.
(9) Noncompetitive Proposals. If a sponsor is using a noncompetitive proposal, a modification to standards may be required. The requirements for a modification to standard are outlined in Paragraph 3-23.

Table U-10 AIP Handbook Clarification of 2 CFR § 200.320(f) - Procurement by Noncompetitive Proposals 2 CFR § 200.320(f) - Procurement by Noncompetitive Proposals

Clarifications include…
(10) Separating Noncompetitive and Competitive Procurement. Per FAA policy, sponsors must separate noncompetitive and competitive procurement because it may limit the free and open competition of the competitive procurement. Four examples where sponsors must separate procurement include changes to existing Airfield Lighting Control and Monitoring Systems (ALCMS), certified airfield lighting equipment with only one manufacturer,. sponsor preferred airfield lighting equipment, and certified airfield lighting equipment that is prohibited from AIP funding. Requirements include: **(a)** The sponsor must notify the ADO in writing before the noncompetitive procurement begins. **(b)** The notification must include the schedule for both procurements. These schedules must indicate that the equipment procurement will be completed before the overall AIP project procurement begins. **(c)** The sponsor must acknowledge in the notification that not all costs will be eligible for reimbursement with AIP funding (see Paragraph 3-93 for the reimbursement rules). **(d)** The sponsor must complete the noncompetitive procurement before the overall AIP project procurement begins.

U-19. 2 CFR § 200.321 - Contracting with Small and Minority Businesses, Women's Business Enterprises, and Labor Surplus Area Firms.

The following italicized text is directly quoted from 2 CFR part 200.

§ 200.321Contracting with small and minority businesses, women's business enterprises, and labor surplus area firms.

(a) The non-Federal entity must take all necessary affirmative steps to assure that minority businesses, women's business enterprises, and labor surplus area firms are used when possible.

(b) Affirmative steps must include:

(1) Placing qualified small and minority businesses and women's business enterprises on solicitation lists;

(2) Assuring that small and minority businesses, and women's business enterprises are solicited whenever they are potential sources;

(3) Dividing total requirements, when economically feasible, into smaller tasks or quantities to permit maximum participation by small and minority businesses, and women's business enterprises;

(4) Establishing delivery schedules, where the requirement permits, which encourage participation by small and minority businesses, and women's business enterprises;

(5) Using the services and assistance, as appropriate, of such organizations as the Small Business Administration and the Minority Business Development Agency of the Department of Commerce; and

(6) Requiring the prime contractor, if subcontracts are to be let, to take the affirmative steps listed in paragraphs (1) through (5) of this section.

Table U-11 AIP Handbook Clarification of 2 CFR § 200.321, Contracting with Small and Minority Businesses, Women's Business Enterprises, and Labor Surplus Area Firms

Clarifications include…
(1) Disadvantaged Business Enterprise and Bid Responsiveness. The Small and Minority, Women's Business Enterprise (MWBE) and labor surplus area programs are distinct from the Disadvantaged Business Enterprise (DBE) program (which is a DOT program and a requirement for AIP). A sponsor is allowed to include aspirational goals in bid documents, as well as race-neutral small business set-asides per 49 CFR § 26.39. However, it is FAA policy, based on 49 CFR part 26, that the sponsor cannot use any goals other than DBE to determine bid responsiveness. Local goals for MWBE and labor surplus area programs may not be included on an AIP project.
(2) Other Civil Rights Requirements Outside of 2 CFR §§ 200.317-200.326. Sponsors are also required to follow the other civil rights requirements for AIP projects, such as those found in 49 CFR part 26.

U-20. 2 CFR § 200.322 - Procurement of Recovered Materials.

The following italicized text is directly quoted from 2 CFR part 200.

§ 200.322 Procurement of recovered materials.

A non-Federal entity that is a state agency or agency of a political subdivision of a state and its contractors must comply with section 6002 of the Solid Waste Disposal Act, as amended by the Resource Conservation and Recovery Act. The requirements of Section 6002 include procuring only items designated in guidelines of the Environmental Protection Agency (EPA) at 40 CFR part 247 that contain the highest percentage of recovered materials practicable, consistent with maintaining a satisfactory level of competition, where the purchase price of the item exceeds $10,000 or the value of the quantity acquired by the preceding fiscal year exceeded $10,000; procuring solid waste management services in a manner that maximizes energy and resource recovery; and establishing an affirmative procurement program for procurement of recovered materials identified in the EPA guidelines.

Table U-12 AIP Handbook Clarification of 2 CFR § 200.322 - Procurement of Recovered Materials

Clarifications include…
(1) New Requirement Per 2 CFR § 200.
(2) Clarification from Section 6002(c)(1) of the Resource Conservation and Recovery Act. Sponsors may decide not to procure recovered material if they are not reasonably available in a reasonable period of time; fail to meet reasonable performance standards; or are only available at an unreasonable price.
(3) Listing of Recovered Materials. A listing is available in 40 CFR § 247.3.

U-21. 2 CFR § 200.323, Contract Cost and Price.

The following italicized text is directly quoted from 2 CFR part 200.

§ 200.323 Contract cost and price.

(a) The non-Federal entity must perform a cost or price analysis in connection with every procurement action in excess of the Simplified Acquisition Threshold including contract modifications. The method and degree of analysis is dependent on the facts surrounding the particular procurement situation, but as a starting point, the non-Federal entity must make independent estimates before receiving bids or proposals.

(b) The non-Federal entity must negotiate profit as a separate element of the price for each contract in which there is no price competition and in all cases where cost analysis is performed. To establish a fair and reasonable profit, consideration must be given to the complexity of the work to be performed, the risk borne by the contractor, the contractor's investment, the amount of subcontracting, the quality of its record of past performance, and industry profit rates in the surrounding geographical area for similar work.

(c) Costs or prices based on estimated costs for contracts under the Federal award are allowable only to the extent that costs incurred or cost estimates included in negotiated prices would be allowable for the non-Federal entity under Subpart E—Cost Principles of this part. The non-Federal entity may reference its own cost principles that comply with the Federal cost principles.

(d) The cost plus a percentage of cost and percentage of construction cost methods of contracting must not be used.

Table U-13 AIP Handbook Clarification of 2 CFR § 200.323 - Contract Cost and Price

Clarifications include…

(1) Price or Cost Analysis is a Mandatory Sponsor Action. Sponsors are required to perform a cost or price analysis for every procurement action that uses AIP funds, including contract modifications. Per FAA policy, this includes all procurement actions including contract modifications that are below the simplified acquisition threshold (provided in Table U-7). The only exception is for micro-purchases discussed in Paragraph U-13).

(2) Application to Professional Services Contracts. Professional service contracts (such as engineering or consultant contracts) are considered *for-profit firms* and therefore the contract cost and price principles in 48 CFR part 31 (not 2 CFR § 200.323) apply.

(3) Contract Modifications. Contract modifications include such items as change orders to construction/equipment contracts and supplemental agreements to negotiated professional service contracts. Contract modifications that change the original scope of the project and do not have a line item in the original bid require a full cost analysis. Otherwise, the sponsor can perform a price analysis by simply documenting that the unit prices are consistent with those in the original contract and/or that the changes are necessary to complete the original scope of the work.

(4) Independent Estimate. The independent estimate methods by project type are included below. These estimates are the initial tool for the sponsor to use in price and cost analyses.

For the following project type…	The independent estimate method is…
Land and easement acquisition	Appraisals and review appraisals
Equipment acquisition and construction	Engineer's estimate
Negotiated professional services (such as consultant costs)	Independent fee estimate
Non-negotiated services (such as newspaper advertisements and rental of facilities for a public hearing)	Advertised pricing
Non-negotiated service based on law or regulation (such as utility work by the utility company or a reimbursable agreement with the FAA Air Traffic Organization (ATO))	Not applicable

(5) Cost Analysis Purpose. A cost analysis is the evaluation of separate elements such as labor or materials that make up the total price to determine if the separate elements are allowable, directly related to the project, and reasonable.

(6) Price Analysis Purpose. A price analysis is a process analyzing a proposed total price without evaluating separate cost elements (including profit). The purpose is solely to ensure that a total price is fair and reasonable.

Table U-13 AIP Handbook Clarification of 2 CFR § 200.323 - Contract Cost and Price

Clarifications include…
(7) Cost Analysis vs. Price Analysis. Cost analysis is used in instances where a price analysis is not viable (instances listed 2 CFR § 200.323(a)) and requires evaluation of the individual elements of cost that make up the total price. Price analysis is based solely on the total price.
(8) How to do a Cost or Price Analysis. There are a number of publically-available documents on preparing a cost analysis. DOD's Contract Pricing Reference Guides is an excellent source. Another good source is the Quick Guide to Cost and Price Analysis for HUD Grantees and Funding Recipients, United States Department of Housing and Urban Development. Because HUD has similar grant requirements for their grantees as AIP does for sponsors, the requirements are very similar to those of AIP. References and links for these documents are included in Appendix B.
(9) File Retention. Sponsors must retain a copy of the price or cost analysis in the sponsor's files.
(10) Documentation to the ADO. Sponsors must submit all cost and price analysis documentation to the ADO upon request as required in Section 14 of Chapter 3.
(11) Negotiation of Profit. Sponsor must remember to include this step as a separate action for all of the situations outlined in 2 CFR § 200.323(b) (including change orders).
(12) Contract Bonus for Expedited Construction Completion. Contracts sometimes provide for payment of a bonus to the contractor for completing construction early or a phase of the construction early. A sponsor can include a bonus clause in a contract on an AIP project, however, AIP cannot fund the bonus payment.
(13) Escalator Clauses. Escalator clauses are provisions in a contract for increasing or decreasing the contracted price for labor, material, etc., in step with the market prices or an agreed upon benchmark. Sponsors must send their request to the ADO and obtain written APP-1 approval before awarding contracts containing an escalator clause.
(14) Required Prior Notification to ADO. If the sponsor makes a contract modification that changes the scope of a contract or increases the contract amount by more than the simplified acquisition threshold (provided in Table U-7), the sponsor must notify the ADO in writing prior to executing the procurement action.

U-22. 2 CFR § 200.324 - Federal Awarding Agency or Pass-Through Entity Review.

The following italicized text is directly quoted from 2 CFR part 200.

§ 200.324 Federal awarding agency or pass-through entity review.

(a) The non-Federal entity must make available, upon request of the Federal awarding agency or pass-through entity, technical specifications on proposed procurements where the Federal awarding agency or pass-through entity believes such review is needed to ensure that the item or service specified is the one being proposed for acquisition. This review generally will take place

prior to the time the specification is incorporated into a solicitation document. However, if the non-Federal entity desires to have the review accomplished after a solicitation has been developed, the Federal awarding agency or pass-through entity may still review the specifications, with such review usually limited to the technical aspects of the proposed purchase.

(b) The non-Federal entity must make available upon request, for the Federal awarding agency or pass-through entity pre-procurement review, procurement documents, such as requests for proposals or invitations for bids, or independent cost estimates, when:

(1) The non-Federal entity's procurement procedures or operation fails to comply with the procurement standards in this part;

(2) The procurement is expected to exceed the Simplified Acquisition Threshold and is to be awarded without competition or only one bid or offer is received in response to a solicitation;

(3) The procurement, which is expected to exceed the Simplified Acquisition Threshold, specifies a "brand name" product;

(4) The proposed contract is more than the Simplified Acquisition Threshold and is to be awarded to other than the apparent low bidder under a sealed bid procurement; or

(5) A proposed contract modification changes the scope of a contract or increases the contract amount by more than the Simplified Acquisition Threshold.

(c) The non-Federal entity is exempt from the pre-procurement review in paragraph (b) of this section if the Federal awarding agency or pass-through entity determines that its procurement systems comply with the standards of this part.

(1) The non-Federal entity may request that its procurement system be reviewed by the Federal awarding agency or pass-through entity to determine whether its system meets these standards in order for its system to be certified. Generally, these reviews must occur where there is continuous high-dollar funding, and third party contracts are awarded on a regular basis;

(2) The non-Federal entity may self-certify its procurement system. Such self-certification must not limit the Federal awarding agency's right to survey the system. Under a self-certification procedure, the Federal awarding agency may rely on written assurances from the non-Federal entity that it is complying with these standards. The non-Federal entity must cite specific policies, procedures, regulations, or standards as being in compliance with these requirements and have its system available for review.

Table U-14 AIP Handbook Clarification of 2 CFR § 200.324 - Federal Awarding Agency or Pass-Through Entity Review

Clarifications include…
(1) ADO Responsibilities. The ADO procurement responsibilities are discussed in detail in Section 10 of Chapter 3. The ADO always has the option of reviewing any sponsor procurement documents and systems at any time during the grant process.
(2) Required Sponsor Notifications to the ADO. It is FAA policy that the sponsor must notify the ADO when any of the situations listed in 2 CFR § 200.324(b) exist. The ADO then has the option to require the sponsor to provide further documentation or to conduct a pre-award review.

U-23. 2 CFR § 200.325 - Bonding Requirements.

The following italicized text is directly quoted from 2 CFR part 200.

§ 200.325 Bonding requirements.

For construction or facility improvement contracts or subcontracts exceeding the Simplified Acquisition Threshold, the Federal awarding agency or pass-through entity may accept the bonding policy and requirements of the non-Federal entity provided that the Federal awarding agency or pass-through entity has made a determination that the Federal interest is adequately protected. If such a determination has not been made, the minimum requirements must be as follows:

(a) A bid guarantee from each bidder equivalent to five percent of the bid price. The "bid guarantee" must consist of a firm commitment such as a bid bond, certified check, or other negotiable instrument accompanying a bid as assurance that the bidder will, upon acceptance of the bid, execute such contractual documents as may be required within the time specified.

(b) A performance bond on the part of the contractor for 100 percent of the contract price. A "performance bond" is one executed in connection with a contract to secure fulfillment of all the contractor's obligations under such contract.

(c) A payment bond on the part of the contractor for 100 percent of the contract price. A "payment bond" is one executed in connection with a contract to assure payment as required by law of all persons supplying labor and material in the execution of the work provided for in the contract.

Table U-15 AIP Handbook Clarification of 2 CFR § 200.325 - Bonding requirements

Clarifications include…
(1) Contracts at or below the Simplified Acquisition Threshold (provided in Table U-7). Sponsors have the option to follow their own requirements relating to bid guarantees, performance bonds, and payment bonds for construction if the contract or subcontract is at or below the simplified acquisition threshold (provided in Table U-7).
(2) Maintenance Bonds and Extended Warrantees. Maintenance bonds and extended warrantees are not required under 2 CFR § 200.325 and cannot be funded under AIP. If a sponsor chooses to require a maintenance bond or an extended warrantee, then the sponsor must clearly bid that item separately and not include the costs in the AIP project.
(3) Requirements for Nonstandard Bonding. If the sponsor deviates from the minimum bonding requirements, the sponsor must submit a written assurance to the ADO that the Federal interests are adequately protected.
(4) Combined Payment and Performance Bonds. A combined payment and performance bond does *not* meet the minimum requirements and must not be used unless sponsor has submitted a written assurance to the ADO that the Federal interests are adequately protected.
(5) Bonding for Equipment Procurement Projects (no construction included in project). For an AIP project that is solely to acquire equipment, with no associated construction of any kind, by FAA policy, the decision to require bonds (or not) is at the discretion of the sponsor.

U-24. 2 CFR § 200.326 - Contract provisions.

The following italicized text is directly quoted from 2 CFR part 200.

§ 200.326 Contract provisions.

The non-Federal entity's contracts must contain the applicable provisions described in Appendix II to Part 200—Contract Provisions for non-Federal Entity Contracts Under Federal Awards.

Appendix II to Part 200—Contract Provisions for Non-Federal Entity Contracts Under Federal Awards

In addition to other provisions required by the Federal agency or non-Federal entity, all contracts made by the non-Federal entity under the Federal award must contain provisions covering the following, as applicable.

(A) Contracts for more than the simplified acquisition threshold currently set at $150,000, which is the inflation adjusted amount determined by the Civilian Agency Acquisition Council and the Defense Acquisition Regulations Council (Councils) as authorized by 41 U.S.C. 1908, must address administrative, contractual, or legal remedies in instances where contractors violate or breach contract terms, and provide for such sanctions and penalties as appropriate.

(B) All contracts in excess of $10,000 must address termination for cause and for convenience by the non-Federal entity including the manner by which it will be effected and the basis for settlement.

(C) Equal Employment Opportunity. Except as otherwise provided under 41 CFR Part 60, all contracts that meet the definition of "federally assisted construction contract" in 41 CFR Part 60-1.3 must include the equal opportunity clause provided under 41 CFR 60-1.4(b), in accordance with Executive Order 11246, "Equal Employment Opportunity" (30 FR 12319, 12935, 3 CFR Part, 1964-1965 Comp., p. 339), as amended by Executive Order 11375, "Amending Executive Order 11246 Relating to Equal Employment Opportunity," and implementing regulations at 41 CFR part 60, "Office of Federal Contract Compliance Programs, Equal Employment Opportunity, Department of Labor."

(D) Davis-Bacon Act, as amended (40 U.S.C. 3141-3148). When required by Federal program legislation, all prime construction contracts in excess of $2,000 awarded by non-Federal entities must include a provision for compliance with the Davis-Bacon Act (40 U.S.C. 3141-3144, and 3146-3148) as supplemented by Department of Labor regulations (29 CFR Part 5, "Labor Standards Provisions Applicable to Contracts Covering Federally Financed and Assisted Construction"). In accordance with the statute, contractors must be required to pay wages to laborers and mechanics at a rate not less than the prevailing wages specified in a wage determination made by the Secretary of Labor. In addition, contractors must be required to pay wages not less than once a week. The non-Federal entity must place a copy of the current prevailing wage determination issued by the Department of Labor in each solicitation. The decision to award a contract or subcontract must be conditioned upon the acceptance of the wage determination. The non-Federal entity must report all suspected or reported violations to the Federal awarding agency. The contracts must also include a provision for compliance with the Copeland "Anti-Kickback" Act (40 U.S.C. 3145), as supplemented by Department of Labor regulations (29 CFR Part 3, "Contractors and Subcontractors on Public Building or Public Work Financed in Whole or in Part by Loans or Grants from the United States"). The Act provides that each contractor or subrecipient must be prohibited from inducing, by any means, any person employed in the construction, completion, or repair of public work, to give up any part of the compensation to which he or she is otherwise entitled. The non-Federal entity must report all suspected or reported violations to the Federal awarding agency.

(E) Contract Work Hours and Safety Standards Act (40 U.S.C. 3701-3708). Where applicable, all contracts awarded by the non-Federal entity in excess of $100,000 that involve the employment of mechanics or laborers must include a provision for compliance with 40 U.S.C. 3702 and 3704, as supplemented by Department of Labor regulations (29 CFR Part 5). Under 40 U.S.C. 3702 of the Act, each contractor must be required to compute the wages of every mechanic and laborer on the basis of a standard work week of 40 hours. Work in excess of the standard work week is permissible provided that the worker is compensated at a rate of not less than one and a half times the basic rate of pay for all hours worked in excess of 40 hours in the work week. The requirements of 40 U.S.C. 3704 are applicable to construction work and provide that no laborer or mechanic must be required to work in surroundings or under working conditions which are unsanitary, hazardous or dangerous. These requirements do not apply to the purchases of supplies or materials or articles ordinarily available on the open market, or contracts for transportation or transmission of intelligence.

(F) Rights to Inventions Made Under a Contract or Agreement. If the Federal award meets the definition of "funding agreement" under 37 CFR § 401.2 (a) and the recipient or subrecipient wishes to enter into a contract with a small business firm or nonprofit organization regarding the substitution of parties, assignment or performance of experimental, developmental, or research work under that "funding agreement," the recipient or subrecipient must comply with the requirements of 37 CFR Part 401, "Rights to Inventions Made by Nonprofit Organizations and Small Business Firms Under Government Grants, Contracts and Cooperative Agreements," and any implementing regulations issued by the awarding agency.

(G) Clean Air Act (42 U.S.C. 7401-7671q.) and the Federal Water Pollution Control Act (33 U.S.C. 1251-1387), as amended—Contracts and subgrants of amounts in excess of $150,000 must contain a provision that requires the non-Federal award to agree to comply with all applicable standards, orders or regulations issued pursuant to the Clean Air Act (42 U.S.C. 7401-7671q) and the Federal Water Pollution Control Act as amended (33 U.S.C. 1251-1387). Violations must be reported to the Federal awarding agency and the Regional Office of the Environmental Protection Agency (EPA).

(H) Mandatory standards and policies relating to energy efficiency which are contained in the state energy conservation plan issued in compliance with the Energy Policy and Conservation Act (42 U.S.C. 6201).

(I) Debarment and Suspension (Executive Orders 12549 and 12689)—A contract award (see 2 CFR 180.220) must not be made to parties listed on the governmentwide Excluded Parties List System in the System for Award Management (SAM), in accordance with the OMB guidelines at 2 CFR 180 that implement Executive Orders 12549 (3 CFR Part 1986 Comp., p. 189) and 12689 (3 CFR Part 1989 Comp., p. 235), "Debarment and Suspension." The Excluded Parties List System in SAM contains the names of parties debarred, suspended, or otherwise excluded by agencies, as well as parties declared ineligible under statutory or regulatory authority other than Executive Order 12549.

(J) Byrd Anti-Lobbying Amendment (31 U.S.C. 1352)—Contractors that apply or bid for an award of $100,000 or more must file the required certification. Each tier certifies to the tier above that it will not and has not used Federal appropriated funds to pay any person or organization for influencing or attempting to influence an officer or employee of any agency, a member of Congress, officer or employee of Congress, or an employee of a member of Congress in connection with obtaining any Federal contract, grant or any other award covered by 31 U.S.C. 1352. Each tier must also disclose any lobbying with non-Federal funds that takes place in connection with obtaining any Federal award. Such disclosures are forwarded from tier to tier up to the non-Federal award.

(K) See § 200.322 Procurement of recovered materials.

Table U-16 AIP Handbook Clarification of 2 CFR § 200.326 - Contract Provisions
2 CFR § 200.326 - Contract provisions

Clarifications include…
(1) Additional Clauses and Provisions for AIP Projects and Obligated Sponsors. Appendix II of 2 CFR part 200 (as referenced by 2 CFR § 200.326 does not contain all of the required clauses and provision for AIP projects and obligated sponsors. There are other regulations and statutes that establish additional clauses and provisions. A consolidated listing of required clauses and provision for AIP projects and obligated sponsors is contained in Contract Provision Guidelines for Obligated Sponsors and Airport Improvement Program Projects (see Appendix B for link).
(2) Explanation of Apparent Conflict in Contract Levels between 40 USC § 3701, et seq. and 2 CFR part 200, Appendix II (E). The Contract Work Hours and Safety Standards Act contract provision applies to all contracts in excess of $100,000 that involve labor based on the following: **(a)** The Contract Work Hours and Safety Standards Act is codified at 40 USC § 3701, et seq. **(b)** The Act applies to sponsor contracts and subcontracts "financed at least in part by loans or grants from… the [Federal] Government." This is based on 40 USC § 3701(b)(1)(B)(iii) and (b)(2); 29 CFR § 5.2(h); and 2 CFR part 200, Appendix II (E). **(c)** Although the original Act required its application in any construction contract over $2,000 or non-construction contract to which the Act applied over $2,500 (and language to that effect is still found in 2 CFR part 200, Appendix II (E)), the Act no longer applies to any "contract in an amount that is not greater than $100,000". This is based on 40 USC § 3701(b)(3)(A)(iii)).
(3) Requirement to Include these Contract Provisions into AIP Funded Project Contracts. The sponsor must physically incorporate these contract provisions in each contract funded under AIP. The sponsor must require the contractor (or subcontractor) to insert these contract provisions in each subcontract and further require its inclusion in all lower tier subcontracts (excluding purchase orders, rental agreements and other agreements for supplies or services). **(a)** The sponsor must require the contractor to incorporate applicable requirements of these contract provisions by reference for work done under any purchase orders, rental agreements and other agreements for supplies or services. The prime contractor is responsible for compliance by any subcontractor, lower-tier subcontractor or service provider. **(b)** Subject to the applicability criteria noted in the specific contractor provisions, these contract provisions apply to all work performed on the contract by the contractor's own organization and with the assistance of workers under the contractor's immediate supervision and to all work performed on the contract by piecework, station work, or by subcontract. **(c)** A breach of any of the stipulations contained in these required contract provisions may be sufficient grounds for withholding of progress payments, withholding of final payment, termination of the contract, suspension/debarment or any other action determined to be appropriate by the sponsor and AIP.
(4) Byrd Anti-Lobbying Amendment. This amendment, which is covered in 2 CFR part 200, Appendix II (J) is also covered under 49 CFR part 20.

Appendix V. Revenue Sources for the Airport and Airway Trust Fund

V-1. General.

The Airport and Airway Trust Fund, which was established by the Airport and Airway Revenue Act of 1970, provides the revenues used to fund AIP projects. The Trust Fund receives revenues from a series of excise taxes paid by users of the national airspace system. The excise taxes are associated with purchases of airline tickets and aviation fuel, as well as the shipment of cargo. Table V-1 lists these tax sources and how they are computed. The current tax structure is established under the Taxpayer Relief Act of 1997 (Public Law 105-35). Information on the Trust Fund can be found from the FAA Office of Policy, International Affairs and Environment website.

Table V-1 lists these tax sources and how they are computed.

Table V-1 Revenue Sources for the Airport and Airway Trust Fund

Aviation Taxes	Comment	Tax Rate
a. Domestic Passenger Ticket Tax (including areas of Canada and Mexico not more than 225 miles from the continental United States)	Ad valorem tax.	7.5% of ticket price.
b. Domestic Passenger Flight Segment	A domestic segment is a flight leg consisting of one takeoff and one landing by a flight.	Rate is indexed by the Consumer Price Index starting January 1, 2002.
c. Passenger Ticket Tax at Rural Airports (having less than 100,000 boardings and more than 75 miles from an airport with 100,000 boardings)	Assessed on tickets on flights that begin/end at a rural airport. Rural airports are airports having less than 100,000 enplanements during second preceding calendar year, and either 1) not located within 75 miles of another airport with 100,000 enplanements, 2) is receiving essential air service subsides, or 3) is not connected by paved roads to another airport.	7.5% of ticket price (same as passenger ticket tax). Flight segment fee does not apply.
d. International Departure and Arrival Taxes	Head tax assessed on passengers arriving or departing for foreign destinations (and U.S. territories) that are not subject to the passenger ticket tax.	Rate is indexed by the Consumer Price Index starting January 1, 1999.

Table V-1 Revenue Sources for the Airport and Airway Trust Fund

Aviation Taxes	Comment	Tax Rate
e. Flights between the Continental United States and Alaska or Hawaii		Rate is indexed by the Consumer Price Index starting January 1, 1999.
f. Frequent Flyer Tax	Ad valorem tax assessed on mileage awards (for example, credit cards).	7.5% of value of miles.
g. Domestic Freight and Mail		6.25% of amount paid for the transportation of property by air.
h. General Aviation Fuel Tax		Aviation gasoline – 19.3¢ per gallon. Jet fuel – 21.8¢ per gallon. Effective after March 31, 2012, a 14.1¢ per gallon surcharge on fuel for aircraft used in a fractional ownership program.
i. Commercial Fuel Tax		4.3¢ per gallon.

Appendix W. Competition Plans

W-1. Legislative History.

AIR-21 (Wendell H. Ford Aviation Investment and Reform Act for the 21st Century, Public Law 106-181), Section 155, required the submission of a Competition Plan by certain large and medium hub airports (covered airports) for an AIP grant to be issued beginning in fiscal year 2001. Competition Plan requirements are found in 49 USC § 47106(f).

W-2. Purpose.

Per FAA policy, major airports must be available on a reasonable basis to all carriers wishing to serve the airport. The underlying purpose of the competition plan is for the airport to demonstrate how it will provide for new entrant access and expansion by incumbent carriers.

W-3. Covered Airports.

Per 49 USC § 47106(f)(4) Completion Plans are required for covered airports that meet the conditions outlined in Table W-1.

Table W-1 Airports Falling Under the Competition Plan Requirements

If the following two conditions exist at an airport, the airport is considered a covered airport…
a. The airport is a medium or large hub airport.
b. One or two air carriers control more than 50% of the passenger boardings.

W-4. Prohibition on Grant Execution.

49 USC § 47106(f) prohibits the FAA from issuing an AIP grant to a covered airport unless the airport has submitted a written Competition Plan. It is FAA policy that AIP grants cannot be issued unless a required Competition Plan or Competition Plan update has been *approved* by the FAA. In rare circumstances, when there is a specific and urgent justification, APP-1 may approve a request for the FAA to award a grant based on a conditional approval, but only if the grant includes a special condition that prohibits drawdown of the grant funds until the conditions of the competition plan approval have been fulfilled to the FAA's satisfaction.

W-5. Requirements for Initial Plan Submittal and Updates.

Per FAA policy, covered airports must submit Competition Plans and updates as required in Table W-2. The FAA encourages covered airport to file their initial Competition Plan as close as possible to the start of the fiscal year. Covered airports must either provide two copies of their Competition Plan or Competition Plan update to APP-1 or file an electronic version as directed by the APP-510. In addition, covered airports must also submit one copy of their Competition Plan or update to the ADO and regional office.

Table W-2 Completion Plan and Update Requirements

For the following situation…	The sponsor must…
a. The sponsor is a covered airport and has not submitted an initial Competition Plan.	Submit an initial plan to the FAA. The FAA will send written notification letters to airports that will be required to file initial Competition Plans as close to the beginning of the fiscal year as possible. The FAA encourages covered airports to file their initial Competition Plan as close as possible to the start of the fiscal year to avoid undue delay in AIP grants.
b. The FAA has approved an initial plan, and the sponsor is on the first or second update.	Submit the update within 18 months of the latest FAA approval letter. The FAA will send written notification letters to airports that will be required to file Competition Plan updates as close to the beginning of the fiscal year as possible. The FAA encourages covered airports to file each update as close as possible to the start of the fiscal year to avoid undue delay in AIP grants.

Table W-2 Completion Plan and Update Requirements

For the following situation…	The sponsor must…
c. The FAA has approved an initial plan and two updates.	Submit an update if either of the following special conditions arise. Per FAA policy, covered airports must file these updates within 60 days of these conditions arising to avoid undue delays in AIP grants. **(1) Denial of Access.** An airport files a competitive access report as required by 49 USC § 47107(s) stating it had denied access to an air carrier for gates or facilities within the last six months. 49 USC § 47107(s) requires any medium or large airport that has denied a carrier's request or requests for access to file a report with the Secretary of Transportation describing the carrier's requests, providing an explanation as to why the requests could not be accommodated, and providing a time frame within which, if any, the airport will be able to accommodate the requests. Reports are due each February and August. The FAA expects the airport's written Competition Plan to discuss any changes since the previous submittal as well as and any issues that were raised in the FAA's approval letter. **(2) New Lease and Use Agreement.** An airport executes a new master lease and use agreement, or significantly amends a lease and use agreement, including an amendment due to use of Passenger Facility Charge financing for gates. The FAA encourages airports to consult with the FAA about new lease provisions and to provide the FAA the opportunity to review the new or amended provisions prior to formal execution.

W-6. Initial Competition Plan Contents.

Per 49 USC § 47106(f), initial Competition Plans must include the information in Table W-3 in order for the FAA to accept a filing.

Table W-3 Required Initial Competition Plan Content

Per 49 USC § 47106(f), Competition Plans must include…	Per FAA policy, the following information must be provided to meet the requirements in 49 USC § 47106(f):
a. The availability of airport gates and related facilities.	**(1)** Number of gates available at the airport by lease arrangement, i.e., exclusive, preferential, or common-use, and current allocation of gates. **(2)** Whether any air carriers that have been serving the airport for more than three years are relying exclusively on common-use gates.

Table W-3 Required Initial Competition Plan Content

Per 49 USC § 47106(f), Competition Plans must include…	Per FAA policy, the following information must be provided to meet the requirements in 49 USC § 47106(f):
	(3) Diagram of the airport's concourses. **(4)** Description of gate use monitoring policies, including any differences in policy at gates subject to Passenger Facility Charge Program Assurance # 7 (Competitive Access) and samples of gate use monitoring charts, along with a description of how the charts are derived and how they are used by the airport. The current version of the assurances can be obtained from the FAA Office of Airports website (see Appendix B for link). **(5)** Description of the process for accommodating new service and for service by a new entrant. **(6)** Description of any instances in which the Passenger Facility Charge Program Assurance #7 (Competitive Access) operated to convert previously exclusive-use gates to preferential-use gates or it caused such gates to become available to other users. The current version of the assurances can be obtained from the FAA Office of Airports website (see Appendix B for link). **(7)** Gate utilization (departures/gate) per week and month reported for each gate. **(8)** The circumstances of accommodating a new entrant or expansion during the 12 months preceding filing, including the length of time between initial carrier contact of airport and start of service, the identity of the carriers and how they were accommodated. **(9)** Resolution of any access complaints by a new entrant or an air carrier seeking to expand service during the 12 months preceding the filing, including a description of the process used to resolve the complaint. **(10)** Use/lose, or use/share policies and recapture policies for gates and other facilities. If no such policies exist, an explanation the role, if any under-utilized gates play in accommodating carrier requests for gates must be provided. **(11)** Plans to make gates and related facilities available to new entrants or to air carriers that want to expand service at the airport and methods of accommodating new gate demand by air carriers at the airport (common-use, preferential-use, or exclusive-use gates). **(12)** Availability of an airport competitive access liaison to assist requesting carriers, including new entrants. **(13)** Number of aircraft remain overnight (RON) positions available at the airport by lease arrangement, i.e., exclusive, preferential, common-use or unassigned, and distribution by carrier. This must include a description of the procedures for monitoring and

Table W-3 Required Initial Competition Plan Content

Per 49 USC § 47106(f), Competition Plans must include…	Per FAA policy, the following information must be provided to meet the requirements in 49 USC § 47106(f):
	assigning RON positions and for communicating availability of RON positions to users.
b. Leasing and subleasing arrangements.	**(1)** Whether a subleasing or handling arrangement with an incumbent carrier is necessary to obtain access. **(2)** How the airport assists requesting airlines to obtain a sublease or handling arrangement. **(3)** Airport polices for sublease fees levels (e.g., maximum 15% above lease rates), and for oversight of fees, ground/handling arrangements and incumbent schedule adjustments that could affect access to subtenants. **(4)** Process by which availability of facilities for sublease or sharing is communicated to other interested carriers and procedures by which sublease or sharing arrangements are processed. **(5)** Procedures for resolving disputes or complaints among carriers regarding use of airport facilities, including complaints by subtenants about excessive sublease fees or unnecessary bundling of services. **(6)** Resolution of any disputes over subleasing arrangements in the 12 months preceding filing. **(7)** Accommodation of independent ground service support contractors, including ground handling, maintenance, fueling, catering or other support services. **(8)** Copies of lease and use agreements in effect at the airport.
c. Gate use requirement.	**(1)** Gate use monitoring policy, including schedules for monitoring, basis for monitoring activity (i.e., airline schedules, flight information display systems, etc.), and the process for distributing the product to interested carriers. **(2)** Requirements for signatory status and identity of signatory carriers. **(3)** Where applicable, minimum use requirements for leases (i.e., frequency of operations, number of seats, etc.). **(4)** The priorities, if any, employed to determine carriers that will be accommodated through forced sharing or sub-leasing arrangements. This must include a description of how these priorities are communicated to interested carriers. **(5)** Justifications for any differences in gate use requirements among tenants. **(6)** Usage policies for common-use gates, including, where applicable, a description of priorities for use of common-use

Table W-3 Required Initial Competition Plan Content

Per 49 USC § 47106(f), Competition Plans must include…	Per FAA policy, the following information must be provided to meet the requirements in 49 USC § 47106(f):
	gates. This must include an explanation of how these priorities are communicated to interested carriers. **(7)** Methods for calculating rental rates or fees for leased and common-use space. This must include an explanation of the basis for disparities in rental fees for common-use versus leased gates.
d. Gate-assignment policy.	**(1)** Gate assignment policy and method of informing existing carriers and new entrants of this policy. This must include standards and guidelines for gate usage and leasing, such as security deposits, minimum usage, if any, fees, terms, master agreements, signatory and non-signatory requirements. **(2)** Methods for announcing to tenant carriers when gates become available. The description must discuss whether all tenant air carriers receive information on gate availability and terms and conditions by the same process at the same time. **(3)** Methods for announcing to non-tenant carriers, including both those operating at the airport and those that have expressed an interest in initiating service, when gates become available, and policies on assigning remain overnight (RON) positions and how RON position availability announcements are made.
e. Financial constraints.	**(1)** The major source of revenue at the airport for terminal projects. **(2)** Rates and charges methodology (residual, compensatory, or hybrid). **(3)** Past use, if any, of Passenger Facility Charges for gates and related terminal projects. **(4)** Availability of discretionary income for airport capital improvement projects.
f. Airport controls over air and ground-side capacity.	**(1)** Majority-in-interest (MII) or no further rates and charges clauses covering groundside and airside projects. **(2)** Any capital construction projects that have been delayed or prevented because an MII was invoked. **(3)** Plans, if any, to modify existing MII agreements.
g. Whether the airport intends to build or acquire gates that would be used as common facilities.	**(1)** The number of common-use gates that the airport intends to build or acquire and the timeline for completing the process of acquisition or construction. This must include a description of the intended financing arrangements for these common-use gates, and whether the gates will be constructed in conjunction with preferential or exclusive-use gates.

Table W-3 Required Initial Competition Plan Content

Per 49 USC § 47106(f), Competition Plans must include…	Per FAA policy, the following information must be provided to meet the requirements in 49 USC § 47106(f):
	(2) Whether common-use gates will be constructed in conjunction with gates leased through exclusive or preferential-use arrangements. **(3)** Whether gates being used for international service are available for domestic service. **(4)** Whether air carriers that only serve domestic markets now operate from international gates. This must include a description and explanation of any disparity in their terminal rentals versus domestic terminal rentals.
h. Per 49 USC § 47107(a)(15), the method for making the Competition Plan available to the public.	**(1)** 49 USC § 47107(a)(15) requires sponsors to make special airport financial reports available to the public. Therefore, the Competition Plan must include the covered airport's method of satisfying this requirement. If web posting is employed, the filing must identify the precise web address where the Competition Plan material may be found. Per FAA policy, if a web posting is not employed, the reasons for this decision must be discussed in the submission.

W-7. Competition Plan Update Contents.

Per FAA Policy, Competition Plan updates must include the information in Table W-4.

Table W-4 Required Competition Plan Update Content

Per FAA Policy, Competition Plan updates must include also include…
a. Changes from Last FAA Approval. Information regarding new relevant changes in competitive circumstances at the airport since the previous FAA approval. If there have been no changes in competitive filing information, the airport must state that there has been no change since the previous plan approval. For new master lease agreements or significantly amended lease agreements, this includes a copy of the agreement, a written description of the changes in lease terms, and leasing practices or policies included in the lease document.
b. Reasons for Not Instituting FAA Recommendations. In instances in which the FAA has recommended that an airport adopt a particular management or operating practice and the airport has declined the recommendation, per FAA policy, the airport must explain the activities and/or procedures it is performing that would achieve the same result as the FAA's recommended practice.
c. Responses to FAA Questions. Responses to questions raised or recommendations included in previous FAA approvals.

Table W-4 Required Competition Plan Update Content

Per FAA Policy, Competition Plan updates must include also include…
d. Public Availability. 49 USC § 47107(a)(15) requires sponsors to make special airport financial reports available to the public. Therefore, the Competition Plan update must include the covered airport's method of satisfying this requirement. If web posting is employed, the filing must identify the precise web address where the Competition Plan update material may be found. If a web posting is not employed, the reasons for this decision must be discussed in the submission.

W-8. Sponsor Guidance.

Additional guidance that sponsors can use to reduce barriers to entry and enhance competitive access is contained in the current version of the document titled Highlights of Reported Actions to Reduce Barriers to Entry and Enhance Competitive Access. Additional useful information is contained in the U.S Department of Transportation report titled Airport Business Practices and Their Impact on Airline Competition. See Appendix B for references and links to these documents.

W-9. Plan Review Process.

Per FAA policy, a joint DOT Office of the Secretary (OST) and FAA team will review each plan to determine that the Competition Plan or Competition Plan update satisfies statutory requirements. APP-1 will advise the covered airport and the applicable regional office and ADO of all acceptances, identified deficiencies, or rejections in writing. The OST/FAA team has the option to contact the airport informally during the course of the Competition Plan review. This contact will generally take the form of a telephone conference call and may include a site visit.

W-10. Additional FAA Actions.

Per FAA policy, the FAA has the option to periodically review the implementation of competition plans of all covered airports and may conduct site visits to meet our obligation to ensure that each covered airport successfully implements its approved plan.

W-11. Plan Development Eligibility.

Per FAA Policy, competition plans and updates are only eligible for AIP funding as part of an eligible master planning project (not as a stand-alone project). Additionally, the scope of work for full master planning studies and updates for the full study must include a Competition Plan development or update as part of the effort (if the studies or updates include a review of terminal development and the airport is a covered airport). However, this requirement would not apply to master planning efforts that are either minor in scope or that are occurring at times that would create a duplication of effort with recently completed plans or updates.

Appendix X. Buy American Guidance

X-1. General Sponsor Buy American Requirements.

The Buy American Preferences under 49 USC § 50101 require that all steel and manufactured goods used in AIP funded projects be produced in the United States. Under 49 USC § 50101(c), ground transportation demonstration projects in 49 USC § 47127 are excluded. Sponsors must complete one of the three requirements in Table X-1 for the AIP projects (including ineligible or non-AIP funded work included in the same contract).

Table X-1 General Sponsor Buy American Requirements

All sponsors must complete one of the following for AIP funded projects…
(1) Certify, in writing, all products are wholly produced in America and are of 100% U.S. materials.
(2) Certify that all equipment that is being used on the project is on the Nationwide Buy American conformance list.
(3) Request a waiver to use non- U.S. produced products.

X-2. Other Buy American and Buy America Requirements.

There are other Buy American and Buy America preference rules and requirements imposed by other Federal agencies that may differ from the AIP Buy American guidance. That is because there are difference statutory requirements for other Federal agencies and grant programs that do not apply to AIP.

X-3. Changes Orders and Buy American Requirements.

A change order to a project requires a separate Buy American review and may require an ADO determination.

X-4. Buy American Waiver Process and Delegation.

Under 49 USC § 50101(b) and 49 CFR § 1.83(a)(11), the FAA is given the authority to waive these Buy American Preferences if certain market or product conditions exist. Many pieces of equipment are constructed with some non- U.S. produced components or subcomponents. Therefore, it is expected that the sponsor will have to request a waiver on a majority of projects (unless the project is constructed of materials that already have a nationwide waiver). These requirements only apply to manufactured components and subcomponents. Software is not considered a component or subcomponent.

The four types of Buy American waivers that the FAA may be issued are listed in Table X-2. The responsibility for Type I and II waivers, as well as any nationwide waivers remains with

APP-500. The ADOs have been delegated the authority to issue Type III and Type IV waivers to a sponsor on a project level.

Table X-2 Criteria by Buy American Waiver Type

For the following…	The following criteria apply…
Type I Waiver	Per 49 USC § 50101(b)(1), the FAA can issue this type of waiver if the FAA determines that applying the Buy American requirements would be inconsistent with the public interest. Due to the possible national implications of such a waiver, APP-500 is responsible for reviewing and issuing Type I Waivers.
Type II Waiver	Per 49 USC § 50101(b)(2), the FAA can issue this type of waiver for equipment or construction material if the FAA determines that the goods are not produced in a sufficient and reasonably available amount or are not of a satisfactory quality. Type II Waivers can only be issued on the equipment/construction material level and cannot be issued for a system and/or facility that is comprised of various pieces of equipment/construction material. These waivers are issued by APP-500, after the FAA publishes a Federal Register Notice asking manufacturers to advise the FAA if they manufacture the equipment/material that is seeking a waiver and if their product meets the FAA specifications and Buy American requirements. After manufacturers respond to this notice, APP-500 will make a determination if there is insufficient quantity or quality.

Table X-2 Criteria by Buy American Waiver Type

For the following…	The following criteria apply…
Type III Waiver	Per 49 USC § 50101(b)(3), the FAA can issue this type of waiver if the FAA determines that 60% or more of the components and subcomponents in the equipment/facility are of U.S. origin and their final assembly is in the United States. A Type III Waiver cannot be issued at the system level and must be issued for each piece of equipment; however, in the case of facilities a Type III Waiver may be issued for the entire facility if all the construction materials when combined meet the 60% U.S. origin requirement. The ADO may issue these waivers. For block grant state projects, only the FAA (usually the ADO) may issue the waivers. Block grant states are not allowed to issue a waiver. To complete a Type III Waiver request, the following supporting documentation must be submitted by the requester: **(1)** A completed Buy American Content Percentage Calculation Worksheet (or equivalent) (see Appendix B for link). Per 49 USC § 50101(c), labor costs at final assembly must be excluded from this worksheet. This is because the Buy American statute is based on the cost of materials and equipment, not labor. **(2)** A completed Buy American Product Final Assembly Questionnaire (or equivalent) (see Appendix B for link). Final assembly in the United States must meet the standard defined below under Final Assembly Location. **(3)** The manufacturer must certify in writing that any major structural steel used in their equipment is of 100% U.S. origin. Small amounts of steel that are used in components and subcomponents, that are not structural steel, may be of foreign origin. This would typically consist of nuts, bolts and clips. For these types of steel, the manufacturer must indicate the use of the steel (nuts, bolts, clips, etc.) and must count this steel as non-U.S. origin when completing the Content Percentage Calculation Form. Per FAA policy, after the ADO reviews the waiver request, the ADO must send a notification to the requester informing them of the approval or disapproval of the waiver. The ADO must use the following language in this notification for project specific waivers: *I have reviewed the request for Waiver of Buy American Requirement submitted by XXX for the use of XXXXX equipment on the subject project. The information submitted by XXXX satisfies the requirement for waiver of the requirements of 49 USC § 50101 based on XX% of the cost of components and subcomponents to be used in the project being produced in the United States with final assembly being performed in XXXXXXX. The waiver is hereby approved for use on this AIP grant project*. The ADO must place a copy of the notifications in the grant file. Following this notification, no further action is required.

Table X-2 Criteria by Buy American Waiver Type

For the following…	The following criteria apply…
Type IV Waiver	Per 49 USC § 50101(b)(4), the FAA can issue this type of waiver if the FAA determines that applying Buy American requirements increases the cost of the overall project by more than 25%. The ADO may issue these waivers. For block grant state projects, only the FAA (usually the ADO) may issue the waivers. Block grant states are not allowed to issue a waiver. In order to issue this type of waiver, the FAA must determine that there is at least one bid from a Buy American compliant supplier to make the 25% cost increase determination. Per FAA policy, after the ADO reviews the waiver request, the ADO must send a notification to the requester informing them of the approval or disapproval of the waiver. The ADO must use the following language in this notification for project specific waivers: *I have reviewed the request for Waiver of Buy American Requirement submitted by XXX for the use of XXXXX equipment on the subject project. The information submitted by XXXX satisfies the requirement for waiver of the requirements of 49 USC § 50101 that including domestic material will increase the cost of the overall project by more than 25%. The waiver is hereby approved for use on this AIP grant project*. The ADO must place a copy of the notifications in the grant file. Following this notification no further action is required.

X-5. National Buy American Waiver.

APP-500 may issue National Waivers for certain equipment/material that is used frequently in AIP funded projects. APP-500 will list these National Waivers on the FAA Office of Airports website under the Buy American Conformance List. Any equipment or materials on the Buy American Conformance List do not need additional waiver materials. All personnel not in APP-500 must direct any manufacturer seeking to be added to this Buy American Conformance List to APP-500.

X-6. Definitions.

To assist in making Buy American Waiver determinations the following definitions apply:

Table X-3 Buy American Specific Definitions

Buy American Waiver specific definitions include…
a. Project. The *Project* is generally the project that is being bid or procured. The *Project* does not extend over multiple grants or phases, even though the overall project may be phased or may be built in multiple bid packages.

Table X-3 Buy American Specific Definitions

Buy American Waiver specific definitions include…
b. Facility or Equipment. This will be defined differently depending on the project. For a building, the portion of the building that is being funded under the AIP grant is the *facility* listed in the waiver. For other projects, the bid items as described in the current version of Advisory Circular 150/5370-10, Standards for Specifying Construction of Airports, will generally be the *equipment* referred to in the waiver except for airfield electrical equipment. For airfield electrical equipment, the L- items listed in the Addendum to the current version of Advisory Circular 150/5345-53, Airport Lighting Equipment Certification Program, will generally be the *equipment* referred to in the waiver. For a vehicle or single piece of equipment like a snow plow or ARFF vehicle, the single vehicle itself is the *equipment*.
c. Final Assembly Location. Final assembly is a process whereby assembly is meaningful and complex utilizing a substantial amount of time and resources, a number of different assembly operations, and a high level of skilled labor. The Final Assembly Questionnaire must be completed in order to determine whether final assembly occurs at the recorded site.
d. Nonavailable Items. By FAA policy, the list of items that have been determined nonavailable per 48 CFR § 25.104 are excluded from the Buy American preference requirements for AIP funded projects. This list includes petroleum products; therefore, asphalt is a nonavailable item per this list. In addition, the FAA has determined that cement and concrete are also nonavailable items excluded from the Buy American preference requirements (although the steel used for reinforcement, ties, stirrups, etc. must meet Buy American).

This page has been intentionally left blank.

Appendix Y. Federal Share at Public Land State Airports

Y-1. General Federal Share Definition.

The United States Government's share of project costs on an AIP grant (also known as Federal share or Federal match) is defined in 49 USC § 47109. The Federal share varies by airport size and is generally 75% for large and medium hub airports and 90% for all other airports. The share applicable to a generic class of airports is called the *general Federal share*.

Y-2. Public Land States Definition.

Since the early days of Federal participation in airport infrastructure projects, Congress has provided a higher Federal share at airports located in states with more than 5% of their geographic acreage comprised of unappropriated and unreserved public lands and nontaxable Indian lands (individual and tribal). Land fitting this definition is called Federal land and states meeting the statutory criteria are called public land states.

There are currently 13 public land states whose Federal lands account for between 6.6% (Washington) and 69.23% (Nevada) of the states' total acreage. The Federal land percentages in each of the public land states are identified in Table Y-1. The FAA obtained these percentages from Federal Highway Administration (FHWA) data published pursuant to 23 USC § 120(b)(1), effective March 17, 1992, per 58 Federal Register 158 (January 4, 1993).

Table Y-1 Federally-Controlled Acreage in Public Land States

For the following state…	The percentage of unappropriated and unreserved public lands and nontaxable Indian lands (individual and tribal) in the State is…
(1) Alaska	34.03%
(2) Arizona	43.37%
(3) California	15.74%
(4) Colorado	12.06%
(5) Idaho	22.69%
(6) Montana	12.42%
(7) Nevada	69.23%
(8) New Mexico	26.44%
(9) Oregon	22.23%
(10) South Dakota	9.72%

Table Y-1 Federally-Controlled Acreage in Public Land States

For the following state…	The percentage of unappropriated and unreserved public lands and nontaxable Indian lands (individual and tribal) in the State is…
(11) Utah	41.83%
(12) Washington	6.6%
(13) Wyoming	27.58%

Y-3. History of the Public Land Share Formula.

Since 1970, airport projects in these public land states have been eligible for increased Federal contributions calculated using a series of complex, legislatively-defined formulas. These grant Federal share formulas for public land states have changed over time to keep pace with legislative changes in general Federal shares. The Federal participation rates at airports in public land states are calculated using the prevailing general Federal share for each classification of airports in 49 USC § 47109.

Between 1970 and 1980, Congress adjusted the general Federal shares significantly through a series of amendments to the Airport and Airway Development Act of 1970. ADAP was the predecessor grant program to AIP. The laws that changed the Federal share during ADAP were Public Law 91-258 (May 21, 1970), Public Law 93-44 (June 18, 1973), Public Law 94-353 (July 12, 1976), Public Law 96-415 (November 15, 1979), Public Law 93-44 (July 18, 1973), and Public Law 94-353 (July 12, 1976). As the general Federal shares for grants have increased, Congress changed the public land state formulas to ensure that smaller airports in public land states received some consideration for the large inventories of Federal lands. The legislative formulas under 49 USC § 47109 part ‘b’ and ‘c’ reference the general Federal shares on two specific dates: June 30, 1975 and August 3, 1979. Table Y-2 illustrates the changes in the general Federal share from 1970 to 1980, highlighting the general Federal shares on the two dates of interest.

AIP was established in 1982. The general Federal share under AIP for large and medium hub primary airport grants stabilized at 75%, and the general Federal share for other airport grants increased and then stabilized at 90%. The laws that changed the Federal share during this period were Public Law 97-248, Section 513(b)(5); (September 3, 1982); Public Law 100-223, Section 111(a)(2) (December 30, 1987); and Public Law 102-581, Section 110(b) (October 31, 1992).

In 2003, Congress passed the FAA Century of Aviation Reauthorization Act (Vision 100), Public Law 108-176, Section 161 (December 12, 2003), which temporarily increased the general Federal share of grants at small hub primary, nonhub primary, nonprimary commercial service airports, nonprimary general aviation, and reliever airports to 95%. This increase to 95% was greater than the maximum Federal share (93.75%) that could be calculated under the public land state formulas. Therefore, there was no reason to calculate the public land state Federal grant

share while Vision 100 was in effect, since the 95% general Federal share would always be greater than the maximum public land state percentage. Therefore, between 2003 and 2011, the public land state airports – along with other small airports in the United States – generally received a Federal share of 95% for AIP grants.

In 2012, Congress passed the FAA Modernization and Reform Act of 2012 (FMRA), Public Law 112-95 (February 14, 2012), which did not retain the increased general Federal share provision of Vision 100. Most airports that had been receiving the higher Vision 100 share of 95% reverted to the prior general Federal share of 90%. Smaller airports in public land states reverted to the shares calculated under the public land state formulas, which allowed a Federal share of up to 93.75%.

Table Y-2 Federal Shares by Airport Classification in Public-Land States Between 1970 and 1980

Year	Large Hub Airports	Medium Hub Airports	Small Hub Primary, Nonhub Primary and Nonprimary Commercial Service Airports*	Non-primary General Aviation and Reliever Airports*
a. 1970 – 1973	50%	50%	50%	50%
b. 1974 – 1975 (part 'b' reference)	50%	75%	75%	75%
c. 1976 – 1978	75%	75%	90%	90%
d. 1979 (part 'c' reference) – 1980	75%	75%	80%	80%

Y-4. Calculating the Federal Share in Public Land States Using the Part 'b' and Part 'c' Formulas.

49 USC § 47109 includes two sets of instructions for calculating the Federal share at airports in public land states. Part 'b' provides the general formula for all airports in public land states. Part 'c' provides an additional formula that only applies to small hub primary, nonhub primary and nonprimary commercial service airports.

Y-5. Part 'b' Formula.

The Part 'b' formula applies to airports of all sizes and involves a multi-part analysis. The calculation involves a yes/no test to determine whether a specific class of airports in a public land state is eligible for an adjusted Federal share calculation. If yes, a three-part formula is used to calculate the appropriate share as shown in Table Y-3.

The numerical values and results of the Part 'b' calculation for all airport classes in public land states are contained in Table Y-4. In each row, the highlighted cell identifies the Federal share percentage that governs in that instance, based on the statutory formulas. Note that the Federal shares for small hub primary, nonhub primary and nonprimary commercial service airports in Table Y-4 may change as a result of the part 'c' calculation discussed in the *Grandfather Rule* section to follow.

Table Y-3 Yes/No Test for Part 'b' Calculation

Is the Current General Federal Share (Column C of Table Y-4) less than the 1975 Share (Column B of Table Y-4)?	**Then the Federal Share is…**
a. No	The Current Share (Column C of Table Y-4)
b. Yes	The lessor of: **(1)** The Current Share Increased by 25% (Column E of Table Y-4) **(2)** The Current Share + 1/2 the Public Land Percent (Column F of Table Y-4) **(3)** The 1975 Share (Column G of Table Y-4)

Table Y-4 Part 'b' Calculation Results (see Table Y-5 for columns marked *)

*The increased Federal share for large hub airports in 1975 was less than the current Federal share of 75%, therefore there is no increase in Federal share for a large hub airport in a public land states.

Table Y-5 Column Notes for Table Y-4

For Column…	The following applies…
(1) State/Airport Type	LH = Large Hub MH = Medium Hub SH = Small Hub NHP = Non Hub Primary NPCS = Nonprimary Commercial Service GA = General Aviation RL = Reliever
(2) A - % Public Land	The actual percentage of public land in a state was last calculated in 1992 by the Department of Interior (DOI). According to DOI, the agency stopped calculating this statistic because the source data comes from five separate Federal agencies, none of which collect and report data consistently. Because the AIP statute directs FAA to use these statistics, and 1992 was the last year these statistics were produced, FAA continues to rely on the 1992 DOI public land inventories (published in 58 Federal Register 158 (January 4, 1993) by the Federal Highway Administration) to calculate current Federal share.

Table Y-5 Column Notes for Table Y-4

For Column…	The following applies…
(3) B - Federal Share % in 1975	The adjusted Federal shares for large hub airports were published in 37 Federal Register 11014 (June 1, 1972). In 1974, Congress increased the general Federal share to 75% for all airports enplaning less than 1% of passengers in 1974. The Airport Development Acceleration Act, enacted on June 18, 1973, amended the Airport and Airway Development Act of 1970 (Public Law 91-258). The Act became effective for grants issued during Federal Fiscal Year 1974, which began July 1, 1973. While this change affected airports categorized as medium hubs and smaller, the FAA did not publish adjusted rates for the smaller airports until 1979. While the Part 'b' calculation requires a comparison to the rates in place for these smaller airports in 1975, the FAA is using the 1979 published shares as a proxy for the 1975 rates for smaller airports. These rates have been used by the FAA for at least 10 years to perform the Part 'b' calculations.
(4) E (calc 1) - Current share Increased by 25%	The statutory formula to increase the current Federal share by 1/2 the public land percentage is calculated by multiplicatively, not additively. To be consistent with the Column D directive to increase current Federal share by 25%, Column E is calculated by increasing the current Federal share by the percentage equal to 1/2 the state's public land percentage. For example, in Alaska, where the Federal land accounts for 34.03% of the state's acreage, Column E is calculated by increasing the current Federal share (75) by 17.015%. [Federal Share = 75+(0.17 *75)].

Y-6. Part 'c' Calculation (the Grandfather Rule).

In Vision 100 (passed in 2003), Congress amended 49 USC § 47109 to include a provision that applies to only small hub primary, nonhub primary and nonprimary commercial service airports in public land states. This provision, which applies in addition to the Part 'b' calculation, is codified in 49 USC § 47109(c) and is called the Part 'c' formula or *Grandfather Rule*.

Table Y-6 identifies the calculated Federal shares for small hub primary, nonhub primary and nonprimary commercial service airports in public land states. The Part 'c' formula calculates the ratio of the 1979 general Federal share for small hub primary, nonhub primary and nonprimary commercial service airports (80%) to the 1979 public land state adjusted share (Col. A) and applies that ratio to the current Federal share. The resulting adjusted Federal share (Col. B) cannot exceed the maximum percentage calculated for small hub primary, nonhub primary and nonprimary commercial service airports under Part 'b' (Col. C) or 93.75% (Col. D). The shaded table cells represent the determined or calculated share resulting from the Part 'b' or Part 'c' formulas.

Formula: 80 / A = 90 / B where B is subject to the maximum of C and D

Table Y-6 Part 'c' Calculation

State	A Adjusted Fed Share in 1979	B Adjusted Federal Share (Current	C Max Part 'b' Calculation	D Maximum of 93.75%	Part 'c' Results
a. Non Public-Land States (all those not listed below)	80.00%	90.00%	NA	NA	90.00%

Y-7. Public Land State Federal Share Results.

Table 4-8 contains the final Federal share calculation using the part 'b' and part 'c' calculations.

Appendix Z. Establishment and Category Upgrade Policy for Instrument Landing Systems (ILS)

Z-1. Background.

On March 24, 2015, the FAA published an updated policy on the Establishment and Category Upgrade Policy for Instrument Landing Systems. The updated policy reflects the significant progress that has been made in the availability and use of area navigation (RNAV) approach capabilities using the satellite-based Global Positioning System (GPS). Moreover, the updated policy recognizes that the FAA had already effectively moved away from installing new ILS. RNAV approaches can now provide an equivalent instrument approach capability as compared to ILS. Fleet equipage has also improved markedly such that aircraft that routinely fly under instrument flight rules (and so need an instrument approach capability) are normally equipped with the necessary avionics. Accordingly, FAA will no longer fund installation of new Category I ILS with AIP except in limited circumstances. Instead, RNAV will be the primary means of establishing new instrument approach access to qualified runway ends.

In 2017, there are approximately nine times as many RNAV/GPS approaches as compared to ILS. There are over 2300 airports, and over 3200 runway ends, that have RNAV approaches that do not have ILS. This represents a tremendous amount of reliable approach capability in the National Airspace System (NAS). Better than 92 percent of general aviation aircraft that actively fly IFR are equipped with RNAV or Wide Area Augmentation System (WAAS) avionics. In addition, the majority of air carrier aircraft have various levels of RNAV equipage installed; this continues to improve with the retirement of older aircraft with legacy non-RNAV avionics.

The existing ILS network will continue to serve non-RNAV equipped aircraft. FAA policy serves to encourage aircraft operators to equip their fleet with upgraded RNAV avionics by not adding to the existing network of ILS. The addition of new precision approach capabilities to the NAS will be accomplished with more cost-effective RNAV rather than ILS.

Z-2. Use of RNAV Approaches Instead of Cat I ILS Systems.

Development of an RNAV approach will be used instead of installation of a new Cat I ILS at all airports where technically feasible.

Z-3. FAA Air Traffic Organization (ATO) Funding for Cat I ILSs.

FAA announced in 76 Federal Register 77939 (December 15, 2011) that "In order to maximize operational benefits and take advantage of the cost savings associated with WAAS, the FAA no longer intends to establish new Category I ILSs using ATO funding." In the same notice, FAA announced consideration of "…programmatic changes under AIP that would favor WAAS for new precision approaches at airports, rather than ILS." The updated 2015 policy is consistent with these announcements and is also consistent with current practice as aligned with the 2016 FAA NAS Performance Based Navigation (PBN) Strategy.

Z-4. AIP Funding for Cat I ILSs.

At most airports, it is no longer cost effective or operationally justified to install a new Cat I ILS where an RNAV approach can provide nearly equivalent capabilities and service levels for reliable access. Therefore, instead of installing Cat I ILS for new runways or significant runway extension projects where an ILS was not presently installed, AIP funds will be the primary source of completing an RNAV survey. The sponsor can then coordinate the development of an RNAV approach with the ADO and ATO.

In the rare instances where the FAA has determined that an RNAV approach is not suitable for a given location, the sponsor can request a waiver from the ADO to use AIP funding of a traditional ILS. A possible example is a new or extended runways at a large or medium hub airports where an ILS may still be needed for merging and spacing operations for arrival sequencing. The ADO cannot use AIP funding unless APP-1 has approved the waiver.

Z-5. AIP or ATO Funding of Cat II/III ILSs.

AIP or ATO funding of Cat II/III ILS will continue for the present.

However, future enhancements to GBAS are expected to enable approaches to Cat II/III minima. When the technology is certified, FAA anticipates further policy amendments to favor non-Federal GBAS installations, rather than new ILS, to deliver Cat II/III access capabilities. Until that time, AIP funds will continue to a possible source of funding for a justified Cat II/III ILS on a new runway or major new extension.

Z-6. AIP Transition from ILS to RNAV.

a. Airport Owned ILS that has reached the end of its useful life. For any existing airport-owned ILS equipment that has reached the end of its useful life, the ADO can support a project for an RNAV survey. Alternatively, if the airport wishes to replace the equipment with other ground based ILS equipment, FAA will consider supporting the replacement of the individual components up to the reasonable cost of the RNAV survey, but the equipment replacement will not qualify for the takeover provisions found in 49 USC § 44502(e), which requires the FAA to take over ownership of the ground based equipment. Therefore, the sponsor will continue to own and maintain the ILS.

b. FAA Owned ILS. Because of budget augmentation issues, AIP funds cannot be used to upgrade or replace ground based equipment that is owned by the FAA. (There is a limited exception where the FAA-owned equipment is impacted by an AIP funded project that is unchanged by this policy.) There is no change to the eligibility of AIP funds being used for justified airfield lighting improvements (such as the installation of a threshold bar or in-pavement centerline runway lights) that are needed to support upgraded approaches.

Sarah,

This is the document we discussed a few weeks back. Aron gave me permission to send this directly. You can also get it thru ODAV as it was submitted as part of our feedback. Just thought as a professional working in the same field, it would be nice to share this analysis with directly. He'd be happy to discuss thoughts.

Aron Faegre is one of the smartest and kindest people I've ever met. He does sort of the same thing as you but is on the backside of his career/scaling back and only working for/with a few clients on a very limited basis.

Hi Tony (and team),

Nice to see all your names here in my inbox. I hope you've all been well and had a nice summer.

Thanks for sending this over, Tony. I have cc'd Joe MacFarlane here, who handles the congresswoman's Aviation Subcommittee portfolio. I will give him some time to digest this, and we will be in touch.

Thanks,

Rebecca Wright

Subject: Aurora State Airport

Good Afternoon Rebecca,

Always good to talk with you! Please forward this on to your colleague in Congresswoman Chavez-DeRemer's office along with my contact information. Also (taking advantage of friendship connections) please share with Christine Drazan (I have no shame). I'm hopeful she could work with us as well as Representative Lewis and Senator Girod.

I can't take credit for the masterful information shared below but it (and the attached) very clearly illustrates the situation at Aurora State Airport…

The Oregon Department of Aviation (ODAV – the state) is involved in a master planning effort costing $ 1 million + in federal dollars producing airport 'alternatives" (attached) that all but guarantee the airport's demise. The state's proposed "alternatives" hold the desperately needed runway extension hostage to getting and spending hundreds of millions of dollars to fund "alternatives". These things are wholly unnecessary: like either moving Highway 551 and condemning many homes and businesses or moving the airport tower somewhere else (we note that the tower was just put in during 2015 at considerable cost), moving the entire runway and condemning all of the more than $200 million in private investment from hangars to Atlantic's FBO, to parts Columbia Helicopters and Helicopter Transport Inc., among others, so that ODAV can basically start over at the airport.

Not only are ODAV's "alternatives" wasteful, unnecessary, and dangerous, there does not seem to be any oversight – at a recent work session (9/5/24) ODAV did not even inform their own board that the airport stakeholders gave ODAV the attached fully supported alternative on 9/3/24. An alternative the FAA will almost certainly approve, that costs very little, and that achieves all legitimate goals. ODAV blames regional FAA folks for their untenable alternatives, but the ODAV "alternatives" aren't even consistent with FAA's authority. If there is someone in the FAA playing along, we should consult with their superiors, because unnecessary multi-hundreds of millions of dollars in spending is not something FAA typically insists upon (if they really are – we do not know).

Aurora State Airport is one of the busiest Oregon airports – it features a vitally important hub for Life Flight, numerous natural disaster response companies and various Oregon businesses. We understand that Marion County's governing body is concerned about the direction ODAV is going as well. We would greatly appreciate setting up a meeting with you for some advice about getting the attention of the appropriate people in the FAA about this slow unfolding disaster. Additional points:

- **None** of ODAV's three "alternatives" for the airport are tenable and all are totally unnecessary, based entirely on false assumptions, would cost taxpayers hundreds of millions of dollars to implement (dollars that do not exist), significant loss of tax revenue, loss of good jobs, loss of area tourist revenue, loss of an extremely important state and regional natural disaster asset, all to gain some 27' of separation between the runway and Highway 551, when federal standards allow imperfect compliance with, ODAV merely has to ask. As noted, the airport stakeholders have helped ODAV by giving them a fully supported "Modification to Standards" that meets all FAA standards prepared by an airport professional. Airports throughout the state and country all have such FAA approvals – ODAV just has to ask for it.
- The future of aviation is not just on the horizon, it is here… now! Electric airplanes and electric vertical aircraft (similar to helicopters) are already operating in US Airspace. Its owner has arranged to provide electrical capacity to support electric aircraft, which are the aircraft of the future. The airport boundary should be adjusted to include the one remaining remaining undeveloped through the fence property so it can be put to the aeronautical use it has been planned for since 1976. ODAV is ignoring that innovation which makes their 20-year plan not seem particularly useful for the long term and it is nothing short of appalling for the short term needs of the airport.
- ORS 836.642 clearly calls for ODAV to promote economic development and "Preserve investments in pilot sites…". These proposed alternatives do the exact opposite!

Let's set up a time to talk in person – happy to meet in Canby or up at the airport. I'm out of town till September 19 and pretty open after that. There is a group of smart people (cc'd) that would like to meet. We look forward to meeting with you and your advice.

Thank you in advance for all you do for us.

Aurora State Airport (UAO)
Proposed Modification of
Runway Object Free Area (ROFA) Design Standards

Prepared by: Aron Faegre, AIA, PE
Aron Faegre Airport Planning & Design

August 29, 2024

This memorandum provides an analysis and methodology by which a Modifications of FAA Airport Design Standards (MOS) at the Aurora State Airport (UAO), for the Runway Object Free Area (ROFA) can be justified as:

> "… resulting in an acceptable level of safety, useful life, lower costs, greater efficiency, or the need to accommodate an unusual local condition on a specific project through approval on a case-by-case basis." - FAA Order 5300.1G, page 1.

as defined and permitted under FAA Order 5300.1G Modifications to Agency Airport Design, Construction, and Equipment Standards[1].

1. BACKGROUND

The Aurora State Airport is surrounded by farm lands, near Aurora, Oregon, at the northern end of Marion County. It primarily serves aviation businesses involved with:

- emergency medical transport[2],
- aviation heavy-lift helicopter fire-fighting and power line construction companies (for which fixed wing aircraft are essential for support),[3]
- business jets for numerous major national corporations based within 10 miles,
- aircraft manufacturing for the S-LSA (Special Light-Sport Aircraft) and kit-build

[1] FAA Order 5300.1G Appendix A specifically gives FAA Office of Airport (ARP) and Region the authority to issue a MOS for Runway Object Free Areas. The Order can be downloaded at: https://www.faa.gov/documentLibrary/media/Order/order-5300-1G-modifications-to-standards.pdf .
[2] Regional headquarters for Life Flight Network, with bases all over Oregon, Washington, Idaho, Montana, and Nevada.
[3] Columbia Helicopters, Helicopter Transport Services, Wilson Construction, companies that work internationally with headquarters at Aurora Airport. The use of the Aurora Airport runway is essential to these companies for rapid providing of crews, equipment, and repairs to helicopters in active service of fighting fires, moving power lines, or doing rescue, relief, or humanitarian work.

industry[4], and

- other general aviation aircraft using the airfield for business, pilot training, and recreational flying.

There is no scheduled air service using the airport. The State of Oregon Department of Aviation (ODAV) owns, governs, and manages the public lands of the airport. Most of the business aircraft based at the airport access the runway via through-the-fence permits with ODAV.

Flights by based business jets, such as a Challenger 300, dictate that the Airport Reference Code is C-II. Due to the geometry of the existing site, the airport does not meet current FAA design standards for the ROFA, due primarily to adjacent Highway 551 to the west of the runway.

Most recently ODAV's planned solution[5] to meeting these standards ("Refined Preliminary Alternatives Summary", by Century West Engineering, dated July 31, 2024) is one of only two options:

- relocate the highway further west, (which involves acquiring both private residential and commercial properties further west), or
- relocate the runway, taxiway, and control tower east (which involves acquiring many acres of existing private property already developed with hangars, taxilanes, and aprons for aviation uses) and demolishing numerous large 40,000 square foot aviation hangars along the taxiway.

Both options have very high financial and environmental costs (probably in the greater than $100 million range), which would make them difficult to ever be implemented. If this master plan is approved as currently planned, and one of these options were not implemented, then ODAV and FAA have reported that the airport would only receive maintenance funding and no additional safety improvement funds. This would result in the airport not keeping pace with the aviation industry standards of safety. The second option (moving the runway, control tower, and demolishing hangars), If implemented, would in addition force closure of many of the major medical transport and fire-fighting facilities on the airport, and would put many of the airport's 1,500 employees out of jobs.

It is noted that in the 2012 Airport Layout Plan (ALP), approved (signed) by both ODAV and FAA, the airport also had the same Runway Design Code (RDC) status of C-II and

[4] Van's Aircraft www.vansaircraft.com the international leader in S-LSA produced aircraft.
[5] Refined Preliminary Alternatives Summary document dated July 31, 2024 by Century West Engineer can be downloaded at: https://publicproject.net/files/UAOAMP/uao-refined-preliminary-alternatives-summary-1-.pdf?d952c4adef .

listed a MOS as the solution to the non-standard ROFA limitation on the west property line. At that time there was consensus between ODAV and FAA that a MOS was a reasonable solution.

This memorandum provides the evidence to show that the 2012 ALP was a good approach to resolution of the ROFA, and that it can reasonably be continued. This report demonstrates that there is an acceptable level of safety through modifying the ROFA standard for the specific deviation to standards located on the west side of the runway.

FAA standards for different airports ROFA's vary from 250 foot width, to an 800 foot width, depending on aircraft type using the airport. As will be shown below, the primary reason justifying the modification is that the going from B-II to C-II category is just where the 500-foot required ROFA width changes to an 800-foot wide required ROFA - yet this is the same width required for all RDC category aircraft all the way to E-VI -Portland International Airport, San Francisco Airport, and every other international airport in the country. UAO will never have the larger size of aircraft those airports accommodate – Boeing 737's to Boeing 777's – so a slight reduction in width on the west side provides a level of safety appropriate for UAO, which will always serve only much smaller aircraft.

Modifications of standards for ROFA's are common at even large national airports. For example, recently several MOS were adopted at San Jose International Airport for deficiencies in the ROFA, as well as for runway-taxiway separations, and for runway object free areas[6]. It even appears that Portland International Airport (PDX) may have their airport perimeter fence, the shoulder of NE Marine Drive, and improper grading within the 400-feet area from runway centerline, at the northeast corner of the ROFA for Runway 10L.

This memorandum provides the detailed technical background and mathematically calculated justification, needed for the FAA and ODAV to again approve a MOS for the ROFA at Aurora State Airport.

2. MOS PROCESS

The process for gaining a modification of standards is provided in FAA AC 150/5300-13B Airport Design[7] in Section 2.8. It states, and we provide commentary after each paragraph as to acceptability:

[6] Norman Y. Mineta San Jose International Airport Runway Incursion Mitigation/Airfield Design Standards Analysis, November 27, 2017. Justification for ROFA modifications in this document were often simply the practical and cost issues of modifying major adjacent highways, similar to what is at issue in a much smaller Aurora Airport.
[7] FAA AC 150/5300-13B Airport Design Available free on line at:
https://www.faa.gov/documentLibrary/media/Advisory_Circular/AC-150-5300-13B-Airport-Design-Chg1.pdf

2.8 ***Modification of Standards.***

Site-specific conditions may make it impractical to meet all FAA design standards at an airport. The FAA considers, on a case-by-case basis, modifications to design standards that result in an acceptable level of safety and efficiency. Specific operational controls may be necessary to establish an acceptable level of safety for operation of aircraft at the airport. FAA Order 5300.1 establishes FAA policy for administering airport requests for modification of standards. See paragraphs 2.4 and 2.5.

This memorandum provides this information and finds that no specific operational controls are necessary, see comments on paragraph 2.4 below.

2.8.1 The FAA views an approved modification of standards as an interim measure intended to mitigate unique site-specific conditions. Unless the FAA explicitly states otherwise in the approval action, the FAA expects airports with approved modifications to pursue ways to meet design standards. This may occur incrementally over time or at such time it becomes practical to correct the non-standard condition.

The FAA and ODAV can work with Oregon Department of Transportation on master planning future revisions to State Highway 551 so that it can be corrected "at such time it becomes practical." Also, there are potential options where ODAV and ODOT could jointly agree to relocate the airport perimeter fence closer to Highway 551, which could be an "incrementally" established improvement.

2.8.2 The FAA will not consider any request to modify design standards associated with the following:

- *RSA dimensions*
- *OFZ dimensions*
- *Approach or departure surface dimensions*
- *Standards established within a regulation (e.g., stopway, clearway).*

The ROFA is not one of these.

2.8.3 An airport seeking FAA approval of modification to a design standard submits a request using the Modification of Standards application tool within the Airport Data and Information Portal (ADIP) at https://adip.faa.gov. The FAA relies on the following information, in part, to determine the acceptability of a modification to FAA design standards:

- *Information on the standard proposed for modification.*
- *Description of proposed modification and why the airport cannot meet standards.*
- *Statement addressing how modification will provide an acceptable level of safety, economy, durability, and workmanship.*
- *Listing of any special operational measures necessary to accommodate the modification.*

This document was prepared to provide the analysis needed for ODAV to submittal for the MOS per Section 2.4.

2.4 Addressing Non-standard Airport Conditions.

> *The FAA expects airport owners to address non-standard conditions through the airport planning process. The FAA acknowledges that conformance to current standards is not always practical. However, the FAA expects airports to continue to investigate mitigation measures, whether in one or multiple phases, and correct the non-standard conditions over time.*

It is important to re-emphasize the above statement, that the FAA here "acknowledges that conformance to current standards is not always practical." Further, per this paragraph, the current master planning activity is the appropriate place for this analysis and the formal establishment of a MOS for the ROFA. This report and analysis identifies intermediate steps that can be taken, such as relocating the airport perimeter fence, that will iteratively move the airport closer to compliance.

This analysis utilizes an FAA established safety analysis methodology to show that the MOS provides an acceptable level of safety. The study found no special measures needed to accommodate the modification.

3. METHODOLOGY

In 2011, the Transportation Research Board (TRB) released Airport Cooperative Research Program (ACRP) Report #51 – Risk Assessment Method to Support Modifications of Airfield Separation Standards. The ACRP is funded by the Federal Aviation Administration (FAA). Report #51 is used to support the ROFA MOS requested at Aurora State Airport.

The proposed ROFA MOS is modeled in this report in accordance with Appendix A – Risk Assessment Methodology of ACRP Report #51[8].

This report uses risk plots, along with the annual number of operations, to analyze the cumulative risks associated with Runway to Object Separations. The operations numbers at UAO are taken from the current draft Master Plan, and are numbers already approved by the FAA in a letter[9] to ODAV dated November 15, 2023 (corrected January 23, 2024). For sake of a conservative analysis, we are using the most distant forecast projects for the year 2041, which are:

- 90,231 total operations all RDC categories, of which
- 862 operations are of RDC C-II and D aircraft

[8] ACRP Report #51 – Risk Assessment Method to Support Modifications of Airfield Separation Standards is available free on line at: https://nap.nationalacademies.org/catalog/14501/risk-assessment-method-to-support-modification-of-airfield-separation-standards

[9] Federal Aviation Administration (FAA) Aurora (UAO Aviation Activity Forecast Approval Airport Improvement Program Grant Number 3-41-0004-022-2021 available at: https://publicproject.net/files/2024-01/Aurora-Airport/uao-forecast-approval-20231115-corrected-20240123.pdf?57af6c19b7

For operations involving the runway, per the methods of Report #51, the risk is analyzed based on three distinct phases of flight:

a. Landing - Airborne Phase
b. Landing - Ground Phase
c. Takeoff

The separation distance from the runway centerline to an object is used with the associated risk plot to calculate the risk of collision per operation.

The risk of collisions per operation is then analyzed along with the number of annual airport operations for the appropriate phase of flight to determine the predicted frequency of occurrence. The frequency of occurrence is used to determine the FAA likelihood level using Table A-3 from ACRP Report #51 which is shown below:

Table A-3. FAA likelihood levels (FAA, 2010).

	General	Airport Specific	ATC Operational	
			Per Facility	NAS-wide
Frequent A	Probability of occurrence per operation is equal to or greater than 1×10^{-3}	Expected to occur more than once per week or every 2,500 departures (4×10^{-4}), whichever occurs sooner	Expected to occur more than once per week	Expected to occur every 1–2 days
Probable B	Probability of occurrence per operation is less than 1×10^{-3}, but equal to or greater than 1×10^{-5}	Expected to occur about once every month or 250,000 departures (4×10^{-6}), whichever occurs sooner	Expected to occur about once every month	Expected to occur several times per month
Remote C	Probability of occurrence per operation is less than 1×10^{-5} but equal to or greater than 1×10^{-7}	Expected to occur about once every year or 2.5 million departures (4×10^{-7}), whichever occurs sooner	Expected to occur about once every 1–10 years	Expected to occur about once every few months
Extremely Remote D	Probability of occurrence per operation is less than 1×10^{-7} but equal to or greater than 1×10^{-9}	Expected to occur once every 10–100 years or 25 million departures (4×10^{-8}), whichever occurs sooner	Expected to occur about once every 10–100 years	Expected to occur about once every 3 years
Extremely Improbable E	Probability of occurrence per operation is less than 1×10^{-9}	Expected to occur less than once every 100 years	Expected to occur less than once every 100 years	Expected to occur less than once every 30 years

Note: Occurrence is defined per movement.

Source: ACRP Report #51

The key takeaway from Table A-3 is that for a specific airport, if the likelihood of incidence is less than once every 100 years it is considered a “Extremely Improbable” Class E occurrence.

A Hazard Severity Classification is then assigned based on the worst credible outcome of an incident. Since the ACRP method is based on wingtip separation, the report states that: “From the point of view of risk and based on the records of incidents and accidents,

the worst credible consequence expected for wingtip collisions of two taxiing aircraft is aircraft damage" (ACRP Report #51 page 19). A similar aircraft damage expectation would be a wingtip collision with the airport perimeter fence, which is the ROFA limitation examined in this report.

The Hazard Severity Classifications were determined in accordance with Table A-4 FAA Severity Definitions from ACRP Report #51 and are shown below:

Table A-4. FAA severity definitions (FAA, 2010).

Hazard Severity Classification				
Minimal 5	**Minor 4**	**Major 3**	**Hazardous 2**	**Catastrophic 1**
No damage to aircraft but minimal injury or discomfort of little consequence to passenger(s) or workers	- Minimal damage to aircraft; - Minor injury to passengers; - Minimal unplanned airport operations limitations (i.e. taxiway closure); - Minor incident involving the use of airport emergency procedures	- Major damage to aircraft and/or minor injury to passenger(s)/ worker(s); - Major unplanned disruption to airport operations; - Serious incident; - Deduction on the airport's ability to deal with adverse conditions	- Severe damage to aircraft and/or serious injury to passenger(s)/ worker(s); - Complete unplanned airport closure; - Major unplanned operations limitations (i.e. runway closure); - Major airport damage to equipment and facilities	- Complete loss of aircraft and/or facilities or fatal injury in passenger(s)/ worker(s); - Complete unplanned airport closure and destruction of critical facilities; - Airport facilities and equipment destroyed

Source: ACRP Report #51

Then, using both the FAA likelihood level and the Hazard Severity Classification the risk is then analyzed using Figure A-1 FAA Risk Matrix from ACRP Report #51, shown below:

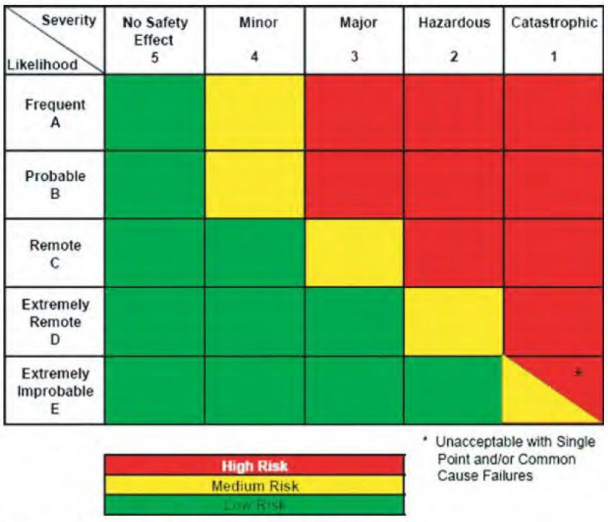

Figure A-1. FAA risk matrix (FAA, 2010).

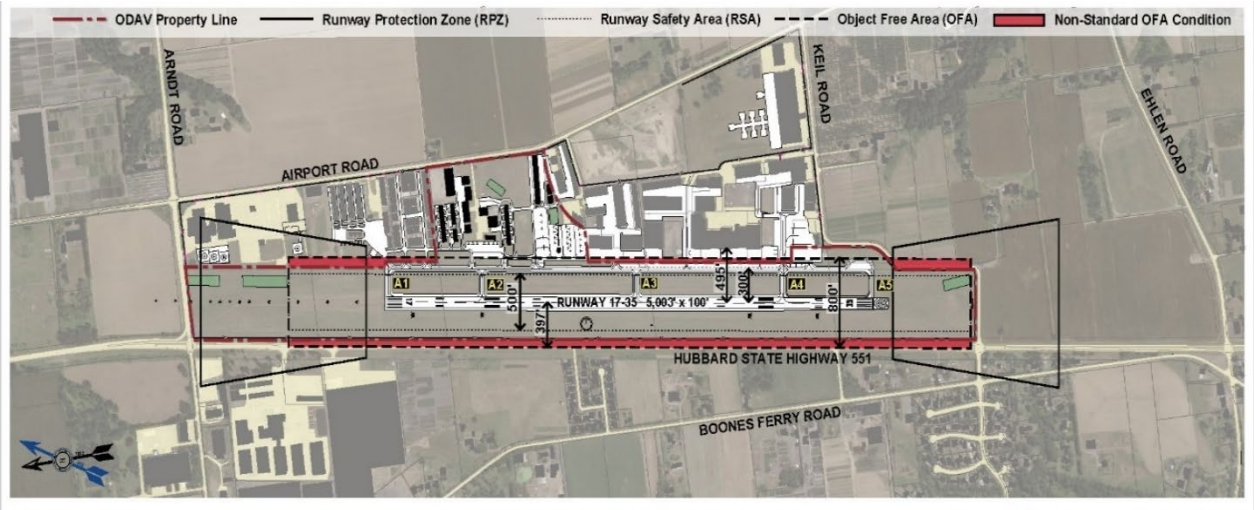
Source: ACRP Report #51



Based on Figure A-1 if the incident is Extremely Improbably (i.e. more than 100 years probability) the risk is considered “Low,” except for an incident considered catastrophic. We will use these graphs to evaluate the results from the detailed risk analysis of UAO below.

4. UAO ANALYSIS

In 2012 Master Plan and ALP established the UAO runway RDC, given existing based aircraft, as C-II, up from a B-II. The required ROFA width of a B-II runway is 500 feet centered on the runway. As it turns out, any runway of higher RDC than a B-II requires 800 feet in width. Thus, the UAO required C-II ROFA width is 800 feet centered on the runway. This 800-foot width is the standard used for aircraft ranging from a Challenger 300 business jet to the largest Boeing 777 or even the largest military aircraft. The 2012 approved ALP lists the ROFA deviation as a modification to standards, since the airport perimeter fence and Highway 551 were within the ROFA.

The UAO forecast of operations predicts that by the year 2041 there will be 90,230 annual operations at the airport, of which 862 would be an RDC above the B-II category. Thus, the 89,368 operations by B-II or lesser category clearly are operating well within ROFA safety standards, as the existing runway to road separations provide more than the 500-foot required width. It is just the 862 operations that need to be analyzed for ROFA safety relative to the required 800-foot width.

The deficiencies in the existing Runway OFA at UAO are shown in the Figure below:

UAO Figure A: Highway 551 Shown as ROFA Deviation Object
Source: Century West Engineers, Aurora State Airport Draft Airport Master Plan, Working Paper No. 1, Figure 2-15, November 2023 (Updated)

The current ROFA object deficiencies are:

d. Hubbard State Highway 551 for which the OFA penetrates 3 feet beyond the highway centerline. (368' to 377' clear width available from outer edge of highway gravel shoulder to Runway CL)
e. Perimeter Fence Inside OFA (312' clear width from Runway CL)

Potentially the airport fence could be relocated to the east edge of the 12-foot-wide gravel shoulder, since both the highway and the airport are owned by the State of Oregon. There can be an agreement between ODOT and ODAV to allow this. Relocating the fence in this way would result in a minimum width of the ROFA on the west side of the runway, to a 368-foot clearance - which would be only 32 feet out of conformance.

However, we will evaluate the ROFA for the existing conditions, and thus use the location of the airport perimeter fence as the maximum ROFA available at this time.

When analyzing the risk associated with a reduction in Runway OFA it is important to consider the purpose of the design standard. Paragraph 3.12 of Advisory Circular 150/5300-13B defines the ROFA but does not give detailed design rational behind the standard:

> *"ROFA is a clear area limited to equipment necessary for air and ground navigation, and provides wingtip protection in the event of an aircraft excursion from the runway"*

Appendix I, Paragraph I.8 of Advisory Circular 150/5300-13B provides the only available reference to the design rationale behind the Runway OFA width:

> *"The ROFA serves two principal purposes: 1. Development buffer in proximity to a runway, and 2. Wing clearance for a runway excursion event to the outer limit of the RSA. `*

Appendix I, in Section I.8.2, also clarifies that part of the "development buffer" intent is:

> *"Protection of the ROFA also reserves space for future development of a parallel taxiway that permits proper alignment of aircraft at a holding position on an entrance taxiway."*

However, for the given physical layout of UAO there can be no plan for a parallel taxiway on the west side of the runway, because of the location of Highway 551 and that there never can be hangars or other aviation uses on that side of the runway. Therefore, that leaves the only ROFA purpose for UAO as only "wingtip clearance for a runway excursion" which is precisely what this analysis provides.

Below we will analyze resolving the ROFA utilizing the risk analysis method of ACRP Report #51, for the case:

- No Change to existing ROFA conditions on West Side of Runway (Hwy 551 and Airport Perimeter Fence remain as existing) resulting in a 312-foot clearance to runway CL.

Per the methodology of ACRP Report 51, we analyze the risks for each of the takeoff and landing scenarios. For landing operations, the analysis is further divided into two parts: airborne (approach) phase and ground (landing rollout) phase. However, because the risk of veering off the runway during takeoff is so much less than for during landing, the methodology indicates that usually it is not necessary to evaluate takeoff option except if there are runways that only are used for takeoffs and not for landings. We will do that takeoff evaluation in any case, just to clearly determine what it is in the UAO context.

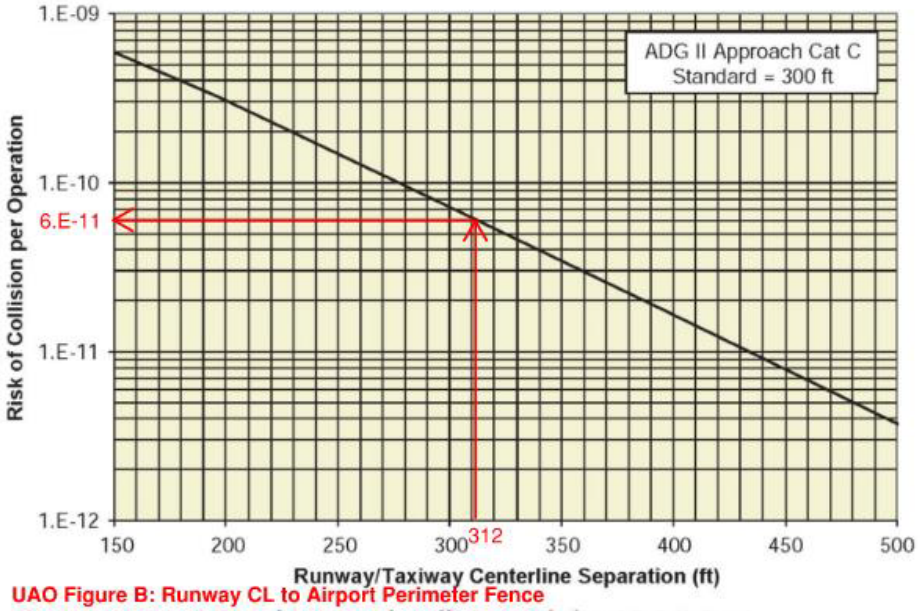
Since the existing runway to taxiway separation meets the current criteria for a C-II airport, for this study that analysis would seem unnecessary. However, we will include that option in this report because it provides a baseline of safety that the AC 150-5300-13B Airport Design Standards have determined is an acceptable and appropriate level of safety for a C-II airport.

Thus, for this UAO ROFA analysis separate risks are developed for each of:

1. Airborne Phase (Landing) is for instrument approaches which terminate the approach as a missed approach, and the risk is hitting another object such as hitting the airport perimeter fence or a vehicle on Highway 551 (using ACRP Report 51 Fig. 31); “the airborne risk is computed only for missed approaches” (ACRP Report 51, page 21).
2. Ground Phase (Landing Rollout) where risk is veering off the runway into the reduced width ROFA and hitting the fence or a car on Highway 551 (using ACRP Report 51 Fig 42). Figure 42 is based on the assumption that the risk is between the two wingtips of two aircraft, one aircraft on the edge of the runway and the other at the centerline of a taxiway. The ACRP makes clear that the x-axis distance on the Risk Figures are centerline of runway to centerline of taxiway because the risk is assumed aircraft to aircraft. However, the predicted risk is based on the wingtip-to-wingtip distance. When using the Risk Figures for objects (not aircraft) like a fence or road (which has no wings), half of the wingspan should be added to the distance to compensate for the wingtip-to-wingtip assumption. Thus, per Group II standards, the clearance distance used for Figure 42 should add half of 79 feet (equals 39.5 feet) of additional clearance, which would create a total of 351 feet to use in Fig. 42. The risk shown with the 312 feet and the 351 feet are each shown in figures.

3. Ground Phase (Takeoff) where risk is veering off the runway into the reduced width ROFA and hitting the fence or a car on Highway 551 (using ACRP Report 51 Fig 49).

Finally, to have more relevant data, we will also perform the risk analysis of the standard required 300-foot separation between runway centerline and taxiway centerline for a landing, which is the level of safety the AC 150/5300-13B sets for in a C-II airport:



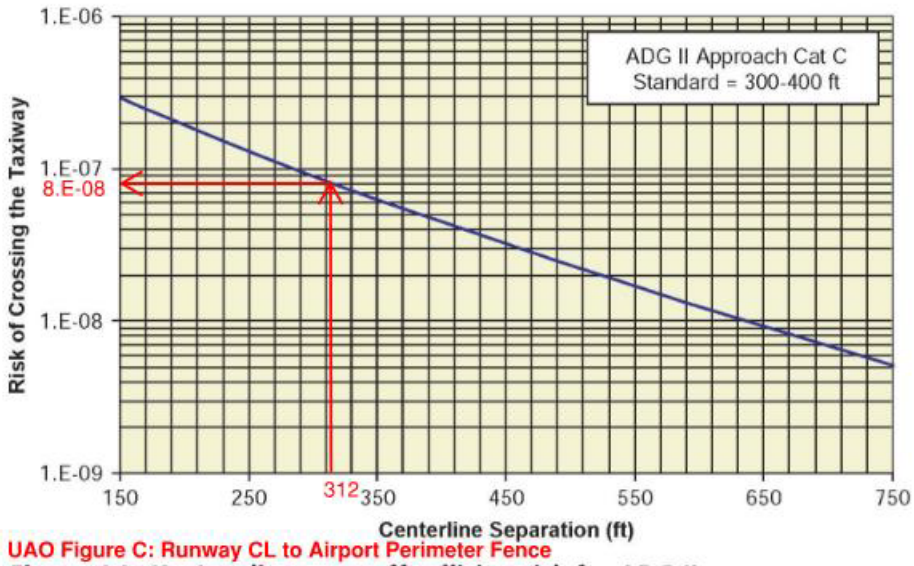
4. Ground Phase (Landing Rollout) where risk is veering off the runway into the taxiway (using ACRP Report 51 Fig 42).

This data will give us an example of an acceptable level of safety utilized in AC 150/5300-13B for a C-II airport.

5. Specific Analysis: Proposed MOS Option - No Change to Existing ROFA Conditions (312' Separation from Runway Centerline to Airport Fence)

The Perimeter Fence at the west side is located 312 feet from the runway centerline. The risks associated with leaving it there as a modification of standards, for each of the phases of flight are analyzed below:

1. Airborne Landing Phase Risk from Reduced ROFA – For a very conservative analysis we will assume that this includes all approach to landings, not just missed approaches. Using the separation of 312' and Figure AA-33 in Appendix A of ACRP Report #51, the following provides a risk level 6.0E-11 of occurrence per landing (which as an inverse, is one chance in a 16.7 trillion landings) that an aircraft gets 312' from the runway centerline. This can be seen in the figure below:



UAO Figure B: Runway CL to Airport Perimeter Fence

Figure AA-31. Missed approach collision risk for ADG II Cat I.

The current annual number of landing operations at UAO is approximately 45,115 or half of the 90,230 annual operations. As the risk is one incident in every 16.7 trillion landings, the time between occurrences is calculated as 16 trillion landings divided by 45,115 landing operations per year which equates to one incident every 369,000 years. Thus, this risk is of no significance.

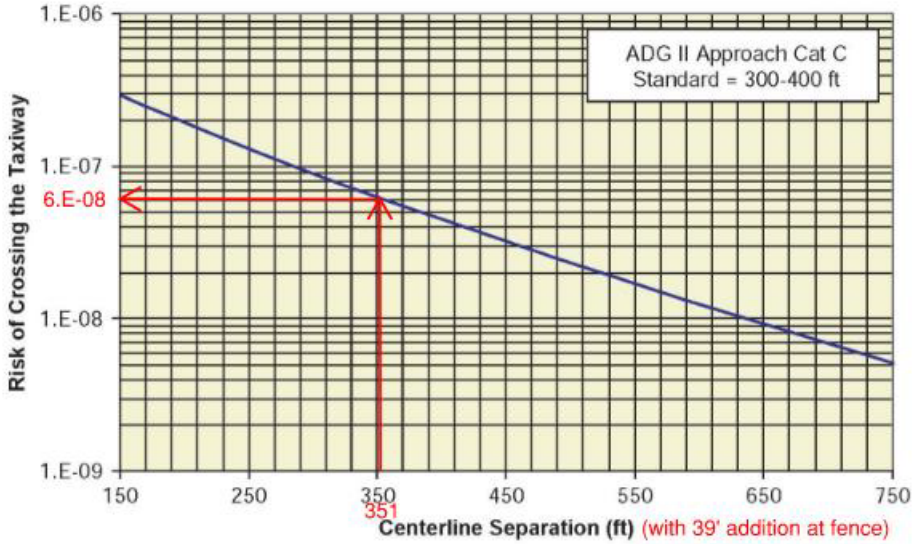
2. Landing Roll Phase Risk for Reduced ROFA - Using the separation of 312' and Figure AA-43 in Appendix A of ACRP Report #51, provides a risk level 8.0E-08 or in the inverse: one chance in 12.5 million landings. This can be seen in the figure below:

UAO Figure C: Runway CL to Airport Perimeter Fence

Figure AA-42. Landing veer-off collision risk for ADG II.

As the risk is one incident in every 12.5 million landings, the rate of occurrence is calculated as 12.5 million landings divided by 45,115 landings per year which equates to one incident every 277 years.

Using the ACRP described adjustment when the object is not another aircraft and half the C-II wingspan can be added to the clearance distance, results in a separation of 351' and Figure AA-43 in Appendix A of ACRP Report #51, provides a risk level 6.0E-08 or one chance in 16.7 million landings. This can be seen in the figure below:



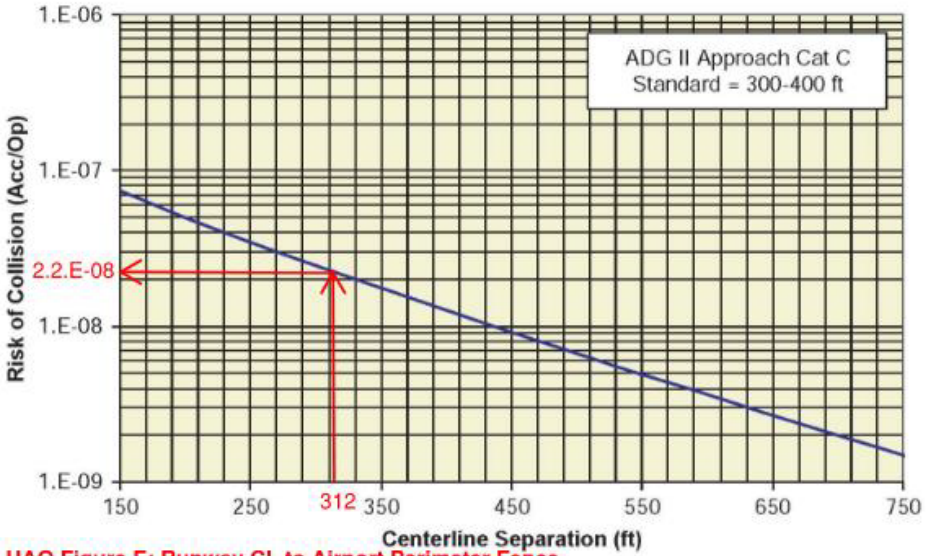


Figure AA-42. Landing veer-off collision risk for ADG II.
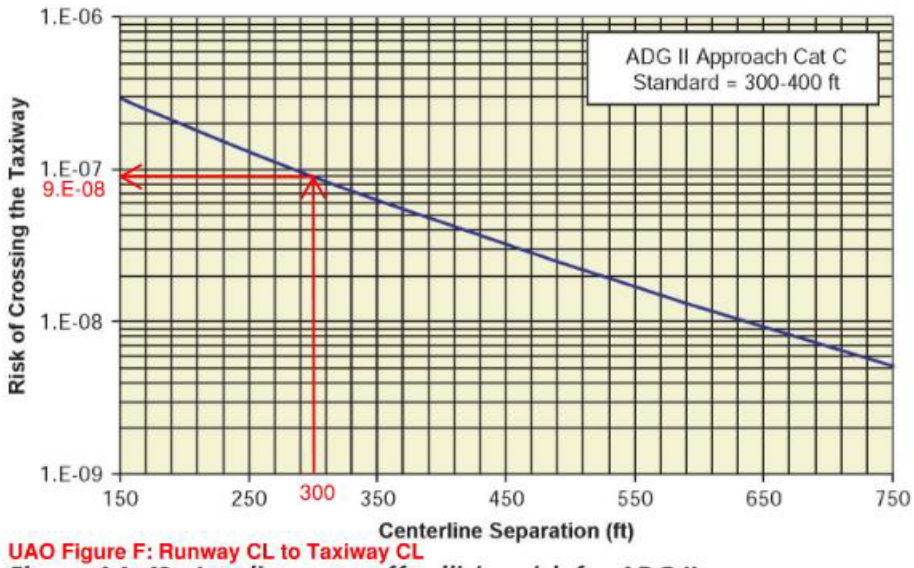
UAO Figure D: Runway CL to Airport Perimeter Fence Including Wingspan adjustment

As the risk is one incident in every 16.7 million landings, the rate of occurrence is calculated as 16.7 million landings divided by 45,115 landings per year which equates to one incident every 369 years.

3. Takeoff Roll Phase Risk for Reduced ROFA - Using the separation of 312' and Figure AA-49 in Appendix A of ACRP Report #51, provides a risk level 2.2E-08) or one chance in 45.5 million takeoffs. This can be seen in the figure below:



UAO Figure E: Runway CL to Airport Perimeter Fence
Figure AA-49. Takeoff veer-off collision risk for ADG II.

As the risk is one incident in every 45.5 million takeoffs, the rate of occurrence is calculated as 45.5 million takeoffs divided by 45,115 takeoffs per year which equates to one incident every 1,008) years.

Finally, as a test of the level of safety that AC 150/5300-13B considers acceptable we check what the predicted risk level is of the existing runway-taxiway separation considered appropriate[10] by FAA.

4. Landing Roll Phase Risk to Taxiway Consistent with Safety Standards of AC 150/5300-13B - Using the separation of 300' and Figure AA-43 in Appendix A of ACRP Report #51, provides a risk level 9.0E-08 or one chance in 11.1 million landings. This can be seen in the figure below:

UAO Figure F: Runway CL to Taxiway CL

Figure AA-42. Landing veer-off collision risk for ADG II.

As the risk is one incident in every 11.1 million landings, the rate of occurrence is calculated as 11.1 million landings divided by 45,115 landings per year which equates to one incident every 246 years.

[10] Note that Section 3-24 of Order 5100.38D Change 1 states that the FAA will not fund airport safety greater than that in the Airport Design standards, so the standard set by the runway-taxiway separation is a significant number. Order 5100.38D Change 1 can be downloaded for free at: https://www.faa.gov/documentLibrary/media/Order/AIP-Handbook-Order-5100-38D-Chg1.pdf

6. Conclusions

Considering the risk of each phase of flight, the risk of collision during the landing roll is the controlling factor. The Hazard Severity Classification for this type of operation would be major and the acceptable probability of occurrence is remote (1E-05) or less than once every 1-10 years. The following table summarizes the risk associated with each phase of flight:

Phase of Flight	Rate of Occurrence	Acceptable Level
Airborne Phase	Once every 369,000 years	Yes
Landing Roll Phase	Once every 277 years (or 369 years with calculation adjustment for fence object in lieu of wing object)	Yes
Takeoff Roll Phase	Once every 1,000 years	Yes

A runway to object separation of 312’ provides an acceptable level of safety as the controlling occurrence is once every 277 years (or 369 years with the adjustment for wingspan at the fence as allowed in the ACRP method). This is much less risk than the once per 100 years FAA standard shown in Table A-3 and results in a Category E “Extremely Improbable” occurrence. Further, per ACRP’s method, a wingtip to fence occurrence is considered by ACRP’s method to be a Table A-4 Minimal Severity occurrence. This combination via Figure A-1 concludes that the outcome as Low Risk.

Figure UAO F shows that the existing risk of occurrence between the existing runway and existing taxiway, which fully meets FAA standards, is one in every 246 years. This means that the risk to an occurrence at the taxiway, is much less (i.e. longer duration between events) than the FAA’s 100-year standard. The risk of collision with the perimeter fence is then even much less than that of a taxiway collision.

Finally, there is an incremental improvement option of ODAV and ODOT coming to an agreement to move the perimeter fence further west, to the east edge of the 12’ wide gravel shoulder, which would result in a 368-foot separation. If the 39.5-foot wing span correction is added at the new fence location, this results in an equivalent distance of 407 feet for use on Figure AA-42. That in turn would result in an ACRP predicted probability occurrence being once every 515 years, almost half the risk of a taxiway collision.

Given that the commercial use of aviation is itself only around 100 years old, these numbers of one predicted occurrence at the existing airport fence every 277 or 369 years, demonstrates the high level of safety that will be maintained at Aurora Airport with this MOS.

Given the regional and national importance of Aurora Airport for emergency medical, firefighting, and emergency power line moving, along with the use by local national corporations, using the MOS ensures the airport can continue to upgrade with safety improvements, and can continue to support the approximately 1,500 employees that rely on the airport for their livelihood.

This study shows definitively that the 2012 signing off on the Aurora Airport master plan and ALP with a modification of standards for the ROFA, by FAA and ODAV, was a reasonable and appropriate action to take. The same action should be taken for the current 2024 master plan work.

Author: Aron Faegre is an architect, civil engineer, physicist, and pilot who has been the lead planner and designer on over two hundred airport planning and development projects in Oregon, Washington, California, New York, and British Columbia over the past 35 years. He has a Master of Architecture from MIT and a Bachelor of Physics from Reed College.

ARON FAEGRE AND ASSOCIATES
AVIATION PLANNING AND DESIGN SERVICES FIRM PROFILE

Introduction

Aron Faegre and Associates is a multi-disciplinary firm with a special interest in performing planning and engineering for aviation projects. The principal of the firm, Aron Faegre, personally manages the firm's key projects and is an aviation planner, architect, civil engineer, and landscape architect. He is also an instrument rated commercial pilot.

Mr. Faegre's firm has completed aviation projects for the following clients:

- Oregon Department of Aviation
- Port of Walla Walla
- Quinault Indian Nation
- Horizon Air
- Southwest Airlines
- Columbia Helicopters
- Helicopter Transport Services
- Oregon Health Sciences University
- Kaiser Hospital
- Atlantic Aviation
- The Port of Portland
- Port of Columbia County Scappoose)
- The City of Portland
- City of Pendleton
- Washington State DOT
- Life Flight Network
- Van's Aircraft
- City of Newberg
- Transwestern Aviation
- Flightcraft PDX

Aviation Services

Aron Faegre & Associates provides consulting services on all aspects of aviation facilities design including:

- Airport Master Plans
- Maintenance Hangars and Shops
- Storage Hangars
- Terminals and Concourses
- Airport Layout Plans
- Runway Design
- Access Road Design
- Instrument Approach Drawings
- Apron Design
- Airport Economic Impact
- Noise Abatement Planning
- Environmental Assessment
- Fixed Base Operator Facilities
- Air Cargo Facilities
- Tenant Fit-up
- Obstruction Survey
- Taxiway Design
- Airport Security Design
- Aviation Land Use Planning
- Public-Private Partnerships

Aron Faegre, P.E, AIA is the principal of AFA, a multi-disciplinary planning and design firm. Mr. Faegre has a Master's Degree in Architecture from the Massachusetts Institute of Technology, during which he was also a National Science Foundation Fellow for three years. Mr. Faegre has a Bachelor's Degree in Physics from Reed College and has published research in scientific journals. He is licensed as a civil engineer, architect, and landscape architect. He is a commercial pilot with instrument rating. He also serves on the board of the Airway Science for Kids, an Oregon non-profit, where he also leads the TeenFlight program – where teams of 15 teenagers build an RV-12is aircraft, and then get to experience flying the airplane they built.

Subject: RE: Idea for ODAV to work with ODOT

Hi Tony,

ODAV and the Planning Team appreciate your feedback and suggestions.

The Alternatives developed by the team address the nonstandard conditions and needs of the airport, as discussed in Chapter 4 - Facility Requirements. One of the most challenging and critical nonstandard conditions being addressed is for the Runway Object Free Area (ROFA), which is 800 feet wide centered on the runway centerline. The FAA defines the ROFA as “a clear area limited to equipment necessary for air and ground navigation and provides wingtip protection in the event of an aircraft excursion from the runway.” The ROFA overlaps portions of Highway 551.

The Planning Team has focused on the least impactful and most feasible solutions. Unfortunately, there is not enough space to move the fence without at least moving the highway or the runway to resolve the ROFA issue. All three Refined Alternatives presented in the July 30th PAC meeting would bring the ROFA and fence into compliance with FAA standards.

Thanks again for your input, we look forward to discussing more at the October 15th PAC Meeting.

Subject: Idea for ODAV to work with ODOT

This message was sent from outside the organization. Treat attachments, links and requests with caution. Be conscious of the information you share if you respond.

Kenji and Tony,

I and another PAC member (Naomi – cc'd) are exploring an idea that I'd like to propose to you. This just might be the win/win situation that if considered in coordination with a phased approach alternative, well, it just might make everyone happy!

Proposed idea…

Rather than shift Highway 551 to the west and/or tear down hangars fronting the runway to the east, what if we move the western airport fence, approximately 30' to the west? This would get it further from the runway.

The property spanning the length of the airport x 30' would have to be purchased by ODAV from ODOT to keep the Oregon Highway Trust whole, but it could be done.

If ODAV is interested in pursuing the conceptual idea, ODOT could begin a market analysis for the value of the land to be sold by ODOT to ODAV to get an idea of the current cost for this proposed idea.

Please add this to the list of things being considered as we prepare for the next PAC meeting.

Hi Tony, hope you enjoyed the long weekend.

ODAV has made its decision on the Preferred Alternative with input from the PAC, which you were part of. We cannot make changes outside of that process. As mentioned earlier, we are accepting comments from the PAC through the 29th of October if you'd like to provide comments on the materials covered in the recent PAC meeting. In our December 10th PAC meeting, we will discuss noise, the Capital Improvement Plan, and Airport Layout Plan.

If you reconsider, Kenji and I are happy to meet to discuss how we can work together to ensure the Aurora State Airport can continue to serve the businesses at the airport.

Good Morning Tony and Kenji,

Was off Friday, now going thru emails – just saw this… very disappointed.

The whole purpose of the meeting would be to discuss the future of the airport – that would include the "preferred alternative" and its detrimental effect on so many business, jobs, communities, etc.…

We were hoping we could figure out how we could work collaboratively to toss around ideas and see if we identify a path forward together.

Sounds like the "preferred alternative" is a done deal.

There is no sense in us meeting tomorrow if this is your position.

Hi Tony, we don't have a PAC meeting on October 29th, we're accepting comments from the PAC through the 29th of October if you'd like to provide comments on the materials covered in the meeting.

We can meet for 1 hour Tuesday October 22nd at 10am at our office in Salem. We are not going to discuss changes to the Preferred Alternative.

Please let us know in advance if an attorney will be present as we will need ours. If ours is not available, we'll have to reschedule sometime in November or December.

Tony,

Thank you for the clarification – this is great news! We're moving forward collaboratively!

We would like to take you up on the offer to "further discuss the feedback materials that were submitted and how we can work together to ensure the Aurora State Airport can continue to serve the businesses at the airport, as well as the community." Would like to do this prior to the next PAC meeting on October 29th.

When and where would you like to meet so we can start herding the cats! We could meet at our conference room in Hangar Juliet – plenty of room!

Both.

We are continuing with the next steps as presented on October 15th, and we can further discuss the feedback materials that were submitted and how we can work together to ensure the Aurora State Airport can continue to serve the businesses at the airport, as well as the community. I apologize for any confusion, I did not intend to suggest we would hold the master plan or change the preferred alternative outside of the PAC process.

As mentioned during the meeting, we'll be collecting comments from the PAC through the 29th of October if you'd like to provide comments on the materials covered in the meeting.

Hi Tony,

Thanks for chatting with Kenji and me on the recent master plan meeting. We understand your concerns and frustrations, and we appreciate you talking through those with us. We also understand you would like an opportunity to meet and discuss the materials that were provided to us as part of the PAC feedback process. Finally, we understand your desire for a safe, realistic, and less impactful path forward for the Aurora State Airport. We believe our alternatives met those criteria, and we selected the alternative that best reflects the feedback we received from the PAC.

We can further discuss the feedback materials and how we can work together to ensure the Aurora State Airport can continue to serve the businesses at the airport, as well as the community.

Thanks again, this email will be sent to the planning team to be included in the public record.

Tony,

Thank you for your patience with my reply. I have been traveling for work the last couple of weeks and am trying to process the situation at UAO.

The alternatives, proposed or preferred, are not ideal - given FAA will not issue any Mods. On that subject, I have asked ODAV to provide a statement from the FAA, as I have not seen FAA's position in writing. Without Mods, it seems they will not accept any alternative that partially addresses the issues - it's all in or nothing. Hopefully a letter will clarify that understanding. As a member of the PAC, did you, or any of the other businesses, voice support of any alternative presented?

I am emphatic to the issue, and I do appreciate the interest, but given my current workload I cannot take on any additional roles. On top of that, I'm not sure state ethics would allow my participation in any process while on the Board.

-Sarah

Good afternoon…

Had dinner with Senator Betsy Johnson last night – wow – she's not a fan of ODAV staff right now! But, she's not in office and knows she really holds no sway with them anymore.

If you are interested, would like to get on the phone next week and talk about how this is going… not good. It seems to the front row hangar owners this is being ram rodded and the decision has already been made. The staff and consultant are only going thru the motions so they can check the blocks on the FAA grant form.

Thing is, this is going to create a very bad situation for everyone, and I don't think the staff, the consultant, or the FAA remotely care about the damage that looms on the horizon.

I doubt you could, due to conflict of interests, but would you be interested/willing to work as a professional consultant for the owners group that is planning to push back against this madness?

Subject: RE: questions

Thanks for the follow up note - Understand – please enter these thoughts into the record…

Its hard for me as a PAC member to support or validate ODAV's preferred alternative including an Vehicle Service Road (VSR) when there is no explanation of definition of an allowed "Vehicle". This essentially gives ODAV the ability to define "Vehicle" anyway it wants **after** the adoption of the MP/ALP – a blank check if you will.

The 2012 ALP approved by the FAA showed an Internal Circulation Road (ICR) with the identified purpose of circulating traffic within the airport such that private vehicles could be included to **support commerce** and allow movement inside the airport without having to go out onto Airport Rd – a 55 mph hightway… i.e., private vehicles, Amazon vans, bikes, pedestrians, tugs, fuel trucks, etc… a SLOW route for the movement of goods and people inside the airport… very valuable for the spirit of the through the fence business development as called out in the ORS. Most of the ICR was purposefully designated in/thru areas **well back from the ramp** with to goal of reducing the probability of a VPD.

We fear the VSR would be substantially different (and can not assume otherwise) in that it is between the ramp and active taxiway(s), making it an unlikely place for private vehicles, bicycles or pedestrians, especially in light of the note included drivers would have to complete ODAV training for driving beyond the movement line… which counts out the amazon drivers, etc…

Hi Tony,

A Vehicle Service Road (VSR) is defined by the FAA as "a designated roadway for vehicles in a non-movement area." The VSR would be for the use of vehicles by individuals that have privileges to access inside the Fence/Aircraft Operations Area at UAO, and have received ODAV's Non-Movement Area Driver's Training.

I'm working on my feedback as a PAC member to send back tomorrow…

Question – the preferred alternative shows a "Vehicle Service Road – VSR"… who will be allowed to use this road? Will only be tugs, fuel trucks, ODAV vehicles, FAA vehicles?

Or – will (i.e.) Tony Helbling's personal car be able to use the road (after state trailing) to move up and down the airport? Will bicycles or walkers be allowed on this road?

Tony Helbling

October 29, 2024

To: Oregon Department of Aviation (ODAV)

FROM: Tony Helbling - PAC Member
Ted Millar - PAC Member
Aurora Airport Improvement Association

RE: Feedback to Preferred Alternative - Aurora Airport Master Plan

Per the invitation at the October 15, 2024, PAC meeting, this comment is submitted by Airport Stakeholders who are PAC members as well as is submitted by the entirety of the Aurora Airport Improvement Association (AAIA). AAIA is the organization of the private airport stakeholders including but not limited to:

- Atlantic Aviation
- TLM Holdings
- Wilson Construction Company
- Kory McGregor
- Blue Skies Aviation
- Tim Warren
- George VanHoomison
- Helicopter Transport Services

This is the Airport Stakeholders feedback to ODAV/Century West on "Preferred Alternative" presented during the October 15, 2024, PAC Meeting.

1. ODAV's preferred alternative needlessly punts indefinitely the desperately needed runway extension, inexplicably relocates the internal access road from where it is already partly constructed (wasting the investment in the existing internal road infrastructure) and where it was approved in the 2012 master plan to a location that dangerously parallels an active taxiway, destroys the septic drainfields necessary for the $300 million in private investment at the airport to continue to support the airport's 1,500 jobs, unnecessarily takes critically needed airplane parking, unnecessarily takes property from people on both sides of the airport, while wholly neglecting ODAVs duty as steward of the airport to keep it safe and nurture the economic engine that the legislature directed ODAV support. ODAV's preferred alternative is contrary to law and ODAV's responsibilities. ODAV's claim "the airport MUST be brought into standards as per the FAA" is simply wrong. We have explained in detail that FAA must and will consider a MOS to enable the runway extension (which will be temporary until ODAV moves Highway 551 thirty feet west in the existing ODOT right-of-way). During the last PAC meeting FAA did not claim otherwise. Rather,

the FAA representative specifically stated the FAA is not directing ODAV what to write and that the agency simply wanted a pathway to design standard compliance. Those words mean FAA will (as it must) allow the runway to be extended so long as the master plan contemplates moving Highway 551 when funding becomes available to do so.

2. The preferred alternative is a nonstarter for the following reasons.

    a. The acquisition of the properties is unfair in that

        i. Acquisition is apparently planned to violate the law. Instead of paying fair market value as the law requires, David Miller, the lead consultant during the PAC meeting – explained rates to be paid for the properties will not be the fair market values, the paid rates will be the tax roll valuations. (Which is a significantly lower price.) Even though this is unlawful, the statement of intention to acquire private property at unlawful law ball prices sets up the area for precondemnation blight.
        ii. ODAV (Tony Beach) stated in a direct conversation that it will not pay for relocation costs for affected properties.
        iii. ODAV will also not pay for business disruption costs. If the alternative proceeds the airport and affected privately owned areas will be blighted.

    b. ODAV is completely failing

        i. To defend investment as called for in ORS 836.642, (3), (e), "Preserve investments in pilot sites…"
        ii. To recognize that more than half of the entire airport is made up of privately owned property, upon which private investment provides nearly 1500 family wage paying jobs. A significant portion of which could be lost if the preferred alternative is adopted.

    c. The "Vehicle Service Road" (VSR) is poorly thought out, damaging and unnecessary.

        i. Previous Master Plan updates to include the 2012 ALP approved by the FAA, showed and Internal Circulation Road (ICR) the underlying land for which is largely currently available at no cost to ODAV now and is partially constructed per the 2012 master plan. The ICR was designed for fuel trucks, tugs, official agency vehicles, private vehicles, and 3rd party vendor delivery vehicles. Most of the ICR was set back from the ramp and the taxiway, reducing the probability of a Vehicle Pedestrian Deviation (VPD) or a collision event.

ii. The VSR anomalously parallels the active taxiway, and the preferred alternative omits the ICR that works and that had previously been planned to be improved to work even better to serve the private investment at the airport. Without an answer to the question put to ODAV, "Who will be allowed to operate a vehicle on the VSR?", it appears that ODAV will only allow fuel trucks, tugs, ODAV and FAA vehicles on the VSR, again seeming to turn a blind eye to the needs of the private aeronautics' investors at the airport and the 1500 family wage jobs they created and, until now at least, have maintained. And its responsibilities assigned by the legislature under ORS 836.640-642,

d. Neither ODAV (nor the FAA) have identified any funding source to pay for anything in the preferred alternative, essentially making this Masterplan and its subsequent Airport Layout Plan completely unachievable, ultimately useless and a colossal waste of taxpayer money. ODAV has failed to discharge its responsibility to establish a meaningful and achievable master plan outlined in a of number federal rules to include:

i. AC 150/5070-6B, Part I, Chapter 1, 101. - "The technical steps described in this AC are generally applicable, although each step should be undertaken only to the extent necessary to produce a **MEANINGFUL** (emphasis added) product for a specific airport."
ii. AC 150/5070-6B, Part I, Chapter 1, 104., b. – "The FAA strongly encourages that planners consider the possible environmental and **SOCIOECONOMIC** costs associated with alternative development concepts, and the possible means of **AVOIDING, MINIMIZING OR MITIGATING IMPACTS** to sensitive resources at the appropriate level of detail for facilities planning."
iii. AC 150/5070-6B, Part I, Chapter 1, 104., c. 5) – "Propose an **ACHIEVABLE** financial plan to support the implementation schedule."

3. It is also frustrating that a group of airport stakeholders asked to have a meeting with ODAV and its consultants to discuss an alternative the stakeholders presented on the record that is wholly consistent with the 2012 master plan, constructs in the short term the runway extended on an approvable MOS, and includes a plan to move Highway 551 west the magic 30 feet in the existing right-of-way, when funding is available to do so. It also maintains the existing drainfields merely requiring that they be brought to compliance with FAA standards as demonstrated is wholly achievable by an uncontroverted geotechnical report in the record.[1] ODAV has made it clear that it has no

[1] ODAV asserted with no evidence, that is zero support that compliance was infeasible. Reliance upon that and other unsupported assertions are disappointingly ODAV's theme in this master plan effort.

interest in the airport stakeholders' meaningful, achievable and much less expensive master plan alternative. Rather:

a. The Airport Stakeholders were told by the Director of ODAV that ODAV would not meet to discuss it outside of a PAC meeting and explained that any discussions of ideas would only happen during, and in full view of the public, a live PAC meeting.
b. As directed by ODAV's director, the Airport Stakeholders waited for the October 15, 2024, meeting to discuss the stakeholders master plan alternative (presented on September 3, 2024, and ignored to date).
c. We asked during that PAC meeting to discuss our proposal and were then told by ODAV's Tony Beach that the proposal had been dismissed by ODAV and the consultant for no reason other than the unsupported conclusion that it was "not possible". And any consideration or discussion of the Stakeholders' alternative was completely foreclosed in the PAC meeting forum.
d. ODAV and the consultants presented the ODAV preferred alternative and next steps to the PAC with no PAC discussion of the stakeholders' alternative. This appears to the PAC, that its input is unwelcome and the entire process pro forma. The only conclusion is that ODAV's decision was already made, and that stakeholder input has been and was always intended to be window-dressing, nothing more.
e. After the PAC Meeting, the airport stakeholders expressed frustration with not being allowed to discuss the proposed stakeholder alternative during the PAC meeting. ODAV merely gave a giant bureaucratic shrug.

4. Anyone can see this Master Plan effort is a sham, has a pre-determined outcome, and public or PAC member input is viewed as a nuisance level necessity

a. It is apparent ODAV, the consultants have decided how the final master plan shall be completed – the preferred alternative is not about airport safety, airport efficiency, aeronautical advancement for the future, economic development, family wage jobs, but about destroying the through the fence operations at the airport. But ODAV must understand, they are in that single minded focus destroying the Goose that laid the golden economic development egg that until now has been the Aurora Airport and importantly they are violating the legislative command of ORS 836.640-642.
b. ODAV's tone deafness to input and the law rests on false assumptions that the FAA can and does demand perfect airport design standard compliance before the runway may be extended, even though it is clearly a real safety issue to ignore the needed runway extension, and the safety risk of imperfect design compliance is almost infinitely minute:

i. The landing risk is “one incident in every 16.7 trillion landings, the time between occurrences is calculated as 16 trillion landings divided by 45,115 landing operations per year which equates to one incident every 369,000 years.”
ii. The landing roll risk is “one incident in every 12.5 million landings, the rate of occurrence is calculated as 12.5 million landings divided by 45,115 landings per year which equates to one incident every 277 years” at worst or more likely “one incident in every 16.7 million landings, the rate of occurrence is calculated as 16.7 million landings divided by 45,115 landings per year which equates to one incident every 369 years.”
iii. The takeoff roll phase, the risk is “one incident in every 45.5 million takeoffs, the rate of occurrence is calculated as 45.5 million takeoffs divided by 45,115 takeoffs per year which equates to one incident every 1,008 years.”
iv. The landing roll phase risk to taxiway is “one incident in every 11.1 million landings, the rate of occurrence is calculated as 11.1 million landings divided by 45,115 landings per year which equates to one incident every 246 years.”

5. You are no doubt aware that FAA is required to consider and approve a MOS “when necessary to meet local conditions” so long as the “modification will provide an acceptable level of safety, economy, durability and workmanship.” (*See,* 14 CFR § 152.11(b)).

    a. That has been proven by the Airport Stakeholders alternative that ODAV is ignoring.
    b. The design standards for which ODAV claims FAA demands perfect prerequisite compliance for any runway extension applies to all airports in the US. The FAA routinely approves MOS for large airports nationwide some with genuine safety concerns. Nothing suggests Aurora has some super anomaly warranting the disparate treatment ODAV claims FAA demands. Rather, as shown above, the risk of 30 feet of imperfection until funding is available to move Highway 551 is ridiculously small.

6. ODAV’s decisions were made before presenting information to the PAC, specifically evident in the facts surrounding the previous two PAC meetings.
    a. Refined Alterantives 1A, 1B and 2 were NOT allowed to be seen by PAC members or the public for meaningful review BEFORE the July 31, 2024, PAC meeting.
    b. The Preferred Alternative was not allowed to be seen by the PAC members or the public for meaningful review BEFORE the October 15, 2024, PAC meeting.

7. ODAV has lost its way. ODAV should pause the process and park the preferred alternative until such time that:

    a. ODAV and consultants set up an in-person work session for the ENTIRE PAC where proposals that bring a win-win situation for everyone could be JOINTLY developed.
    b. ODAV works collaboratively with the FAA, and the PAC to define a path forward that provides as safe airport, respectful of surrounding communities, protects the investment in private property both on and off the airport, and follows the law to include ORS 836.640-642.

Sincerely,

Tony Helbling - PAC Member
Ted Millar - PAC Member

Subject: RE: PAC

Hi all,

I am sorry but we can't make last minute changes to the PAC. As you know, there is a lot of interest from airport users and local communities in representing a wide range of organizations for the UAO master plan. Our PAC is already significantly larger than used for most master plans, and our goal is to be as fair and transparent as possible. Most importantly, we value the feedback from the members of the organizations that we have requested representation on the PAC for this master plan.

The process in which we conduct the master plan for UAO is very important. For 3 years since this process started we have made sure that all PAC members had equal opportunities for engagement. This includes, for public benefit, transparency in who represents organizations and communities throughout this process. The PAC list is published on the project website.

The public will have ample opportunities to provide comments in the meeting as long as time allows. If there is not enough time, the public can submit written comments that will be considered by the planning team and included in the public record for this master plan.

Thank you for your understanding,

Tony Beach

Master Planning Committee,

I would like to appoint Betsy Johnson as my alternate for the PAC meeting this evening.

Please confirm receipt of this email and the appointment has been made.

I also want to register my concern on how the current Preferred Alternate would effect the emergency services provided from our property on the Airport and the devastating impact on our airport neighbors.

The Preferred Alternate would displace many of the airport neighbors living to the west of the Hubbard Hwy. Many of the residents are retired and living on a fixed income. In a time where there is a housing shortage, forcing the residents out of their homes would a horrendous burden.

The Civil Air Patrol (CAP) and the Disaster Airlift Response Team (DART) both have facilities on our property to support of Oregonians during and after an emergency.

We provide, at no cost, a facility where the CAP has established a permanent Emergency Operations Center (EOC). The CAP has installed communications equipment to coordinate their efforts with State and Federal agencies in responding to disasters. It is a communications hub for Oregon and Southwest Washington.

The EOC also is the home for a CAP Cadet program. CAP's cadet program is designed to inspire the country's youth to become leaders and good American citizens through their interest in aerospace and service to the country. Cadets work their way through a series of achievements by completing studies and other activities. Some of the achievements include aerospace education, moral leadership, physical fitness, drill and ceremonies, leadership, and other special activities.

The EOC is also used as a staging area for Oregon DART. This distribution hub is used to store and transport emergency supplies, medical equipment and responders from Aurora to outlying communities impacted by fire, floods and other natural disasters.

If the current Preferred Alternate is adopted, the EOC building would be demolished, forcing the EOC to be closed. This would significantly Oregon's emergency

preparedness response.

Thank you for your consideration,

David Waggoner

Dave,

Please see thread below. We're going to need you to set up Betsy Johnson as your alternate for tonight's PAC meeting. Otherwise, she can only speak for 2 min during public testimony.

Durning the public input segment, you will still be able to share your direct concern about your property being taken and it's effect on emergency aero services associated with Willamette Aviation's property – detrimental effect on disaster response – but may be limited to two minutes.

Thanks for doing this…

Overview

1. In 2007, SB680 was approved by the Oregon State Legislature and became ORS 864-642. It clearly stated Aurora State Airport (KUAO) as well as five other rural airport are to participate in the effort. The spirit of the legislation called for government agencies to look outside of the box to allow surrounding communities to provide sewer, water, fire & police protection without having to annex into those cities.
    a. In reliance ORS 864-642, according to the Marion County tax records, over $250 Million dollars' worth of buildings have been built at KUAO by private enterprise.
    b. KUAO pays over $1,750,000 in property taxes into the General Fund supporting schools, libraries, over 1/3 of the Aurora Fire district budget etc. according to the Marion County tax records.
    c. According to ODAV's "Oregon Aviation Plan", the multiplier effect to the surrounding cities and communities is approximately $2.50 Billion per year.
    d. KUAO now has over 1500 living wage jobs in addition to supporting most of the major employer businesses in Clackamas & Marion Counties.
2. The FAA designated KUAO to be one of 83 non-commercial service airports in the nation that has Major Significance to the National Transportation System.
    a. KUAO is the airport base for numerous companies that provide emergency services, firefighting, police & drug enforcement etc. such as Life Flight, Columbia Helicopters, Helicopter Transport, Wilson Construction, Winco Power Line Services, Clackamas County Sherrif's Dept., Portland Police, FBI, Civil Air Patrol, Angel Flight and many more.
    b. KUAO is further recognized as important in the State's Emergency Management Plan in the event of a major disaster.
3. The 2012 Airport Master Plan Update (2021 MPU) was approved by the Oregon Department of Aviation and by the FAA in 2012. It was law & not challengeable.
4. The Control Tower was approved & constructed in 2014 based on the 2012 MPU. It was successfully built with full Non-Partisan support by Governor Kitzhaber, Senator Wyden, Senator Merkley, Senator Bob Smith, Senator Schrader and others.
5. Former ODAV Director, Betty Stansbury decided to have the 2012 MPU re-approved. The airport users begged her not to do so as it would open the new approval to legal challenges, but she did it anyway, triggering several costly major lawsuits to the State of Oregon because of Betty Stansbury's action.
6. The airport opposition groups with the assistance of City of Wilsonville, & City of Aurora nearly immediately filed an appeal of the 2012 MPU re-approval.
7. ODAV's State Airports Manager, Tony Beach (Betty Stansbury's protégé) is now continuing to NOT support the safety & economic viability of the airport with the development of a completely new "preferred alternative" in the master plan proposal (Exhibit 1), in such a manner, airport users are severely limited in their ability to participate in the discussion. Some members of the Public Advisory Committee (PAC) were disallowed to speak about their proposed solution after being told, the only time they would be allowed to speak was during a PAC meeting for the new Master Plan development.
8. Major employers at the Airport have been strong participants as part of the "Advanced Manufacturing Industry Cluster – Aviation" called out in the Oregon Business Plan. Their work efforts are actively coordinated with Business Oregon.

9. Nearly all these businesses have branch offices in Idaho, Nevada & Washington and if ODAV kills their opportunities to expand & operate safely at KUAO, surrounding states would be happy to offer them tax & incentive subsidies to move to these states. We should not let that happen!!!
10. **ODAV (Betty Stansbury and Tony Beach) Caused this Problem!! ODAV (Now Director Kenji Sugahara and Tony Beach) needs to correct it!! Not Make it Worse!!**

December 5, 2024

A brief prepared by

Aurora Airport Improvement Association

for

Oregon Aviation Board

The Great State of Oregon

"Oregon Department of Aviation's Aurora State Airport Master Plan Preferred Alternative includes an unacceptable phasing program that withholds the urgently needed runway extension while destroying the drain-fields necessary to serve the septic needs of over $250 million in private aeronautic investment. This alternative makes the airport less safe and needlessly diminishes significant private investment that created nearly 1500 jobs. These were investments at the Aurora Airport made in good faith pursuant to State of Oregon legislation."

Aurora State Airport is located at the north end of Marion County, between the towns of Aurora and Wilsonville, parallel to State Highway 551. Adjacent to the airport is private property established as "through the fence" operations per ORS 836.640 and ORS 836.642. Pursuant to the promise of those state statutes, significant private monies have been invested into national and international aviation businesses situated at the airport. These businesses are responsible for nearly 1,500 family-wage paying jobs. The economic impact of the airport is measured at over a half billion dollars annually by the Oregon Aviation Plan Airport Summary, published by the Oregon Department of Aviation (ODAV) several years ago. The airport's economic impact is even greater now.

The Federal Aviation Administration (FAA) provides funding to airports that have formalized plans for future improvements and safety upgrades. These plans look ahead 20 years based on current operations and future forecasts. The formal term for these plans is an airport "Master Plan" (MP), part of which is the future "Airport Layout Plan" (ALP). Typically, these plans are "Updated" (Plan Updates or MPUs) every 10 years. The MP and Plan Updates to include the ALP are approved by the FAA and are the roadmaps to where and how airports develop adequately and safely over the planning horizon. ODAV is creating a new MP in lieu of conducting update to the MP they already have for the airport.

THE NEEDED RUNWAY EXTENSION WAS ALWAYS A PART OF AURORA AIRPORT MASTER PLANS. IT CANNOT BE ABANDONED NOW WHEN THE NEED IS MOST URGENT

The first MP was approved in 1976, showing the airport was determined to be of substantial value to the State's and the region's transportation and economic infrastructure. The 1976 MP called for a 6,000 linear foot runway and a tower to control air traffic. Subsequent MPUs and ALPs all called for a 6,000 linear foot runway and tower. The runway is now 5,003 linear feet, still nearly 1,000 feet too short for the aircraft that now use the airport.[1] The tower was recently completed in 2014. But the runway extension languishes.[2] As the airport and private properties have developed over the years in accordance with FAA standards and ORS 836.642 "Program for through the fence operations", private industry has invested heavily and worked closely, or at least have attempted to do so, with ODAV.

---

[1] This is not about making the runway longer to attract new aircraft. This is exclusively about making the runway long enough to safely handle the aircraft that already use the airport. This fact is not disputed but is often lost in the din.

[2] ODAV's prior director unwisely and inexplicably allowed airport opponents to challenge the 2012 mast plan some eight (8) years after it was finally approved by both the state and the FAA and after significant public and private investments were made on the strength of it. City of Aurora and other perennial airport opponents took full advantage of that opportunity and objected to pretty much everything about the master plan to include the planned 1,000 linear foot runway extension to the south citing that some of that land was zoned "EFU." The court remanded, but to the great frustration of the aviation stakeholders, ODAV refused to respond to that remand, preferring to start over.

ODAV FALSE CLAIMS DRIVING UNACCEPTABLE AIRPORT DEVELOPMENT FOR NEXT 20 YEARS

ODAV is now claiming that the FAA will not allow the runway to be lengthened unless and until the distance between the runway and Highway 551 is increased by 32 feet, a herculean, hundred-plus millions of dollars, task.[3] ODAV makes this claim even though aviation crews and passenger safety has demanded that the runway be lengthened for more than 10 years, and its lengthening was approved in the 2012 MP and its ALP. ODAV blames the FAA, asserting that the FAA now refuses to accept any "Modifications of Standard" for certain airport features that do not perfectly comply with FAA design standards and the FAA is saying Aurora must be brought into perfect compliance with said standards right now or the FAA will put the airport into a "maintenance only," mode, whatever that means. What this means is that unless the state and federal government come up with the $100+ million to move Hwy 551 (money that no one claims exists), the runway is condemned to be substandard for the aircraft that use it for the foreseeable future – an unacceptable result. But ODAV's premise is wrong and ignores what the FAA actually requires – the FAA requires no immediate compliance with every design standard – but rather current assurances of safety for existing conditions and a pathway to eventual compliance to be achieved when it is feasible. As you will see from attached Exhibit 2, Letter to FAA Regional Director Garrison, the situation is so untenable that the aviation stakeholders have asked FAA to clarify that ODAV has misinterpreted FAA's requirements.

The truth is that FAA **routinely** approves such Modifications of Standards for existing conditions that cannot practically be changed (like moving highways) for airports all over the United States, on findings that the airport will be safe regardless of a lack of perfect compliance. Here, as you can see from the attached risk report (Exhibit 3), FAA's safety standard is met (not more than a single adverse "event" every 100 years) without holding the runway extension hostage to spending the gargantuan sums of money to increase the distance between the highway and the runway 32' (i.e. without perfect design standard compliance). Highlights from the Exhibit 3 risk analysis for the existing proximity between the runway and Hwy 551:

(A) The landing risk is "one incident in every 16.7 trillion landings, the time between occurrences is calculated as 16 trillion landings divided by 45,115 landing operations per year which equates to one incident every 369,000 years."
(B) The landing roll risk is "one incident in every 12.5 million landings, the rate of occurrence is calculated as 12.5 million landings divided by 45,115 landings per year which equates to one incident every 277 years" at worst or more likely "one incident in every 16.7 million landings, the rate of occurrence is calculated as 16.7 million landings divided by 45,115 landings per year which equates to one incident every 369 years."
(C) The takeoff roll phase, the risk is "one incident in every 45.5 million takeoffs, the rate of occurrence is calculated as 45.5 million takeoffs divided by 45,115 takeoffs per year which equates to one incident every 1,008 years."

[3] ODAV says the distance between the runway and Hwy 551 must be much greater, but there can be no dispute that just 32 feet that is needed for the runway to meet the FAA design standard. No one knows why ODAV claims that such greater distance is required. ODAV isn't saying.

(D) The landing roll phase risk to taxiway is "one incident in every 11.1 million landings, the rate of occurrence is calculated as 11.1 million landings divided by 45,115 landings per year which equates to one incident every 246 years."

What the FAA is almost certainly telling ODAV, is what it tells everyone - that the MP has to contemplate merely a "pathway to compliance". In other words, FAA needs only to see that ODAV plans to address design standards over the life of the MP - if there is funding to do so. The FAA cannot assert that it will not allow the runway to be lengthened unless and until the distance between the runway and Highway 551 is increased by 32 feet, because FAA has rules for exactly this situation that allow modifications on showing that safety is maintained. And it routinely grants the same. Thus, what ODAV's MP ***should be showing*** is a modification of standards (based on Exhibit 3 or a document like it) allowing the runway to be lengthened now - as an "interim" measure - with the MP promising that by the end of the MP planning period of 20 years, that Hwy 551 will be moved the 32 feet west, within the existing ODOT right-of-way to achieve perfect design standard compliance, if funding is available to do so. This is not hard.

ODAV also falsely asserts that the FAA is demanding that the north and south drain-fields that support two of the airport's major collective septic systems must be moved, but ODAV has not identified locations where either can be feasibly moved. Here again, FAA rules do not require this extreme that ODAV insists upon, but rather the FAA requires simply the drain-fields meet certain soil compaction standards, which, with modest improvement, the drain-fields can meet. The only evidence in ODAV's record is that the drain-fields can be improved to meet FAA rules. ODAV asserts, without providing any support for their claim, that they think otherwise. But one thing is clear: the FAA does not demand that the drain-fields be moved at all, rather only that they meet compaction requirements. This is ODAV's harmful demand, and ODAV's alone.[4]

Therefore, ODAV's MP "preferred alternative" includes a phasing plan that no runway extension can occur until and unless Highway 551 is moved west and that demands removal of the critically necessary septic drain fields, to nowhere are based upon wholly false premises that ODAV refuses to correct. ODAV is refusing to apply for Modification of Standard, when that is normative and what every other airport in ODAV's situation would and does do – with success. As such, ODAV is needlessly, if not negligently, pursuing a Master Plan that will severely damage the airport and the significant private investment in it.

ODAV IS IGNORING ITS LEGISLATIVE COMMAND

Per the recommendation of the Oregon Economic Development Department, the Oregon legislature specifically adopted ORS 836.640 and ORS 836.642 (Exhibit 4 attached) to make Aurora Airport and a handful of other sites economic powerhouses for their region. These statutes

[4] The aviation stakeholders suspect that ODAV is trying to push the aviation stakeholders to annex to the City of Aurora. The City of Aurora's current mayor publicly stated he wants to annex the airport to get its tax base. Previous mayors are on record expressing desires to shut the airport down and the city has litigated against the airport ceaselessly. If is indeed ODAV's secret plan to get the airport annexed into the City of Aurora, then ODAV must disclose that and have a transparent discussion on the topic. Hidden agendas help no one and public agencies are not supposed to harbor them.

are the "Through the Fence Operations" program and require ODAV "to encourage through the fence operations designed to promote economic development by creating family wage jobs, by increasing local tax bases and by increasing financial support" for such airports through "public-private partnerships." "Through the fence operations" are defined as the usual and customary aeronautical activities by a "commercial or industrial user" in the "airport boundary."

ODAV is ignoring this command in the development of this new MP and ALP. Instead, it undermining the investments made in good faith by private industry on the strength of the statutes, in the following ways:

1. Demanding removal of the septic drain-fields that the through the fence operations rely upon (with no identified feasible alternative locations) on the wholly false claim that FAA demands such.
2. Refusing to submit a well-documented risk assessment provided by "through the fence" stakeholders that is Exhibit 3 (or an assessment ODAV thinks is better) to support an "interim" modification of standard to enable the runway to be extended now and the highway moved later when there is funding to do so.
3. Identifying the privately owned through the fence areas established by the above statutes, as land not honored for its aeronautical investment and economic development success, but rather as land ODAV will buy up, if funding becomes available to do so.
4. Refusing to expand the airport boundary to include and thus support all of the previous MP identified through the fence properties.[5]

ODAV PRESENTED ALTERNATIVES THAT CAUSED NEEDLESS ANGST, THEN SELECTED A DIFFERENT ONE

ODAV presented startling alternatives to its Master Plan Public Advisory Committee (PAC) on 7/31/24. During the presentation, ODAV and its consultants stated the alternatives were all premised on the (false) claim the FAA said no runway extension could occur unless the Highway 551 Runway Object Free Area (ROFA) design standard was first met.

This incorrect premise drove all ODAV's binary 7/31 alternatives that needlessly pitted aeronautical interests against homeowners and nonaeronautical businesses – one alternative moving Highway 551 west significantly more than is needed to meet the FAA's design standard, and in so doing wiping out homes and businesses ***or*** moving the runway (and air traffic control tower) east, wiping out the private aeronautical investment at the airport and a truly awful alternative that blended the worst of both. Yet, to meet the 32 feet of increased distance between the runway and Highway 551, all that was needed is 32 feet and that can all be taken from the existing right-or-way – no homes or businesses needed to be wiped out at all. And, all of ODAV's

[5] Per the above statutes, aeronautical through the fence operations can only occur within the airport's "boundary." The airport's "boundary" is a term of art that simply identifies all areas master planning identifies as suitable for aeronautical activity. All Aurora Airport MPs have identified particular areas adjacent to the airport as suitable for airport related uses. Yet, ODAV STILL has not expanded the boundary to include all of those properties and so far is apparently not planning to do so in the current iteration of the MP.

"alternatives" wiped out the septic drain-fields that enable private investment to exist. And all of the alternatives included an unwise internal airport access road paralleling the active taxiway and runway, when it is elementary airport planning that such is to be avoided as a matter of safety. Yet even though the 2012 MP approved an internal airport access road (that is already partially built) that is internal to the airport and does not run the risk of unintended internal traffic - like an Amazon driver in the driving rain, inadvertently finding their way onto the active taxiway or runway, ODAV with no explanation, ignored that reasonable and prudent option. The preferred alternative now puts the internal access road in a new location, perilously close to the runway and next to the active taxiway.

Finding themselves, the "adult in the room", the airport's aeronautical stakeholders presented an airport MP alternative that extended the runway to the north in the short term to serve the decades-plus long need for improved existing aircraft safe operations. The stakeholder's alternative provided a fully documented Modification of Standard study (Exhibit 3) demonstrating unequivocally that Modification of Standard requirements were met through careful risk analysis, to support the runway lengthening. It also contemplated HWY 551 be moved 32 ft to the west after the runway extension happens, and later in the MP planning period and within the acquired ODOT right of way (taking no homes/businesses), if funding is available. It contemplates the drainfield simply be improved to FAA standards and remain in place. And restored the 2012 internal access road so that there were no risks of incursions.

To date, ODAV has ignored this alternative and worse, would not allow discussion of the proposed alternative during the October 15, 2024 Public Advisory Committee meeting.

What ODAV did was to decide that a modified Alternative 1A be identified as the preferred alternative (Exhibit 1). This alternative was the best of the three truly terrible alternatives ODAV floated. This one moves Hwy 551 west – but well more than the 32 feet that is needed, puts the internal circulation road along side the active taxiway and runway, removes the septic drain fields to nowhere, fails to expand the airport boundary and still shows ODAV buying up, tearing down front privately owned front row hangars, only to rebuild new hangars that would be leased out by the State. Additionally, the ODAV shows intent to purchase privately owned properties now devoted to aeronautical uses. Newly part of this alternative as of October 16, 2024, is that the critically needed runway extension is planned to languish and is only "phased in" when Hwy 551 is moved. ODAV can do better. And in its history, it has done better.

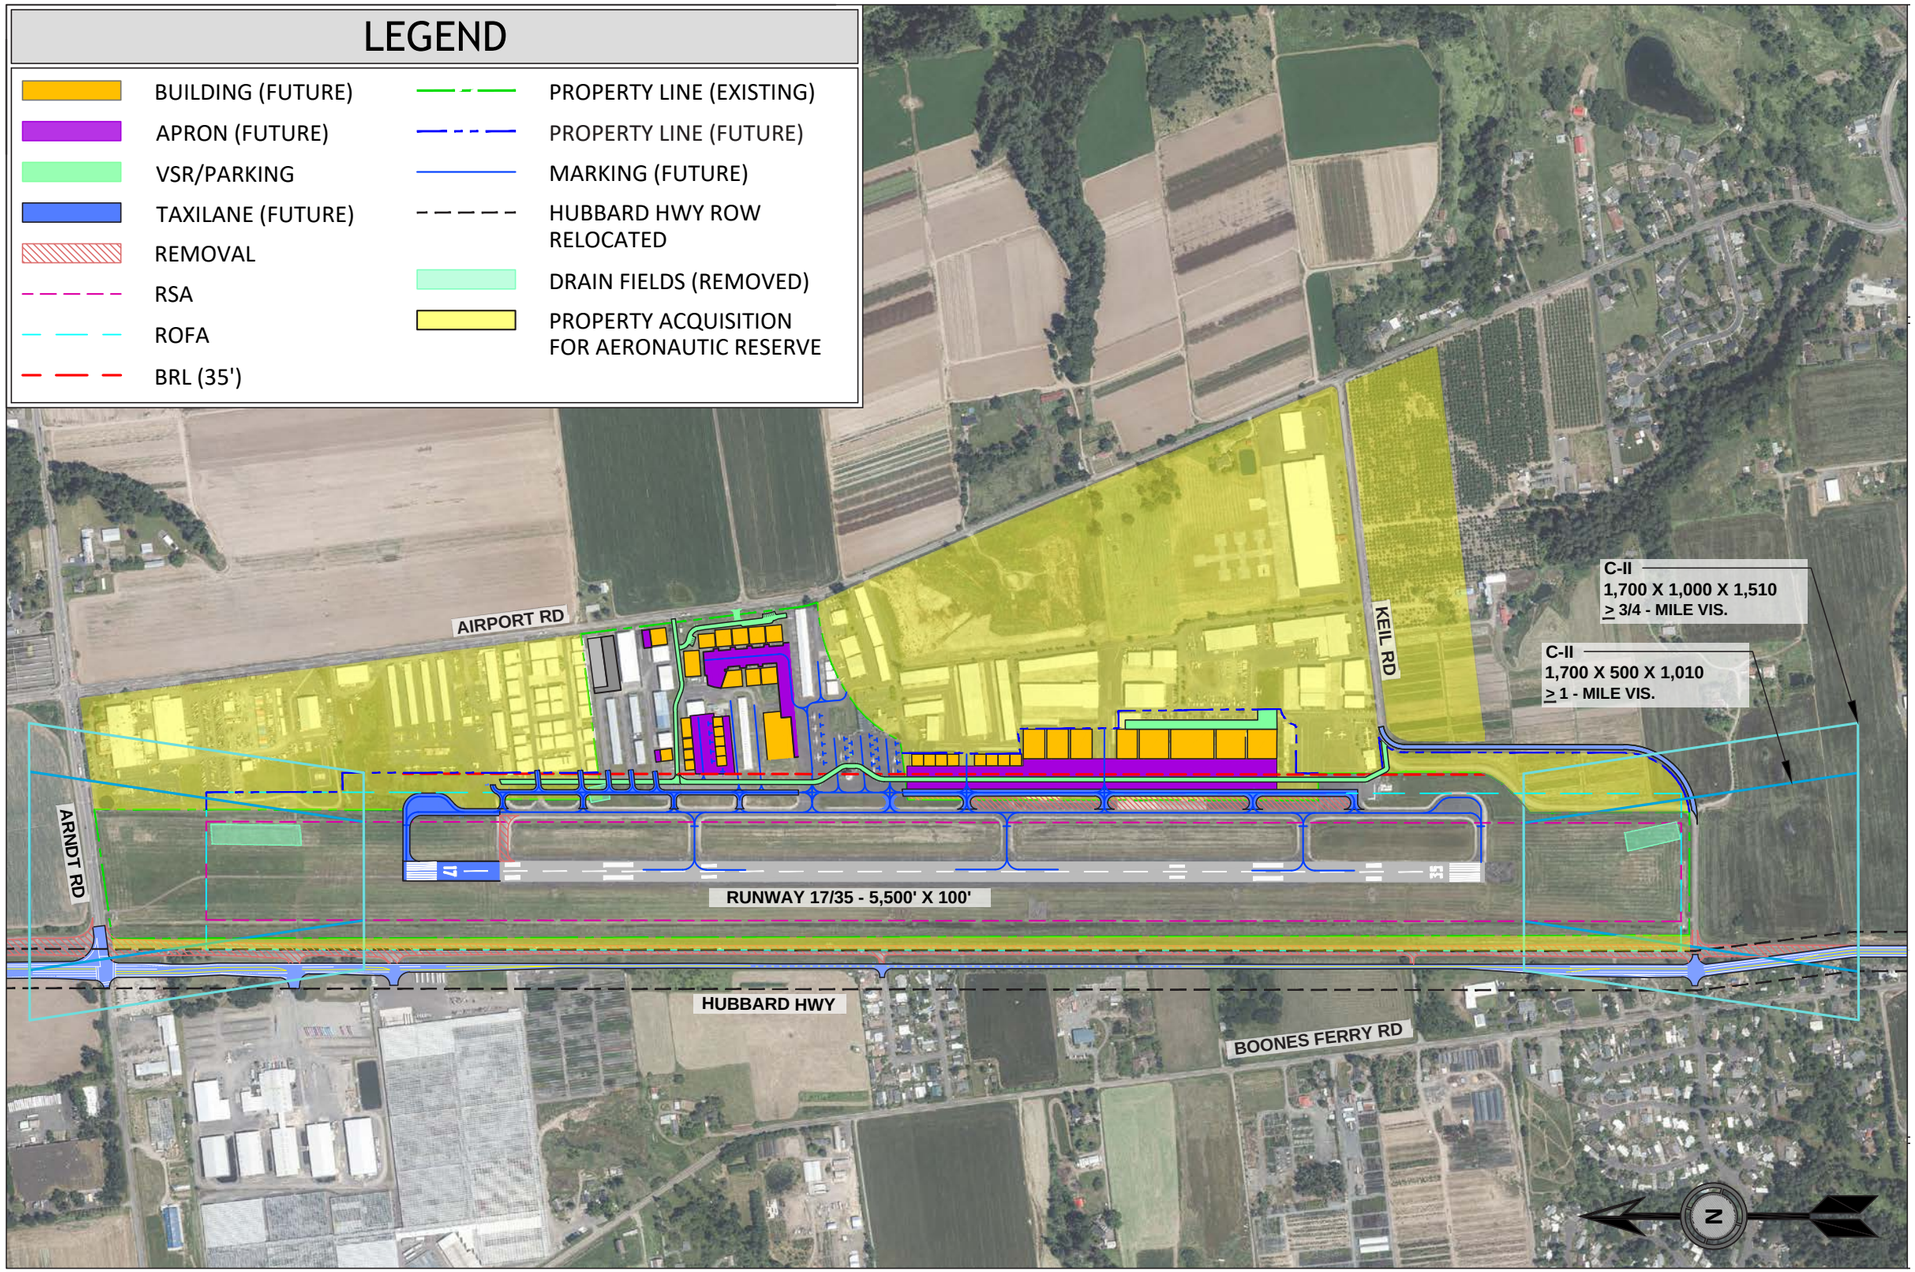
THE ASK

We need your help. ODAV has lost its way. We ask that the Oregon Aviation Board to recognize the damaging effect presented by this plan to private investment made in good faith in accordance with the State statute. Please confer with the Governor's Office to convene the key players – Governor's Office, FAA, ODAV, ODOT, airport stakeholders, nearby Cities, Marion and Clackamas County, and interest groups – for an open discussion of the future of the airport. If people simply have a way to talk to each other, we think many of these problems can be avoided.

If that is not doable, we ask that ODAV be directed to support its preferred alternative 1A with the following very modest and normative changes:

- Phase in the runway extension at least 500 feet to the north **as an immediate action** regardless of the 32' of imperfect ROFA compliance and, to prove up on safety doing so, submit the Exhibit 3 Modification to Standards to FAA to support it. The FAA will approve it. Call this step an interim measure, subject to moving Highway 551 in the longer term, when funds are available (next bullet).
- Plan to move Highway 551, 32 feet west (and also move the airport's perimeter fence proportionately west), outside the ROFA but within ODOT right-of-way by the end of the planning period if funding is available.
- The septic system drain-fields be brought to FAA standard and remain in place.
- Remove the Vehicle Service Road from the plan and replace it with the Internal Circulation Road as approved in the 2012 Master Plan Update.
- Remove the parallel taxi-lane from the ball, negating (and removing) the need for the indicated taking of the front row hangars.
- The airport boundary is adjusted to include the property that all airport Master Plans have shown as suitable for airport development.

Preferred Alternative



Project Update 10/15/2024

Refined Preliminary Alternative 1A was selected as the preferred alternative following an extensive review of all feedback provided by the FAA, members of the PAC, airport users, and the public throughout the planning process. The preferred alternative identifies a path to conformance to correct the existing non-standard ROFA and RSA as required by the FAA, and it offers advantages over the other preliminary alternatives including:

- It maintains the runway in its current location compared to Refined Preliminary Alternatives 1B and 2.
- It reduces the impacts on west residential properties compared to Refined Preliminary Alternative 1B.
- It does not require relocation of the ATCT as required in Preliminary Alternative 2.
- It provides phased opportunities for the flexible implementation of projects to conform to standards, improve efficiency, and improves safety. The phases of these projects are in no specific order of implementation; however, based on FAA input, the phase to extend the runway would not occur until the phase to meet ROFA and RSA standards are completed. The phases of the preferred alternative include:
  - » Figure 1: Preferred Alternative Overview
  - » Figure 2: Phase for projects needed to meet ROFA & RSA conformance standards
  - » Figure 3: Phase for addition of a vehicle service road (VSR)
  - » Figure 4: Phase for runway and parallel taxiway extension
  - » Figure 5: Phase for the addition of a parallel taxilane
  - » Figure 6: Property Overview

Via US CERTIFIED MAIL
& Courtesy Electronic Mail
William "Chuck" Garrison
Director
Federal Aviation Administration
2200 S 216th St.
Des Moines, WA 98198

RE: Aurora State Airport Master Plan

Dear Mr. Garrison:

The undersigned represents the private aviation stakeholders responsible for more than $300 million in investment at the airport who are directly impacted by the State of Oregon's in-process update to the Aurora State Airport Master Plan. An issue has arisen for which we seek your clarification.

Although a runway extension was included in the 2012 Aurora State Airport Master Plan and the approved Airport Layout Plan, it was never constructed. The runway extension is not meant to serve new aircraft, but rather to ensure the safety of the aircraft currently using the airport.

The Oregon Department of Aviation (ODAV) is claiming that the FAA is requiring—

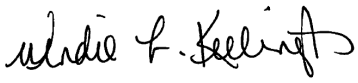
(1) Perfect airport design standard compliance before the runway may be extended. And that without perfect design standard compliance, that the FAA will put the airport into "maintenance mode".

(2) A septic drain field be moved even though there is no location identified where it can be moved, and there is no dispute that the current drain field can be improved to meet design standards.

Further ODAV is claiming that the FAA is refusing to consider much less approve of any Modification of Standards (MOS) needed for the modest Runway Object Free Area (ROFA) adjustment (32 feet) because state Highway 551 is just 32 feet short of ROFA compliance.

You are no doubt aware that FAA is required to consider and approve a MOS "when necessary to meet local conditions" so long as the "modification will provide an acceptable level of safety, economy, durability and workmanship." (*See,* 14 CFR § 152.11(b)).

The design standards for which ODAV claims FAA demands perfect prerequisite compliance for any runway extension applies to all airports in the US. The FAA routinely



approves MOS for large airports nationwide some with genuine safety concerns. Nothing suggests Aurora has some super anomaly warranting the disparate treatment ODAV claims FAA demands.

A MOS ROFA for Highway 551 can be approved because the risk presented is extremely small and far better than the FAA's 100-year occurrence standard as the attached report explains in detail. In sum—

(A) The landing risk is "one incident in every 16.7 trillion landings, the time between occurrences is calculated as 16 trillion landings divided by 45,115 landing operations per year which equates to one incident every 369,000 years."
(B) The landing roll risk is "one incident in every 12.5 million landings, the rate of occurrence is calculated as 12.5 million landings divided by 45,115 landings per year which equates to one incident every 277 years" at worst or more likely "one incident in every 16.7 million landings, the rate of occurrence is calculated as 16.7 million landings divided by 45,115 landings per year which equates to one incident every 369 years."
(C) The takeoff roll phase, the risk is "one incident in every 45.5 million takeoffs, the rate of occurrence is calculated as 45.5 million takeoffs divided by 45,115 takeoffs per year which equates to one incident every 1,008 years."
(D) The landing roll phase risk to taxiway is "one incident in every 11.1 million landings, the rate of occurrence is calculated as 11.1 million landings divided by 45,115 landings per year which equates to one incident every 246 years."

Since the ODAV has provided nothing in writing from the FAA we believe that ODAV is mistaken about the agency's demands and urgently request that you clarify FAA's requirements at your earliest opportunity. This is extremely time sensitive because all of ODAV's actions concerning the master plan update are predicated upon their claimed FAA premise demands.

Very truly yours,

Wendie L. Kellington

Airports and Landing Fields

ORS 836.642
Program for through the fence operations

- **rules**

(1) The Oregon Department of Aviation shall establish a pilot program at up to six rural airports to encourage development of through the fence operations designed to promote economic development by creating family wage jobs, by increasing local tax bases and by increasing financial support for rural airports. To the extent practicable, the airport sponsor of a pilot site shall use public-private partnerships that incorporate:

(a) Innovative and creative technologies for increasing airport usability and safety;

(b) Innovative and creative performance of aviation services to make the services more competitive and useful for the public;

(c) Development of the pilot site as a setting for customary and usual aviation-related activities to develop and thrive, in concert with the goals of the Oregon Business Development Department; and

(d) Shared responsibility for:

(A) Establishing and meeting the fiscal needs of the pilot site;

(B) Maintaining safety of operations; and

(C) Maintaining positive community relations and compatibility with existing uses.

(2) The pilot program shall operate at:

(a) The Aurora State Airport; and

(b) Not more than five additional rural airports that volunteer to participate and are selected by the Oregon Department of Aviation with the concurrence of the county in which each rural airport is located.

(3) The Oregon Department of Aviation, by rule, shall provide standards and guidelines for through the fence operations that:

(a) Ensure that the operations provide financial support to the pilot sites in compliance with Federal Aviation Administration regulations;

(b) Require submission, review, approval and, as appropriate, revision of a facility site plan for each through the fence operation so that the real property covered by the site plan can be incorporated into the airport boundary and coordinated with the other aspects of the airport master plan;

(c) Ensure that the operations are conducted according to a written contract between the commercial or industrial user of property within the airport boundary and the airport sponsor;

(d) Ensure that pilot sites continue to operate in a safe manner and to fulfill their roles in Oregon's emergency response system;

(e) Preserve investments in pilot sites and the level of service provided by pilot sites;

(f) Facilitate orderly management of pilot sites;

(g) Provide equitable and uniform treatment of airport tenants and users at pilot sites;

(h) Advance economic development through qualified customary and usual aviation-related activities within the airport boundaries of pilot sites;

(i) Encourage well-ordered economic development within the airport boundaries of the pilot sites;

(j) Facilitate and foster good relations with the communities surrounding the pilot sites;

(k) Enable conformity with approved airport master plans;

(L) Make pilot sites available for public use on reasonable terms; and

(m) Assist pilot sites in developing financial self-sufficiency through the use of innovative funding and economic development programs.

(4) The Department of Land Conservation and Development, the county and a city, if any, within whose jurisdiction a pilot site is located shall coordinate with the Oregon Department of Aviation to ensure that the applicable comprehensive plans and land use regulations, including airport zoning classifications pursuant to ORS 836.600 (Policy) to 836.630 (Siting of new airports to comply with land use laws), facilitate through the fence operations and support the development or expansion of the pilot site consistent with applicable statewide land use planning requirements.

(5) The Oregon Business Development Department shall assist the pilot sites to:

(a) Identify, qualify for and apply for funding from appropriate grant and loan programs; and

(b) Develop innovative short-term and long-term funding opportunities.

(6) To the extent practicable, the airport sponsors shall utilize innovative airport infrastructure and operations funding to support the pilot sites including, but not limited to:

(a) Airport districts as provided in ORS chapter 838;

(b) Economic development programs administered by the Oregon Business Development Department;

(c) Tax increment financing to provide funding for airport-related infrastructure;

(d) United States Department of Agriculture Rural Development grants or low-interest loans; and

(e) Programs, including funding for short line railroads under ORS 367.067 (Short Line Credit Premium Account), designed to facilitate development of intermodal

transportation projects. [2005 c.820 §3; 2009 c.398 §2]

Aurora State Airport (UAO)
Proposed Modification of
Runway Object Free Area (ROFA) Design Standards

Prepared by: Aron Faegre, AIA, PE
Aron Faegre Airport Planning & Design

August 29, 2024

This memorandum provides an analysis and methodology by which a Modifications of FAA Airport Design Standards (MOS) at the Aurora State Airport (UAO), for the Runway Object Free Area (ROFA) can be justified as:

> "… resulting in an acceptable level of safety, useful life, lower costs, greater efficiency, or the need to accommodate an unusual local condition on a specific project through approval on a case-by-case basis." - FAA Order 5300.1G, page 1.

as defined and permitted under FAA Order 5300.1G Modifications to Agency Airport Design, Construction, and Equipment Standards[1].

1. BACKGROUND

The Aurora State Airport is surrounded by farm lands, near Aurora, Oregon, at the northern end of Marion County. It primarily serves aviation businesses involved with:

- emergency medical transport[2],
- aviation heavy-lift helicopter fire-fighting and power line construction companies (for which fixed wing aircraft are essential for support),[3]
- business jets for numerous major national corporations based within 10 miles,
- aircraft manufacturing for the S-LSA (Special Light-Sport Aircraft) and kit-build

[1] FAA Order 5300.1G Appendix A specifically gives FAA Office of Airport (ARP) and Region the authority to issue a MOS for Runway Object Free Areas. The Order can be downloaded at: https://www.faa.gov/documentLibrary/media/Order/order-5300-1G-modifications-to-standards.pdf .
[2] Regional headquarters for Life Flight Network, with bases all over Oregon, Washington, Idaho, Montana, and Nevada.
[3] Columbia Helicopters, Helicopter Transport Services, Wilson Construction, companies that work internationally with headquarters at Aurora Airport. The use of the Aurora Airport runway is essential to these companies for rapid providing of crews, equipment, and repairs to helicopters in active service of fighting fires, moving power lines, or doing rescue, relief, or humanitarian work.

industry[4], and

- other general aviation aircraft using the airfield for business, pilot training, and recreational flying.

There is no scheduled air service using the airport. The State of Oregon Department of Aviation (ODAV) owns, governs, and manages the public lands of the airport. Most of the business aircraft based at the airport access the runway via through-the-fence permits with ODAV.

Flights by based business jets, such as a Challenger 300, dictate that the Airport Reference Code is C-II. Due to the geometry of the existing site, the airport does not meet current FAA design standards for the ROFA, due primarily to adjacent Highway 551 to the west of the runway.

Most recently ODAV's planned solution[5] to meeting these standards ("Refined Preliminary Alternatives Summary", by Century West Engineering, dated July 31, 2024) is one of only two options:

- relocate the highway further west, (which involves acquiring both private residential and commercial properties further west), or
- relocate the runway, taxiway, and control tower east (which involves acquiring many acres of existing private property already developed with hangars, taxilanes, and aprons for aviation uses) and demolishing numerous large 40,000 square foot aviation hangars along the taxiway.

Both options have very high financial and environmental costs (probably in the greater than $100 million range), which would make them difficult to ever be implemented. If this master plan is approved as currently planned, and one of these options were not implemented, then ODAV and FAA have reported that the airport would only receive maintenance funding and no additional safety improvement funds. This would result in the airport not keeping pace with the aviation industry standards of safety. The second option (moving the runway, control tower, and demolishing hangars), If implemented, would in addition force closure of many of the major medical transport and fire-fighting facilities on the airport, and would put many of the airport's 1,500 employees out of jobs.

It is noted that in the 2012 Airport Layout Plan (ALP), approved (signed) by both ODAV and FAA, the airport also had the same Runway Design Code (RDC) status of C-II and

[4] Van's Aircraft www.vansaircraft.com the international leader in S-LSA produced aircraft.
[5] Refined Preliminary Alternatives Summary document dated July 31, 2024 by Century West Engineer can be downloaded at: https://publicproject.net/files/UAOAMP/uao-refined-preliminary-alternatives-summary-1-.pdf?d952c4adef .

listed a MOS as the solution to the non-standard ROFA limitation on the west property line. At that time there was consensus between ODAV and FAA that a MOS was a reasonable solution.

This memorandum provides the evidence to show that the 2012 ALP was a good approach to resolution of the ROFA, and that it can reasonably be continued. This report demonstrates that there is an acceptable level of safety through modifying the ROFA standard for the specific deviation to standards located on the west side of the runway.

FAA standards for different airports ROFA's vary from 250 foot width, to an 800 foot width, depending on aircraft type using the airport. As will be shown below, the primary reason justifying the modification is that the going from B-II to C-II category is just where the 500-foot required ROFA width changes to an 800-foot wide required ROFA - yet this is the same width required for all RDC category aircraft all the way to E-VI -Portland International Airport, San Francisco Airport, and every other international airport in the country. UAO will never have the larger size of aircraft those airports accommodate – Boeing 737's to Boeing 777's – so a slight reduction in width on the west side provides a level of safety appropriate for UAO, which will always serve only much smaller aircraft.

Modifications of standards for ROFA's are common at even large national airports. For example, recently several MOS were adopted at San Jose International Airport for deficiencies in the ROFA, as well as for runway-taxiway separations, and for runway object free areas[6]. It even appears that Portland International Airport (PDX) may have their airport perimeter fence, the shoulder of NE Marine Drive, and improper grading within the 400-feet area from runway centerline, at the northeast corner of the ROFA for Runway 10L.

This memorandum provides the detailed technical background and mathematically calculated justification, needed for the FAA and ODAV to again approve a MOS for the ROFA at Aurora State Airport.

2. MOS PROCESS

The process for gaining a modification of standards is provided in FAA AC 150/5300-13B Airport Design[7] in Section 2.8. It states, and we provide commentary after each paragraph as to acceptability:

[6] Norman Y. Mineta San Jose International Airport Runway Incursion Mitigation/Airfield Design Standards Analysis, November 27, 2017. Justification for ROFA modifications in this document were often simply the practical and cost issues of modifying major adjacent highways, similar to what is at issue in a much smaller Aurora Airport.
[7] FAA AC 150/5300-13B Airport Design Available free on line at:
https://www.faa.gov/documentLibrary/media/Advisory_Circular/AC-150-5300-13B-Airport-Design-Chg1.pdf

2.8 ***Modification of Standards.***

Site-specific conditions may make it impractical to meet all FAA design standards at an airport. The FAA considers, on a case-by-case basis, modifications to design standards that result in an acceptable level of safety and efficiency. Specific operational controls may be necessary to establish an acceptable level of safety for operation of aircraft at the airport. FAA Order 5300.1 establishes FAA policy for administering airport requests for modification of standards. See paragraphs 2.4 and 2.5.

This memorandum provides this information and finds that no specific operational controls are necessary, see comments on paragraph 2.4 below.

2.8.1 The FAA views an approved modification of standards as an interim measure intended to mitigate unique site-specific conditions. Unless the FAA explicitly states otherwise in the approval action, the FAA expects airports with approved modifications to pursue ways to meet design standards. This may occur incrementally over time or at such time it becomes practical to correct the non-standard condition.

The FAA and ODAV can work with Oregon Department of Transportation on master planning future revisions to State Highway 551 so that it can be corrected "at such time it becomes practical." Also, there are potential options where ODAV and ODOT could jointly agree to relocate the airport perimeter fence closer to Highway 551, which could be an "incrementally" established improvement.

2.8.2 The FAA will not consider any request to modify design standards associated with the following:

- *RSA dimensions*
- *OFZ dimensions*
- *Approach or departure surface dimensions*
- *Standards established within a regulation (e.g., stopway, clearway).*

The ROFA is not one of these.

2.8.3 An airport seeking FAA approval of modification to a design standard submits a request using the Modification of Standards application tool within the Airport Data and Information Portal (ADIP) at https://adip.faa.gov. The FAA relies on the following information, in part, to determine the acceptability of a modification to FAA design standards:

- *Information on the standard proposed for modification.*
- *Description of proposed modification and why the airport cannot meet standards.*
- *Statement addressing how modification will provide an acceptable level of safety, economy, durability, and workmanship.*
- *Listing of any special operational measures necessary to accommodate the modification.*

This document was prepared to provide the analysis needed for ODAV to submittal for the MOS per Section 2.4.

2.4 Addressing Non-standard Airport Conditions.

> *The FAA expects airport owners to address non-standard conditions through the airport planning process. The FAA acknowledges that conformance to current standards is not always practical. However, the FAA expects airports to continue to investigate mitigation measures, whether in one or multiple phases, and correct the non-standard conditions over time.*

It is important to re-emphasize the above statement, that the FAA here "acknowledges that conformance to current standards is not always practical." Further, per this paragraph, the current master planning activity is the appropriate place for this analysis and the formal establishment of a MOS for the ROFA. This report and analysis identifies intermediate steps that can be taken, such as relocating the airport perimeter fence, that will iteratively move the airport closer to compliance.

This analysis utilizes an FAA established safety analysis methodology to show that the MOS provides an acceptable level of safety. The study found no special measures needed to accommodate the modification.

3. METHODOLOGY

In 2011, the Transportation Research Board (TRB) released Airport Cooperative Research Program (ACRP) Report #51 – Risk Assessment Method to Support Modifications of Airfield Separation Standards. The ACRP is funded by the Federal Aviation Administration (FAA). Report #51 is used to support the ROFA MOS requested at Aurora State Airport.

The proposed ROFA MOS is modeled in this report in accordance with Appendix A – Risk Assessment Methodology of ACRP Report #51[8].

This report uses risk plots, along with the annual number of operations, to analyze the cumulative risks associated with Runway to Object Separations. The operations numbers at UAO are taken from the current draft Master Plan, and are numbers already approved by the FAA in a letter[9] to ODAV dated November 15, 2023 (corrected January 23, 2024). For sake of a conservative analysis, we are using the most distant forecast projects for the year 2041, which are:

- 90,231 total operations all RDC categories, of which
- 862 operations are of RDC C-II and D aircraft

[8] ACRP Report #51 – Risk Assessment Method to Support Modifications of Airfield Separation Standards is available free on line at: https://nap.nationalacademies.org/catalog/14501/risk-assessment-method-to-support-modification-of-airfield-separation-standards

[9] Federal Aviation Administration (FAA) Aurora (UAO Aviation Activity Forecast Approval Airport Improvement Program Grant Number 3-41-0004-022-2021 available at: https://publicproject.net/files/2024-01/Aurora-Airport/uao-forecast-approval-20231115-corrected-20240123.pdf?57af6c19b7

For operations involving the runway, per the methods of Report #51, the risk is analyzed based on three distinct phases of flight:

a. Landing - Airborne Phase
b. Landing - Ground Phase
c. Takeoff

The separation distance from the runway centerline to an object is used with the associated risk plot to calculate the risk of collision per operation.

The risk of collisions per operation is then analyzed along with the number of annual airport operations for the appropriate phase of flight to determine the predicted frequency of occurrence. The frequency of occurrence is used to determine the FAA likelihood level using Table A-3 from ACRP Report #51 which is shown below:

Table A-3. FAA likelihood levels (FAA, 2010).

	General	Airport Specific	ATC Operational	
			Per Facility	NAS-wide
Frequent A	Probability of occurrence per operation is equal to or greater than 1×10^{-3}	Expected to occur more than once per week or every 2,500 departures (4×10^{-4}), whichever occurs sooner	Expected to occur more than once per week	Expected to occur every 1–2 days
Probable B	Probability of occurrence per operation is less than 1×10^{-3}, but equal to or greater than 1×10^{-5}	Expected to occur about once every month or 250,000 departures (4×10^{-6}), whichever occurs sooner	Expected to occur about once every month	Expected to occur several times per month
Remote C	Probability of occurrence per operation is less than 1×10^{-5} but equal to or greater than 1×10^{-7}	Expected to occur about once every year or 2.5 million departures (4×10^{-7}), whichever occurs sooner	Expected to occur about once every 1–10 years	Expected to occur about once every few months
Extremely Remote D	Probability of occurrence per operation is less than 1×10^{-7} but equal to or greater than 1×10^{-9}	Expected to occur once every 10–100 years or 25 million departures (4×10^{-8}), whichever occurs sooner	Expected to occur about once every 10–100 years	Expected to occur about once every 3 years
Extremely Improbable E	Probability of occurrence per operation is less than 1×10^{-9}	Expected to occur less than once every 100 years	Expected to occur less than once every 100 years	Expected to occur less than once every 30 years

Note: Occurrence is defined per movement.

Source: ACRP Report #51

The key takeaway from Table A-3 is that for a specific airport, if the likelihood of incidence is less than once every 100 years it is considered a “Extremely Improbable” Class E occurrence.

A Hazard Severity Classification is then assigned based on the worst credible outcome of an incident. Since the ACRP method is based on wingtip separation, the report states that: “From the point of view of risk and based on the records of incidents and accidents,

the worst credible consequence expected for wingtip collisions of two taxiing aircraft is aircraft damage" (ACRP Report #51 page 19). A similar aircraft damage expectation would be a wingtip collision with the airport perimeter fence, which is the ROFA limitation examined in this report.

The Hazard Severity Classifications were determined in accordance with Table A-4 FAA Severity Definitions from ACRP Report #51 and are shown below:

Table A-4. FAA severity definitions (FAA, 2010).

Hazard Severity Classification				
Minimal 5	**Minor 4**	**Major 3**	**Hazardous 2**	**Catastrophic 1**
No damage to aircraft but minimal injury or discomfort of little consequence to passenger(s) or workers	- Minimal damage to aircraft; - Minor injury to passengers; - Minimal unplanned airport operations limitations (i.e. taxiway closure); - Minor incident involving the use of airport emergency procedures	- Major damage to aircraft and/or minor injury to passenger(s)/ worker(s); - Major unplanned disruption to airport operations; - Serious incident; - Deduction on the airport's ability to deal with adverse conditions	- Severe damage to aircraft and/or serious injury to passenger(s)/ worker(s); - Complete unplanned airport closure; - Major unplanned operations limitations (i.e. runway closure); - Major airport damage to equipment and facilities	- Complete loss of aircraft and/or facilities or fatal injury in passenger(s)/ worker(s); - Complete unplanned airport closure and destruction of critical facilities; - Airport facilities and equipment destroyed

Source: ACRP Report #51

Then, using both the FAA likelihood level and the Hazard Severity Classification the risk is then analyzed using Figure A-1 FAA Risk Matrix from ACRP Report #51, shown below:

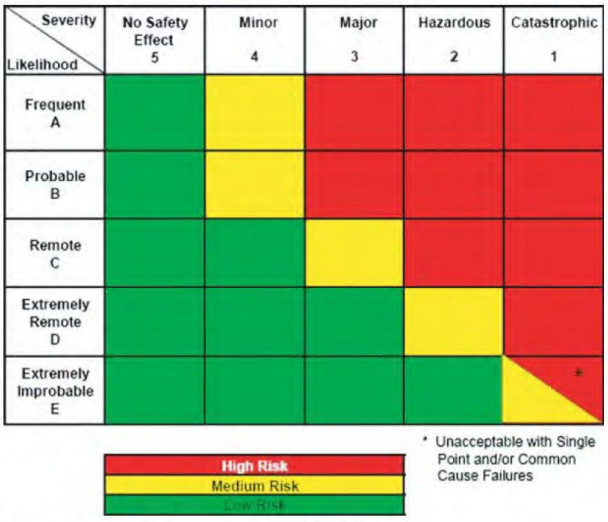

Figure A-1. FAA risk matrix (FAA, 2010).

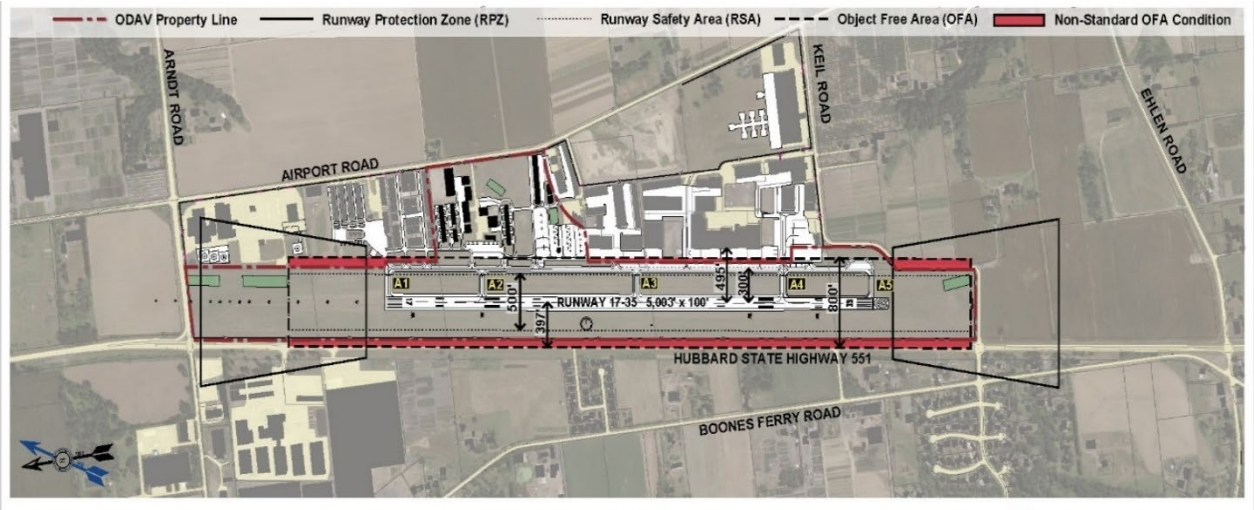
Source: ACRP Report #51



Based on Figure A-1 if the incident is Extremely Improbably (i.e. more than 100 years probability) the risk is considered “Low,” except for an incident considered catastrophic. We will use these graphs to evaluate the results from the detailed risk analysis of UAO below.

4. UAO ANALYSIS

In 2012 Master Plan and ALP established the UAO runway RDC, given existing based aircraft, as C-II, up from a B-II. The required ROFA width of a B-II runway is 500 feet centered on the runway. As it turns out, any runway of higher RDC than a B-II requires 800 feet in width. Thus, the UAO required C-II ROFA width is 800 feet centered on the runway. This 800-foot width is the standard used for aircraft ranging from a Challenger 300 business jet to the largest Boeing 777 or even the largest military aircraft. The 2012 approved ALP lists the ROFA deviation as a modification to standards, since the airport perimeter fence and Highway 551 were within the ROFA.

The UAO forecast of operations predicts that by the year 2041 there will be 90,230 annual operations at the airport, of which 862 would be an RDC above the B-II category. Thus, the 89,368 operations by B-II or lesser category clearly are operating well within ROFA safety standards, as the existing runway to road separations provide more than the 500-foot required width. It is just the 862 operations that need to be analyzed for ROFA safety relative to the required 800-foot width.

The deficiencies in the existing Runway OFA at UAO are shown in the Figure below:

UAO Figure A: Highway 551 Shown as ROFA Deviation Object
Source: Century West Engineers, Aurora State Airport Draft Airport Master Plan, Working Paper No. 1, Figure 2-15, November 2023 (Updated)

The current ROFA object deficiencies are:

d. Hubbard State Highway 551 for which the OFA penetrates 3 feet beyond the highway centerline. (368' to 377' clear width available from outer edge of highway gravel shoulder to Runway CL)
e. Perimeter Fence Inside OFA (312' clear width from Runway CL)

Potentially the airport fence could be relocated to the east edge of the 12-foot-wide gravel shoulder, since both the highway and the airport are owned by the State of Oregon. There can be an agreement between ODOT and ODAV to allow this. Relocating the fence in this way would result in a minimum width of the ROFA on the west side of the runway, to a 368-foot clearance - which would be only 32 feet out of conformance.

However, we will evaluate the ROFA for the existing conditions, and thus use the location of the airport perimeter fence as the maximum ROFA available at this time.

When analyzing the risk associated with a reduction in Runway OFA it is important to consider the purpose of the design standard. Paragraph 3.12 of Advisory Circular 150/5300-13B defines the ROFA but does not give detailed design rational behind the standard:

> *"ROFA is a clear area limited to equipment necessary for air and ground navigation, and provides wingtip protection in the event of an aircraft excursion from the runway"*

Appendix I, Paragraph I.8 of Advisory Circular 150/5300-13B provides the only available reference to the design rationale behind the Runway OFA width:

> *"The ROFA serves two principal purposes: 1. Development buffer in proximity to a runway, and 2. Wing clearance for a runway excursion event to the outer limit of the RSA. `*

Appendix I, in Section I.8.2, also clarifies that part of the "development buffer" intent is:

> *"Protection of the ROFA also reserves space for future development of a parallel taxiway that permits proper alignment of aircraft at a holding position on an entrance taxiway."*

However, for the given physical layout of UAO there can be no plan for a parallel taxiway on the west side of the runway, because of the location of Highway 551 and that there never can be hangars or other aviation uses on that side of the runway. Therefore, that leaves the only ROFA purpose for UAO as only "wingtip clearance for a runway excursion" which is precisely what this analysis provides.

Below we will analyze resolving the ROFA utilizing the risk analysis method of ACRP Report #51, for the case:

- No Change to existing ROFA conditions on West Side of Runway (Hwy 551 and Airport Perimeter Fence remain as existing) resulting in a 312-foot clearance to runway CL.

Per the methodology of ACRP Report 51, we analyze the risks for each of the takeoff and landing scenarios. For landing operations, the analysis is further divided into two parts: airborne (approach) phase and ground (landing rollout) phase. However, because the risk of veering off the runway during takeoff is so much less than for during landing, the methodology indicates that usually it is not necessary to evaluate takeoff option except if there are runways that only are used for takeoffs and not for landings. We will do that takeoff evaluation in any case, just to clearly determine what it is in the UAO context.

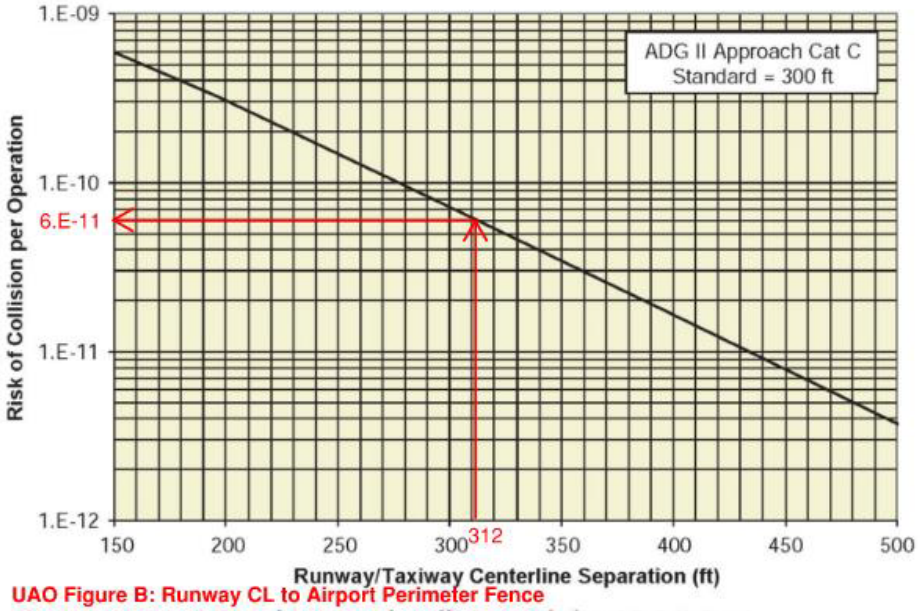
Since the existing runway to taxiway separation meets the current criteria for a C-II airport, for this study that analysis would seem unnecessary. However, we will include that option in this report because it provides a baseline of safety that the AC 150-5300-13B Airport Design Standards have determined is an acceptable and appropriate level of safety for a C-II airport.

Thus, for this UAO ROFA analysis separate risks are developed for each of:

1. Airborne Phase (Landing) is for instrument approaches which terminate the approach as a missed approach, and the risk is hitting another object such as hitting the airport perimeter fence or a vehicle on Highway 551 (using ACRP Report 51 Fig. 31); “the airborne risk is computed only for missed approaches” (ACRP Report 51, page 21).
2. Ground Phase (Landing Rollout) where risk is veering off the runway into the reduced width ROFA and hitting the fence or a car on Highway 551 (using ACRP Report 51 Fig 42). Figure 42 is based on the assumption that the risk is between the two wingtips of two aircraft, one aircraft on the edge of the runway and the other at the centerline of a taxiway. The ACRP makes clear that the x-axis distance on the Risk Figures are centerline of runway to centerline of taxiway because the risk is assumed aircraft to aircraft. However, the predicted risk is based on the wingtip-to-wingtip distance. When using the Risk Figures for objects (not aircraft) like a fence or road (which has no wings), half of the wingspan should be added to the distance to compensate for the wingtip-to-wingtip assumption. Thus, per Group II standards, the clearance distance used for Figure 42 should add half of 79 feet (equals 39.5 feet) of additional clearance, which would create a total of 351 feet to use in Fig. 42. The risk shown with the 312 feet and the 351 feet are each shown in figures.

3. Ground Phase (Takeoff) where risk is veering off the runway into the reduced width ROFA and hitting the fence or a car on Highway 551 (using ACRP Report 51 Fig 49).

Finally, to have more relevant data, we will also perform the risk analysis of the standard required 300-foot separation between runway centerline and taxiway centerline for a landing, which is the level of safety the AC 150/5300-13B sets for in a C-II airport:



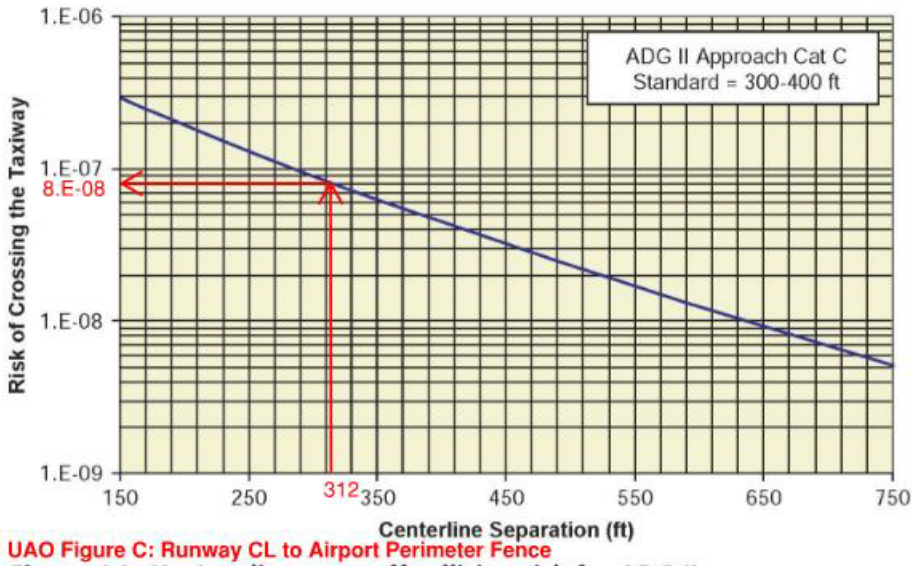
4. Ground Phase (Landing Rollout) where risk is veering off the runway into the taxiway (using ACRP Report 51 Fig 42).

This data will give us an example of an acceptable level of safety utilized in AC 150/5300-13B for a C-II airport.

5. Specific Analysis: Proposed MOS Option - No Change to Existing ROFA Conditions (312' Separation from Runway Centerline to Airport Fence)

The Perimeter Fence at the west side is located 312 feet from the runway centerline. The risks associated with leaving it there as a modification of standards, for each of the phases of flight are analyzed below:

1. Airborne Landing Phase Risk from Reduced ROFA – For a very conservative analysis we will assume that this includes all approach to landings, not just missed approaches. Using the separation of 312' and Figure AA-33 in Appendix A of ACRP Report #51, the following provides a risk level 6.0E-11 of occurrence per landing (which as an inverse, is one chance in a 16.7 trillion landings) that an aircraft gets 312' from the runway centerline. This can be seen in the figure below:



UAO Figure B: Runway CL to Airport Perimeter Fence

Figure AA-31. Missed approach collision risk for ADG II Cat I.

The current annual number of landing operations at UAO is approximately 45,115 or half of the 90,230 annual operations. As the risk is one incident in every 16.7 trillion landings, the time between occurrences is calculated as 16 trillion landings divided by 45,115 landing operations per year which equates to one incident every 369,000 years. Thus, this risk is of no significance.

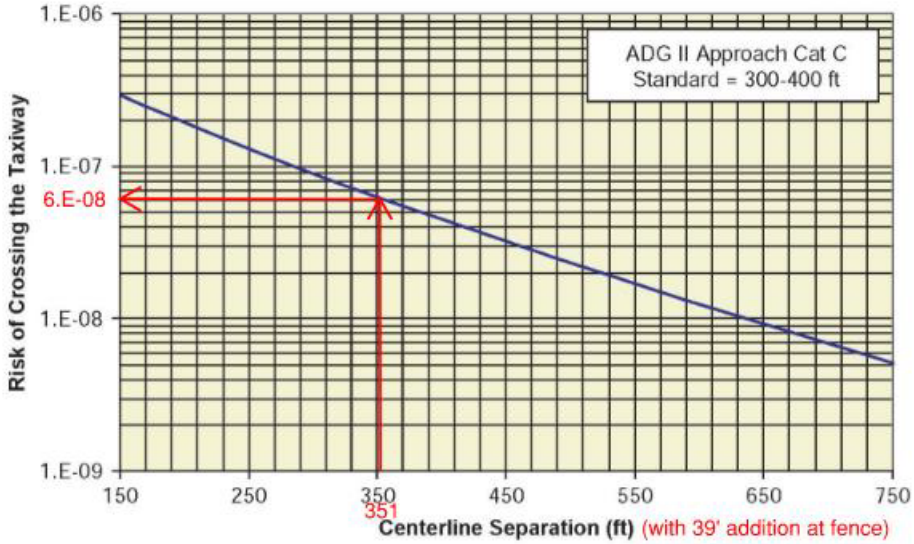
2. Landing Roll Phase Risk for Reduced ROFA - Using the separation of 312' and Figure AA-43 in Appendix A of ACRP Report #51, provides a risk level 8.0E-08 or in the inverse: one chance in 12.5 million landings. This can be seen in the figure below:

UAO Figure C: Runway CL to Airport Perimeter Fence

Figure AA-42. Landing veer-off collision risk for ADG II.

As the risk is one incident in every 12.5 million landings, the rate of occurrence is calculated as 12.5 million landings divided by 45,115 landings per year which equates to one incident every 277 years.

Using the ACRP described adjustment when the object is not another aircraft and half the C-II wingspan can be added to the clearance distance, results in a separation of 351' and Figure AA-43 in Appendix A of ACRP Report #51, provides a risk level 6.0E-08 or one chance in 16.7 million landings. This can be seen in the figure below:



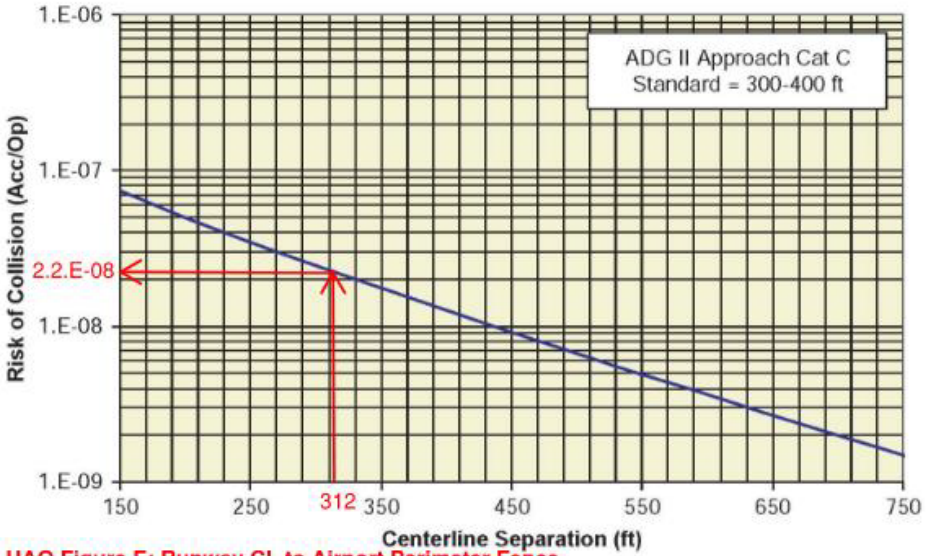


Figure AA-42. Landing veer-off collision risk for ADG II.
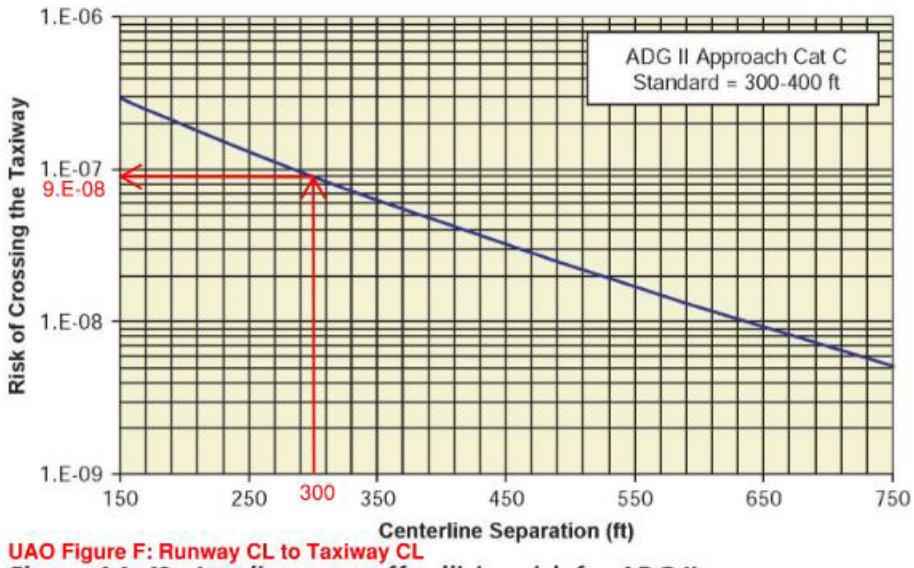
UAO Figure D: Runway CL to Airport Perimeter Fence Including Wingspan adjustment

As the risk is one incident in every 16.7 million landings, the rate of occurrence is calculated as 16.7 million landings divided by 45,115 landings per year which equates to one incident every 369 years.

3. Takeoff Roll Phase Risk for Reduced ROFA - Using the separation of 312' and Figure AA-49 in Appendix A of ACRP Report #51, provides a risk level 2.2E-08) or one chance in 45.5 million takeoffs. This can be seen in the figure below:



UAO Figure E: Runway CL to Airport Perimeter Fence
Figure AA-49. Takeoff veer-off collision risk for ADG II.

As the risk is one incident in every 45.5 million takeoffs, the rate of occurrence is calculated as 45.5 million takeoffs divided by 45,115 takeoffs per year which equates to one incident every 1,008) years.

Finally, as a test of the level of safety that AC 150/5300-13B considers acceptable we check what the predicted risk level is of the existing runway-taxiway separation considered appropriate[10] by FAA.

4. Landing Roll Phase Risk to Taxiway Consistent with Safety Standards of AC 150/5300-13B - Using the separation of 300' and Figure AA-43 in Appendix A of ACRP Report #51, provides a risk level 9.0E-08 or one chance in 11.1 million landings. This can be seen in the figure below:

UAO Figure F: Runway CL to Taxiway CL

Figure AA-42. Landing veer-off collision risk for ADG II.

As the risk is one incident in every 11.1 million landings, the rate of occurrence is calculated as 11.1 million landings divided by 45,115 landings per year which equates to one incident every 246 years.

[10] Note that Section 3-24 of Order 5100.38D Change 1 states that the FAA will not fund airport safety greater than that in the Airport Design standards, so the standard set by the runway-taxiway separation is a significant number. Order 5100.38D Change 1 can be downloaded for free at: https://www.faa.gov/documentLibrary/media/Order/AIP-Handbook-Order-5100-38D-Chg1.pdf

6. Conclusions

Considering the risk of each phase of flight, the risk of collision during the landing roll is the controlling factor. The Hazard Severity Classification for this type of operation would be major and the acceptable probability of occurrence is remote (1E-05) or less than once every 1-10 years. The following table summarizes the risk associated with each phase of flight:

Phase of Flight	Rate of Occurrence	Acceptable Level
Airborne Phase	Once every 369,000 years	Yes
Landing Roll Phase	Once every 277 years (or 369 years with calculation adjustment for fence object in lieu of wing object)	Yes
Takeoff Roll Phase	Once every 1,000 years	Yes

A runway to object separation of 312’ provides an acceptable level of safety as the controlling occurrence is once every 277 years (or 369 years with the adjustment for wingspan at the fence as allowed in the ACRP method). This is much less risk than the once per 100 years FAA standard shown in Table A-3 and results in a Category E “Extremely Improbable” occurrence. Further, per ACRP’s method, a wingtip to fence occurrence is considered by ACRP’s method to be a Table A-4 Minimal Severity occurrence. This combination via Figure A-1 concludes that the outcome as Low Risk.

Figure UAO F shows that the existing risk of occurrence between the existing runway and existing taxiway, which fully meets FAA standards, is one in every 246 years. This means that the risk to an occurrence at the taxiway, is much less (i.e. longer duration between events) than the FAA’s 100-year standard. The risk of collision with the perimeter fence is then even much less than that of a taxiway collision.

Finally, there is an incremental improvement option of ODAV and ODOT coming to an agreement to move the perimeter fence further west, to the east edge of the 12’ wide gravel shoulder, which would result in a 368-foot separation. If the 39.5-foot wing span correction is added at the new fence location, this results in an equivalent distance of 407 feet for use on Figure AA-42. That in turn would result in an ACRP predicted probability occurrence being once every 515 years, almost half the risk of a taxiway collision.

Given that the commercial use of aviation is itself only around 100 years old, these numbers of one predicted occurrence at the existing airport fence every 277 or 369 years, demonstrates the high level of safety that will be maintained at Aurora Airport with this MOS.

Given the regional and national importance of Aurora Airport for emergency medical, firefighting, and emergency power line moving, along with the use by local national corporations, using the MOS ensures the airport can continue to upgrade with safety improvements, and can continue to support the approximately 1,500 employees that rely on the airport for their livelihood.

This study shows definitively that the 2012 signing off on the Aurora Airport master plan and ALP with a modification of standards for the ROFA, by FAA and ODAV, was a reasonable and appropriate action to take. The same action should be taken for the current 2024 master plan work.

Author: Aron Faegre is an architect, civil engineer, physicist, and pilot who has been the lead planner and designer on over two hundred airport planning and development projects in Oregon, Washington, California, New York, and British Columbia over the past 35 years. He has a Master of Architecture from MIT and a Bachelor of Physics from Reed College.

ARON FAEGRE AND ASSOCIATES
AVIATION PLANNING AND DESIGN SERVICES FIRM PROFILE

Introduction

Aron Faegre and Associates is a multi-disciplinary firm with a special interest in performing planning and engineering for aviation projects. The principal of the firm, Aron Faegre, personally manages the firm's key projects and is an aviation planner, architect, civil engineer, and landscape architect. He is also an instrument rated commercial pilot.

Mr. Faegre's firm has completed aviation projects for the following clients:

- Oregon Department of Aviation
- Port of Walla Walla
- Quinault Indian Nation
- Horizon Air
- Southwest Airlines
- Columbia Helicopters
- Helicopter Transport Services
- Oregon Health Sciences University
- Kaiser Hospital
- Atlantic Aviation
- The Port of Portland
- Port of Columbia County Scappoose)
- The City of Portland
- City of Pendleton
- Washington State DOT
- Life Flight Network
- Van's Aircraft
- City of Newberg
- Transwestern Aviation
- Flightcraft PDX

Aviation Services

Aron Faegre & Associates provides consulting services on all aspects of aviation facilities design including:

- Airport Master Plans
- Maintenance Hangars and Shops
- Storage Hangars
- Terminals and Concourses
- Airport Layout Plans
- Runway Design
- Access Road Design
- Instrument Approach Drawings
- Apron Design
- Airport Economic Impact
- Noise Abatement Planning
- Environmental Assessment
- Fixed Base Operator Facilities
- Air Cargo Facilities
- Tenant Fit-up
- Obstruction Survey
- Taxiway Design
- Airport Security Design
- Aviation Land Use Planning
- Public-Private Partnerships

Aron Faegre, P.E, AIA is the principal of AFA, a multi-disciplinary planning and design firm. Mr. Faegre has a Master's Degree in Architecture from the Massachusetts Institute of Technology, during which he was also a National Science Foundation Fellow for three years. Mr. Faegre has a Bachelor's Degree in Physics from Reed College and has published research in scientific journals. He is licensed as a civil engineer, architect, and landscape architect. He is a commercial pilot with instrument rating. He also serves on the board of the Airway Science for Kids, an Oregon non-profit, where he also leads the TeenFlight program – where teams of 15 teenagers build an RV-12is aircraft, and then get to experience flying the airplane they built.

Re: Opposition Removal of HDSE Drain-field

Mr. Thomas,

Please enter into the record my fervent opposition to the proposed “Preferred Alternative” for the Aurora State Airport Master Plan, currently in development, to include and especially, opposition to the removal of HDSE’s Drain-field.

This alternative is diametrically opposed to Oregon Revised Statute 836.642, promoting development at Oregon’s rural airports, specifically in this case, Aurora State Airport. The plan calls for the destruction of many jobs and the taking of private property due to misguided planning, not required by the Federal Aviation Administration.

Private investors brought development and jobs to the airport at the invitation of the State of Oregon, now to be told the investment is not worthy of protection by the very agency charged to do so in the statute. Furthermore, the agency plans to destroy this investment while openly declaring the intent to

build new hangars in their places and then commercially lease those properties. This plan is as unfathomable as it is immoral.

Many of these properties are served by HDSE's state-of-the-art septic system which includes a drain field on the south end of the runway. The drain-field was installed with the knowledge and approval of ODAV and the FAA. HDSE has an easement in perpetuity as well as a valid lease that is in it's first of two, five-year extensions which began in August of 2024. (See Attached)

It is clear to us a different approach could achieve the much-needed safety improvement of a runway extension as was admitted to by the FAA's Tim House during the last Public Advisory Committee meeting. This approach would show progress toward C-II compliance rather than an "all or nothing" approach as called for in the proposed Preferred Alternative. This approach could include the modification of the drain-field to be brought into compliance with FAA standards for an allowed "utility" within the Runway Safety Area.

We are specifically asking for ODAV and its consultants to tap the brakes on this process so that a public, face-to-face, work-session type meeting could be held with all the PAC members, ODAV staff, their consultants as well as the FAA, and be open to the public. At this meeting, we could JOINTLY and FREELY discuss ideas and options with a common goal of developing a plan that does not destroy jobs and private property investment. We could work together in the spirit of ORS 836.642, 3(e) "… protect investment" rather than destroy it.

Sincerely,

Tony Helbling
President
HDSE Board of Directors

Re: Aurora State Airport Master Plan Proposed Preferred Alternative

Mr. Thomas,

Please enter this letter into the record for the Oregon Department of Aviation's (ODAV) proposed "Preferred Alternative" for the Aurora State Airport Master Plan. We support Director Sugahara's statement that ODAV is willing to modify its Preferred Alternative for the Aurora Airport Master Plan. We believe that it is important that ODAV do so, to enable the airport to continue to deliver significant tax benefits, family wage jobs, emergency resiliency and aeronautical innovation to the region and state. The current version of ODAV's proposed Preferred Alternative is inconsistent with these objectives.

ODAV is bound by ORS 836.640-642 which was developed by Business Oregon. That statute strongly encourages private investment at the Aurora Airport and commands ODAV to carry out that objective. Contrary to that statute, ODAV's proposed alternative contemplates ODAV taking by eminent domain the Aurora Airport front line aircraft hangars for which the owners have invested more than $200 million, created millions in tax revenue, more than 1000 good jobs and millions in directly and indirectly related tourist revenue for surrounding communities, with ORS 836.640-642 as the catalyst.

Against this backdrop, the "Preferred Alternative" anomalously designates areas that have been set aside in airport master plans for airport related development since 1976, as areas for ODAV acquisition instead of bringing them into the airport boundary established by ORS 836.640-642 for development for airport related uses and wipes out the front line hangars.

Both elements of the preferred alternative are misguided. Among other objectives for the Aurora Airport, ORS 836.642 requires ODAV to "Preserve investments [at the Aurora Airport] and the level of service provided by [the Aurora Airport]" and to "promote economic development" at Aurora "by creating family wage jobs, increasing local tax bases" through support of private aviation-related uses so that they may "develop and thrive." The preferred alternative is contrary to ORS 836.640-642 and expressly seeks to trade the private investment that the statute seeks to encourage and grow, for government condemnation and ownership.

Concerningly, ODAV's preferred alternative significantly gambles with the significant economic benefits that private investment at the airport has delivered, risking their continuation. The threat of ODAV condemnation, not to mention ODAV actually engaging in such litigation against those owners, presents an unacceptable risk of driving away not only those aircraft hangar owners, but also their businesses, jobs and related tax and tourist revenue. Once they are gone, the stigma of such ODAV action could make the airport and indeed any airport that ODAV manages, a private investment pariah for decades. Such a risk should not be taken where, as here, a state statute commands ODAV otherwise and there are alternatives.

It is respectfully submitted that the justification for the "preferred alternative" simply does not justify its deleterious effects. ODAV is on record stating that these harmful consequences only flow from ODAV's desire for a "vehicle service road" (VSR) and a new aircraft taxiway. But neither necessitates the preferred alternative.

Regarding the VSR, the 2012 master plan approved a VSR that has none of the Preferred Alternative's deleterious effects and does not carry a $200 million condemnation price tag. At worst, the 2012 VSR costs the state some pavement. Moreover, we are advised that the private aeronautical stakeholder owners have offered ODAV the land needed for the 2012 MP VSR free of charge. I am unaware of any reason for ODAV to not pursue that 2012 MP VSR and we can only see good reasons to do so.

I am further advised that there are alternatives for a new taxiway that ODAV has not explored. I understand that ODAV has not explored any such alternatives because it does not own the land needed for a taxiway to be located elsewhere. However, so far as I know this has never been an impediment previously to the development of the Aurora Airport and should not be an impediment now. Many features of the proposed alternative are now contemplated on land that ODAV does not own – including the taking of the frontline hangars. Even if ODAV had to acquire some private land for a new taxiway, ODAV should explore such alternatives having the least adverse impact on the continuation and growth of private aeronautical investment at the airport, not to mention a price tag well south of the $200 million under the Preferred Alternative. Finally, I am advised that ODAV simply does not "want" to extend the airport boundary to include the land that is now and has long been foreseen for airport-related development in the airport boundary. Such a justification if true, would obviously be contrary to ODAV's mission and responsibility to enable the Aurora Airport to grow with aviation-related uses.

I am frankly perplexed by these problems given the success of the airport and the commands of ORS 836.640-642. ODAV should be eager to develop a master plan that ensures the Aurora Airport's continued growth and success over the master plan's 20-year horizon. If these problems that risk sending the airport backwards by decades arise from a lack of meaningful airport stakeholder engagement in the development of the preferred alternative, then ODAV should meaningfully engage. But whatever the reason, we strongly encourage ODAV to dismiss the Preferred Alternative and to meet with the airport stakeholders and to explore a more normative and economically reasonable preferred alternative that is consistent with ORS 836.640-642.

Sincerely,

Tony Helbling

AURORA STATE AIRPORT
UTILITY EASEMENT

This utility easement agreement ("**Easement**") made and amended effective the 1st day of September, 2019, by and between **THE STATE OF OREGON** by and through the **OREGON DEPARTMENT OF AVIATION**, **Grantor**, and **HDSE SEWER SYSTEM OWNERS ASSOCIATION**, an Oregon nonprofit corporation, **Grantee** or the "**Association**" hereunder.

RECITALS

A. Grantor is the owner of the real property in Marion County, Oregon legally described in the attached Exhibit A (the "**Airport Property**"), which is commonly known as the Aurora State Airport in Marion County, Oregon.

B. Grantee is a sewer system association established pursuant to that Declaration of Protective Covenants, Conditions, Restrictions and Easements for the HDSE Sewer System records at Reel 2577 Page 69 of the Records of Marion County, Oregon, with sewer facilities located on a portion of the common element property of the Southend Corporate Airpark Condominium located adjacent to the Airport Property as well as other nearby private property, and which system serves property owned by members of the Association.

C. Grantee pays rent over the portion of the Airport Property that is the Easement Area (as defined below) pursuant to a lease of the Easement Area from Grantor, which rent is also consideration for this Easement, the sufficiency of which Grantor acknowledges.

GRANT OF EASEMENT

The Grantor does hereby grant and convey to the Grantee, its heirs, successors and assigns, (i) a nonexclusive, perpetual easement on, over, under and through the portion of the Airport Property that is legally described and depicted in Exhibit B, being the areas marked "Drainfield" and "Reserve Area" in the attached Exhibit B, and under sufficient area between the Drainfield area and Reserve Area for piping in its existing location and (together, the "**Easement Area**"), for the construction, operation, testing, maintenance, use and repair of an individual water-carried on-site sewage disposal system (the "**Drainfield**"), which easement is in gross and personal to Grantee and for the benefit of the members of Grantee, together with (ii) a nonexclusive, perpetual easement on, over and through

AURORA STATE AIRPORT
UTILITY EASEMENT

This utility easement agreement ("**Easement**") made and amended effective the 1st day of September, 2019, by and between **THE STATE OF OREGON** by and through the **OREGON DEPARTMENT OF AVIATION**, **Grantor**, and **HDSE SEWER SYSTEM OWNERS ASSOCIATION**, an Oregon nonprofit corporation, **Grantee** or the "**Association**" hereunder.

RECITALS

A. Grantor is the owner of the real property in Marion County, Oregon legally described in the attached Exhibit A (the "**Airport Property**"), which is commonly known as the Aurora State Airport in Marion County, Oregon.

B. Grantee is a sewer system association established pursuant to that Declaration of Protective Covenants, Conditions, Restrictions and Easements for the HDSE Sewer System records at Reel 2577 Page 69 of the Records of Marion County, Oregon, with sewer facilities located on a portion of the common element property of the Southend Corporate Airpark Condominium located adjacent to the Airport Property as well as other nearby private property, and which system serves property owned by members of the Association.

C. Grantee pays rent over the portion of the Airport Property that is the Easement Area (as defined below) pursuant to a lease of the Easement Area from Grantor, which rent is also consideration for this Easement, the sufficiency of which Grantor acknowledges.

GRANT OF EASEMENT

The Grantor does hereby grant and convey to the Grantee, its heirs, successors and assigns, (i) a nonexclusive, perpetual easement on, over, under and through the portion of the Airport Property that is legally described and depicted in Exhibit B, being the areas marked "Drainfield" and "Reserve Area" in the attached Exhibit B, and under sufficient area between the Drainfield area and Reserve Area for piping in its existing location and (together, the "**Easement Area**"), for the construction, operation, testing, maintenance, use and repair of an individual water-carried on-site sewage disposal system (the "**Drainfield**"), which easement is in gross and personal to Grantee and for the benefit of the members of Grantee, together with (ii) a nonexclusive, perpetual easement on, over and through

the Airport Property as necessary for access to the Easement Area for the permitted uses granted herein.

TERMS AND CONDITIONS

This agreement is subject to the following terms and conditions:

1. The easement described herein grants to the Grantee, and to its successors, assigns, authorized agents or contractors, the right to enter the Easement Area for operation, testing, construction, maintenance, evaluation and repair and replacement of the Drainfield. Grantee must provide reasonable advance notification to Grantor before entry onto the Airport Property to exercise Grantee's rights under this Easement Agreement, by calling contact telephone numbers:

a. State Airports Manager (503) 378-2523

b. State Airports Operation Specialist (503) 378-2521

The above contact information may be changed at any time by Grantor notifying Grantee of such, it being understood and agreed that the contact information shown above, and any revisions of the information, will be effective for notification to Grantor under this Easement Agreement at any time.

2. Grantee is responsible for obtaining all required permits and for payment of all associated fees in respect of the Drainfield. All facilities constructed after the date of this Easement A
vgreement will have to be placed to the depth below ground surface specified in approved Oregon Department of Environmental ("**DEQ**") permits for such installations in the Easement Area.

3. The Grantee is responsible for any needed repair or replacement of the Drainfield and for damage to said Easement Area by reason of any negligence, act or omission on the part of Grantee, its contractors, agents, members, directors, or officers.

4. Upon performing any construction, repair or maintenance in the Easement Area, Grantee will make reasonable efforts to return the site to its original or better condition.

5. No structure other than existing above-ground facilities and future above-ground facilities constructed or installed in accordance with approved DEQ permits for the Drainfield may be constructed on the Easement Area. This Easement Agreement does not grant or convey to the Grantee any right or title to the surface of the soil or land of the Easement Area or the Airport Property, other than expressly stated herein. Due to the Drainfield being located on the Aurora State Airport, any new construction that exceeds the upward elevation of ground level must be constructed in accordance with Oregon Administrative Rule Chapter 738, Division 70.

6. Grantor will have the right to use the Easement Area so long as its use does not unreasonably interfere with Grantee's permitted use and is not detrimental to the Drainfield system or contrary to laws and rules of governmental agencies applicable or related to the Drainfield system. Grantee will maintain in force during the duration of the Easement, liability insurance covering the operations of Grantee while accessing the Airport Property as permitted under this Easement

Agreement. Grantee will also conducts its activities under this Easement Agreement at Grantee's own risk, and will hold harmless and indemnify the State of Oregon, Department of Aviation, its agents, officers and employees form all damages, demands, suits or actions whatsoever resulting from or because of, any damage to property, injury, or death to or of any person(s) arising out of Grantee's negligent construction, operation, maintenance, repair, alteration, operation, control or use of the Easement Area and the Drainfield and access thereto over the Airport Property.

7. When Grantee no longer uses the Easement for the purposes described herein, it is the responsibility of the Grantee to notify Grantor of its intent to terminate this Easement and to record a termination of this Agreement in the Records of Marion County, Oregon. It is understood and agreed that upon such termination Grantor may require Grantee to remove from the Easement Area all of its facilities authorized hereunder. If Grantor so elects, Grantor shall provide notice thereof, and Grantee shall, at its own expense and within a reasonable time following receipt of written notification thereof from Grantor remove all such facilities.

IN WITNESS WHEREOF, the Grantor of this Easement Agreement has fixed its hand and seal the day and year first above written. As a state agency, it has caused its name to be signed and its seal, if any, affixed by an officer or other persons duly authorized to do so by designated authority of the Oregon Department of Aviation by duly adopted Sub delegation Order No SUB-16, dated March 18, 1999.

Exhibit B

STATE OF OREGON

AURORA STATE AIRPORT

NON-COMMERCIAL SITE LEASE

This **NON-COMMERCIAL SITE LEASE ("Lease")** is between the **State of Oregon acting by and through its Oregon Department of Aviation ("Aviation")** and **HDSE Sewer System Owners Association,** an Oregon nonprofit corporation ("Lessee") and is dated effective September 1, 2019.

The HDSE Sewer System operated and owned by Lessee is located on the adjacent common element land of the Southend Corporate Airpark Condominium and other adjacent private property; the sewer system Lessee owns and operates serves the members of Lessee.

Aviation and Lessee agree as **follows:**

1) PREMISES. Aviation, as owner of the Aurora State Airport, Marion County, Oregon hereby leases to Lessee and Lessee leases from Aviation the premises described in Exhibit A, comprised of a portion of the Aurora State Airport property of approximately **23,370** square feet for a Drainfield for the HDSE Sewer System and approximately **23,370** square feet for reserve area for the Drainfield and approximately **14,635** square feet for piping between the existing drainfield and the reserve area and to the HDSE private property in an area comprising 2.5 on either side of such piping (the **"Premises").** The Premises are located on Tax Lot 041W11A00800 and is shown as the areas marked "drainfield" and "reserve area" on the attached Exhibit A, which is included herein by this reference.

Aviation conveys to Lessee an access easement over, across and under the Aurora State Airport land for access to the Premises. The easement is subject to all the terms and conditions of this Lease except the easement is not used in the calculation of the Rent, as described in Section 7 below.

Lessee may use the Premises only for the purposes set forth in Section 10 below. Lessee's use of the Premises is nonexclusive, but Aviation will not permit any other uses of the Premises that materially interferes with Lessee's permitted use of the Premises. Lessee acknowledges that the Premises are part of the Aurora State Airport and agrees that its uses of and entry into the Premises are subject to the operations of the Aurora State Airport in the ordinary course.

2) TERM. The term of this Lease (the **"Base Term")** commenced September 1, 2019 (the **"Effective Date")** and ends August 30, 2024. Lessee's right of possession begins on the Effective Date and, if not reviewed as described in Section 4 below, ends upon expiration of the Base Term or upon earlier termination of the Lease hereunder. Upon expiration or termination of the Lease Lessee must surrender the Premises to Aviation in good condition and may be required to remove the Drainfield facilities, piping, or appurtenant underground equipment.

3) HOLDING OVER. If the Lease is not renewed under Section 4 below, any holding over after the expiration of the Base Term or, if the Lease is renewed pursuant to Section 4, after expiration or the renewal term, will constitute a month to month tenancy subject to the terms of this Lease, but at a monthly

rental rate to be determined by Aviation in its sole discretion. Holding over is subject to termination on 30 days written notice by Aviation.

4) OPTION TO RENEW. Lessee may renew this Lease by written notice to Aviation at least 120 days before the expiration of the then-current term for two additional terms of five years each, subject to the satisfaction of the following conditions:

a) Lessee must not be in default by the end of the term then in effect.

b) The Premises must be in safe and clean condition as determined by Aviation as described in OAR 738-015-0025 and the drainfield must be functioning as intended and in compliance with all applicable permits and laws. If the drainfield appears to be malfunctioning, Aviation may require Lessee to obtain an inspection by a certified inspector, at Lessee's expense, to verify the condition and functioning of the drainfield. Lessee shall correct any deficiencies as a condition of Lease renewal.

c) Lessee has given written notice to Aviation at least 120 days before the last day of the Base Term that Lessee has complied with requirements (a) and (b) of this section and intends to exercise Lessee's option to renew.

d) Lessee is willing to amend the Lease to include any modified or additional lease terms required by Aviation to conform the Lease to terms generally applicable to non-commercial site leases on state -owned airports then in effect.

e) Lessee is willing to agree to modifications in Rent due under the Lease that may be required under Oregon Administrative Rules, Chapter 738, Division 10, Schedule of Rates and Fees for State-Owner Airports.

5) ASSIGNMENT. This Lease is personal to Lessee and may not be assigned without the prior written approval of Aviation, which Aviation may grant, condition or withhold in its sole discretion. As a condition of granting approval of an assignment of this Lease, Aviation may require the assignee to enter into a new lease of the Premises.

6) SUBLEASING. Lessee may not sublease any portion of the Premises for any purpose.

7) RENT. Lessee shall pay to Aviation an initial annual rent of **$3,068.75 ($00.05 per square foot per year) ("Rent")** for its use and enjoyment of the Premises. The first year's Rent is payable not later than the Effective Date, and thereafter each year in advance and without notice, not later than the anniversary of the Effective Date. Aviation reserves the right to review and adjust the Rent as described in Oregon Administrative Rules, Chapter 738, Division 10, Schedule of Rates and Fees for State-Owner Airports for a non-commercial site lease. If Aviation adjusts the Rent, Aviation will notify Lessee not less than 60 days prior to the date upon which the adjusted Rent is due.

8) TAXES and LIENS.

a) The Premises are currently listed on the Marion County property tax rolls as state-owned property not subject to property tax assessment. Lessee acknowledges that the tax classification of the Premises may change as a result of the lease of the Premises to a taxable lessee. Lessee shall pay when due all

taxes, if any, levied against the Premises and on any improvements made or placed on the Premises, whether due to a change in the tax classification of the Premises, or otherwise. Lessee shall ensure that any taxable improvements are lawfully brought to the attention of the Marion County tax assessor. If the County sends a . tax statement directly to Aviation, Aviation shall provide a copy to Lessee along with a demand for payment of the taxes, if any, by Lessee. Lessee shall pay any such taxes in full within 30 days after receipt of demand and shall provide proof of payment to Aviation.

b) Lessee shall keep the Premises free of all liens and encumbrances.

c) If Lessee's use of the Premises incurs utility charges, Lessee will be responsible for the cost.

9) PENALTIES.

a) If any payment due under this Lease is not paid within 10 days after its due date, Lessee shall owe and shall pay to Aviation an administrative charge of 10 percent of the amount due per month. Failure to make full payment, including the administrative charge, within 30 days after the date the payment is due is a default. Imposition of an administrative charge on delinquent payments does not constitute a waiver of any of Aviation's rights to pursue its legal remedies under the law or as provided in this Lease.

b) If any check to Aviation for payment under this Lease is returned to Aviation by Lessee's bank unpaid for any cause, Lessee shall owe to Aviation a $50 fee in addition to the amount of the check and any administrative charge owed under the above paragraph. Amounts due Aviation are considered unpaid until Aviation receives payment from the bank.

10) PERMI1 ED USES. Lessee may use the Premises solely for the construction, maintenance, repair, use, operation, and replacement of an individual water-carried on-site sewage disposal system that serves the members of Lessee. Lessee shall install, maintain and repair the drainfield to Marion County standards and requirements and in compliance with all federal, state and local law. If there is any indication of Drainfield failure, Lessee shall immediately cease use of the drainfield until repairs are accomplished. Lessee may landscape the Premises, provided such landscaping is compatible with the Aurora State Airport and its environs. Lessee is required to mow and maintain the ground within the Premises' footprint to prevent the Premises from being an attractant for wildlife.

11) CONS 1'RUCTION OF IMPROVEMENTS. A drainfield of approximately 54,575 square feet has been constructed on the Premises in the location show on the attached Exhibit A and an additional 54,575 square feet was available for reserve in the future. Lessee may construct additional drainfield facilities in the area of the Premises so long as Lessee obtains all necessary county or state permits and approvals for construction of the drainfield, which will be constructed and maintained in accordance with plans approved during the local government and Department of Environmental Quality permit process. Aviation may require post of performance and payment bonds, letters of credit, or other security instruments to ensure Lessee's financial responsibility. Upon verification of completion of construction of any expansion of the drainfield, any security instrument held by Aviation will be released. Notice of all proposed construction or alteration must be submitted through Aviation to the Federal Aviation Administration on FAA Form 7460-1, "Notice of Proposed Construction or Alteration" as prescribed in Section 77.17 of the Federal Aviation Regulations. All construction or alteration must be completed in a good and workmanlike manner.

12) INDEMNIFICATION. Lessee shall conduct its activities under this Lease at Lessee's own risk, and shall hold harmless and indemnify the State of Oregon, Department of Aviation, its agents, officers and employees from all damages, demands, suits or actions whatsoever resulting from or because of, any damage to property, injury or death to any person(s) arising out of Lessee's negligent construction, maintenance, repair, alteration, operation, control or use of the Premises.

13) INSURANCE.

a) Liability Insurance. Lessee shall maintain in force during the term of this Lease commercial general liability insurance covering the Premises and operations of Lessee. Combined single limit for bodily injury and property damage must not be less than $1,000,000 per occurrence.

b) Additional Insured. The liability coverage must include the State of Oregon, the Oregon Department of Aviation, and their respective officers and employees as additional insureds. Coverage must be severable for all insureds or covered under cross liability of all insureds.

c) Certificate of Insurance. As evidence of the insurance coverage required under this agreement, Lessee shall furnish certificate(s) of insurance to aviation no later than the Effective Date. The certificate(s) must clearly show the State of Oregon, the Oregon Department of Aviation, and their respective officers and employees as additional insureds for the liability coverage required under this section, and must otherwise reflect compliance with the relevant terms of this section. The policies required in this section must be obtained from insurers with a Best's rating of not less than "A" or with approved Oregon surplus lines insurers.

d) Notice of Cancellation. There must be no cancellation of any insurance required under this section, or potential exhaustion of aggregate limits, without 30 days written notice from Lessee or its insurers to Aviation.

14) HAZARDOUS SUBSTANCES. Lessee shall not store or allow any hazardous substance as defined in OAR 738-005-0010 (67) or petroleum products to be released on the Premises or on Airport property other than that necessary for the conduct of Lessee's business. Lessee shall recycle petroleum products and dispose of hazardous substances in accordance with Oregon Department of Environmental Quality's rules and regulations, which are available to Lessee by contacting the Oregon Department of Environmental Quality. All costs associated with the use of hazardous substances or petroleum products, including costs of cleanup, removal, remediation, and compliance with federal, state and local environmental requirements, are the sole responsibility of lessee and Lessee shall indemnify and hold Aviation harmless from any costs, fees, penalties or other expense incurred by Aviation in connection with remediation of hazardous substances on the Premises. All hazardous substances and petroleum products must be used, handled, cleaned up, removed and remediated in accordance with federal, state and local requirements.

15) FIRE PREVENTION. Lessee shall exercise due and reasonable care and caution to prevent and control fires on the Premises. Lessee shall comply with all relevant state, county, and local fire laws, codes and rules. Local and state fire marshals may enter the Premises to determine compliance with fire prevention laws, codes and rules.

16) COMPLIANCE WITH LAW. Lessee shall comply with all laws, ordinances, rules and regulations promulgated by any lawful authority of the United States, the State of Oregon, or any municipal

subdivision having authority over or jurisdiction of the Premises, including safety, health, sanitary, fire, electrical and building codes, zoning and state and local comprehensive plans and criminal laws.

17) AIRPORT REGULATIONS. This Lease is subject to and Lessee shall comply with all existing and future FAA regulations and other regulations and administrative rules adopted by the State Aviation Board relating to matters under the jurisdiction of FAA or the Aviation Board. Lessee shall execute any amendment to the Lease required in order to conform the Lease to FAA or aviation regulations or rules.

18) PROTECTION OF THE AIRPORT'S IMAGINARY SURFACES. Aviation may take action it considers necessary to protect the Aurora State Airport's imaginary surfaces, as defined by Federal Aviation Regulations, Part 77, and Oregon Administrative Rules against obstructions, and may prevent Lessee from erecting or permitting to be erected any building or other structure on the Premises that, in the opinion of Aviation, would limit the usefulness of the Aurora State Airport or constitute a hazard to aircraft.

19) AVIATION'S RIGHT OF EN IRY. Aviation may enter onto the Premises at any time to ascertain compliance with the terms of this Lease.

20) MAINTENANCE OF AIRPORT. Aviation shall maintain the runways, public taxiways, and aircraft parking area at the Airport. Aviation retains sole authority to determine the methods and schedules by which any maintenance or necessary construction is to be performed. Aviation shall close the Airport whenever it deems it necessary for reasons of public safety or convenience. Aviation shall make a good faith effort to provide advance notice of Airport closures when possible, but no advance notice is required when closure of the Airport is due to weather, acts of God, or other unforeseen circumstances.

21) DEFAULT. The following are events of default:

a) Default in Rent. Failure of Lessee to pay any Rent or other charge within 60 days after it is due.

b) Default of other Covenants. Failure of Lessee to comply with any term or fulfill any obligation of this Lease other than the payment of rent or other charges within 30 days after written notice by aviation specifying the nature of the default with reasonable particularity. If the default is of such a nature that it cannot be completely remedied within the 30-day period, Lessee will not be in default if Lessee begins correction of the default within the 30-day period and thereafter proceeds with reasonable diligence and in good faith to effect the remedy as soon as practicable.

c) Bankruptcy. Lessee enters bankruptcy proceedings and the trustee in such proceedings fails to assume the Lease.

22) REMEDIES ON DEFAULT.

a) Termination. In the event of a default by Lessee, Aviation may terminate this Lease by giving written notice to Lessee. Aviation may reenter, take possession of the Premises and remove any persons or property by legal action or by self-help without liability for damages and without having accepted surrender. Even if the Lease is terminated by the election of Aviation or otherwise, Aviation is entitled to recover damages from Lessee for the default, as described in this Section.

b) Lessee's Improvements. Within 120 days after receiving written notice of termination from Aviation, Lessee must vacate the Premises, including removing any improvements constructed by Lessee on the Premises. The written notice of default from Aviation may require that Lessee cease certain operations being conducted on the Premises, while Lessee is removing the improvements.

c) Rent during Termination Period. Rent will accrue until the improvements and personal property of Lessee have been removed and the Premises restored to their original condition, or until a new lease for the Premises has been negotiated, whichever first occurs. Rental amounts may be abated at the option of Aviation, in proportion to the amount of activity that Lessee continues to carry out during the 120-day termination period. Failure to comply with the conditions in the termination notice will be cause for immediate termination of possession and Lessee shall abandon all improvements.

d) Lessee's Operations. Aviation may require in its written notice of default that Lessee cease its operations on the Premises while Lessee is removing its personal property and improvements. Failure to comply with such a condition in the termination notice will be cause for immediate termination of possession.

e) Reletting. Following reentry or abandonment, Aviation may relet the Premises and in so doing may make any suitable alterations to the Premises, or change the character or use of the Premises, But Aviation is not required to relet for any cause or any use or purpose other than that specified in this Lease or that Aviation may reasonably consider injurious to the Premises, or to any tenant that Aviation may reasonably consider objectionable. Aviation may relet all or part of the Premises, alone or in conjunction with other properties, for a term longer or shorter than the term of this Lease, upon any reasonable terms and conditions, including granting some rent-free occupancy or other rent concession.

f) Damages. In the event of termination or retaking possession of the Premises following Lessee's default, Aviation is entitled to recover immediately, without waiting until the due date of any future rent or until the date fixed for expiration of the Lease term, the following amounts as damages:

i) all rent prepaid by Lessee;

ii) the loss of rental income from the date of default until a new Lessee is, or with the exercise of reasonable efforts could have been, secured and paying rent; and

iii) the reasonable costs of reentry and reletting, including the cost of any cleanup, refurbishing, removal and storage of Lessee's property, or any other expenses occasioned by Lessee's default including any repair costs, attorney fees, and court costs.

g) Aviation's Authority to Cure Default. If Lessee fails to perform any obligation under this Lease, Aviation may do so after giving 30 days' written notice to Lessee. Lessee will have to reimburse on demand, with interest at the rate of 10 percent per annum from the date of expenditure by Aviation, all of Aviation's expenditures to correct the default. Aviation's cure under this subsection does not waive any other remedies available to Aviation because of the default.

h) Remedies Cumulative. The foregoing remedies are in addition to and do not exclude any other remedy available to Aviation under applicable law.

23) TERMINATION FOR AIRPORT DEVELOPMENT. If the State Aviation Board determines that the Premises are required by Aviation for Airport development in accordance with the Airport Master Plan and FAA-approved Airport Layout Plan, Aviation shall either offer an alternative site to Lessee, if available on the Aurora State Airport property or terminate the Lease upon 120 days written notice to Lessee. If no suitable alternative site is available, or Lessee chooses not to relocate within the 120-day period, this Lease may be terminated by either party. Upon termination, Lessee will vacate the Premises. No compensation is due for loss of renewal terms. Aviation shall prorate and return to Lessee any prepaid rent upon satisfactory vacation of the Premises.

24) TERMINATION FOR NECESSARY CLOSURE OF THE AIRPORT. If the State Aviation Board determines that it is necessary or advisable to abandon or close the Aurora State Airport due to the development of uncontrollable hazards to flight operations, lack of public use, prohibitive maintenance costs, legislative actions or other cause, Aviation may terminate this Lease on 120 days written notice to Lessee and compliance with Section 22.

25) ABOLITION OF DEPARTMENT OF AVIATION OR TRANSFER OF AIRPORT OWNERSHIP. If Aviation is replaced or abolished as a state agency, or the Aurora State Airport is transferred into other ownership, Aviation shall make a diligent effort as a condition of the transfer to secure in writing the transferee's prior assurance that the transferee, by acceptance of ownership of the Airport, assumes Aviation's responsibilities under terms and conditions of this Lease.

26) NO WARRANTY OF NON-IN I EREERENCE BY ENTITIES OUTSIDE AVIATION'S CONTROL. If the State Aviation Board determines that it is necessary or advisable to abandon or close the Airport due to the development of uncontrollable hazards to flight operations, lack of public use, prohibitive maintenance costs, legislative actions or other cause, Aviation may terminate this Lease by written notice to lessee.

27) ACCRUED RIGHTS. Any termination of this Lease or of rights and benefits under it is without prejudice to the obligations, liabilities or rights of any party already accrued prior to termination.

28) NOTICES.

a) Any notices required to be given under this Lease must be in writing and given by personal delivery, facsimile or deposit in the regular United States Mail postage prepaid. Any notice delivered by mail is deemed given three days after mailing is provided above. Any notice delivered by facsimile is deemed given when a confirmation of successful transmission is generated by the transmitting machine. To be effective against Aviation, facsimile transmission must be confirmed by telephone notice to an employee at the Department of Aviation at (503) 387-8689. Any communication or notice by personal delivery is deemed given when actually delivered. A party may designate a change of address by written notice to the other party.

b) Notices to Aviation must be directed to the following address, facsimile number and email:

Oregon Department of Aviation
3040 25th Street SE
Salem, OR 97302
Phone (503)378-4880
Fax: (503) 378-1688

Rent payments to be sent to:

Oregon Department of Transportation
Financial Services
3930 Fairview Industrial Drive SE, MS #1
Salem OR 97302-1166

Questions regarding the Lease may be directed to:

State Airports Manager
Attn: Matthew Maass, or successor
Phone: (503) 378-2521
Email: nnatthew.d.maass@aviation.state.or.us

Or ODA Airport Operations Specialist

Attn: John Wilson, or successor
Phone: (503) 378-2521
Email: john.p.wilson@aviation.state.orus

c) Notices to Lessee must be directed to the address and facsimile number, if any, provided on the signature page of this Lease.

29) COVENANTS. The covenants of this Lease are continuing covenants, and waiver, whether express or implied by Aviation or Lessee, of any breach of these covenants may not be deemed a waiver of subsequent breaches.

30) FUTURE AGREEMENTS. This Lease constitutes the entire contract between the parties other than that certain Easement between the parties affecting the Premises dated effective September 1, 2019. Any future agreement between the parties relative to this Lease is ineffective to modify or discharge the Lease, in whole or in part, unless it is in writing and executed with the same formalities as this instrument. Lessee, by signing below, hereby acknowledges reading this Lease, understanding it, and agreeing to be bound by its terms.

31) AVIATION'S RIGHT TO DEVELOP THE AIRPORT. Aviation reserves the right to further develop or improve the Airport in accordance with its duty to develop aviation within the state as dictated by the demands of air traffic and aviation safety.

32) SUBORDINATION TO FEDERAL-STATE, AGREEMENTS.

a) The terms of this Lease are subordinate to any existing or future agreement between Aviation and the United States relative to the operation or maintenance of the Aurora State Airport, the execution of which has been or may be required as a condition precedent to the receipt of federal funds for the development of the Aurora State Airport. Failure of Lessee to comply with any term of this Lease required by any existing or future agreement between Aviation and the United States is a default, following notice and opportunity to cure as set forth in Section 21(b) above.

b) During a time of war or national emergency, Aviation may lease the landing area or any part of it to the United States for military or other federal government purposes and, if this occurs, any term of this Lease that is inconsistent with any term in such a lease to the federal government is deemed to be suspended while such lease is in effect.

33) NO EXCLUSIVE RIGHT. Nothing in this Lease may be construed to grant or authorize the granting of an exclusive right forbidden by the FAA Airport Compliance Manual Order 5190.6B Chapter 8 (Exclusive Rights).

34) TIME. Time is of the essence for every term of this Lease.

35) AUTHORITY.

a) All powers and authority conferred upon lessee by this Lease are to be strictly construed, and no other power may be lawfully exercised by lessee without Aviation's prior written consent. Lessee has no any authority to act on behalf of Aviation, or to bind Aviation to any third party, contractually or otherwise, except as is expressly stated in this Lease.

b) The terms of this Lease may not be construed to make Lessee an officer, employee or agent of the State of Oregon or its Department of Aviation, as those terms are used in ORS 36.265.

c) The person executing this Lease on behalf of Lessee represents that he or she has the legal power, right, and actual authority to bind Lessee to the terms and conditions of this Lease.

d) The State Aviation Board, by duly-adopted Delegation Order No.1, dated October 12, 2000 has authorized the Director of the Department of Aviation to act in its behalf in approving and executing this Lease.

Subject: RE: Aurora State Airport Master Expansion Plan

Hi Mr. Johnson, thank you for your comments.

ODAV does not have any airspace authority or regulate how pilots operate their aircraft. Those are the responsibility of the FAA. However, our published noise abatement procedures do encourage traffic to turn over I-5 and avoid flying over neighboring communities such as Wilsonville. Helicopter Transport Services is not part of the Aurora State Airport, but we will pass on your message to them as well.

I appreciate you sending these comments and we will continue to work with our operators to fly neighborly and avoid noise sensitive areas in our community.

Thanks again,

Tony Beach

Aurora Airport Expansion
Noise Mitigation

Request that if the airport is allowed to lengthen the runway for larger aircraft, that those flights be limited to the I-5 freeway corridor. That steeper take-off angles be mandated. And that Wilsonville OR be designated a Noise Abatement Zone. Today, Helicopter Transport fly directly over our home in Wilsonville. Sometimes at low altitude but always in the late and early morning hours. Our windows shake and dogs bark in the neighborhood.

To be fair, you have already addressed this issue by requiring pilots of business jets to gain altitude quickly but still present noise pollution upon take-off and landing over town.. along with helicopter "red-eye" service.

The I-5 corridor won't eliminate noise but will help.

Mark Johnson
Wilsonville, OR

Dear ODAV c/o Alex Thomas,

As a member of the business aviation community who sees how vital Aurora is to big business in oregon, please register and record my urgent input for the Aurora Airport Master Plan that is underway not to consider the condemnation and destruction of any aircraft hangars. What we need is more hangars, not less hangars. GA is a boon to the economy and Biz Av is a productivity tool. The money in biz aviation right now in Oregon is at that airport. It's got the highest number of business jets and is so key to many customers. This is an airport to expand, not shrink.

Thank you
Cat Keller

Kenji,

We'd like to schedule a 20-minute zoom meeting with you this coming Tuesday or Wednesday to discuss KUAO. As you know, the aeronautical interests at the airport are justifiably quite concerned about the master plan alternatives and it has gotten the attention of national interests as well. We want to be sure that you understand the concerns and we would like to understand your thinking for advancing them. Please let me know what works. Thank you. All the best, Wendie

ODAV Form.pdf; FINAL 9.03.24 LTR TO ODAV.pdf;

Tony, Brandy, and Alex,

Please see the attached letter and forthcoming exhibits reflecting the comments of PAC Member Millar, TLM and AABC (collectively Millar) concerning the July 30, 2024, draft Aurora Airport Alternatives. Please include this letter and its exhibits in the record of the Aurora Airport Master Plan proceedings. Please confirm receipt. Please also note that due to the size of this transmission it will be coming in nine (9) parts. To summarize the attached and forthcoming transmittals with Millar's comments:

- **None** of ODAV's three "alternatives" for the airport are tenable, although Millar notes that Alternative 1B is the least bad and that Alternative 2 is completely devastating to aviation at the airport. Alternative 2 effectively condemns the airport with ODAV acquiring all or most of it so ODAV can essentially start over – costing taxpayers hundreds of millions of dollars to implement (dollars that do not exist and ODAV does not show otherwise), significant loss of tax revenue, loss of good jobs, loss area tourist revenue, loss of an extremely important state and regional natural disaster asset, all to gain some 27' of separation between the runway and Highway 551, when federal standards allow imperfect compliance with that standard, if ODAV merely asks. To aid ODAV in that regard, a fully supported "Modification to Standards" prepared by an airport professional is Exhibit B to Millar's submitted materials. There is little doubt that FAA will approve it. We note FAA approved such minimal imperfection when it approved the 2012 ALP. If "incremental progress" toward perfection is desired, Millar's Exhibit A alternative suggests merely working with ODOT to move the perimeter fence closer to the ODOT ROW.
- All ODAV alternatives spring from unsupported and, respectfully, unlawful assumptions – those incorrect assumptions unsurprisingly led to incorrect alternatives.
- Using assumptions that are supported by law and the only evidence, an alternative is possible that extends the runway, does not hold the runway extension hostage to finding the hundreds of millions of dollars that does not exist to move Highway 551 and in the process condemn numerous homes and businesses, does not require ODAV to "remove" all or mostly all of the 200 million dollar plus in aeronautical investment at the airport including business jet hangar space, Atlantic's FBO and Life Flight, Wilson Construction, Vans Aircraft, HTS (largest helicopter transport company in the world), Columbia Helicopters, etc.; does not "remove" the septic drainfields that the airport relies upon to function at all, does not feature an internal circulation road parallel and next to the active taxiway and runway, and does not require anyone to "move" the air traffic control tower. *See* Millar's Exhibit A, supported by the Exhibit B technical analysis.

- The airport boundary should be adjusted to include the only remaining undeveloped through the fence property (owned by TLM) so that property can reasonably be put to aeronautical use as it is has been planned to be used by all planning documents prepared by ODAV and adopted by the county since the adoption of the Aurora Airport 1976 master plan. As you know, TLM has arranged to provide electrical capacity on its property to support electric aircraft, which are the aircraft of the future. In the absence of including the TLM property in the airport boundary, ODAV's alternatives make no provision and there is no room for, the aeronautical innovation that all experts agree will land during the life of the forthcoming airport master plan.

We look forward to working with ODAV concerning a reset with reasonable alternatives like Exhibit A, for the airport. Regards, Wendie Kellington

EXH E HDSE drainfield expansion Geotech Study AronFA-2-01-110821-geor.pdf; EXH D Transportation Research Board - ACRP Report 51.pdf;

Tony, Brandy, and Alex,

Please see the attached letter and forthcoming exhibits reflecting the comments of PAC Member Millar, TLM and AABC (collectively Millar) concerning the July 30, 2024, draft Aurora Airport Alternatives. Please include this letter and its exhibits in the record of the Aurora Airport Master Plan proceedings. Please confirm receipt. Please also note that due to the size of this transmission it will be coming in nine (9) parts. To summarize the attached and forthcoming transmittals with Millar's comments:

- **None** of ODAV's three "alternatives" for the airport are tenable, although Millar notes that Alternative 1B is the least bad and that Alternative 2 is completely devastating to aviation at the airport. Alternative 2 effectively condemns the airport with ODAV acquiring all or most of it so ODAV can essentially start over – costing taxpayers hundreds of millions of dollars to implement (dollars that do not exist and ODAV does not show otherwise), significant loss of tax revenue, loss of good jobs, loss area tourist revenue, loss of an extremely important state and regional natural disaster asset, all to gain some 27' of separation between the runway and Highway 551, when federal standards allow imperfect compliance with that standard, if ODAV merely asks. To aid ODAV in that regard, a fully supported "Modification to Standards" prepared by an airport professional is Exhibit B to Millar's submitted materials. There is little doubt that FAA will approve it. We note FAA approved such minimal imperfection when it approved the 2012 ALP. If "incremental progress" toward perfection is desired, Millar's Exhibit A alternative suggests merely working with ODOT to move the perimeter fence closer to the ODOT ROW.
- All ODAV alternatives spring from unsupported and, respectfully, unlawful assumptions – those incorrect assumptions unsurprisingly led to incorrect alternatives.
- Using assumptions that are supported by law and the only evidence, an alternative is possible that extends the runway, does not hold the runway extension hostage to finding the hundreds of millions of dollars that does not exist to move Highway 551 and in the process condemn numerous homes and businesses, does not require ODAV to "remove" all or mostly all of the 200 million dollar plus in aeronautical investment at the airport including business jet hangar space, Atlantic's FBO and Life Flight, Wilson Construction, Vans Aircraft, HTS (largest helicopter transport company in the world), Columbia Helicopters, etc.; does not "remove" the septic drainfields that the airport relies upon to function at all, does not feature an internal circulation road parallel and next to the active taxiway and runway, and does not require anyone to "move" the air traffic control tower. *See* Millar's Exhibit A, supported by the Exhibit B technical analysis.

- The airport boundary should be adjusted to include the only remaining undeveloped through the fence property (owned by TLM) so that property can reasonably be put to aeronautical use as it is has been planned to be used by all planning documents prepared by ODAV and adopted by the county since the adoption of the Aurora Airport 1976 master plan. As you know, TLM has arranged to provide electrical capacity on its property to support electric aircraft, which are the aircraft of the future. In the absence of including the TLM property in the airport boundary, ODAV's alternatives make no provision and there is no room for, the aeronautical innovation that all experts agree will land during the life of the forthcoming airport master plan.

We look forward to working with ODAV concerning a reset with reasonable alternatives like Exhibit A, for the airport. Regards, Wendie Kellington

Tony, Brandy, and Alex,

This is the last transmittal of comments from PAC Member Millar, TLM and AABC (collectively Millar) concerning the July 30, 2024, draft Aurora Airport Alternatives. Due to the size of the transmission it came to you in nine (9) parts. We transmitted the following to you today:

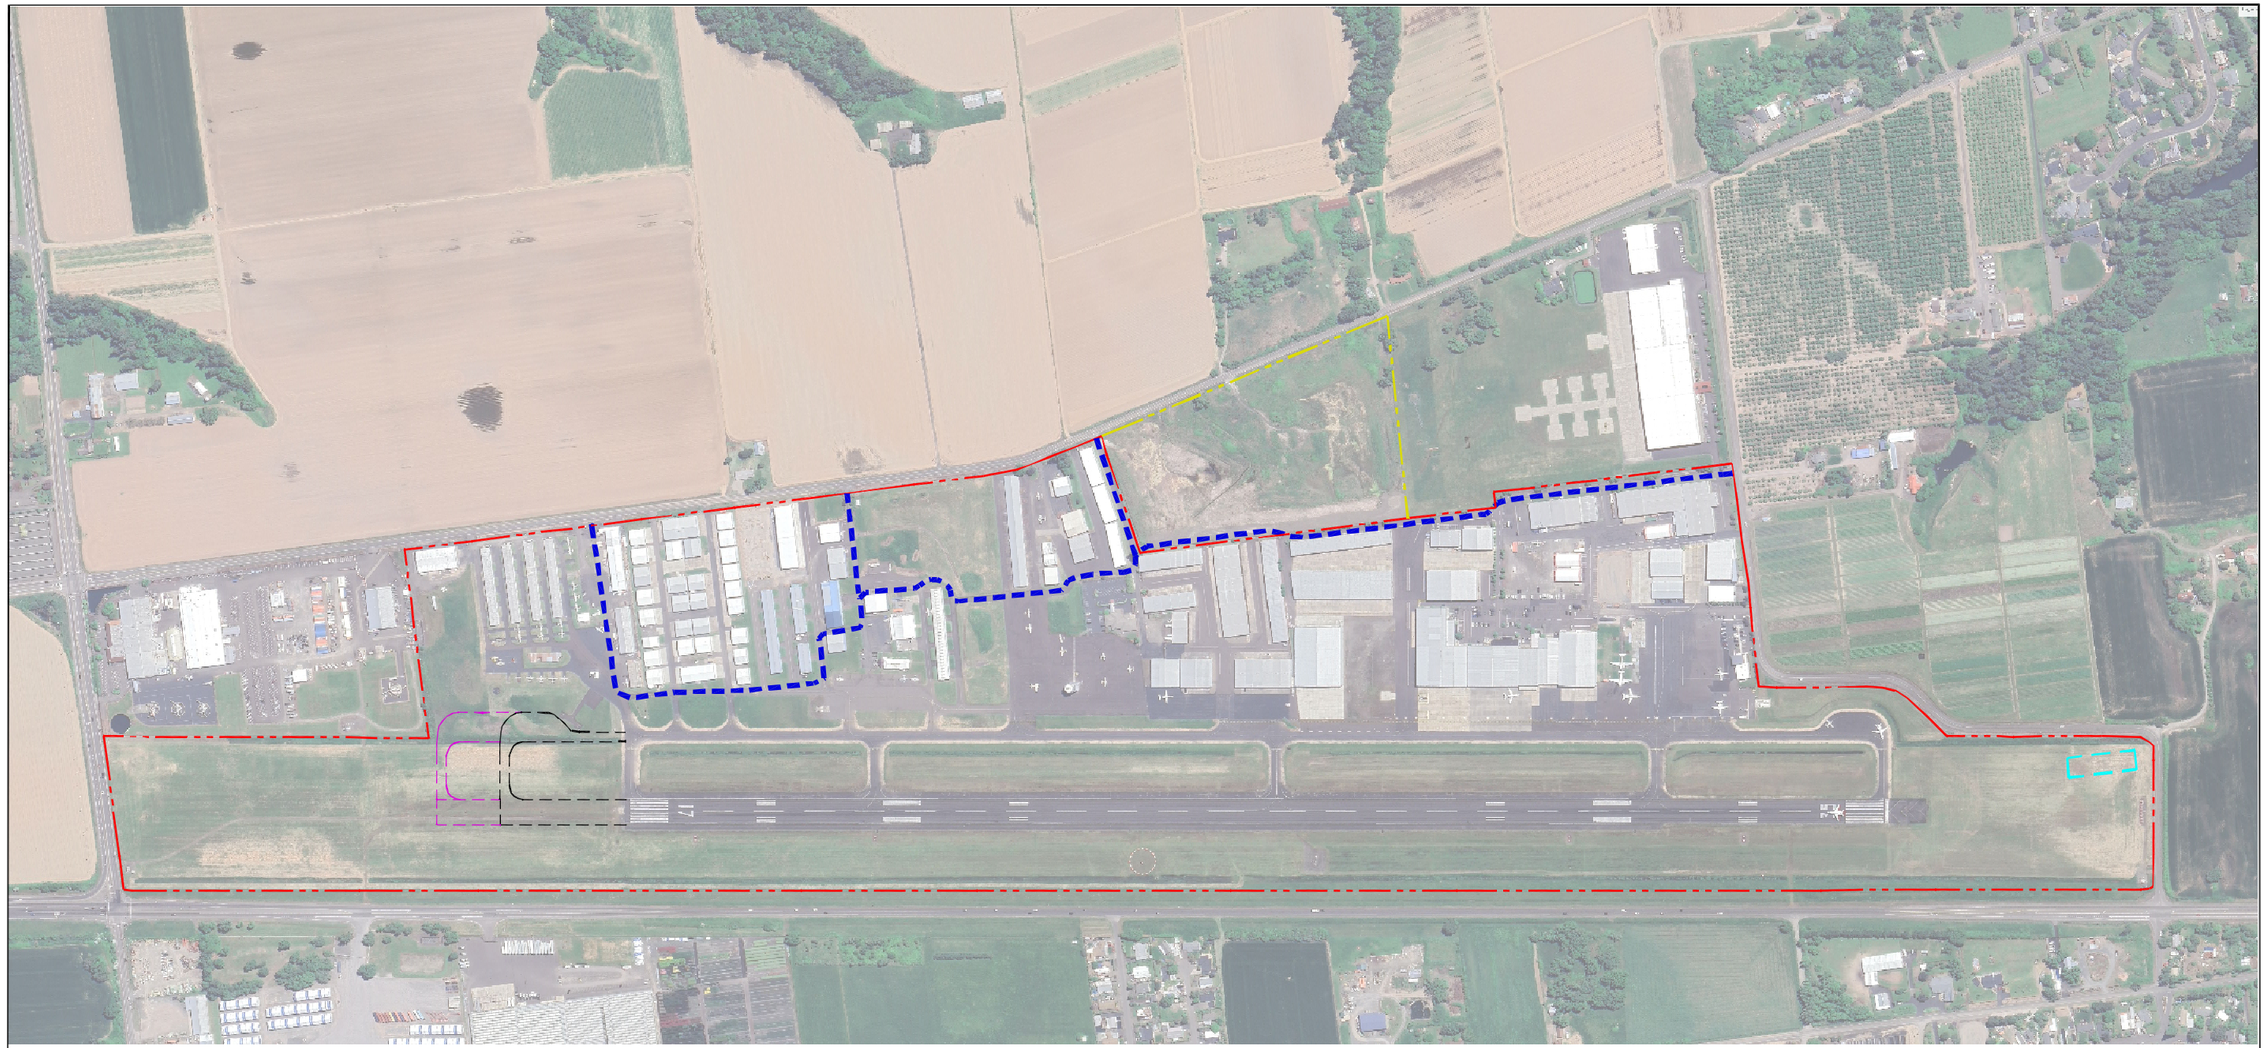
- The PAC Member form
- Letter
- Exhibits A-N

There are no further emails coming from this PAC member responding to the July 30, 2024, ODAV alternatives for the airport. Please note that email 5 of 9 transmitting Exhibits F-J was inadvertently named transmittal 4 of 9 rather than 5 of 9.

To summarize the attached and forthcoming transmittals with Millar's comments:

- **None** of ODAV's three "alternatives" for the airport are tenable, although Millar notes that Alternative 1B is the least bad and that Alternative 2 is completely devastating to aviation at the airport. Alternative 2 effectively condemns the airport with ODAV acquiring all or most of it so ODAV can essentially start over – costing taxpayers hundreds of millions of dollars to implement (dollars that do not exist and ODAV does not show otherwise), significant loss of tax revenue, loss of good jobs, loss area tourist revenue, loss of an extremely important state and regional natural disaster asset, all to gain some 27' of separation between the runway and Highway 551, when federal standards allow imperfect compliance with that standard, if ODAV merely asks. To aid ODAV in that regard, a fully supported "Modification to Standards" prepared by an airport professional is Exhibit B to Millar's submitted materials. There is little doubt that FAA will approve it. We note FAA approved such minimal imperfection when it approved the 2012 ALP. If "incremental progress" toward perfection is desired, Millar's Exhibit A alternative suggests merely working with ODOT to move the perimeter fence closer to the ODOT ROW.
- All ODAV alternatives spring from unsupported and, respectfully, unlawful assumptions – those incorrect assumptions unsurprisingly led to incorrect alternatives.
- Using assumptions that are supported by law and the only evidence, an alternative is possible that extends the runway, does not hold the runway extension hostage to finding the hundreds of millions of dollars that does not exist to move Highway 551 and in the process condemn numerous homes and businesses, does not require ODAV to "remove" all or mostly all of the 200 million dollar plus in aeronautical investment at the airport including business jet hangar space, Atlantic's FBO and Life Flight, Wilson Construction, Vans Aircraft, HTS (largest helicopter transport company in the world), Columbia Helicopters, etc.; does not "remove" the septic drainfields that the airport relies upon to function at all, does not feature an internal circulation road parallel and next to the active taxiway and

runway, and does not require anyone to "move" the air traffic control tower. *See* Millar's Exhibit A, supported by the Exhibit B technical analysis.



- The airport boundary should be adjusted to include the only remaining undeveloped through the fence property (owned by TLM) so that property can reasonably be put to aeronautical use as it is has been planned to be used by all planning documents prepared by ODAV and adopted by the county since the adoption of the Aurora Airport 1976 master plan. As you know, TLM has arranged to provide electrical capacity on its property to support electric aircraft, which are the aircraft of the future. In the absence of including the TLM property in the airport boundary, ODAV's alternatives make no provision and there is no room for, the aeronautical innovation that all experts agree will land during the life of the forthcoming airport master plan.

We look forward to working with ODAV concerning a reset with reasonable alternatives like Exhibit A, for the airport. Regards, Wendie Kellington

Aurora State Airport (UAO)
Proposed Modification of
Runway Object Free Area (ROFA) Design Standards

Prepared by: Aron Faegre, AIA, PE
Aron Faegre Airport Planning & Design

August 29, 2024

This memorandum provides an analysis and methodology by which a Modifications of FAA Airport Design Standards (MOS) at the Aurora State Airport (UAO), for the Runway Object Free Area (ROFA) can be justified as:

> "… resulting in an acceptable level of safety, useful life, lower costs, greater efficiency, or the need to accommodate an unusual local condition on a specific project through approval on a case-by-case basis." - FAA Order 5300.1G, page 1.

as defined and permitted under FAA Order 5300.1G Modifications to Agency Airport Design, Construction, and Equipment Standards[1].

1. BACKGROUND

The Aurora State Airport is surrounded by farm lands, near Aurora, Oregon, at the northern end of Marion County. It primarily serves aviation businesses involved with:

- emergency medical transport[2],
- aviation heavy-lift helicopter fire-fighting and power line construction companies (for which fixed wing aircraft are essential for support),[3]
- business jets for numerous major national corporations based within 10 miles,
- aircraft manufacturing for the S-LSA (Special Light-Sport Aircraft) and kit-build

[1] FAA Order 5300.1G Appendix A specifically gives FAA Office of Airport (ARP) and Region the authority to issue a MOS for Runway Object Free Areas. The Order can be downloaded at: https://www.faa.gov/documentLibrary/media/Order/order-5300-1G-modifications-to-standards.pdf .
[2] Regional headquarters for Life Flight Network, with bases all over Oregon, Washington, Idaho, Montana, and Nevada.
[3] Columbia Helicopters, Helicopter Transport Services, Wilson Construction, companies that work internationally with headquarters at Aurora Airport. The use of the Aurora Airport runway is essential to these companies for rapid providing of crews, equipment, and repairs to helicopters in active service of fighting fires, moving power lines, or doing rescue, relief, or humanitarian work.

industry[4], and

- other general aviation aircraft using the airfield for business, pilot training, and recreational flying.

There is no scheduled air service using the airport. The State of Oregon Department of Aviation (ODAV) owns, governs, and manages the public lands of the airport. Most of the business aircraft based at the airport access the runway via through-the-fence permits with ODAV.

Flights by based business jets, such as a Challenger 300, dictate that the Airport Reference Code is C-II. Due to the geometry of the existing site, the airport does not meet current FAA design standards for the ROFA, due primarily to adjacent Highway 551 to the west of the runway.

Most recently ODAV's planned solution[5] to meeting these standards ("Refined Preliminary Alternatives Summary", by Century West Engineering, dated July 31, 2024) is one of only two options:

- relocate the highway further west, (which involves acquiring both private residential and commercial properties further west), or
- relocate the runway, taxiway, and control tower east (which involves acquiring many acres of existing private property already developed with hangars, taxilanes, and aprons for aviation uses) and demolishing numerous large 40,000 square foot aviation hangars along the taxiway.

Both options have very high financial and environmental costs (probably in the greater than $100 million range), which would make them difficult to ever be implemented. If this master plan is approved as currently planned, and one of these options were not implemented, then ODAV and FAA have reported that the airport would only receive maintenance funding and no additional safety improvement funds. This would result in the airport not keeping pace with the aviation industry standards of safety. The second option (moving the runway, control tower, and demolishing hangars), If implemented, would in addition force closure of many of the major medical transport and fire-fighting facilities on the airport, and would put many of the airport's 1,500 employees out of jobs.

It is noted that in the 2012 Airport Layout Plan (ALP), approved (signed) by both ODAV and FAA, the airport also had the same Runway Design Code (RDC) status of C-II and

[4] Van's Aircraft www.vansaircraft.com the international leader in S-LSA produced aircraft.
[5] Refined Preliminary Alternatives Summary document dated July 31, 2024 by Century West Engineer can be downloaded at: https://publicproject.net/files/UAOAMP/uao-refined-preliminary-alternatives-summary-1-.pdf?d952c4adef .

listed a MOS as the solution to the non-standard ROFA limitation on the west property line. At that time there was consensus between ODAV and FAA that a MOS was a reasonable solution.

This memorandum provides the evidence to show that the 2012 ALP was a good approach to resolution of the ROFA, and that it can reasonably be continued. This report demonstrates that there is an acceptable level of safety through modifying the ROFA standard for the specific deviation to standards located on the west side of the runway.

FAA standards for different airports ROFA's vary from 250 foot width, to an 800 foot width, depending on aircraft type using the airport. As will be shown below, the primary reason justifying the modification is that the going from B-II to C-II category is just where the 500-foot required ROFA width changes to an 800-foot wide required ROFA - yet this is the same width required for all RDC category aircraft all the way to E-VI -Portland International Airport, San Francisco Airport, and every other international airport in the country. UAO will never have the larger size of aircraft those airports accommodate – Boeing 737's to Boeing 777's – so a slight reduction in width on the west side provides a level of safety appropriate for UAO, which will always serve only much smaller aircraft.

Modifications of standards for ROFA's are common at even large national airports. For example, recently several MOS were adopted at San Jose International Airport for deficiencies in the ROFA, as well as for runway-taxiway separations, and for runway object free areas[6]. It even appears that Portland International Airport (PDX) may have their airport perimeter fence, the shoulder of NE Marine Drive, and improper grading within the 400-feet area from runway centerline, at the northeast corner of the ROFA for Runway 10L.

This memorandum provides the detailed technical background and mathematically calculated justification, needed for the FAA and ODAV to again approve a MOS for the ROFA at Aurora State Airport.

2. MOS PROCESS

The process for gaining a modification of standards is provided in FAA AC 150/5300-13B Airport Design[7] in Section 2.8. It states, and we provide commentary after each paragraph as to acceptability:

[6] Norman Y. Mineta San Jose International Airport Runway Incursion Mitigation/Airfield Design Standards Analysis, November 27, 2017. Justification for ROFA modifications in this document were often simply the practical and cost issues of modifying major adjacent highways, similar to what is at issue in a much smaller Aurora Airport.
[7] FAA AC 150/5300-13B Airport Design Available free on line at:
https://www.faa.gov/documentLibrary/media/Advisory_Circular/AC-150-5300-13B-Airport-Design-Chg1.pdf

2.8 ***Modification of Standards.***

Site-specific conditions may make it impractical to meet all FAA design standards at an airport. The FAA considers, on a case-by-case basis, modifications to design standards that result in an acceptable level of safety and efficiency. Specific operational controls may be necessary to establish an acceptable level of safety for operation of aircraft at the airport. FAA Order 5300.1 establishes FAA policy for administering airport requests for modification of standards. See paragraphs 2.4 and 2.5.

This memorandum provides this information and finds that no specific operational controls are necessary, see comments on paragraph 2.4 below.

2.8.1 The FAA views an approved modification of standards as an interim measure intended to mitigate unique site-specific conditions. Unless the FAA explicitly states otherwise in the approval action, the FAA expects airports with approved modifications to pursue ways to meet design standards. This may occur incrementally over time or at such time it becomes practical to correct the non-standard condition.

The FAA and ODAV can work with Oregon Department of Transportation on master planning future revisions to State Highway 551 so that it can be corrected "at such time it becomes practical." Also, there are potential options where ODAV and ODOT could jointly agree to relocate the airport perimeter fence closer to Highway 551, which could be an "incrementally" established improvement.

2.8.2 The FAA will not consider any request to modify design standards associated with the following:

- *RSA dimensions*
- *OFZ dimensions*
- *Approach or departure surface dimensions*
- *Standards established within a regulation (e.g., stopway, clearway).*

The ROFA is not one of these.

2.8.3 An airport seeking FAA approval of modification to a design standard submits a request using the Modification of Standards application tool within the Airport Data and Information Portal (ADIP) at https://adip.faa.gov. The FAA relies on the following information, in part, to determine the acceptability of a modification to FAA design standards:

- *Information on the standard proposed for modification.*
- *Description of proposed modification and why the airport cannot meet standards.*
- *Statement addressing how modification will provide an acceptable level of safety, economy, durability, and workmanship.*
- *Listing of any special operational measures necessary to accommodate the modification.*

This document was prepared to provide the analysis needed for ODAV to submittal for the MOS per Section 2.4.

2.4 Addressing Non-standard Airport Conditions.

> *The FAA expects airport owners to address non-standard conditions through the airport planning process. The FAA acknowledges that conformance to current standards is not always practical. However, the FAA expects airports to continue to investigate mitigation measures, whether in one or multiple phases, and correct the non-standard conditions over time.*

It is important to re-emphasize the above statement, that the FAA here "acknowledges that conformance to current standards is not always practical." Further, per this paragraph, the current master planning activity is the appropriate place for this analysis and the formal establishment of a MOS for the ROFA. This report and analysis identifies intermediate steps that can be taken, such as relocating the airport perimeter fence, that will iteratively move the airport closer to compliance.

This analysis utilizes an FAA established safety analysis methodology to show that the MOS provides an acceptable level of safety. The study found no special measures needed to accommodate the modification.

3. METHODOLOGY

In 2011, the Transportation Research Board (TRB) released Airport Cooperative Research Program (ACRP) Report #51 – Risk Assessment Method to Support Modifications of Airfield Separation Standards. The ACRP is funded by the Federal Aviation Administration (FAA). Report #51 is used to support the ROFA MOS requested at Aurora State Airport.

The proposed ROFA MOS is modeled in this report in accordance with Appendix A – Risk Assessment Methodology of ACRP Report #51[8].

This report uses risk plots, along with the annual number of operations, to analyze the cumulative risks associated with Runway to Object Separations. The operations numbers at UAO are taken from the current draft Master Plan, and are numbers already approved by the FAA in a letter[9] to ODAV dated November 15, 2023 (corrected January 23, 2024). For sake of a conservative analysis, we are using the most distant forecast projects for the year 2041, which are:

- 90,231 total operations all RDC categories, of which
- 862 operations are of RDC C-II and D aircraft

[8] ACRP Report #51 – Risk Assessment Method to Support Modifications of Airfield Separation Standards is available free on line at: https://nap.nationalacademies.org/catalog/14501/risk-assessment-method-to-support-modification-of-airfield-separation-standards

[9] Federal Aviation Administration (FAA) Aurora (UAO Aviation Activity Forecast Approval Airport Improvement Program Grant Number 3-41-0004-022-2021 available at: https://publicproject.net/files/2024-01/Aurora-Airport/uao-forecast-approval-20231115-corrected-20240123.pdf?57af6c19b7

For operations involving the runway, per the methods of Report #51, the risk is analyzed based on three distinct phases of flight:

a. Landing - Airborne Phase
b. Landing - Ground Phase
c. Takeoff

The separation distance from the runway centerline to an object is used with the associated risk plot to calculate the risk of collision per operation.

The risk of collisions per operation is then analyzed along with the number of annual airport operations for the appropriate phase of flight to determine the predicted frequency of occurrence. The frequency of occurrence is used to determine the FAA likelihood level using Table A-3 from ACRP Report #51 which is shown below:

Table A-3. FAA likelihood levels (FAA, 2010).

	General	Airport Specific	ATC Operational	
			Per Facility	NAS-wide
Frequent A	Probability of occurrence per operation is equal to or greater than 1×10^{-3}	Expected to occur more than once per week or every 2,500 departures (4×10^{-4}), whichever occurs sooner	Expected to occur more than once per week	Expected to occur every 1–2 days
Probable B	Probability of occurrence per operation is less than 1×10^{-3}, but equal to or greater than 1×10^{-5}	Expected to occur about once every month or 250,000 departures (4×10^{-6}), whichever occurs sooner	Expected to occur about once every month	Expected to occur several times per month
Remote C	Probability of occurrence per operation is less than 1×10^{-5} but equal to or greater than 1×10^{-7}	Expected to occur about once every year or 2.5 million departures (4×10^{-7}), whichever occurs sooner	Expected to occur about once every 1–10 years	Expected to occur about once every few months
Extremely Remote D	Probability of occurrence per operation is less than 1×10^{-7} but equal to or greater than 1×10^{-9}	Expected to occur once every 10–100 years or 25 million departures (4×10^{-8}), whichever occurs sooner	Expected to occur about once every 10–100 years	Expected to occur about once every 3 years
Extremely Improbable E	Probability of occurrence per operation is less than 1×10^{-9}	Expected to occur less than once every 100 years	Expected to occur less than once every 100 years	Expected to occur less than once every 30 years

Note: Occurrence is defined per movement.

Source: ACRP Report #51

The key takeaway from Table A-3 is that for a specific airport, if the likelihood of incidence is less than once every 100 years it is considered a “Extremely Improbable” Class E occurrence.

A Hazard Severity Classification is then assigned based on the worst credible outcome of an incident. Since the ACRP method is based on wingtip separation, the report states that: “From the point of view of risk and based on the records of incidents and accidents,

the worst credible consequence expected for wingtip collisions of two taxiing aircraft is aircraft damage" (ACRP Report #51 page 19). A similar aircraft damage expectation would be a wingtip collision with the airport perimeter fence, which is the ROFA limitation examined in this report.

The Hazard Severity Classifications were determined in accordance with Table A-4 FAA Severity Definitions from ACRP Report #51 and are shown below:

Table A-4. FAA severity definitions (FAA, 2010).

Hazard Severity Classification				
Minimal 5	**Minor 4**	**Major 3**	**Hazardous 2**	**Catastrophic 1**
No damage to aircraft but minimal injury or discomfort of little consequence to passenger(s) or workers	- Minimal damage to aircraft; - Minor injury to passengers; - Minimal unplanned airport operations limitations (i.e. taxiway closure); - Minor incident involving the use of airport emergency procedures	- Major damage to aircraft and/or minor injury to passenger(s)/ worker(s); - Major unplanned disruption to airport operations; - Serious incident; - Deduction on the airport's ability to deal with adverse conditions	- Severe damage to aircraft and/or serious injury to passenger(s)/ worker(s); - Complete unplanned airport closure; - Major unplanned operations limitations (i.e. runway closure); - Major airport damage to equipment and facilities	- Complete loss of aircraft and/or facilities or fatal injury in passenger(s)/ worker(s); - Complete unplanned airport closure and destruction of critical facilities; - Airport facilities and equipment destroyed

Source: ACRP Report #51

Then, using both the FAA likelihood level and the Hazard Severity Classification the risk is then analyzed using Figure A-1 FAA Risk Matrix from ACRP Report #51, shown below:

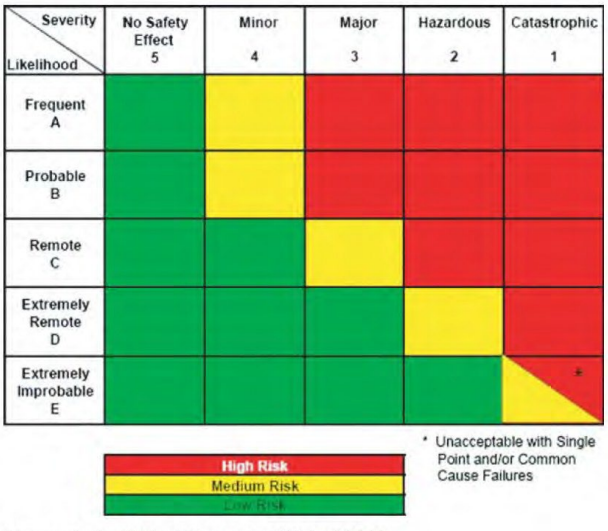

Figure A-1. FAA risk matrix (FAA, 2010).

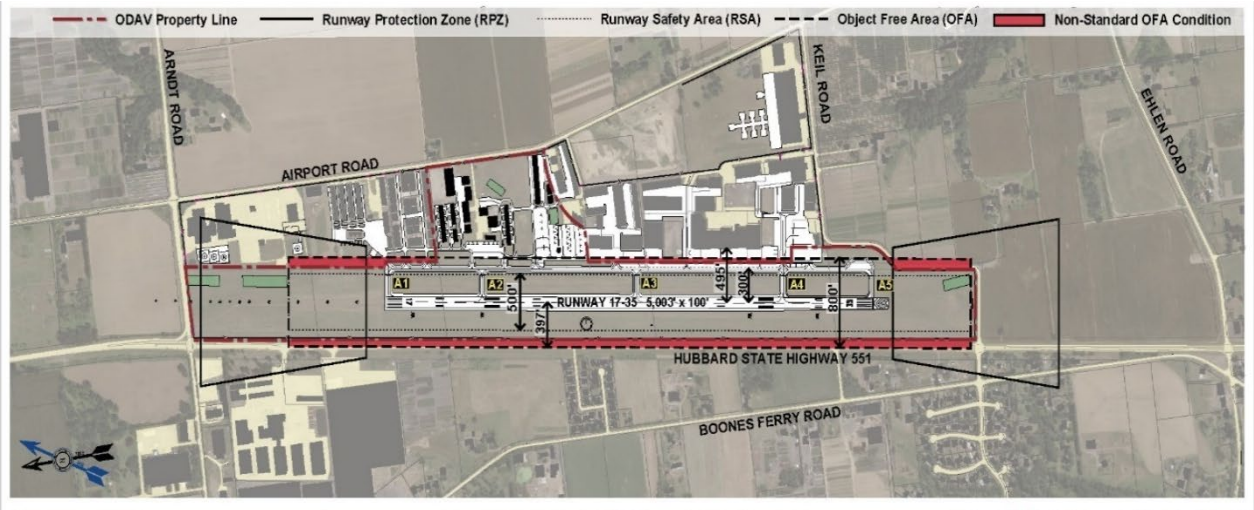
Source: ACRP Report #51



Based on Figure A-1 if the incident is Extremely Improbably (i.e. more than 100 years probability) the risk is considered “Low,” except for an incident considered catastrophic. We will use these graphs to evaluate the results from the detailed risk analysis of UAO below.

4. UAO ANALYSIS

In 2012 Master Plan and ALP established the UAO runway RDC, given existing based aircraft, as C-II, up from a B-II. The required ROFA width of a B-II runway is 500 feet centered on the runway. As it turns out, any runway of higher RDC than a B-II requires 800 feet in width. Thus, the UAO required C-II ROFA width is 800 feet centered on the runway. This 800-foot width is the standard used for aircraft ranging from a Challenger 300 business jet to the largest Boeing 777 or even the largest military aircraft. The 2012 approved ALP lists the ROFA deviation as a modification to standards, since the airport perimeter fence and Highway 551 were within the ROFA.

The UAO forecast of operations predicts that by the year 2041 there will be 90,230 annual operations at the airport, of which 862 would be an RDC above the B-II category. Thus, the 89,368 operations by B-II or lesser category clearly are operating well within ROFA safety standards, as the existing runway to road separations provide more than the 500-foot required width. It is just the 862 operations that need to be analyzed for ROFA safety relative to the required 800-foot width.

The deficiencies in the existing Runway OFA at UAO are shown in the Figure below:

UAO Figure A: Highway 551 Shown as ROFA Deviation Object
Source: Century West Engineers, Aurora State Airport Draft Airport Master Plan, Working Paper No. 1, Figure 2-15, November 2023 (Updated)

The current ROFA object deficiencies are:

d. Hubbard State Highway 551 for which the OFA penetrates 3 feet beyond the highway centerline. (368' to 377' clear width available from outer edge of highway gravel shoulder to Runway CL)
e. Perimeter Fence Inside OFA (312' clear width from Runway CL)

Potentially the airport fence could be relocated to the east edge of the 12-foot-wide gravel shoulder, since both the highway and the airport are owned by the State of Oregon. There can be an agreement between ODOT and ODAV to allow this. Relocating the fence in this way would result in a minimum width of the ROFA on the west side of the runway, to a 368-foot clearance - which would be only 32 feet out of conformance.

However, we will evaluate the ROFA for the existing conditions, and thus use the location of the airport perimeter fence as the maximum ROFA available at this time.

When analyzing the risk associated with a reduction in Runway OFA it is important to consider the purpose of the design standard. Paragraph 3.12 of Advisory Circular 150/5300-13B defines the ROFA but does not give detailed design rational behind the standard:

> *"ROFA is a clear area limited to equipment necessary for air and ground navigation, and provides wingtip protection in the event of an aircraft excursion from the runway"*

Appendix I, Paragraph I.8 of Advisory Circular 150/5300-13B provides the only available reference to the design rationale behind the Runway OFA width:

> *"The ROFA serves two principal purposes: 1. Development buffer in proximity to a runway, and 2. Wing clearance for a runway excursion event to the outer limit of the RSA. `*

Appendix I, in Section I.8.2, also clarifies that part of the "development buffer" intent is:

> *"Protection of the ROFA also reserves space for future development of a parallel taxiway that permits proper alignment of aircraft at a holding position on an entrance taxiway."*

However, for the given physical layout of UAO there can be no plan for a parallel taxiway on the west side of the runway, because of the location of Highway 551 and that there never can be hangars or other aviation uses on that side of the runway. Therefore, that leaves the only ROFA purpose for UAO as only "wingtip clearance for a runway excursion" which is precisely what this analysis provides.

Below we will analyze resolving the ROFA utilizing the risk analysis method of ACRP Report #51, for the case:

- No Change to existing ROFA conditions on West Side of Runway (Hwy 551 and Airport Perimeter Fence remain as existing) resulting in a 312-foot clearance to runway CL.

Per the methodology of ACRP Report 51, we analyze the risks for each of the takeoff and landing scenarios. For landing operations, the analysis is further divided into two parts: airborne (approach) phase and ground (landing rollout) phase. However, because the risk of veering off the runway during takeoff is so much less than for during landing, the methodology indicates that usually it is not necessary to evaluate takeoff option except if there are runways that only are used for takeoffs and not for landings. We will do that takeoff evaluation in any case, just to clearly determine what it is in the UAO context.

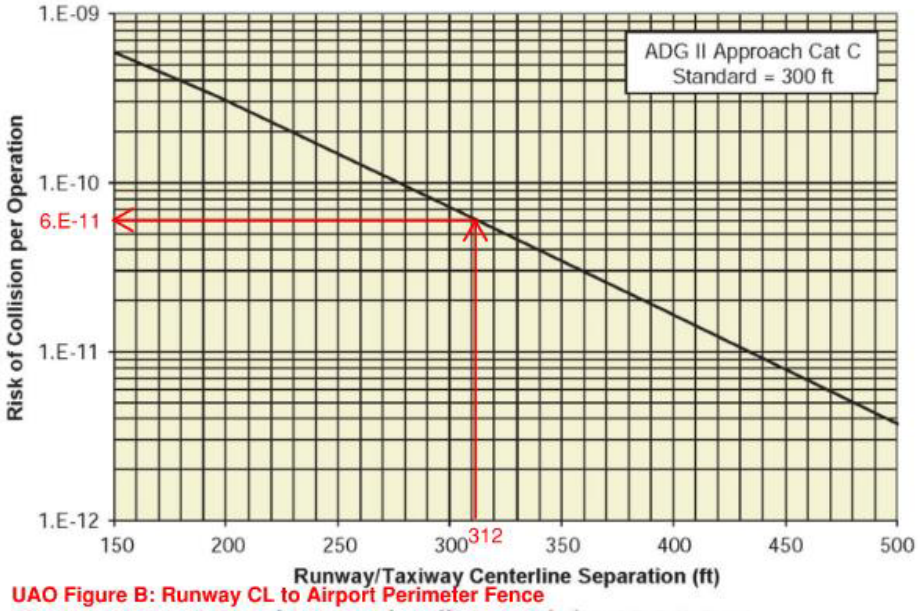
Since the existing runway to taxiway separation meets the current criteria for a C-II airport, for this study that analysis would seem unnecessary. However, we will include that option in this report because it provides a baseline of safety that the AC 150-5300-13B Airport Design Standards have determined is an acceptable and appropriate level of safety for a C-II airport.

Thus, for this UAO ROFA analysis separate risks are developed for each of:

1. Airborne Phase (Landing) is for instrument approaches which terminate the approach as a missed approach, and the risk is hitting another object such as hitting the airport perimeter fence or a vehicle on Highway 551 (using ACRP Report 51 Fig. 31); “the airborne risk is computed only for missed approaches” (ACRP Report 51, page 21).
2. Ground Phase (Landing Rollout) where risk is veering off the runway into the reduced width ROFA and hitting the fence or a car on Highway 551 (using ACRP Report 51 Fig 42). Figure 42 is based on the assumption that the risk is between the two wingtips of two aircraft, one aircraft on the edge of the runway and the other at the centerline of a taxiway. The ACRP makes clear that the x-axis distance on the Risk Figures are centerline of runway to centerline of taxiway because the risk is assumed aircraft to aircraft. However, the predicted risk is based on the wingtip-to-wingtip distance. When using the Risk Figures for objects (not aircraft) like a fence or road (which has no wings), half of the wingspan should be added to the distance to compensate for the wingtip-to-wingtip assumption. Thus, per Group II standards, the clearance distance used for Figure 42 should add half of 79 feet (equals 39.5 feet) of additional clearance, which would create a total of 351 feet to use in Fig. 42. The risk shown with the 312 feet and the 351 feet are each shown in figures.

3. Ground Phase (Takeoff) where risk is veering off the runway into the reduced width ROFA and hitting the fence or a car on Highway 551 (using ACRP Report 51 Fig 49).

Finally, to have more relevant data, we will also perform the risk analysis of the standard required 300-foot separation between runway centerline and taxiway centerline for a landing, which is the level of safety the AC 150/5300-13B sets for in a C-II airport:



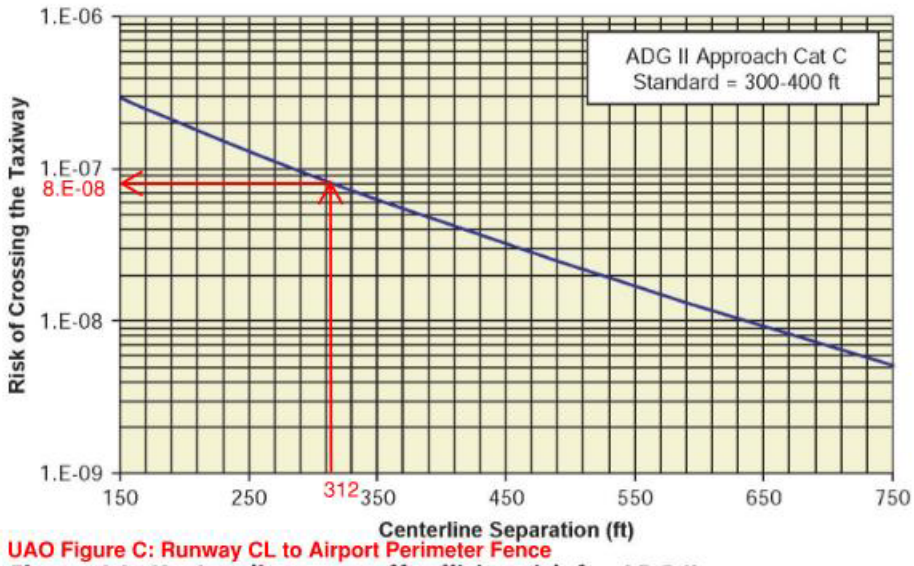
4. Ground Phase (Landing Rollout) where risk is veering off the runway into the taxiway (using ACRP Report 51 Fig 42).

This data will give us an example of an acceptable level of safety utilized in AC 150/5300-13B for a C-II airport.

5. Specific Analysis: Proposed MOS Option - No Change to Existing ROFA Conditions (312' Separation from Runway Centerline to Airport Fence)

The Perimeter Fence at the west side is located 312 feet from the runway centerline. The risks associated with leaving it there as a modification of standards, for each of the phases of flight are analyzed below:

1. Airborne Landing Phase Risk from Reduced ROFA – For a very conservative analysis we will assume that this includes all approach to landings, not just missed approaches. Using the separation of 312' and Figure AA-33 in Appendix A of ACRP Report #51, the following provides a risk level 6.0E-11 of occurrence per landing (which as an inverse, is one chance in a 16.7 trillion landings) that an aircraft gets 312' from the runway centerline. This can be seen in the figure below:



UAO Figure B: Runway CL to Airport Perimeter Fence

Figure AA-31. Missed approach collision risk for ADG II Cat I.

The current annual number of landing operations at UAO is approximately 45,115 or half of the 90,230 annual operations. As the risk is one incident in every 16.7 trillion landings, the time between occurrences is calculated as 16 trillion landings divided by 45,115 landing operations per year which equates to one incident every 369,000 years. Thus, this risk is of no significance.

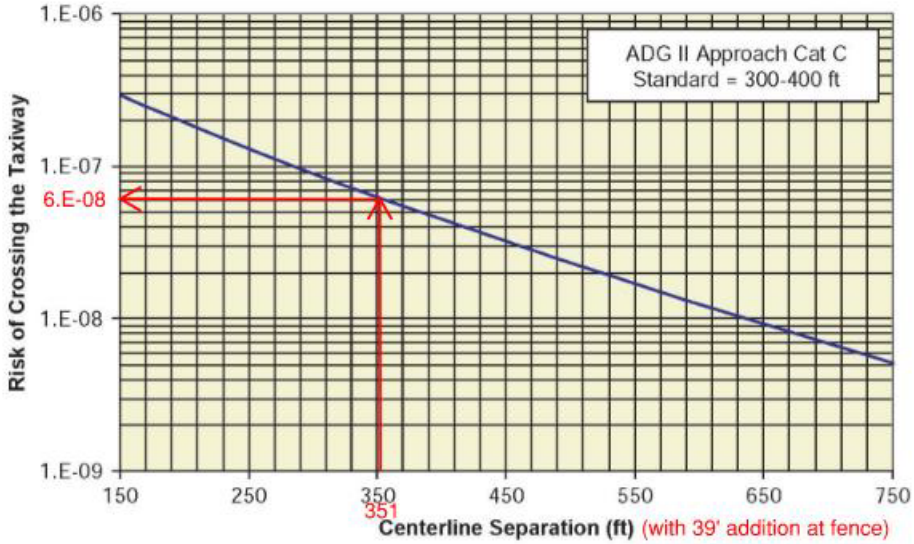
2. Landing Roll Phase Risk for Reduced ROFA - Using the separation of 312' and Figure AA-43 in Appendix A of ACRP Report #51, provides a risk level 8.0E-08 or in the inverse: one chance in 12.5 million landings. This can be seen in the figure below:

UAO Figure C: Runway CL to Airport Perimeter Fence

Figure AA-42. Landing veer-off collision risk for ADG II.

As the risk is one incident in every 12.5 million landings, the rate of occurrence is calculated as 12.5 million landings divided by 45,115 landings per year which equates to one incident every 277 years.

Using the ACRP described adjustment when the object is not another aircraft and half the C-II wingspan can be added to the clearance distance, results in a separation of 351' and Figure AA-43 in Appendix A of ACRP Report #51, provides a risk level 6.0E-08 or one chance in 16.7 million landings. This can be seen in the figure below:



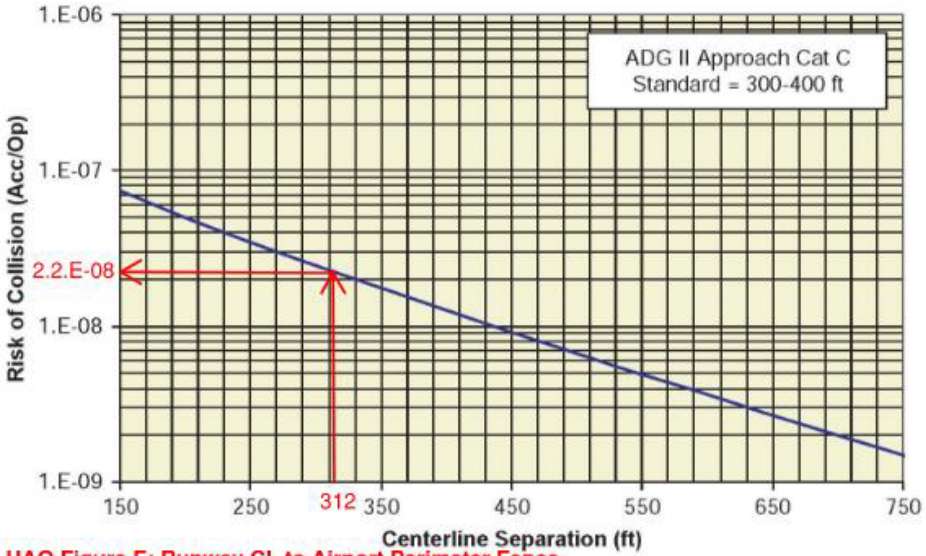


Figure AA-42. Landing veer-off collision risk for ADG II.
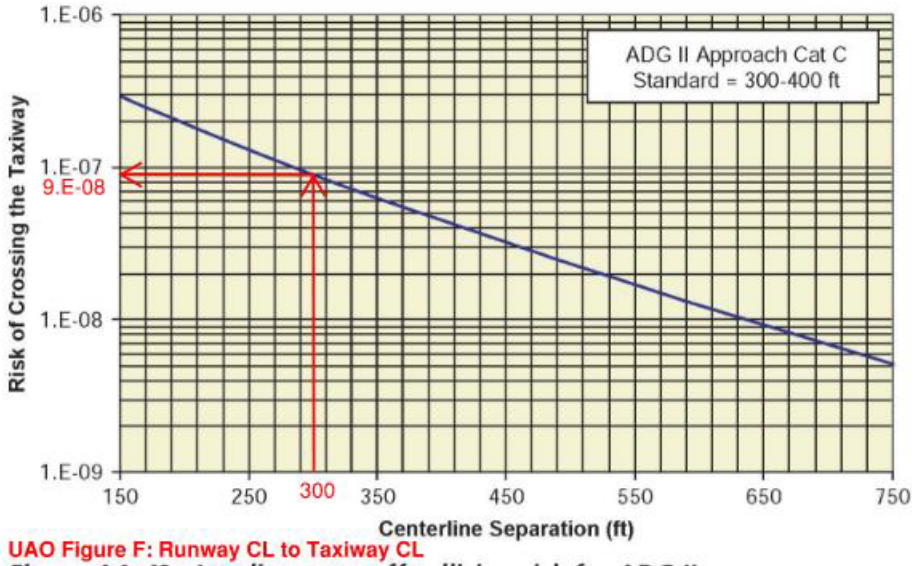
UAO Figure D: Runway CL to Airport Perimeter Fence Including Wingspan adjustment

As the risk is one incident in every 16.7 million landings, the rate of occurrence is calculated as 16.7 million landings divided by 45,115 landings per year which equates to one incident every 369 years.

3. Takeoff Roll Phase Risk for Reduced ROFA - Using the separation of 312' and Figure AA-49 in Appendix A of ACRP Report #51, provides a risk level 2.2E-08) or one chance in 45.5 million takeoffs. This can be seen in the figure below:



UAO Figure E: Runway CL to Airport Perimeter Fence
Figure AA-49. Takeoff veer-off collision risk for ADG II.

As the risk is one incident in every 45.5 million takeoffs, the rate of occurrence is calculated as 45.5 million takeoffs divided by 45,115 takeoffs per year which equates to one incident every 1,008) years.

Finally, as a test of the level of safety that AC 150/5300-13B considers acceptable we check what the predicted risk level is of the existing runway-taxiway separation considered appropriate[10] by FAA.

4. Landing Roll Phase Risk to Taxiway Consistent with Safety Standards of AC 150/5300-13B - Using the separation of 300' and Figure AA-43 in Appendix A of ACRP Report #51, provides a risk level 9.0E-08 or one chance in 11.1 million landings. This can be seen in the figure below:

UAO Figure F: Runway CL to Taxiway CL

Figure AA-42. Landing veer-off collision risk for ADG II.

As the risk is one incident in every 11.1 million landings, the rate of occurrence is calculated as 11.1 million landings divided by 45,115 landings per year which equates to one incident every 246 years.

[10] Note that Section 3-24 of Order 5100.38D Change 1 states that the FAA will not fund airport safety greater than that in the Airport Design standards, so the standard set by the runway-taxiway separation is a significant number. Order 5100.38D Change 1 can be downloaded for free at: https://www.faa.gov/documentLibrary/media/Order/AIP-Handbook-Order-5100-38D-Chg1.pdf

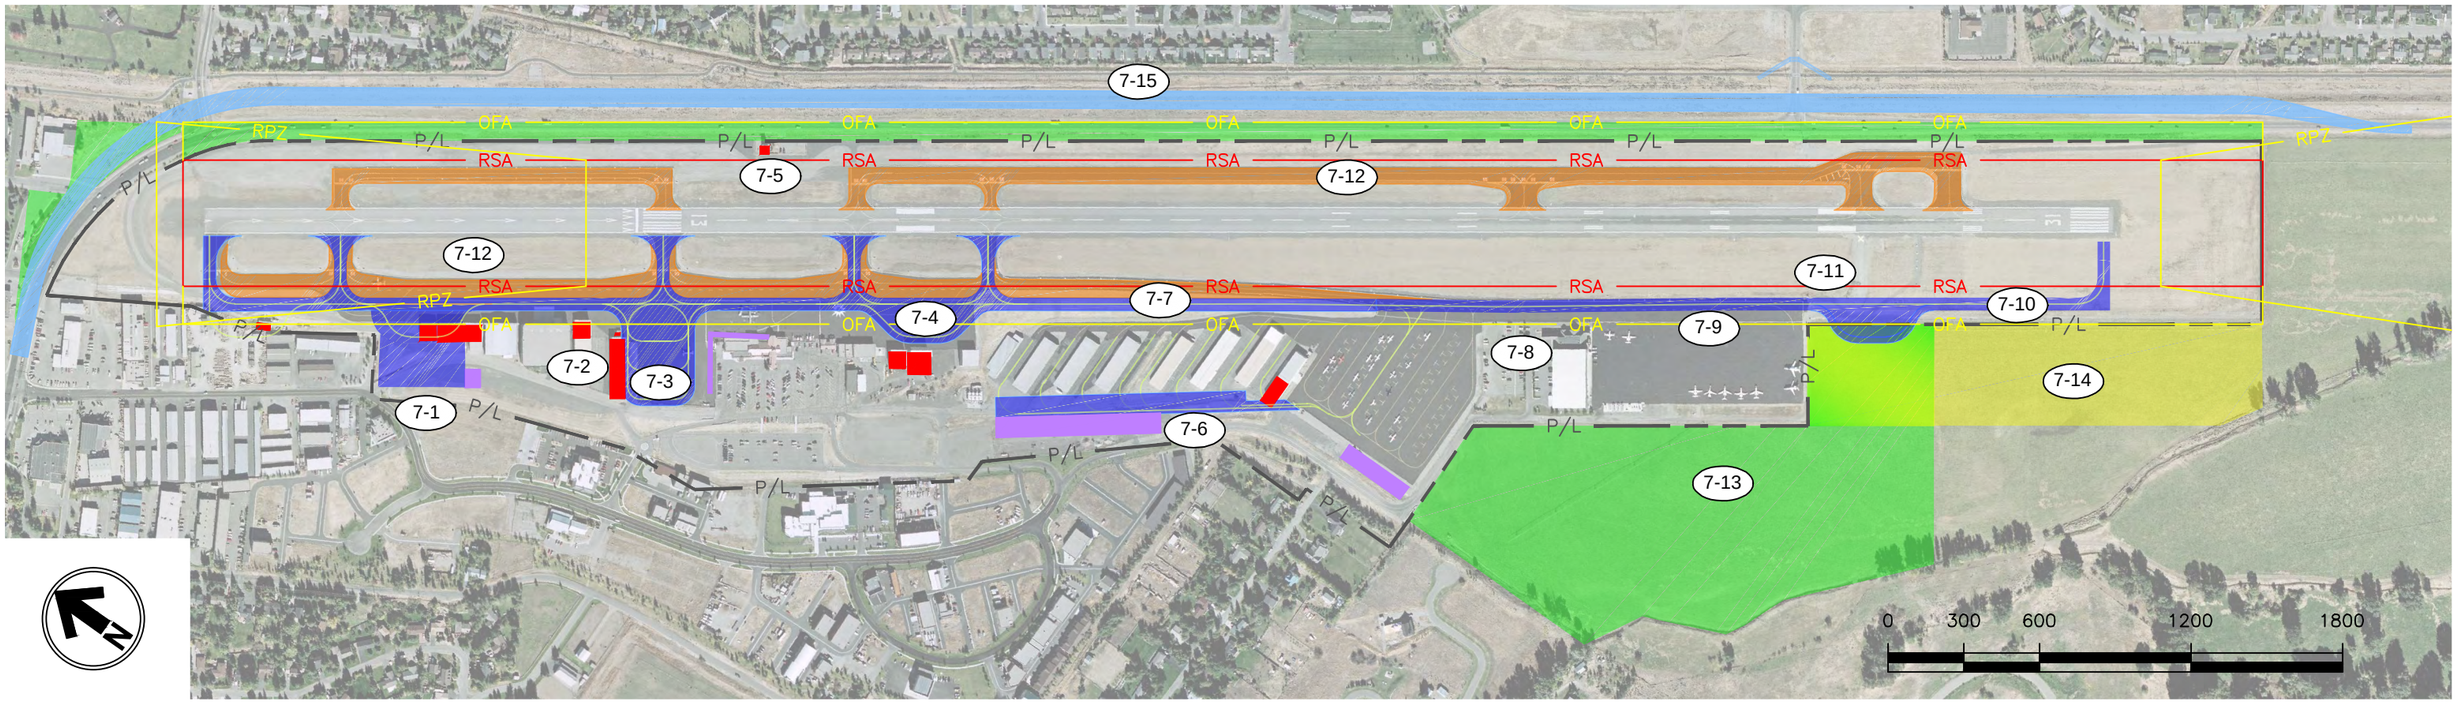
6. Conclusions

Considering the risk of each phase of flight, the risk of collision during the landing roll is the controlling factor. The Hazard Severity Classification for this type of operation would be major and the acceptable probability of occurrence is remote (1E-05) or less than once every 1-10 years. The following table summarizes the risk associated with each phase of flight:

Phase of Flight	Rate of Occurrence	Acceptable Level
Airborne Phase	Once every 369,000 years	Yes
Landing Roll Phase	Once every 277 years (or 369 years with calculation adjustment for fence object in lieu of wing object)	Yes
Takeoff Roll Phase	Once every 1,000 years	Yes

A runway to object separation of 312’ provides an acceptable level of safety as the controlling occurrence is once every 277 years (or 369 years with the adjustment for wingspan at the fence as allowed in the ACRP method). This is much less risk than the once per 100 years FAA standard shown in Table A-3 and results in a Category E “Extremely Improbable” occurrence. Further, per ACRP’s method, a wingtip to fence occurrence is considered by ACRP’s method to be a Table A-4 Minimal Severity occurrence. This combination via Figure A-1 concludes that the outcome as Low Risk.

Figure UAO F shows that the existing risk of occurrence between the existing runway and existing taxiway, which fully meets FAA standards, is one in every 246 years. This means that the risk to an occurrence at the taxiway, is much less (i.e. longer duration between events) than the FAA’s 100-year standard. The risk of collision with the perimeter fence is then even much less than that of a taxiway collision.



Finally, there is an incremental improvement option of ODAV and ODOT coming to an agreement to move the perimeter fence further west, to the east edge of the 12’ wide gravel shoulder, which would result in a 368-foot separation. If the 39.5-foot wing span correction is added at the new fence location, this results in an equivalent distance of 407 feet for use on Figure AA-42. That in turn would result in an ACRP predicted probability occurrence being once every 515 years, almost half the risk of a taxiway collision.

Given that the commercial use of aviation is itself only around 100 years old, these numbers of one predicted occurrence at the existing airport fence every 277 or 369 years, demonstrates the high level of safety that will be maintained at Aurora Airport with this MOS.

Given the regional and national importance of Aurora Airport for emergency medical, firefighting, and emergency power line moving, along with the use by local national corporations, using the MOS ensures the airport can continue to upgrade with safety improvements, and can continue to support the approximately 1,500 employees that rely on the airport for their livelihood.

This study shows definitively that the 2012 signing off on the Aurora Airport master plan and ALP with a modification of standards for the ROFA, by FAA and ODAV, was a reasonable and appropriate action to take. The same action should be taken for the current 2024 master plan work.

- NEW BUILDING / HANGAR / STRUCTURE AREA
- BUILDING / HANGAR / STRUCTURE REMOVAL
- NEW LAND ACQUISITION - OPTION A
- NEW LAND ACQUISITION - OPTION B
- RELOCATED HIGHWAY

NOTES

1. PROPERTY ACQUISITION SHOWN REFLECTS AN ASSUMED PARCEL FOR ACQUISITION. ALTERNATE CONFIGURATION MAY BE PREFERABLE TO LANDOWNER.

EXHIBIT 5-7
ALTERNATIVE 7 - MODEST LAND ACQUISITION

Table 5-7 – Alternative 7 – Modest Expansion

RDC C-III ≥1 Mile	MEETS STANDARDS?	DISPOSITION/COMMENTS
RUNWAY PROTECTION STANDARDS		
Runway Safety Area (RSA)	Yes	• Meets RSA grading and dimensional standards. Dimensional standards met with the removal of Taxiway A on the east side and relocation of Taxiway B on the west side.
Runway Object Free Area (OFA) – dimensional standards Runway Object Free Area (OFA) – grading standards Taxiway Object Free Area (TOFA)	Yes No – MOS Required No – MOS Required	• Relocation of Highway 75 and bike path to the east provides for a fully compliant OFA. • Requires the acquisition of 15 acres of land to relocate Highway 75 and bike path Right-of-Ways (ROW). • Requires removal and relocation of Air Traffic Control Tower (ATCT). • MOS for runway OFA grading and aircraft specific TOFA.
Object Free Zone (OFZ)	Yes	• Provides fully compliant OFZ
Runway Protection Zone (RPZ)	No	• Portions of Highway 75 remain in RPZ on both ends (may be allowable with FAA approval). • Land acquisition required to accommodate RPZ on Runway 31 end.
SEPARATION STANDARDS		
Centerline to Holdline(s)	Yes	• Fully compliant at 250 feet
Centerline to Parallel Taxiway	No – MOS Required	• Taxiway A – Removed. 320-330 foot runway to Taxiway B centerline – Requires MOS.
Centerline to Aircraft Parking	No – MOS Required	• Requires MOS. Existing separation 400 feet – standard is 500 feet.
MAJOR ENVIRONMENTAL CONSIDERATIONS		
Compatible Land Use Wetlands	N/A	• 41 acres of land acquisition, including the acquisition of some ranch land and land for Highway 75 ROW may have adverse environmental impacts based on these impact categories.
OTHER		
Compliance and Infrastructure	N/A	• Requires the use of MOS. Results in loss of current hangars, aircraft parking and snow storage. Replacement of lost facilities can be recovered on acquired land.
Schedule (including planning/ environmental/land acquisition/construction)	N/A	**Maximum** 3 years (2013-2015). **MUST BE IMPLEMENTED IMMEDIATELY TO MEET RSA DEADLINE.**
COST ESTIMATE		**$59,500,000**

APPENDIX D

PROPOSED MODIFICATION OF AIRPORT DESIGN STANDARDS

APPENDIX D – PROPOSED MODIFICIATION OF AIRPORT DESIGN STANDARDS

As discussed in Chapter 3, the current approved Airport Layout Plan for SUN lists several non-standard conditions relative to airport design standards. Alternatives 5-7 included in Chapter 5 propose several Modification of Airport Design Standards (MOS) to improve existing non-standard conditions while maintaining an acceptable level of safety at the airport. Use of MOS is *not* allowed for RSA dimensional standards and SUN will be required to comply with the Congressional RSA mandate by the end of 2015.

In 2011, the Transportation Research Board (TRB) published Airport Cooperative Research Program (ACRP) Report 51 – *Risk Assessment Method to Support Modification of Airfield Separation Standards*. This ACRP report provides a process to justify MOS for airports where standards cannot be met using practical means. This document is recognized by the FAA and was used in the development of the proposed MOS included in this analysis.

A Technical Memo was prepared that summarizes the analysis used in development of these MOS. A copy of that Memo is included in this Appendix.

Proposed draft MOS are also included in this Appendix. The draft MOS have been developed in the current FAA format. Further coordination with the FAA Airports District and Regional Offices regarding the approval of the proposed draft MOS will be necessary.

- Runway OFA
- Runway-Taxiway Separation
- Taxiway OFA
- Runway OFA Grading
- RSA Grading
- Runway Centerline to Aircraft Parking

APPENDIX D - MOS TECHNICAL MEMO

Technical Memorandum

RE: SUN Modifications of Design Standards

Prepared by: Nathan Cuvala, T-O Engineers

The intent of this memorandum is to explain the methodology behind the requests for Modifications of Airport Design Standards (MOS) at the Friedman Memorial Airport. The requested MOS forms will be submitted separately.

1. BACKGROUND

The Friedman Memorial Airport is located in Hailey, Idaho. This airport serves the Wood River Valley region of Idaho, including the Sun Valley resort area. The Airport is currently served by two commercial service air carriers: SkyWest and Horizon Air. A large number of corporate jets and other general aviation aircraft also use the airfield for business, recreation and travel to and from the large number of second homes in the area. The Friedman Memorial Airport Authority (FMAA) governs and manages the airport under a joint powers agreement between the City of Hailey and Blaine County, who jointly sponsor the airport.

Traffic by aircraft such as the Bombardier Q400, operated by Horizon Air, and several models of large GA aircraft (e.g., Gulfstream G-V and Bombardier Global Express) dictates the Airport Reference Code for the airport is C-III. Due to the geometry of the existing site, the airport does not meet current FAA design standards for many criteria including:

- Runway to Parallel Taxiway Separation
- Parallel Taxiway Object Free Area
- Runway Object Free Area Grading
- Runway Object Free Area (OFA) Width
- Runway Safety Area (RSA) Grading
- Runway to Aircraft Parking Separation

Until recently, the planned solution to meeting these standards was to relocate the airport to a new site to the south and away from the valley cities. The Federal Aviation Administration (FAA) was conducting an Environmental Impact Statement (EIS) study for a new location until the decision was made to suspend the study in August 2011, due to financial and environmental concerns with the sites under consideration.

A relocated airport is still the ultimate solution, as it will provide airport infrastructure that will meet standards, accommodate all foreseeable demand and provide a reliable all-weather airport. Locating a site and building a new airport is likely to take time, however, and some improvements are required in order for the Airport to survive and thrive at the existing site.

The FMAA has developed a plan to meet standards at the existing site wherever possible and provide an equivalent level of safety where standards can't be met. This technical memorandum will provide the background and justification for each of the requested MOS. These MOS are

seen as an interim solution while the sponsor continues the process of locating a site for the future airport.

2. METHODOLOGY

In 2011, the Transportation Research Board (TRB) released Airport Cooperative Research Program (ACRP) Report #51 – Risk Assessment Method to Support Modifications of Airfield Separation Standards. The ACRP is funded by the Federal Aviation Administration (FAA). This report was used to support several of the MOS requested at the Friedman Memorial Airport. Engineering Brief (EB) #78 – Linear Equations for Evaluating the Separation of Airplane Design Groups on Parallel Taxiways and Taxiways to Fixed/Movable Objects was also used.

The following four MOS listed below were modeled in accordance with Appendix A – Risk Assessment Methodology of ACRP Report #51:

- Runway to Parallel Taxiway Separation
- Runway to Aircraft Parking Separation
- Runway Object Free Area (OFA) Width
- Parallel Taxiway Object Free Area

This report uses a series of risk plots along with the annual number of operations to analyze the risk associated with either Runway to Parallel Taxiway, Runway to Object, or Taxiway to Object Separations. The operations numbers at SUN over the last decade were reviewed to determine the average annual number of operations. The average annual number of operations from 1990 to 2011 was approximately 50,000 operations. Since 2001, operations levels steadily declined until 2008 when they leveled off at approximately 30,000 annual operations. For the purpose of this risk analysis, the average annual operation level was used as it was deemed to be more conservative.

For operations involving the runway, the risk is analyzed based on three distinct phases of flight:

- Landing - Airborne Phase
- Landing - Ground Phase
- Takeoff

The separation distance from the runway centerline to either the parallel taxiway centerline or an object is used with the associated risk plot to calculate the risk of collision per operation. An example of one of the risk plots is shown below:

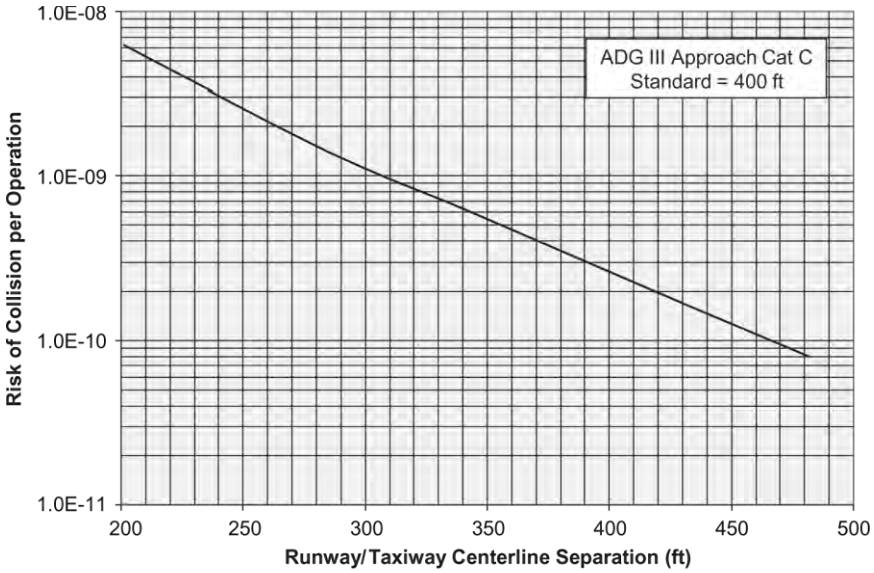

Figure AA-33. Missed approach collision risk for ADG III Cat I.

Source: ACRP Report #51

The risk of collisions per operation is then analyzed along with the number of annual airport operations for the appropriate phase of flight to determine the frequency of occurrence. The frequency of occurrence is used to determine the FAA likelihood level using Table A-3 from ACRP Report #51 which is shown below:

Table A-3. FAA likelihood levels (FAA, 2010).

	General	Airport Specific	ATC Operational	
			Per Facility	NAS-wide
Frequent A	Probability of occurrence per operation is equal to or greater than 1×10^{-3}	Expected to occur more than once per week or every 2,500 departures (4×10^{-4}), whichever occurs sooner	Expected to occur more than once per week	Expected to occur every 1–2 days
Probable B	Probability of occurrence per operation is less than 1×10^{-3}, but equal to or greater than 1×10^{-5}	Expected to occur about once every month or 250,000 departures (4×10^{-6}), whichever occurs sooner	Expected to occur about once every month	Expected to occur several times per month
Remote C	Probability of occurrence per operation is less than 1×10^{-5} but equal to or greater than 1×10^{-7}	Expected to occur about once every year or 2.5 million departures (4×10^{-7}), whichever occurs sooner	Expected to occur about once every 1–10 years	Expected to occur about once every few months
Extremely Remote D	Probability of occurrence per operation is less than 1×10^{-7} but equal to or greater than 1×10^{-9}	Expected to occur once every 10–100 years or 25 million departures (4×10^{-8}), whichever occurs sooner	Expected to occur about once every 10–100 years	Expected to occur about once every 3 years
Extremely Improbable E	Probability of occurrence per operation is less than 1×10^{-9}	Expected to occur less than once every 100 years	Expected to occur less than once every 100 years	Expected to occur less than once every 30 years

Note: Occurrence is defined per movement.

Source: ACRP Report #51

A Hazard Severity Classification is then assigned based on the worst credible outcome of an incident. The Hazard Severity Classifications were determined in accordance with Table A-4 FAA Severity Definitions from ACRP Report #51 and are shown below:

Table A-4. FAA severity definitions (FAA, 2010).

Hazard Severity Classification				
Minimal 5	**Minor 4**	**Major 3**	**Hazardous 2**	**Catastrophic 1**
No damage to aircraft but minimal injury or discomfort of little consequence to passenger(s) or workers	- Minimal damage to aircraft; - Minor injury to passengers; - Minimal unplanned airport operations limitations (i.e. taxiway closure); - Minor incident involving the use of airport emergency procedures	- Major damage to aircraft and/or minor injury to passenger(s)/ worker(s); - Major unplanned disruption to airport operations; - Serious incident; - Deduction on the airport's ability to deal with adverse conditions	- Severe damage to aircraft and/or serious injury to passenger(s)/ worker(s); - Complete unplanned airport closure; - Major unplanned operations limitations (i.e. runway closure); - Major airport damage to equipment and facilities	- Complete loss of aircraft and/or facilities or fatal injury in passenger(s)/ worker(s); - Complete unplanned airport closure and destruction of critical facilities; - Airport facilities and equipment destroyed

Source: ACRP Report #51

Using both the FAA likelihood level and the Hazard Severity Classification the risk was then analyzed using Figure A-1 FAA Risk Matrix from ACRP Report #51, shown below:

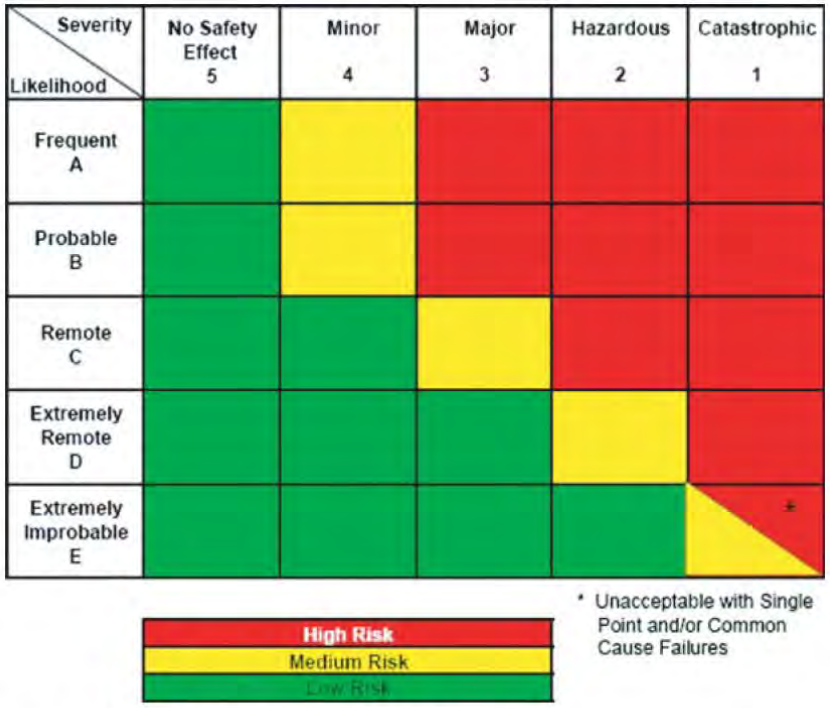

Figure A-1. FAA risk matrix (FAA, 2010).

Source: ACRP Report #51

The MOS for Parallel Taxiway Object Free Area was analyzed in accordance with Engineering Brief #78.

The MOS for both Runway Safety Area and Object Free Area grading were analyzed in accordance with the stated purpose of each of the FAA design standards in either Advisory Circular 150/5300-13A or 150/5300-13 Change 18.

3. ANALYSIS

Several of the MOS are tied directly together in that if one is not approved there is no need for the others. The first three related MOS are:

- 1A - Runway to Parallel Taxiway Separation
- 1B - Parallel Taxiway Object Free Area
- 1C - Runway Object Free Area (OFA) Grading

The remaining MOS are shown below:

- 2- Runway Object Free Area (OFA) Width
- 3- Runway Safety Area (RSA) Grading
- 4 - Runway to Aircraft Parking Separation

Several of the MOS listed above are related to MOS 1A, B or C. If MOS 3 – RSA Grading is approved, MOS 1C – Runway OFA Grading is not required. If MOS 1A, B or C are not

approved, MOS 4 – Runway to Aircraft Parking will not be applicable. In the introduction to the analysis for each MOS below, the relation to the other MOS is noted. The following table shows the relationship between each MOS.

MOS	Decision	MOS Not Applicable
1A	Not Approved	1B, 1C, 3, 4
1B	Not Approved	1A, 1C, 4
1C	Not Approved	1A, 1B, 4
3	Approved	1C
4	Not Approved	1A, 1B, 1C, 2, 3

As the relationship between each MOS is complex, it is recommended all proposed MOS be considered together. Following is the analysis of each individual MOS.

MOS 1A - Runway to Parallel Taxiway Separation

The FAA design standard for Runway to Parallel Taxiway Separation for ARC C-III is 400'. The requested MOS for Runway to Parallel Taxiway Separation of Taxiway B is 320'. This MOS is requested in conjunction with MOS 1B - Parallel Taxiway OFA and MOS 1C - Runway OFA Grading. If this MOS is not approved, MOS 4 – Runway to Aircraft Parking Separation is not required.

When analyzing the risk associated with a reduction in Runway to Parallel Taxiway Separation it is important to consider the purpose of the design standard. Appendix 8, Paragraph 1 b. of Advisory Circular 150/5300-13 Change 18 provides the design rationale for separations associated with runway to parallel taxiway:

> *"Runway to parallel taxiway/taxilane separation is determined by the landing and takeoff flight path profiles and physical characteristics of airplanes. The runway to parallel taxiway/taxilane standard precludes any part of an airplane (tail, wingtip, nose, etc.) on a parallel taxiway/taxilane centerline from being within the runway safety area or penetrating the OFZ."*

Paragraph 321 a. (1) of Advisory Circular 150/5300-13A provides the same rationale; however the reference to penetrations of the runway safety area or OFZ has been removed:

> *"These standards are determined by landing and takeoff flight path profiles and physical characteristics of aircraft."*

Additional background on the research that went into determining Runway to Parallel Taxiway Separation is further discussed on Page 5 of ACRP Report #51:

> *"In the 1960s, the FAA's Flight Standards organization and the ICAO Obstacle Clearance Panel (OCP) developed the Collision Risk Model (CRM) for ILS operations. The CRM was based on actual observation of 2,500 aircraft on an ILS precision approach to a runway. Four observations were made for each aircraft's approach. This model was used to define the area that needed to be protected on an airport when an aircraft was making an ILS approach. The runway/taxiway separation also took into account the possibility of an aircraft on landing rollout or takeoff roll veering off the runway."*

A separation to the C-III standard could be met in one of two ways, either shift Runway 13-31 and State Highway 75 to the east or shift all facilities on the airfield including the terminal, FBO facilities, ARFF, maintenance and all hangars to the west. The estimated costs of each alternative are shown below:

- Shift Runway 13-31 and State Highway 75 East - $144 Million dollars
- Shift Airfield Facilities West - $115 Million dollars

The maximum separation possible at SUN without major impacts to airfield facilities is 320' from Runway 13-31 centerline. There is a small area on the south end of the airfield where the separation could be increased to 330'; however as 320' is the controlling separation, a separation of 330' was not analyzed. The risks associated with each of the phases of flight described previously are analyzed for a Runway to Taxiway Separation of 320' below:

Airborne Landing Phase - Using the separation of 320' and Figure AA-33 in Appendix A of ACRP Report #51, the following provides a risk level 8.4E-10 or one chance in 1.2 billion landings. This can be seen in the figure below:

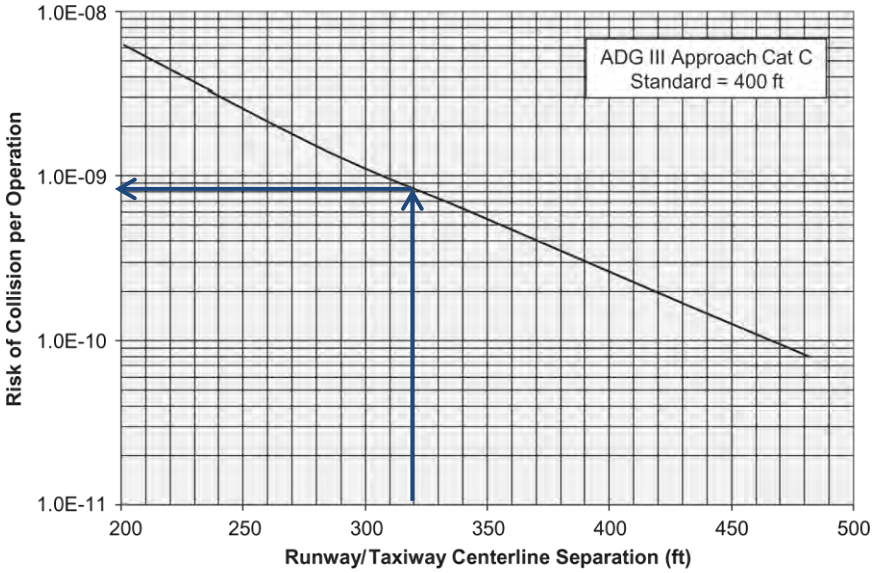

Figure AA-33. Missed approach collision risk for ADG III Cat I.

Source: ACRP Report #51

The current annual number of landing operations at SUN is approximately 25,000 or half of the 50,000 annual operations. As the risk is one incident in every 1.2 billion landings, the occurrence is calculated as 1.2 billion divided by 25,000 operations per year which equates to one incident every 47,620 years.

Landing Roll Phase - Using the separation of 320' and Figure AA-43 in Appendix A of ACRP Report #51, provides a risk level 9.0E-08 or one chance in 11 million landings. This can be seen in the figure below:

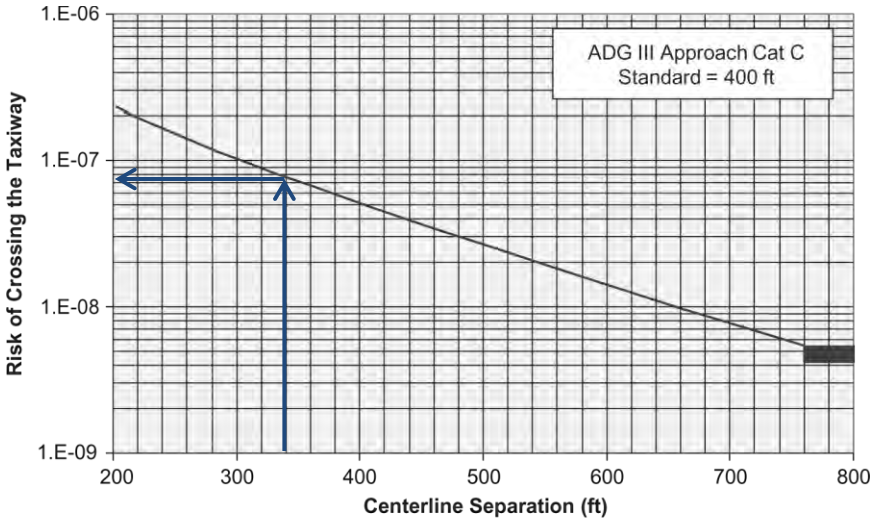

Figure AA-43. Landing veer-off collision risk for ADG III.

Source: ACRP Report #51

As the risk is one incident in every 11 million landings, the occurrence is calculated as 11 million divided by 25,000 operations per year which equates to one incident every 440 years.

Takeoff Roll Phase - Using the separation of 320' and Figure AA-50 in Appendix A of ACRP Report #51, provides a risk level 2.5E-08 or one chance in 40 million takeoffs. This can be seen in the figure below:

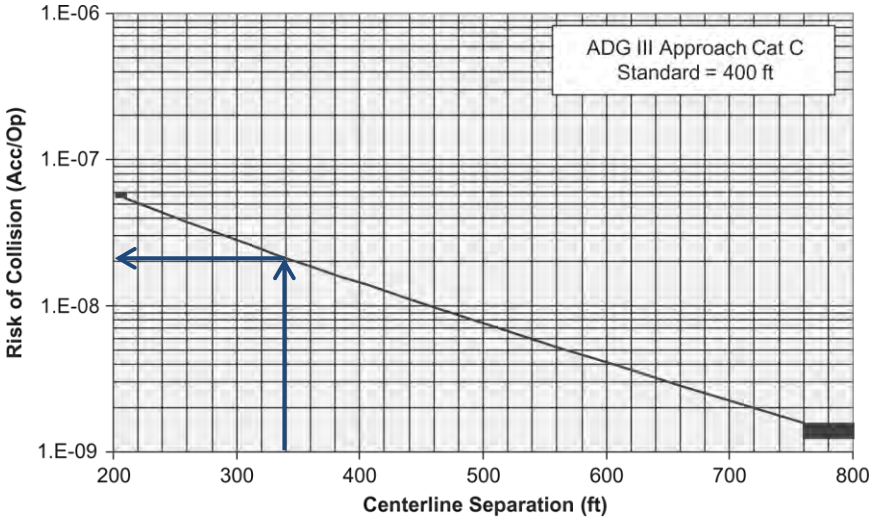

Figure AA-50. Takeoff veer-off collision risk for ADG III.

Source: ACRP Report #51

As the risk is one incident in every 40 million landings, the occurrence is calculated as 40 million divided by 25,000 operations per year which equates to one incident every 1,600 years.

Considering the risk of each phase of flight, the risk of collision during the landing roll is the controlling factor. The Hazard Severity Classification for this type of operation would be

catastrophic and the acceptable probability of occurrence is extremely improbable (1E-09) or less than once every 100 years. The following table summarizes the risk associated with each phase of flight:

Phase of Flight	Rate of Occurrence	Acceptable Level?
Airborne Phase	Once every 47,620 years	Yes
Landing Roll Phase	Once every 440 years	Yes
Takeoff Roll Phase	Once every 1,600 years	Yes

A Runway to Parallel Taxiway Separation of 320' appears to provide an acceptable level of risk. In addition a separation of 320' would keep any part of an aircraft on the taxiway from penetrating the RSA, the Runway Obstacle Free Zone (OFZ) and the Part 77 Primary Surface.

MOS 1B - Taxiway Object Free Area Width

The FAA design standard for Taxiway OFA for ARC C-III is 186'. The requested MOS for Taxiway OFA is 160'. This MOS is requested in conjunction with the MOS - 1A for Runway to Parallel Taxiway Separation and MOS - 1C Runway OFA Grading.

In the airport's current configuration, relocation of Parallel Taxiway B to a separation of 320 feet with a full C-III Taxiway OFA of 186 feet would require significant modification to existing airport facilities, along with property acquisition and removal of adjacent buildings. The estimated cost of these improvements is approximately $11 million dollars.

When considering the current and anticipated traffic at the airport, these improvements are not necessary. The published pavement strength for Runway 13-31 at SUN is 95,000 pounds. For the current fleet of all available aircraft, no aircraft with a maximum takeoff weight of 95,000 pounds or less has a wingspan of greater than 100 feet. Therefore, existing and anticipated aircraft traffic will include only aircraft with wingspans less than 100 feet.

Equation #2 from Table 1 in EB #78 gives the separation from centerline to an object as 0.7 x Wingspan + 10 feet. Using this equation and a wingspan of 100', an aircraft specific Taxiway OFA is calculated at 160 feet. For the aircraft that use and are anticipated to use the airport, this Taxiway OFA meets standards and therefore will provide an acceptable level of safety.

In addition, ACRP Report #51 provides the methodology for analyzing the risk of taxiway to object separations. Using the separation of 80' and Figure AA-10 in Appendix A of ACRP Report #51, provides a risk level 2.5E-09 or one chance in 400 million operations. This can be seen in the figure below:

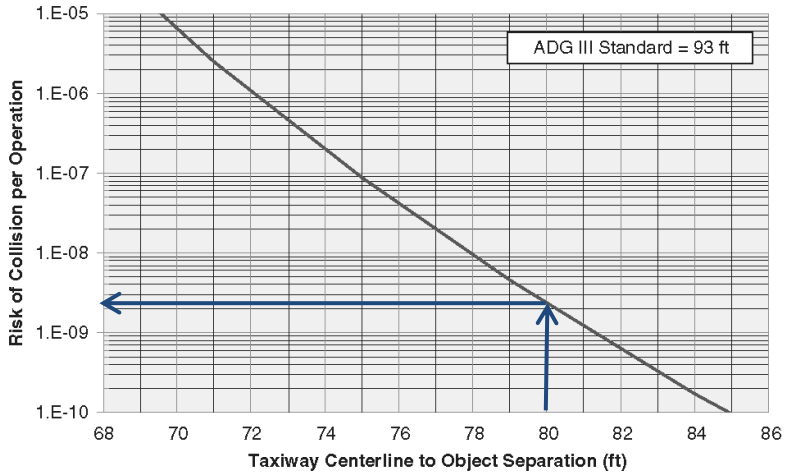

Figure AA-10. Collision risk associated with taxiway to object separation for ADG III.

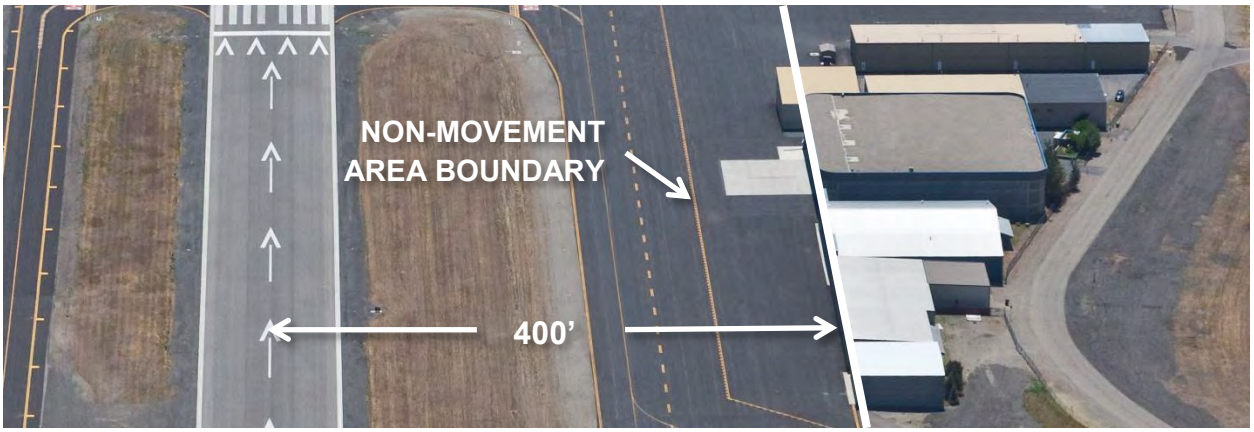
Source: ACRP Report #51

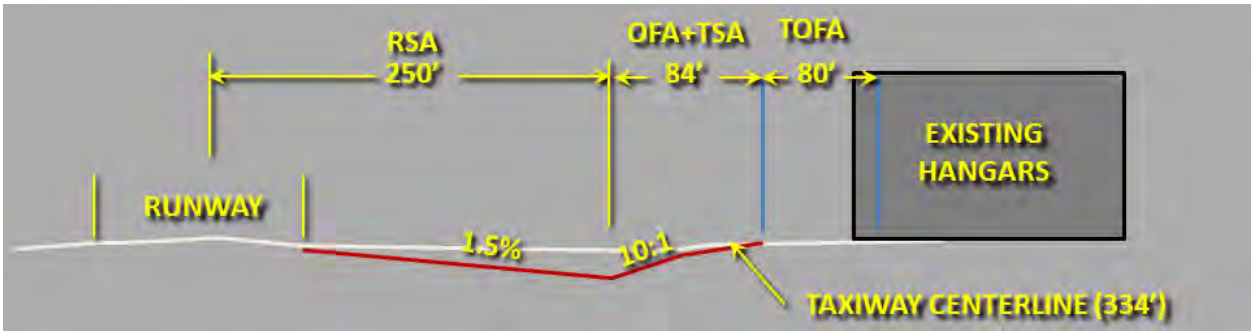


As the risk is one incident in every 400 million operations, the occurrence is calculated as 400 million divided by 50,000 operations per year which equates to one incident every 8,000 years.

The Hazard Severity Classification for this type of operation would be major and the acceptable probability of occurrence is remote (1E-05) or less than once every 1-10 years. A Taxiway OFA of 160’ appears to provide an acceptable level of safety especially when considering the current and future aircraft fleet.

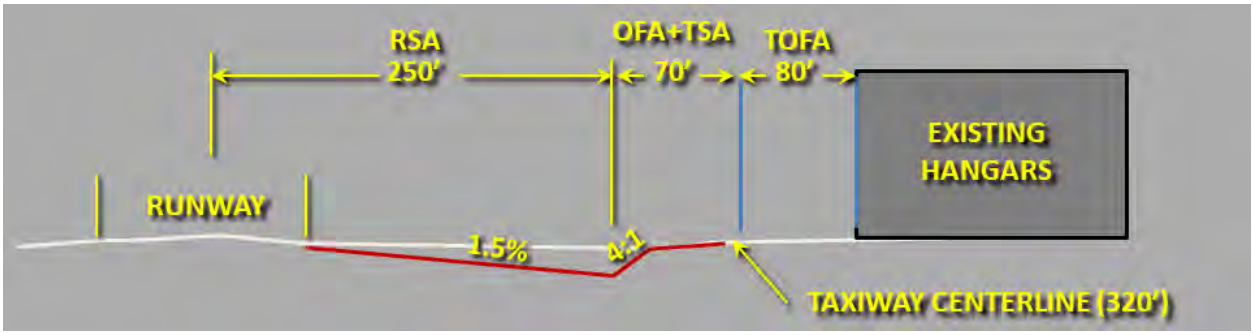
MOS 1C - Runway Object Free Area Transverse Grading

The FAA design standard for maximum transverse OFA grading for ADG III is a 10:1 slope for the first 59' of the OFA followed by a maximum slope of 4:1. The requested MOS for maximum transverse OFA grade is a 4:1 slope from the edge of OFA. This MOS is requested in conjunction with MOS - 1A for Runway to Parallel Taxiway Separation and MOS 1B - Parallel Taxiway OFA. This MOS is not required if MOS 3 - Runway Safety Area Grading is approved.



There is one area at the north end of the airfield, where meeting a 10:1 slope incurs significant impacts and cost. At the north end of the airfield, a series of existing hangars are located at approximately 400' from the runway centerline. The estimated cost of relocating these hangars is approximately $7 Million dollars. This cost does not include any land acquisition costs to accommodate the similar size hangars. The hangars are shown in the figure below:

Source: T-O Engineers



For reference, the current runway to parallel taxiway separation is 250' and a separation of 320' would place the taxiway centerline on the non-movement area boundary marking shown to the right in the photo above. One hangar is currently located less than 400' from the runway centerline and is planned to be removed.

In this area, the existing RSA grades are less than the minimum of 1.5%. Meeting the minimum transverse RSA grade of 1.5% requires removal of up to 4.5' of material at the outside edge of the RSA. In this area, the new RSA grade would be below the TSA and using the maximum allowable grades in the TSA decreases the total elevation change between the RSA and TSA to approximately 2.5', requiring 25' of grading at a 10:1 slope. This grading combined with the RSA grading and TSA grading results in a minimum runway to parallel taxiway separation of 334' and is shown in the figure below:

Source: T-O Engineers

If the parallel taxiway were located at 334' from runway centerline, the hangars shown above would need to be removed as they would be located inside the aircraft specific Taxiway OFA of 160'. Allowing a maximum OFA grade of 4:1 results in a minimum runway to parallel taxiway separation of 319' and would not impact the hangars on the north end. This is shown in the figure below:

Source: T-O Engineers

Prior to the release of AC 150/5300-13A, the previous maximum gradient for the Runway OFA was a 4:1 slope. This MOS is required due to the recent change in the design standard. The main hazard associated with allowing a slope of greater than a 4:1 is the risk a wingtip striking the ground in the event of an excursion from the runway.. At the north end of the airfield, the ground would penetrate approximately 30 inches above the edge of the RSA and would be the same height as an airfield light. The total cost required to meet the maximum OFA slope of a 10:1 at the north end of the airfield is in excess of $7 Million dollars. Considering the cost and benefit involved in meeting the new design standard, a slope of 4:1 inside the OFA appears to be acceptable.

MOS 2 - Runway Safety Area Transverse Grading

The FAA design standard for transverse RSA grades for ADG III is a minimum of 1.5% and a maximum of 3%. The requested MOS for transverse RSA grade is for less than 1.5%. If this MOS is approved, MOS 1C – Runway Object Free Area Transverse Grading is not required.

Meeting the minimum gradient of 1.5% at SUN requires the removal of 300,000 cubic yards of earthwork. In order to accomplish this, 250,000 cubic yards of earthwork would have to be disposed of off of airport property. The estimated cost of disposing of the material is in excess of $3.5 Million dollars. In addition, nearly the entire storm drainage system would need to be removed and relocated in order to meet the new grades. This includes 10,000 feet of pipe along with 30 aircraft rated inlets. The estimated cost of relocating the storm drainage system is $1.5 Million dollars. The work required to grade the RSA and relocate the storm drainage system would require the airport to be closed for 90 days. In the mountain environment of Hailey this work would have to take place in the summer months and would require the runway to be closed during the peak travel season.

When considering this MOS it is important to understand the purpose of the RSA. Paragraph 307 of Advisory Circular 150/5300-13A gives the purpose of the RSA:

> *"The RSA enhances the safety of aircraft which undershoot, overrun or veer off the runway, and it provides greater accessibility for fire-fighting and rescue equipment during such incidents."*

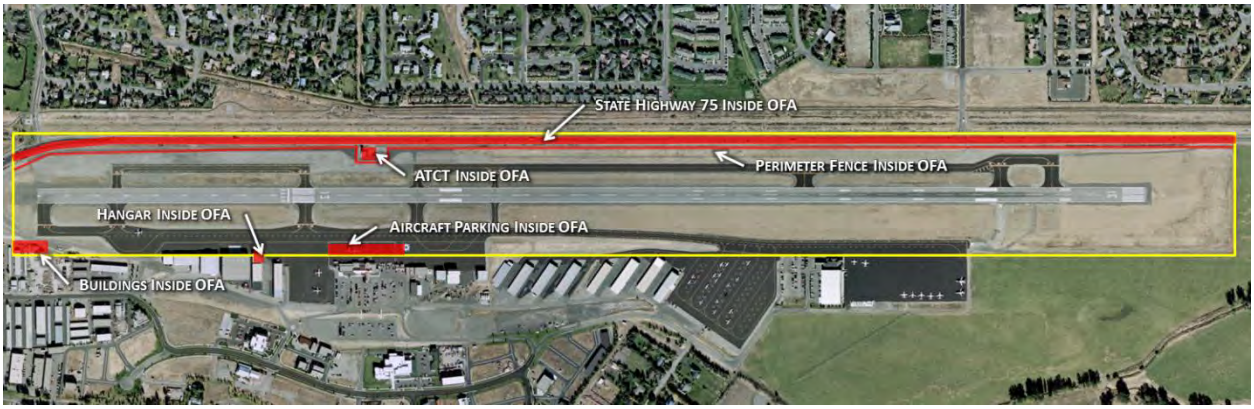
Paragraph 307 b. of Advisory Circular 150/5300-13A defines the requirements of the RSA:

> *"(1) cleared and graded and have no potentially hazardous ruts, humps, depressions, or other surface variations;*
>
> *(2) drained by grading or storm sewers to prevent water accumulation;*
>
> *(3) capable under dry conditions of supporting snow removal equipment, Aircraft Rescue and Fire Fighting (ARFF) equipment, and the occasional passage of aircraft; and*
>
> *(4) free of objects, except for objects that need to be relocated in the RSA because of their function."*

As the purpose of the RSA is to enhance the safety of aircraft in the event of a departure from the runway, the distance an aircraft departs from the runway is affected by three (3) major elements: weight of the aircraft, speed of the aircraft and RSA gradient. The third variable and the subject of this modification, the RSA gradient, affects the rate at which an aircraft slows after departing the runway. The steeper the gradient the longer it will take for an aircraft to stop. The existing transverse RSA gradients at SUN are flatter than standard; meaning an aircraft would actually come to a stop sooner if all other variables were equal. Paragraph 307 f in AC 5300-13 describes this condition:

"Keeping negative grades to the minimum practicable contributes to the effectiveness of the RSA."

Though flatter than standard, the RSA at SUN is graded smoothly and is capable of safely accommodating an aircraft without damage, in the case of a veer off.



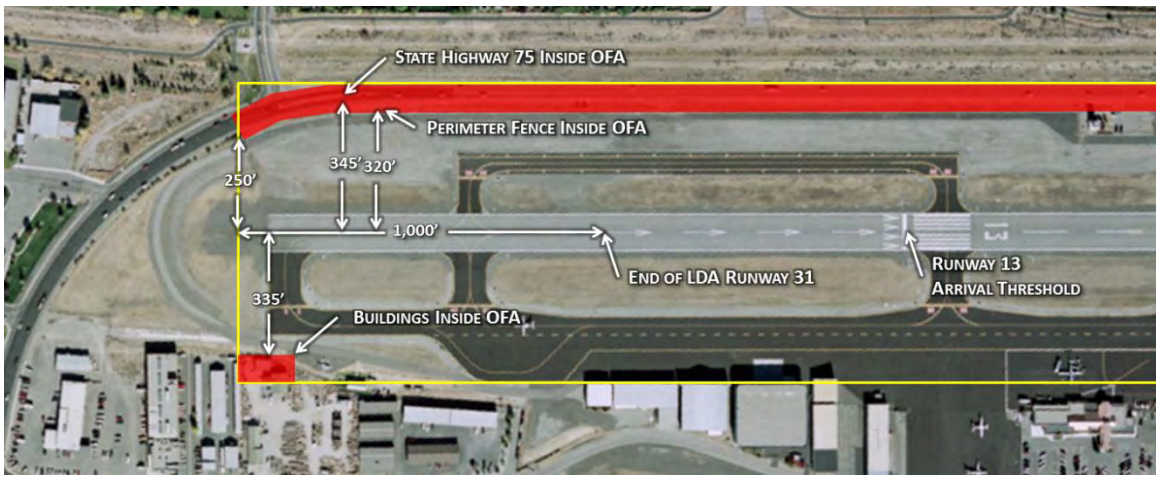
The negative aspect of gradients flatter than standard are their inability to adequately drain the RSA during rainfall events. The existing RSA at SUN drains extremely well, with no accumulation of standing water. Existing soils have a very high permeability and the local climate is dry, with an average annual rainfall of only 16 inches. In addition, the runway is equipped with a storm drainage system that collects and removes drainage efficiently. The following table summarizes the design requirements that would be met at SUN:

RSA Requirement	Standard Met
Cleared and Graded	Yes
Drained by grading or storm sewers	Yes
Capable of supporting SRE, ARFF and aircraft	Yes
Free of objects	Yes

The total estimated cost of meeting the minimum transverse grade of a 1.5% is $5 Million dollars and will require a full airport closure for 3 months. As the proposed RSA at SUN will meet the RSA requirements defined in AC 5300-13A, the grades flatter than standard will provide an acceptable level of safety.

MOS 3 - Runway Object Free Area (OFA) Width

The FAA design standard for Runway OFA Width for ARC C-III is 800', centered on the runway. The deficiencies in the existing Runway OFA at SUN are shown in the Figure below:



Source: T-O Engineers

The current deficiencies include:

- ATCT Inside OFA (To be relocated)
- Aircraft Parking Inside OFA (To be relocated)
- Hangar Inside OFA (To be relocated)
- Perimeter Fence Inside OFA (250'-320' from Runway CL)
- State Highway 75 Inside OFA (275'-345' from Runway CL)
- Off Airport Buildings Inside OFA (335' from Runway CL)

This MOS only includes the Perimeter Fence, State Highway 75 and the Off Airport Buildings inside the OFA; all of which are located off or at the edge of airport property. The remainder of the OFA deficiencies are located on airport property and could be relocated. State Highway 75 and the Perimeter Fence run parallel to Runway 13-31 from south to north until approximately 210' from the Runway 13 pavement end at which point they curve toward the runway until they are a minimum distance of 250' for the Perimeter Fence and 275' for State Highway 75 from the extended runway centerline. The following figure shows the deficiencies on the north end of the airfield in more detail:

Source: T-O Engineers

As SUN is currently configured using declared distances, the OFA for arrivals and departures in each direction have different deficiencies. The OFA to the east of Runway 13-31 for both arrivals and departures is penetrated by both State Highway 75 and the Perimeter Fence at 345' and 320' respectively. The OFA for Runway 13 departures and Runway 31 arrivals are penetrated to a greater degree at the north end of the airfield by the Perimeter Fence and State Highway 75 along with two buildings located off airport property. The deficiencies are summarized in the following table:

Runway OFA	State Highway 75	Perimeter Fence	Off Airport Buildings
13 Arrivals	345'	320'	None
13 Departures	275' to 345'	250' to 320'	335'
31 Arrivals	275' to 345'	250' to 320'	335'
31 Departures	345'	320'	None

Relocating the perimeter fence is not possible without the relocation of State Highway 75. A large residential neighborhood is located to the east of the SH 75 and the relocation of State Highway 75 closer to the residential neighborhood would raise significant environmental concerns including Historical Resources, Noise and Environmental Justice. Environmental impacts notwithstanding, the estimated costs to relocate State Highway 75 are in excess of $17 Million dollars.

The buildings located outside of airport property are currently located in an area zoned as light industrial. As the availability of light industrial land in the area is very low, the land is highly desirable. The estimated cost to acquire the light industrial land and remove the structures is $2 Million dollars.

When analyzing the risk associated with a reduction in Runway OFA it is important to consider the purpose of the design standard. Paragraph 309 of Advisory Circular 150/5300-13A defines the OFA but does not give the design rational behind the standard:

> *"The ROFA is centered about the runway centerline. The ROFA clearing standard requires clearing the ROFA of above-ground objects protruding above the nearest point of the RSA."*

Appendix 8, Paragraph 4 of Advisory Circular 150/5300-13 Change 18 provides the only available reference to the design rationale behind the Runway OFA width:

> *"The ROFA is a result of an agreement that a minimum 400-foot (120 m) separation from runway centerline is required for equipment shelters, other than localizer equipment shelters."*

Below is a summary of RSA and OFA width for each Runway Design Code (RDC):

RDC	RSA Width	OFA Width
A/B-I Small	120'	250'
A/B-I	120'	400'
A/B-II	150'	500'
A/B-III	300'	800'
C-I through E-IV	500'	800'

Source: AC 150/5300-13A

As shown in the table above, the OFA width for any RDC above A/B-II is 800'. This means an airport such as SUN serving the Canadair Regional Jet 700 and the Bombardier Q400 with a Non Precision approach has the same size OFA as Denver International or SEATAC airports, which serve very large commercial aircraft (such as the Boeing 747) with CAT III Precision approaches. Logically it appears a smaller OFA would be acceptable for smaller aircraft. The risk analysis procedure outlined in ACRP Report #51 appears to substantiate this.

Using the same risk based analysis as in the Runway to Parallel Taxiway Separation, there are three separate objects that must be considered; the Perimeter Fence, State Highway 75 and the buildings located off airport property. The risk associated with allowing each of these to remain will be analyzed separately.

Perimeter Fence (250' Separation)

The Perimeter Fence at the northernmost corner on the OFA is located 250' from the extended runway centerline. The risks associated with each of the phases of flight are analyzed below:

Airborne Landing Phase - Using the separation of 250' and Figure AA-33 in Appendix A of ACRP Report #51, the following provides a risk level 2.6E-09 or one chance in 384 million landings. This can be seen in the figure below:

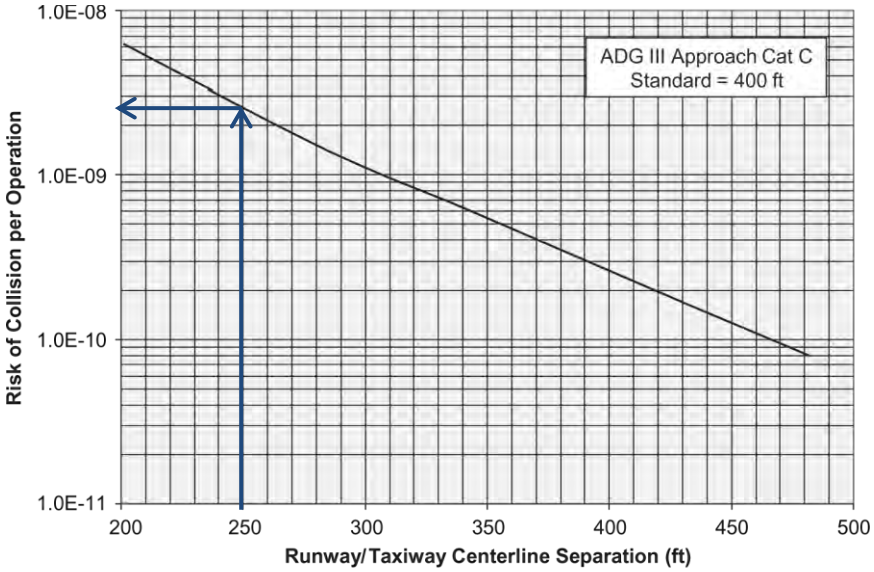


Figure AA-33. Missed approach collision risk for ADG III Cat I.

Source: ACRP Report #51

The current annual number of landing operations at SUN is approximately 25,000 or half of the 50,000 annual operations. As the risk is one incident in every 384 million landings, the rate of occurrence is calculated as 384 million landings divided by 25,000 landing operations per year which equates to one incident every 15,360 years.

Landing Roll Phase - Using the separation of 250' and Figure AA-43 in Appendix A of ACRP Report #51, provides a risk level 1.6E-07 or one chance in 6.25 million landings. This can be seen in the figure below:

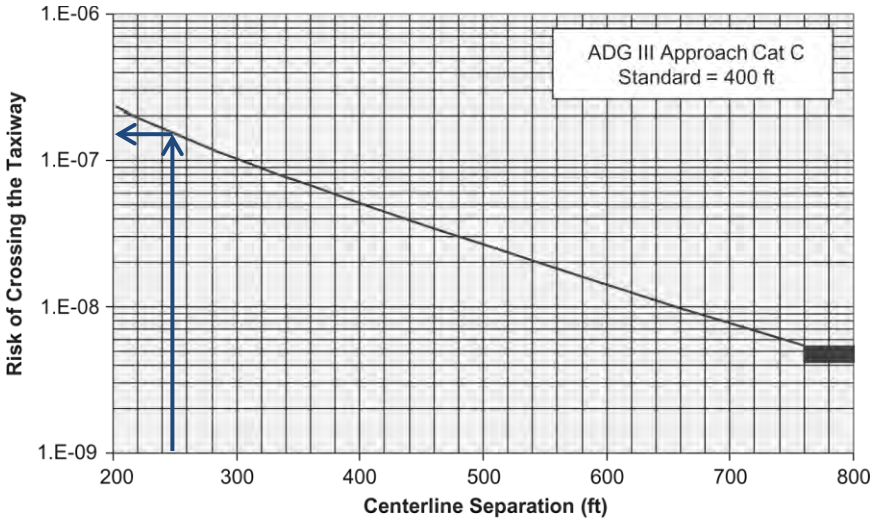

Figure AA-43. Landing veer-off collision risk for ADG III.

Source: ACRP Report #51

As the risk is one incident in every 6.25 million landings, the rate of occurrence is calculated as 6.25 million landings divided by 25,000 landings per year which equates to one incident every 250 years.

Takeoff Roll Phase - Using the separation of 250' and Figure AA-50 in Appendix A of ACRP Report #51, provides a risk level 4E-08 or one chance in 25 million takeoffs. This can be seen in the figure below:

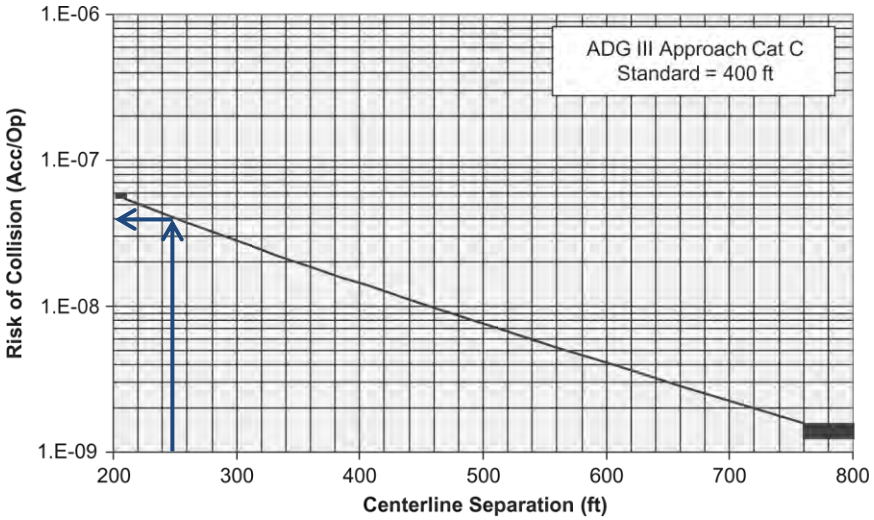

Figure AA-50. Takeoff veer-off collision risk for ADG III.

Source: ACRP Report #51

As the risk is one incident in every 25 million takeoffs, the rate of occurrence is calculated as 25 million takeoffs divided by 25,000 takeoffs per year which equates to one incident every 1,000 years.

Considering the risk of each phase of flight, the risk of collision during the landing roll is the controlling factor. The Hazard Severity Classification for this type of operation would be major and the acceptable probability of occurrence is remote (1E-05) or less than once every 1-10 years. The following table summarizes the risk associated with each phase of flight:

Phase of Flight	Rate of Occurrence	Acceptable Level
Airborne Phase	Once every 15,360 years	Yes
Landing Roll Phase	Once every 250 years	Yes
Takeoff Roll Phase	Once every 1,000 years	Yes

A Runway to object separation of 250' appears to provide an acceptable level of risk as the controlling occurrence is once every 250 years.

Perimeter Fence (320' Separation)

The Perimeter Fence runs along the east side of Runway 13-31 OFA and is located 320' from the extended runway centerline. The risks associated with each of the phases of flight are exactly the same as those for a Runway to Parallel Taxiway Separation of 320':

- Airborne Landing Phase - one incident every 47,620 years
- Landing Roll Phase - one incident every 440 years
- Takeoff Roll Phase - one incident every 1,600 years

Considering the risk of each phase of flight, the risk of collision during the landing roll is the controlling factor. The Hazard Severity Classification for this type of operation would be major and the acceptable probability of occurrence is remote (1E-05) or less than once every 1-10 years. A Runway to object separation of 250' appears to provide an acceptable level of risk as the controlling rate of occurrence is once every 440 years.

State Highway 75 (275' Separation)

State Highway 75 at the northernmost corner on the OFA is located 275' from the extended runway centerline. The risks associated with each of the phases of flight are analyzed below:

Airborne Landing Phase - Using the separation of 275' and Figure AA-33 in Appendix A of ACRP Report #51, the following provides a risk level 1.8E-09 or one chance in 555 million landings. This can be seen in the figure below:

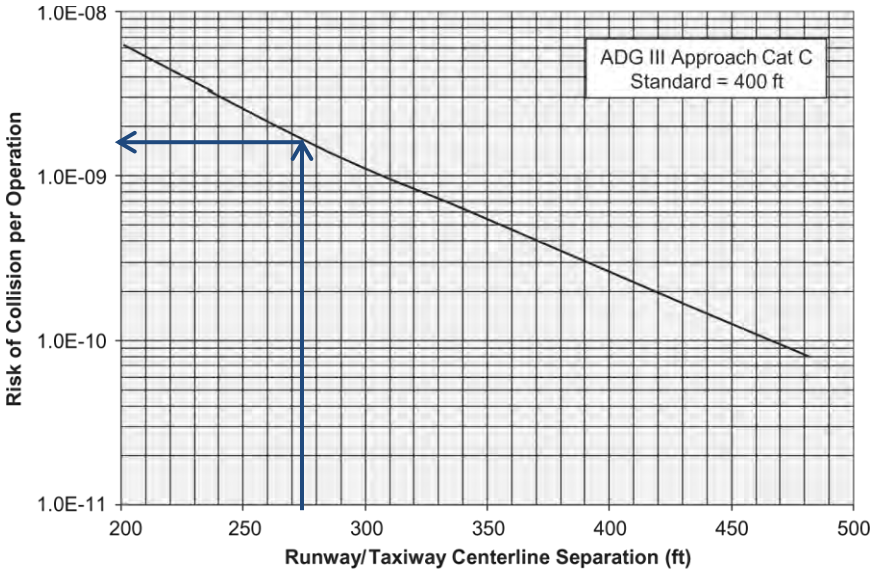

Figure AA-33. Missed approach collision risk for ADG III Cat I.

Source: ACRP Report #51

The current annual number of landing operations at SUN is approximately 25,000 or half of the 50,000 annual operations. As the risk is one incident in every 555 million landings, the rate of occurrence is calculated as 555 million landings divided by 25,000 landing operations per year which equates to one incident every 22,200 years.

Landing Roll Phase - Using the separation of 275' and Figure AA-43 in Appendix A of ACRP Report #51, provides a risk level 1.2E-07 or one chance in 8.33 million landings. This can be seen in the figure below:

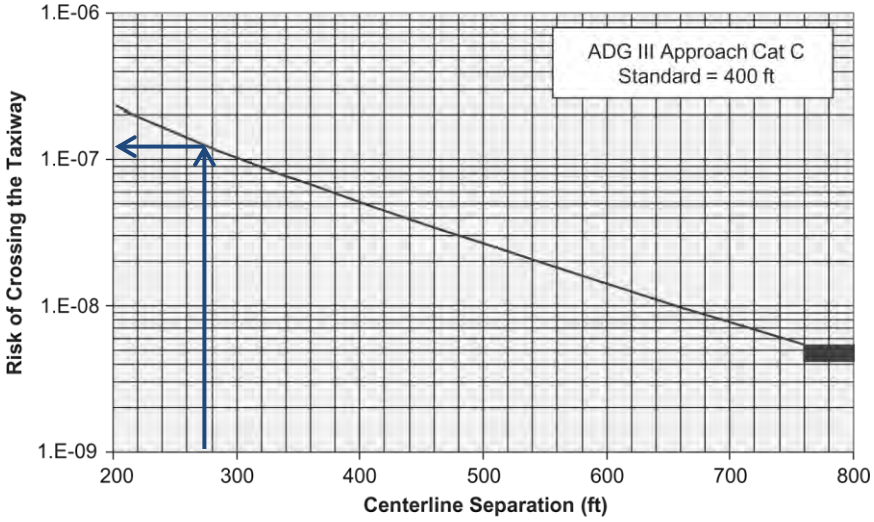

Figure AA-43. Landing veer-off collision risk for ADG III.

Source: ACRP Report #51

As the risk is one incident in every 8.33 million landings, the rate of occurrence is calculated as 8.33 million landings divided by 25,000 landings per year which equates to one incident every 333 years.

Takeoff Roll Phase - Using the separation of 275' and Figure AA-50 in Appendix A of ACRP Report #51, provides a risk level 3.2E-08 or one chance in 31 million takeoffs. This can be seen in the figure below:

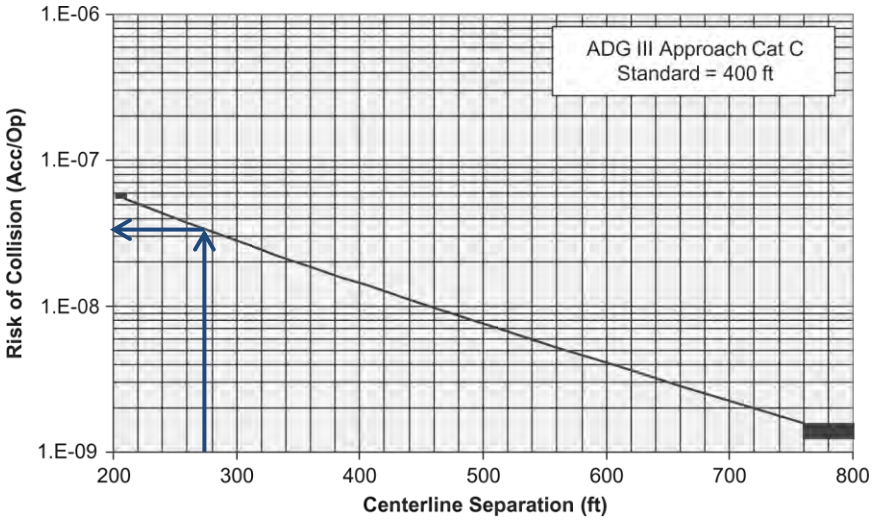

Figure AA-50. Takeoff veer-off collision risk for ADG III.

Source: ACRP Report #51

As the risk is one incident in every 31 million takeoffs, the rate of occurrence is calculated as 31 million takeoffs divided by 25,000 takeoffs per year which equates to one incident every 1,240 years.

Considering the risk of each phase of flight, the risk of collision during the landing roll is the controlling factor. The Hazard Severity Classification for this type of operation would be catastrophic and the acceptable probability of occurrence is extremely improbable (1E-09) or less than once every 100 years. The following table summarizes the risk associated with each phase of flight:

Phase of Flight	Rate of Occurrence	Acceptable Level
Airborne Phase	Once every 22,200 years	Yes
Landing Roll Phase	Once every 333 years	Yes
Takeoff Roll Phase	Once every 1,240 years	Yes

A Runway to Object Separation of 275' appears to provide an acceptable level of risk as the controlling rate of occurrence is once every 333 years.

State Highway 75 (345' Separation)

State Highway 75 runs along the east side of the Runway 13-31 OFA and is located 345' from the extended runway centerline. The risks associated with each of the phases of flight are analyzed below:

Airborne Landing Phase - Using the separation of 345' and Figure AA-33 in Appendix A of ACRP Report #51, the following provides a risk level 6E-10 or one chance in 1.7 billion landings. This can be seen in the figure below:

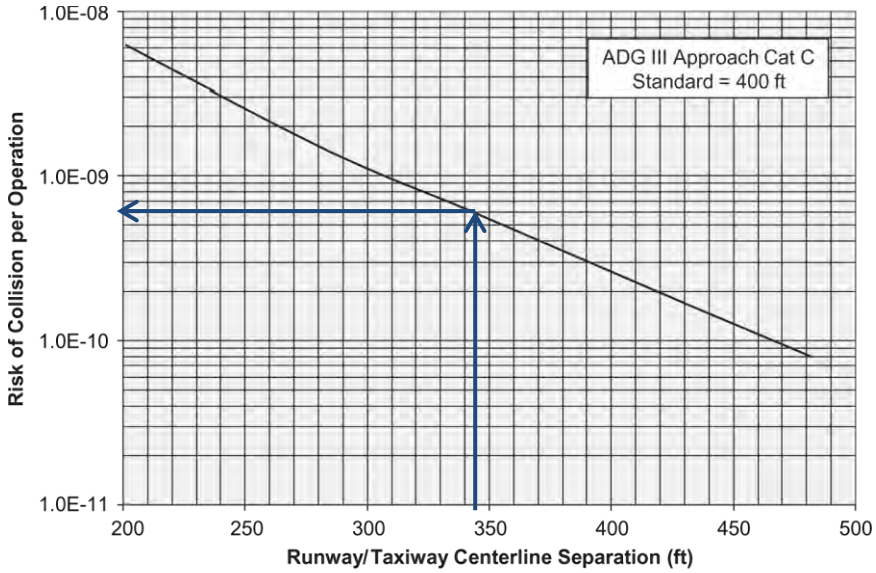

Figure AA-33. Missed approach collision risk for ADG III Cat I.

Source: ACRP Report #51

The current annual number of landing operations at SUN is approximately 25,000 or half of the 50,000 annual operations. As the risk is one incident in every 1.7 billion landings, the rate of occurrence is calculated as 1.7 billion landings divided by 25,000 landing operations per year which equates to one incident every 66,666 years.

Landing Roll Phase - Using the separation of 345' and Figure AA-43 in Appendix A of ACRP Report #51, provides a risk level 7E-08 or one chance in 14 million landings. This can be seen in the figure below:

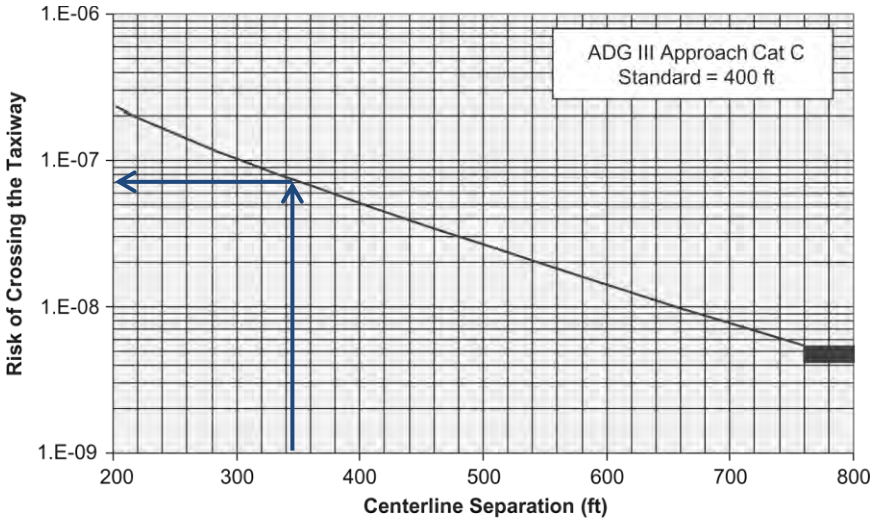

Figure AA-43. Landing veer-off collision risk for ADG III.

Source: ACRP Report #51

As the risk is one incident in every 14 million landings, the rate of occurrence is calculated as 14 million landings divided by 25,000 landings per year which equates to one incident every 571 years.

Takeoff Roll Phase - Using the separation of 345' and Figure AA-50 in Appendix A of ACRP Report #51, provides a risk level 2E-08 or one chance in 50 million takeoffs. This can be seen in the figure below:

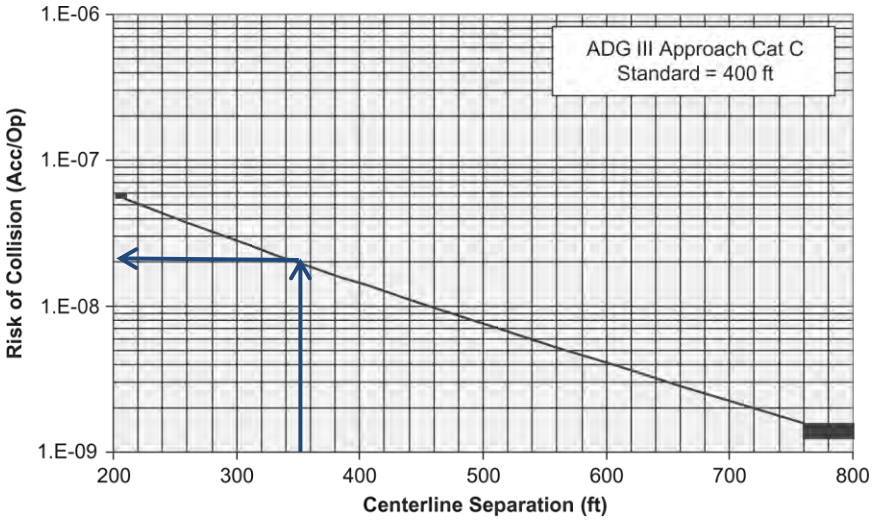

Figure AA-50. Takeoff veer-off collision risk for ADG III.

Source: ACRP Report #51

As the risk is one incident in every 50 million takeoffs, the rate of occurrence is calculated as 50 million takeoffs divided by 25,000 takeoffs per year which equates to one incident every 2,000 years.

Considering the risk of each phase of flight, the risk of collision during the landing roll is the controlling factor. The Hazard Severity Classification for this type of operation would be catastrophic and the acceptable probability of occurrence is extremely improbable (1E-09) or less than once every 100 years. The following table summarizes the risk associated with each phase of flight:

Phase of Flight	Rate of Occurrence	Acceptable Level
Airborne Phase	Once every 66,666 years	Yes
Landing Roll Phase	Once every 571 years	Yes
Takeoff Roll Phase	Once every 2,000 years	Yes

A Runway to Object Separation of 345' appears to provide an acceptable level of risk as the controlling rate of occurrence is once every 571 years.

Buildings Located Off Airport Property (335' Separation)

The buildings located at the northernmost corner on the west side of the OFA are located 335' from the extended runway centerline. The risks associated with each of the phases of flight are analyzed below:

Airborne Landing Phase - Using the separation of 335' and Figure AA-33 in Appendix A of ACRP Report #51, the following provides a risk level 6E-10 or one chance in 1.6 billion landings. This can be seen in the figure below:

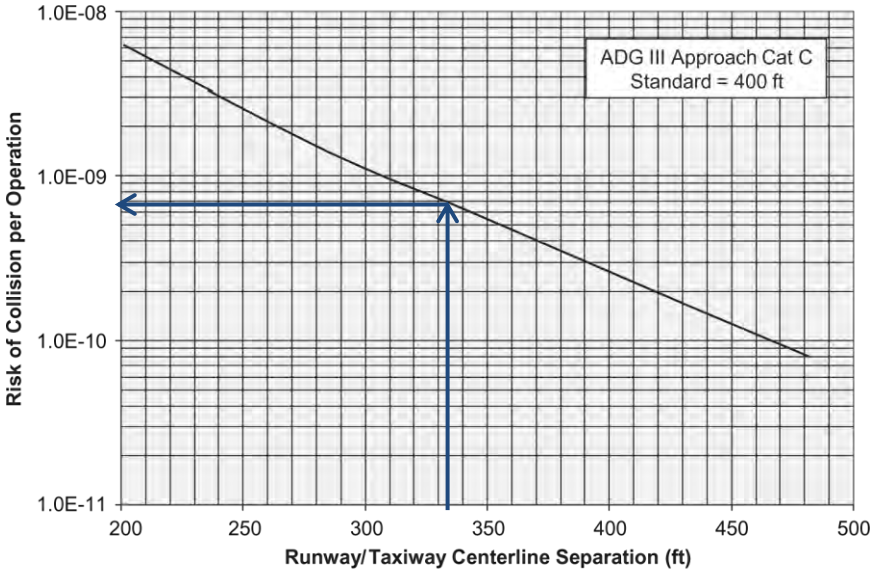

Figure AA-33. Missed approach collision risk for ADG III Cat I.

Source: ACRP Report #51

The current annual number of landing operations at SUN is approximately 25,000 or half of the 50,000 annual operations. As the risk is one incident in every 1.6 billion landings, the rate of occurrence is calculated as 1.6 billion landings divided by 25,000 landing operations per year which equates to one incident every 64,000 years.

Landing Roll Phase - Using the separation of 335' and Figure AA-43 in Appendix A of ACRP Report #51, provides a risk level 8E-08 or one chance in 12.5 million landings. This can be seen in the figure below:

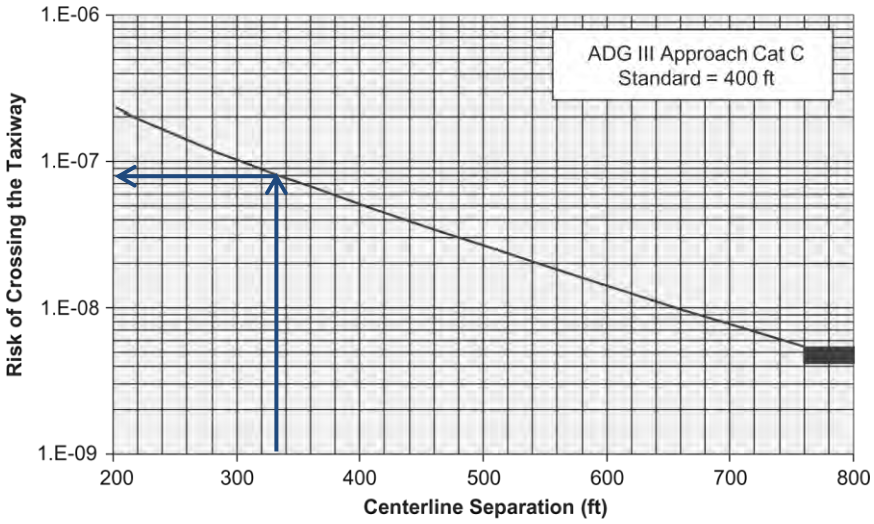

Figure AA-43. Landing veer-off collision risk for ADG III.

Source: ACRP Report #51

As the risk is one incident in every 12.5 million landings, the rate of occurrence is calculated as 12.5 million landings divided by 25,000 landings per year which equates to one incident every 500 years.

Takeoff Roll Phase - Using the separation of 335' and Figure AA-50 in Appendix A of ACRP Report #51, provides a risk level 2.2E-08 or one chance in 45 million takeoffs. This can be seen in the figure below:

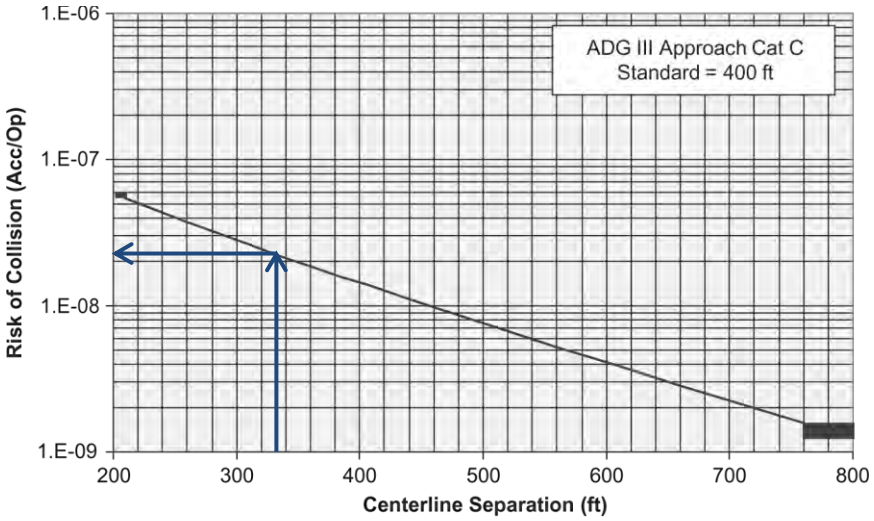

Figure AA-50. Takeoff veer-off collision risk for ADG III.

Source: ACRP Report #51

As the risk is one incident in every 45 million takeoffs, the rate of occurrence is calculated as 45 million takeoffs divided by 25,000 takeoffs per year which equates to one incident every 1,800 years.

Considering the risk of each phase of flight, the risk of collision during the landing roll is the controlling factor. The Hazard Severity Classification for this type of operation would be catastrophic and the acceptable probability of occurrence is extremely improbable (1E-09) or less than once every 100 years. The following table summarizes the risk associated with each phase of flight:

Phase of Flight	Rate of Occurrence	Acceptable Level
Airborne Phase	Once every 64,000 years	Yes
Landing Roll Phase	Once every 500 years	Yes
Takeoff Roll Phase	Once every 1,800 years	Yes

A Runway to Object Separation of 335' appears to provide an acceptable level of risk as the controlling rate of occurrence is once every 500 years.

For each of the various object separations the Landing Roll phase of flight provided the controlling risk. Each of the separations and the associated rate of occurrence are summarized in the following table:

Object (Separation)	Controlling Phase of Flight	Hazard Severity Classification	Rate of Occurrence	Acceptable Level?

Perimeter Fence (250')	Landing Roll	Major	Once every 250 years	Yes
Perimeter Fence (320')	Landing Roll	Major	Once every 440 years	Yes
State Highway 75 (275')	Landing Roll	Catastrophic	Once every 333 years	Yes
State Highway 75 (345')	Landing Roll	Catastrophic	Once every 571 years	Yes
Off Airport Buildings (335')	Landing Roll	Catastrophic	Once every 500 years	Yes

As shown in the table above, each of the various Runway to Object Separations provide an acceptable level of risk. In addition, the closest separations are all located on the north end of the airfield. Though each of these penetrates the departure OFA for Runway 13, the risk of an incident is actually much lower as an aircraft would be taking off in the opposite direction of the objects. For arrivals on Runway 31, due to the use of declared distances, the objects are located a minimum of 1,000' from the end of the runway declared suitable for landing operations. Their location is modeled as if the objects are located laterally to the runway and as such the actual risk of an incident is much lower.

MOS 4 - Runway to Aircraft Parking Separation

The FAA design standard for Runway to Aircraft Parking Separation for ARC C-III is 500'. The requested MOS for Runway to Aircraft Parking Separation is 400'. This MOS is not applicable if MOS 1A, 1B, or 1C are not approved.

A separation to the C-III standard of 500' could be met in one of two ways, either shift Runway 13-31 and State Highway 75 to the east or relocate the majority of apron parking on the airfield including the terminal, to the southwest. The estimated costs of each alternative are shown below:

- Shift Runway 13-31 and State Highway 75 East - $144 Million dollars
- Shift Airfield Parking and Terminal Southwest - $30 Million dollars

The maximum separation possible at SUN without major impacts to airfield facilities is 400' from Runway 13-31 centerline. When analyzing the level of safety associated with a reduction in Runway to Aircraft Parking Separation it is important to consider the purpose of the design standard. Paragraph 321 a. (3) of Advisory Circular 150/5300-13A provides the design rationale:

> *"Runway to aircraft parking area separation is determined by the landing and takeoff flight path profiles and physical characteristics of the aircraft. The runway to parking area separation standard precludes any part of a parked aircraft (tail, wingtip, nose, etc.) from being within the ROFA or penetrating the OFZ."*

A Runway to Aircraft Parking Separation of 400' at SUN will preclude any part of an aircraft from penetrating the Runway OFA or Runway OFZ. In addition, a separation of 400 feet would also provide the following benefits:

- Prevent parked aircraft from penetrating the Runway Primary Surface
- Prevent parked aircraft from penetrating the Runway Transitional Surface
- Prevent parked aircraft from penetrating the Taxiway OFA

As the runway to aircraft parking area separation of 400 feet meets the purpose of this standard as stated in AC 150/5300-13A, this configuration will provide an acceptable level of safety.

MODIFICATION OF AIRPORT DESIGN STANDARDS

BACKGROUND

1. AIRPORT: **Friedman Memorial Airport**	2. LOCATION(CITY,STATE): **Hailey, ID**	3. LOC ID: **SUN**
4. EFFECTED RUNWAY/TAXIWAY: **RUNWAY 13-31**	5. APPROACH (EACH RUNWAY): **RW 13 VISUAL** **RW 31 NPI**	6. AIRPORT REF. CODE (ARC): **C-III**

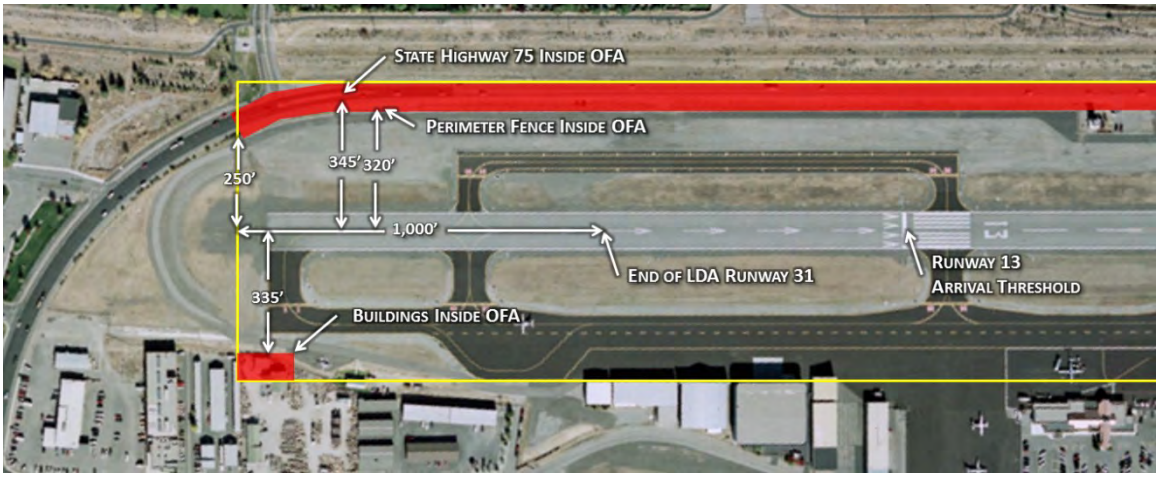
7. DESIGN AIRCRAFT (EACH RUNWAY/TAXIWAY): **Bombardier Q-400 and Gulfstream G-V**

MODIFICATION OF STANDARDS

8. TITLE OF STANDARD BEING MODIFIED (CITE REFERENCE DOCUMENT):

Runway Object Free Area (OFA), Advisory Circular 150/5300-13A, *Airport Design* (AC 150/5300-13A)

9. STANDARD/REQUIREMENT:



800 feet (400 foot either side of centerline) per Table 3-8 on page 94 of AC 150/5300-13A.

10. PROPOSED:

Varies see below.

11. EXPLAIN WHY STANDARD CANNOT BE MET (FAA ORDER 5300.1E):

State Highway 75 and the Perimeter Fence run parallel to Runway 13-31 from south to north until approximately 210' from the Runway 13 pavement end at which point they curve toward the runway until they are a minimum distance of 250' for the Perimeter Fence and 275' for State Highway 75 from the extended runway centerline. The following figure shows the deficiencies on the north end of the airfield in more detail:

As SUN is currently configured using declared distances, the OFA for arrivals and departures in each direction have different deficiencies. The OFA to the east of Runway 13-31 for both arrivals and departures is penetrated by both State Highway 75 and the Perimeter Fence at 345' and 320' respectively. The OFA for Runway 13 departures and Runway 31 arrivals are penetrated to a greater degree at the north end of the airfield by the Perimeter Fence and State Highway 75 along with two buildings located off airport property. The deficiencies are summarized in the following table:

Runway OFA	State Highway 75	Perimeter Fence	Off Airport Buildings
13 Arrivals	345'	320'	None
13 Departures	275' to 345'	250' to 320'	335'
31 Arrivals	275' to 345'	250' to 320'	335'
31 Departures	345'	320'	None

U.S. DEPARTMENT OF TRANSPORTATION
FEDERAL AVIATION ADMINISTRATION
NORTHWEST MOUNTAIN REGION
AIRPORT IMPROVEMENT PROGRAM

MODIFICATION OF AIRPORT DESIGN STANDARDS

In order to meet OFA requirements either the Runway and all airport facilities would have to be shifted to the West or State Highway 75 would have to be shifted to the East.

Neither of these options are seen as practicable and providing a less than standard OFA will provide an acceptable level of safety, based on the aircraft traffic at the airport.

12. DISCUSS VIABLE ALTERNATIVES (FAA ORDER 5300.1E):

The airport sponsor has considered three alternatives to provide a Runway OFA at the airport that complies with standards. The first two alternatives, though viable, are not practicable, due to cost and environmental impact.

1. Relocate Runway And All Airport Facilities To The West – Not Practicable
    - Essentially reconstructs the entire airport west of existing facilities, including the terminal, FBO facilities, all hangars and maintenance/ARFF facilities.
    - Total estimated cost exceeds $144 million.
2. Relocate Highway to the East – Not Practicable
    - Requires relocation of approximately 2 miles of State Highway 75 approximately 75 feet to the east.
    - A large neighborhood exists east of the airport in this location and relocating the highway will greatly increase the environmental impact of the highway on that neighborhood. Idaho Transportation Department has completed an Environmental Impact Statement study for a proposed project on this highway, which identifies the following environmental impacts of the highway in this location, all of which would be exacerbated significantly by relocating the highway as described. Note that an environmental analysis for the proposed action relative to the airport has not been completed – these impacts are identified based on previous studies and would require further evaluation.
        - Historical Resources: Relocation of the highway would require removal of a railroad berm that has been identified as a potential historic structure.
        - Noise: The noise levels of a relocated highway may exceed those permitted by Federal Highway Administration guidelines and require mitigation. Mitigation is difficult at this location, due to local ordinances prohibiting construction of noise walls.
        - Environmental Justice: The adjacent neighborhood is high density, with relatively low incomes and a high minority population. Based on these factors, relocating the highway could induce environmental justice impacts.
    - Costs for relocating the highway are estimated to exceed $17 million.
3. Allow Highway, Fence and Buildings To Remain
    - Do not relocate the highway.
    - Based on existing traffic at the airport, this will provide an acceptable level of safety. (See explanation below.)

U.S. DEPARTMENT OF TRANSPORTATION
FEDERAL AVIATION ADMINISTRATION
NORTHWEST MOUNTAIN REGION
AIRPORT IMPROVEMENT PROGRAM

MODIFICATION OF AIRPORT DESIGN STANDARDS

13. STATE WHY MODIFICATION WOULD PROVIDE ACCEPTABLE LEVEL OF SAFETY, ECONOMY, DURABILITY, AND WORKMANSHIP (FAA ORDER 5300.1E):

In 2011, the Transportation Research Board (TRB) published ACRP Report 51 – Risk Assessment Method to Support Modification of Airfield Separation Standards. This report provides a method for calculating the probability and associated risk for various runway to object separations, with the purpose of determining acceptability of modifications of standards. The method outlined in the report involves calculating the risk for three separate phases of aircraft operation: airborne phase, landing roll and takeoff roll. The highest risk value is then used to evaluate whether the separation is acceptable. The report provides figures for each of the phases of aircraft operations where the runway to object separation is used to determine the risk.

Current traffic at SUN includes less than 50,000 operations (25,000 takeoffs and 25,000 landings) per year. Using these operational numbers and the procedure outlined in ACRP Report 51, the estimated risk along with the return period for each phase of operation is summarized below for each of the objects located in the Runway Object Free Area. In each case, the controlling phase of flight was the Landing Roll. The table below summarizes the risk associated with each object.

Object (Separation)	Controlling Phase of Flight	Hazard Severity Classification	Rate of Occurrence	Acceptable Level?
Perimeter Fence (250')	Landing Roll	Major	Once every 250 years	Yes
Perimeter Fence (320')	Landing Roll	Major	Once every 440 years	Yes
State Highway 75 (275')	Landing Roll	Catastrophic	Once every 333 years	Yes
State Highway 75 (345')	Landing Roll	Catastrophic	Once every 571 years	Yes
Off Airport Buildings (335')	Landing Roll	Catastrophic	Once every 500 years	Yes

As shown in the table above, each of the various Runway to Object Separations provide an acceptable level of risk. In addition, the closest separations are all located on the north end of the airfield. Though each of these penetrates the departure OFA for Runway 13, the risk of an incident is actually much lower as an aircraft would be taking off in the opposite direction of the objects. For arrivals on Runway 31, due to the use of declared distances, the objects are located a minimum of 1,000' from the end of the runway declared suitable for landing operations. Their location is modeled as if the objects are located laterally to the runway and as such the actual risk of an incident is much lower.

MODIFICATION OF STANDARDS

8. TITLE OF STANDARD BEING MODIFIED (CITE REFERENCE DOCUMENT):

Runway to Parallel Taxiway Separation, Advisory Circular 150/5300-13A, *Airport Design* (AC 150/5300-13A)

9. STANDARD/REQUIREMENT:

400 feet, per Table 3-8 on page 94 of AC 5300-13A.

10. PROPOSED:

320 feet.

11. EXPLAIN WHY STANDARD CANNOT BE MET (FAA ORDER 5300.1E):

In the airport's current configuration, relocation of Parallel Taxiway B to a separation of 400 feet would either require relocating the runway, adjacent Highway 75 and other facilities to the east or relocating all existing airport facilities to the west. Neither of these options are seen as practicable and providing a less than standard Runway to Parallel Taxiway Separation will provide an acceptable level of safety, based on the aircraft traffic at the airport.

12. DISCUSS VIABLE ALTERNATIVES (FAA ORDER 5300.1E):

The airport sponsor has considered three alternatives to improve Runway To Parallel Taxiway Separation at the airport. The first two alternatives, though viable, are not practicable, due to cost and environmental impact.

1. Relocate Runway And All Airport Facilities To The West – Not Practicable
    - Essentially reconstructs the entire airport west of existing facilities, including the terminal, FBO facilities, all hangars and maintenance/ARFF facilities.
    - Total estimated cost exceeds $144 million.
2. Relocate Runway and Highway to the East – Not Practicable
    - Requires relocation of approximately 2 miles of State Highway 75 to the east.
    - Requires acquisition of over 100 homes to accommodate relocated highway.
    - Idaho Transportation Department has completed an Environmental Impact Statement study for a proposed project on this highway, which identifies the following environmental impacts of the highway in this location, all of which would be exacerbated significantly by relocating the highway as described. Note that an environmental analysis for the proposed action relative to the airport has not been completed – these impacts are identified based on previous studies and would require further evaluation.
        - Historical Resources: Relocation of the highway would require removal of a railroad berm that has been identified as a potential historic structure.
        - Noise: The noise levels of a relocated highway may exceed those permitted by Federal Highway Administration guidelines and require mitigation. Mitigation is difficult at this location, due to local ordinances prohibiting construction of noise walls.
        - Environmental Justice: The adjacent neighborhood is high density, with relatively low incomes and a high minority population. Based on these factors, relocating the highway could induce environmental justice impacts.
    - Costs for this alternative are estimated to exceed $115 million.
3. Relocate Taxiway B to 320-feet Separation From Runway 13-31
    - Requires reconstruction of Taxiway B.
    - Requires relocation of several hangars and terminal parking apron to accommodate aircraft parking and maneuvering.
    - Based on existing traffic at the airport, this will provide an acceptable level of safety. (See explanation below.)

U.S. DEPARTMENT OF TRANSPORTATION
FEDERAL AVIATION ADMINISTRATION
NORTHWEST MOUNTAIN REGION
AIRPORT IMPROVEMENT PROGRAM

MODIFICATION OF AIRPORT DESIGN STANDARDS

13. STATE WHY MODIFICATION WOULD PROVIDE ACCEPTABLE LEVEL OF SAFETY, ECONOMY, DURABILITY, AND WORKMANSHIP (FAA ORDER 5300.1E):

Runway to Parallel Taxiway separation serves two purposes; the first is to prevent an aircraft on the taxiway from colliding with an aircraft that departs the runway surface during landing or takeoff and the second is to prevent an aircraft executing a missed approach from colliding with an aircraft on the taxiway. In 2011, the Transportation Research Board (TRB) published ACRP 51 – Risk Assessment Method to Support Modification of Airfield Separation Standards. This report provides a method for calculating the probability and associated risk for various runway to parallel taxiway separations. The method outlined in the report involves calculating the risk for three separate phases of aircraft operation: airborne phase, landing roll and takeoff roll. The highest risk value is then used to evaluate whether the less than standard separation is acceptable. The report provides figures for each of the phases of aircraft operations where the runway to taxiway separation is used to determine the risk.

Current traffic at SUN includes less than 50,000 operations (25,000 takeoffs and 25,000 landings) per year. Using these operational numbers and the procedure outlined in ACRP Report 51, the estimated risk along with the return period for each phase of operation is summarized below.

Airborne Phase – 8.4E-10 (one chance in 1.2 billion landings or once every 47,620 years)
Landing Roll – 9.0E-08 (one chance in 11 million landings or once every 440 years)
Takeoff Roll – 2.5E-08 (one chance in 40 million landings or once every 1,600 years)

The risk of collision during the landing roll is the controlling factor. Using the FAA's risk matrix, a severity level of catastrophic was assigned to the landing roll phase for this type of incident. Using the FAA likelihood levels, the acceptable level of risk associated with a catastrophic event is extremely improbable or less than once every 100 years. As shown above, the expected rate of occurrence is once every 440 years. A Runway to Parallel Taxiway Separation of 320' appears to provide an acceptable level of risk. In addition a separation of 320' would keep any part of an aircraft on the taxiway from penetrating the RSA, the Runway Obstacle Free Zone (OFZ) and the Part 77 Primary Surface.

7. DESIGN AIRCRAFT (EACH RUNWAY/TAXIWAY): **Bombardier Q-400 and Gulfstream G-V**

MODIFICATION OF STANDARDS

8. TITLE OF STANDARD BEING MODIFIED (CITE REFERENCE DOCUMENT):

Parallel Taxiway Object Free Area (OFA), Advisory Circular 150/5300-13A, *Airport Design* (Advisory Circular 150/5300-13A)

9. STANDARD/REQUIREMENT:

186 feet per Table 4-1 on page 124 of AC 150/5300-13A.

10. PROPOSED:

160 feet.

11. EXPLAIN WHY STANDARD CANNOT BE MET (FAA ORDER 5300.1E):

In a separate modification request, the airport proposes relocating Taxiway B to 320 feet separation from Runway 13-31. In the airport's current configuration, relocation of Parallel Taxiway B to a separation of 320 feet with a full C-III Taxiway OFA of 186 feet would require significant modification to existing airport facilities, along with property acquisition and removal of adjacent buildings. This significant effort is not necessary, due to current and anticipated aircraft traffic at the airport.

12. DISCUSS VIABLE ALTERNATIVES (FAA ORDER 5300.1E):

The airport sponsors have considered two alternatives for Taxiway OFA on Taxiway B. Though both are viable, the first is not seen as practicable, due to the high costs and impacts, nor is it seen as necessary, due to the existing traffic at the airport.

1. Provide full C-III Taxiway OFA
    - Requires removal/relocation of 6 private hangars (1 of which is multi-unit condo hangars) on the north end of the airfield along with relocation of the FBO access at the south end of the airfield.
    - Several businesses northwest of the airport outside of the existing property boundary would need to be acquired and removed.
    - The estimated cost of removing the hangars and reconfiguring the FBO is at least $8.5 million. The estimated cost of acquiring the land northwest of the airport is $2.5 million, for a total cost in excess of $11 million.
2. Reduce Taxiway OFA to 160 feet.
    - Provides acceptable level of safety for aircraft that currently use the airport.

U.S. DEPARTMENT OF TRANSPORTATION
FEDERAL AVIATION ADMINISTRATION
NORTHWEST MOUNTAIN REGION
AIRPORT IMPROVEMENT PROGRAM

MODIFICATION OF AIRPORT DESIGN STANDARDS

13. STATE WHY MODIFICATION WOULD PROVIDE ACCEPTABLE LEVEL OF SAFETY, ECONOMY, DURABILITY, AND WORKMANSHIP (FAA ORDER 5300.1E):

The published pavement strength for Runway 13-31 at SUN is 95,000 pounds. For the current fleet of all available aircraft, no aircraft with a maximum takeoff weight of 95,000 pounds or less has a wingspan of greater than 100 feet. Therefore, existing and anticipated aircraft traffic will include only aircraft with wingspans less than 100 feet.

Using equation #2 from Table 1 in Engineering Brief (EB) 78 and this maximum wingspan, an aircraft specific Taxiway OFA was calculated. Equation #2 from EB 78 gives the separation from centerline to an object as 0.7 x Wingspan + 10 feet. Using the 100' wingspan described above, this calculation results in a Taxiway OFA of 160 feet. For the aircraft that use the airport, this Taxiway OFA meets standards and therefore will provide an acceptable level of safety.

In addition, ACRP Report #51 provides the methodology for analyzing the risk of taxiway to object separations. Using the separation of 80' and Figure AA-10 in Appendix A of ACRP Report #51, provides a risk level of 2.5E-09 or one chance in 400 million operations. As the risk is one incident in every 400 million operations, the occurrence is calculated as 400 million divided by 50,000 operations per year which equates to one incident every 8,000 years. The Hazard Severity Classification for this type of operation would be major and the acceptable probability of occurrence is remote (1E-05) or less than once every 1-10 years. A Taxiway OFA of 160' appears to provide an acceptable level of safety especially when considering the current and future aircraft fleet.

U.S. DEPARTMENT OF TRANSPORTATION
